OBD II Group System Description
Porsche Cayenne V6 MY11

This description applies for the following OBD groups/ test groups:

Durability Group	**BPRXGPGNNCB6**	**Cayenne V6**
Evaporative/Refuling Family	**BPRXR0230RED**	
Test Group	**BPRXT03.6CBD**	
Model Year	2011	
Models:	Cayenne V6	
Controller:	Bosch ME(D)17	

General statements:

- The sections “enable conditions” describe typical enable condition for the monitoring functions. All specific enable conditions for each monitor are described in the summary table, see chapter D.
- Disabling symptoms are described in the disabling list, see chapter F.

Table of Contents

Content and structure of technical OBD description for Bosch ME(D)17 based on the structure of CCR sect. 1968.2 sect (e):

1 CATALYST MONITORING 8

1.1 Active measurement of OSC 8
1.1.1 General description 8
1.1.2 Monitoring function description 9
1.2 Monitoring of front catalyst and catalyst system 12
1.2.1 General description 12
1.2.2 Secondary parameters 15
1.2.3 In-Use Monitor Performance Ratio 15

2 HEATED CATALYST MONITORING 16

3 MISFIRE MONITORING 16

3.1 General description 16
3.2 Monitoring strategy 16
3.3 Enable conditions 17
3.4 Malfunction criteria 17
3.5 Flow chart 18

4 EVAPORATIVE SYSTEM DIAGNOSIS 19

4.1 Leakage check 19
4.1.1 General description 19
4.1.2 Monitoring function description 19
4.1.3 Flow chart leakage check 20
4.2 Purge Check 21
4.2.1 General description 21
4.2.2 Monitoring Strategy 21
4.2.3 Enable Conditions 22
4.2.4 Malfunction Criteria 22
4.2.5 Flow charts 23
4.2.6 In-Use Monitor Performance Ratio 25

5 SECONDARY AIR SYSTEM MONITORING 26

6 FUEL SYSTEM MONITORING 26

6.1 General specific description of lambda control strategies 26
6.1.1 Principle of Operation of a Balanced Modulation Control 30
6.1.2 Influence of the Oxygen Charge State of the Catalyst on the Conversion 33
6.2 Air / fuel system monitoring 38
6.2.1 General description 38
6.2.2 Monitoring function description 38
6.2.3 Chart and flow charts air / fuel system monitoring 39
6.2.4 Similar conditions for fuel system 42

7 EXHAUST GAS SENSOR MONITORING 44

7.1 FO2 Sensor dynamic 45
7.1.1 Oxygen sensor, signal too slow, P0133, P0153, ... 46
7.2 FO2 Sensor circuit continuity check 58
7.2.1 Diagnosis of electrical faults at the FO2 Sensor 58
7.2.2 Diagnosis of evaluation IC of the FO2 Sensor 59
7.3 FO2 Sensor rationality check 71
7.3.1 Offset check 71
7.3.2 Plausibility check with help of upstream and downstream O2S signals 72
7.3.3 Diagnosis of O2 sensor voltage (FO2S not in exhaust system) 77
7.3.4 Heater Coupling Check 78

7.4 FO2 Sensor heater 79
7.4.1 Calibration resistor check 79
7.4.2 Temperature check of Nernst cell after engine start 80
7.4.3 Maximum heater output check 80
7.5 Rear downstream oxygen sensor (RO2S) dynamic 84
7.5.1 Diagnosis of aging of RO2 Sensor - Oscillation check (rear sensor) 84
7.5.2 Threshold check during trailing throttle fuel cut-off (rear sensor) 84
7.6 Signal range and electrical circuit monitoring of the rear oxygen sensor 88
7.6.1 System overview 88
7.6.2 General description 88
7.6.3 In-Use Monitoring Performance Ratio 98
7.7 RO2 Sensor response time and transition time monitoring 99
7.7.1 Response rate monitoring rear sensor 99
7.7.2 Monitoring of the response time 101
7.7.3 Monitoring of transition time 103
7.7.4 In-Use Monitoring Performance Ratio 104
7.8 RO2 Sensor heater 106

8 EGR MONITORING 109

9 PCV-DESCRIPTION 109

10 ENGINE COOLANT SYSTEM MONITORING 109

10.1 General description 109
10.2 Concepts without radiator temperature sensor 110
10.2.1 Monitor Functional Description 110
10.2.2 Cooling System Performance (P2181) 111
10.2.3 Engine Coolant Temperature Sensor Rationality (P3081) 113
10.2.4 Engine Coolant Temperature Sensor Stuck (P0116) 114
10.2.5 Engine coolant temperature sensor extended stuck check (P0116) 117
10.2.6 Engine coolant temperature sensor out of range check (P0118 / P0117) 121
10.2.7 Engine Coolant Temperature Sensor Rationality (P0116) 122
10.2.8 Engine Coolant Temperature Sensor Stuck (P0116) 124
10.2.9 Engine Coolant Temperature Sensor Out of Range Check (P0115 / P0117) 126

11 COLD START EMISSION REDUCTION STRATEGY MONITORING 127

11.1 General Description 127
11.2 Monitoring function description 127
11.3 Parameters of cold start condition 128
11.4 Ignition timing monitor during cold start 129
11.4.1 Signal Range Fault in Idle Speed Range: P050B 129
11.4.2 Signal Range Fault in Off-Idle Operation: P13EA 131

12 AIR CONDITIONING (A/C) SYSTEM COMPONENT MONITORING 133

12.1 General Description 133
12.2 Monitoring Concept 133

13 VARIABLE VALVE TIMING AND/OR CONTROL (VVT) SYSTEM MONITORING 134

13.1 Intake and Exhaust Camshaft Adjustment, Bank 1/2 134
13.1.1 General Description 134
13.1.2 Camshaft Adjustment Slow Response, P000A/P000B/P000C/P000D 134
13.1.3 Camshaft Adjustment Target error, P0011/P0014/P0021/P0024 137
13.2 VVT system monitoring during cold start 140

14 COMPREHENSIVE COMPONENTS MONITORING 142

14.1 Injection valve 142
14.2 Ignition coil 142
14.3 Idle Speed Control 143
14.3.1 Idle Speed Control (warm engine) 143

14.3.2 Idle control check during cold start 148
14.4 Engine speed sensor 150
14.5 Signal range check for input sensor 151
14.6 Mass air flow sensor monitoring (MAF) 152
14.6.1 Single MAF Sensor System 152
14.6.2 Correlation Air temperature intake manifold/ MAF intake air 153
14.7 Vehicle speed sensor (VSS) 155
14.7.1 Vehicle Speed Signal Monitoring via ESP/ABS 155
14.7.2 Vehicle Speed Signal Monitoring via Deceleration Fuel Cut-Off Check 156
14.8 Throttle position sensor (throttle unit with E-gas actuator) 159
14.9 Accelerator pedal position sensor (APPS) 160
14.10 Camshaft position (CMP) sensor 161

1 CATALYST MONITORING

There is one diagnostic function which is used for the monitoring of the catalyst efficiency. This is based on measuring the oxygen within the catalyst determined by at least two oxygen sensors. The oxygen storage capacity correlates with the NMHC or NOx emissions. Depending on which one of these two emission components reaches its OBD threshold first, the relevant threshold corresponds to either the NMHC or the NOx emissions.

The catalyst system may consist of two separated catalyst bricks, with the oxygen sensors mounted before and after the primary catalyst.

The diagnostic routine is executed once per driving cycle.

1.1 Active measurement of OSC

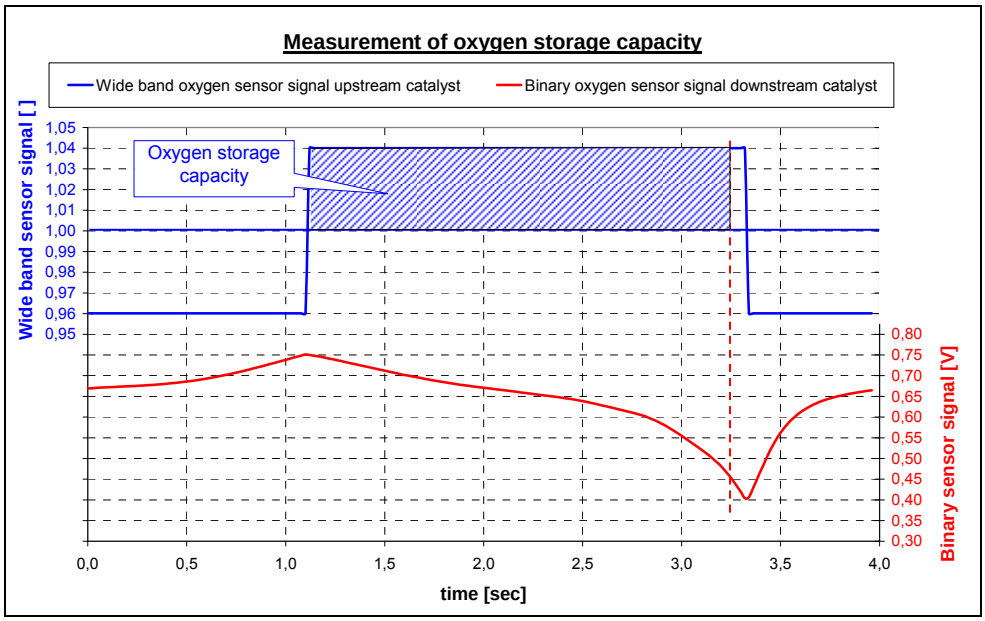
1.1.1 General description

The catalyst monitor is based on the determination of the oxygen storage capacity (OSC). The correlation between the conversion efficiency and the OSC has been investigated on catalysts with various characteristics specifically concerning stages of aging correlated to exhaust emissions (HC/NOx). Therefore, the catalyst is diagnosed by comparing its storage capability against the storage capability of a borderline catalyst.
The oxygen storage capacity (OSC) can be determined by the following method:

1. Determination of the Oxygen storage state (active test)
For the purpose of monitoring, the ECM cycles the A/F ratio by commanding a rich and a lean fuel mixture as follows.

- First, a rich A/F ratio is commanded by the ECM until a minimum of oxygen has been removed (cumulated rich gas > threshold - This threshold is derived from the Oxygen Storage Capacity of the borderline catalyst for the current operating point taken from the corresponding look-up table and typically multiplied with a factor between 1.3 and 2.5).
- Then, the catalyst is operated with a lean A/F ratio commanded by the ECM and the Oxygen Storage Capacity is calculated from the oxygen mass stored in the catalyst as follows:
- OSC = ∫ air mass flow * lean mixture (λ-1) * dt
- The catalyst is operated in this mode until the oxygen stored in the catalyst exceeds a calibrated limit or the downstream oxygen sensor indicates that the catalyst is completely saturated with oxygen (typically 450-550mV), or when the measured OSC value is higher than the x-fold (x =1.5-2.5) Oxygen Storage Capacity of the borderline catalyst for the current operating point.
- The catalyst is then diagnosed by comparing its oxygen storage capacity to the calibrated threshold of a borderline catalyst. A normalized OSC value is calculated from the quotient of the actual OSC value and borderline OSC value.
- After each completion of a measuring cycle a cycle counter is incremented
- Measuring cycles are run until the cycle counter reaches a certain number (typically 3 to 5 without EWMA and 1 with EWMA), then the diagnostic is finished.
- Calculation of the normalized mean value from the single measurements
- Comparison of the filtered normalized value with the fault threshold

The following picture shows an example of an OSC measurement:



1.1.2 Monitoring function description

According to the operating principle described above the following main parts of the monitor can be distinguished:

- Check of monitoring conditions for active test
- Lambda request (interface to lambda controller)
- Mixture enrichment in order to remove any stored oxygen
- Measurement of oxygen storage capacity (OSC) by lean A/F ratio operation
- Processing
- Fault detection

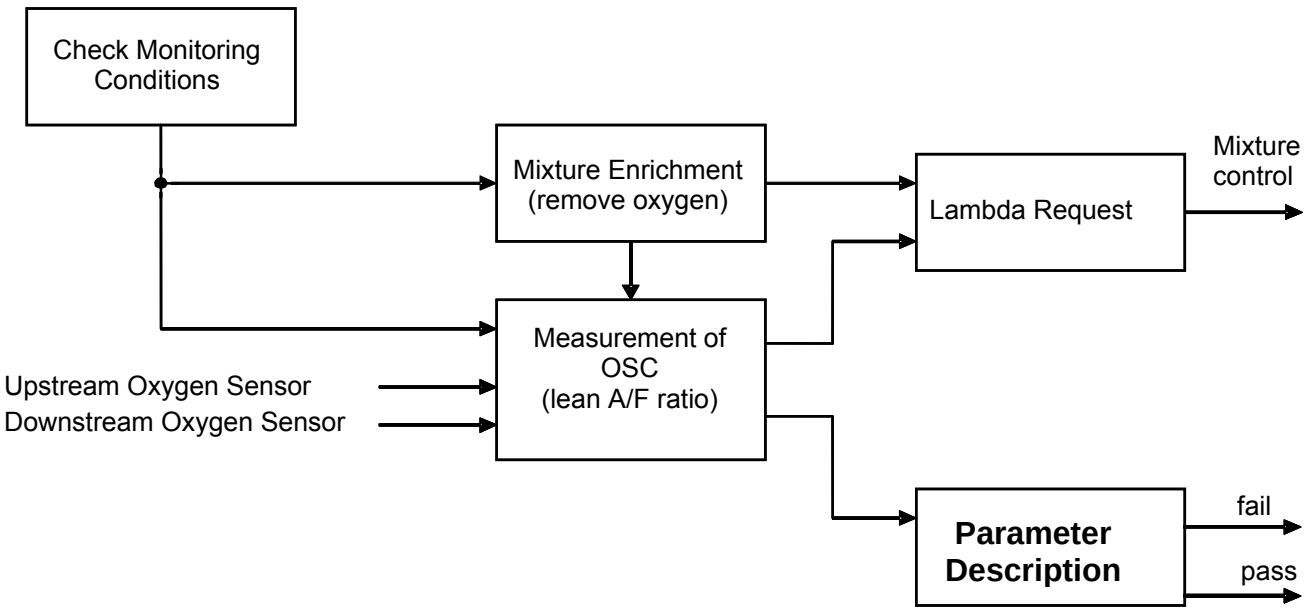


Figure 1: Active measurement of OSC – monitoring structure

Processing:

After the measurement of the OSC, the OSC value is normalized to the OSC value of the borderline catalyst, which is taken from a map, depending on the exhaust gas mass flow and catalyst temperature.

The final diagnostic result is calculated by averaging several, normalized OSC values and compared to the threshold. The measurement of the OSC can be carried out consecutively or stepwise.

Flow chart catalyst monitoring

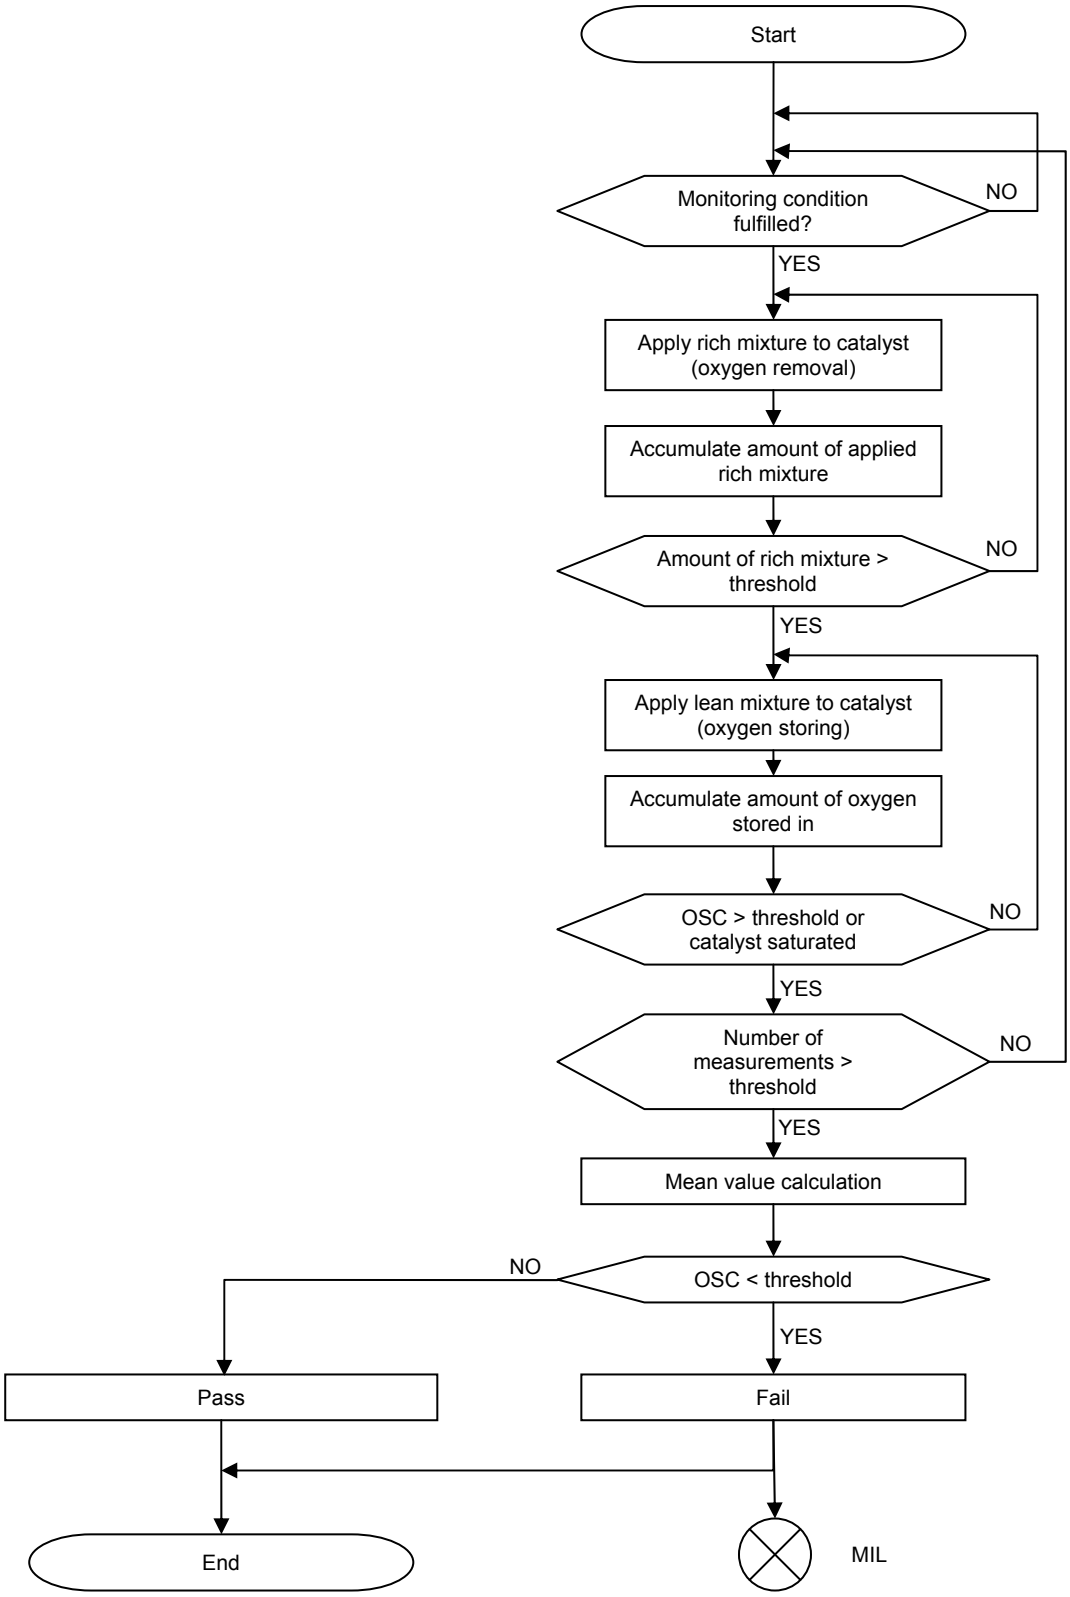

Figure 2: Flow chart catalyst monitoring

1.2 Monitoring of front catalyst and catalyst system

1.2.1 General description

The catalyst monitor is based on the determination of the oxygen storage capacity (OSC). The correlation between the conversion efficiency and the OSC has been investigated on catalysts with various characteristics, specifically concerning stages of aging correlated to exhaust emissions (HC/NOx). Therefore, the catalyst is monitored by comparing its storage capability against the storage capability of a borderline catalyst.

In this special application, the exhaust gas system consists of a close coupled catalyst (primary catalyst) and an underfloor catalyst (main catalyst).

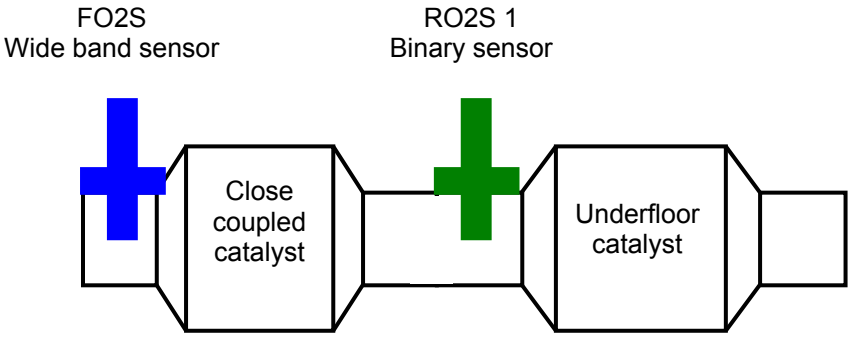

Figure 3: Overview front and main catalyst, one spare part only

This diagnostic function determines the OSC of the primary catalyst and the OSC of the catalyst system, (close coupled and underfloor catalyst), and depending on the results, a malfunction of the cat system is detected.

The diagnosis only depends on the measured OSC of the close coupled catalyst, if the oxygen storage capacity of the close coupled catalyst is greater then a first threshold. In this case the OSC of the catalyst system will not be measured.

If the oxygen storage capacity of the close couple catalyst is smaller than a first threshold, the OSC of the catalyst system will also be measured.

Malfunction criteria:
The exhaust gas aftertreatment system is recorded defective, if the OSC of the complete catalyst system is smaller than a second threshold.
Based on the following hardware configurations and the corresponding diagnostic concepts the following methods are applied to receive a diagnostic result:

1. System with total volume catalyst monitoring (ULEV II/Bin5, 1 brick or 2 bricks):

- Determination of a normalized mean overall catalyst diagnostic value, system without EWMA
- Determination of a normalized, EWMA filtered overall catalyst diagnostic value, system with EWMA

- Determination of a normalized mean total volume catalyst diagnostic value,
- Generation of the product from the primary catalyst diagnostic value and the total volume diagnostic value and comparison of the result with a fault threshold

➡ In the case of the above described switching of the diagnostic routine, two calibrated look-up tables will be referenced to alter the values of the individual partial and total volume catalyst values and export them as factors, which allows the quantified assessment of the individual catalysts within the complete system
Depending on the calibration of the look-up tables the following methods are applied:

In case the measurement of the primary cat delivers a very positive result (value exceeds a threshold), the main cat is not measured, which means that in this case only the primary cat factor is compared with a fault threshold.

Primary cat factor > threshold → Pass Result

However, measuring of the main cat is simulated for the IUMPR creation.

In case the result of the primary cat measurement remains below the threshold, the additional measurement of the total volume catalyst monitoring is activated.

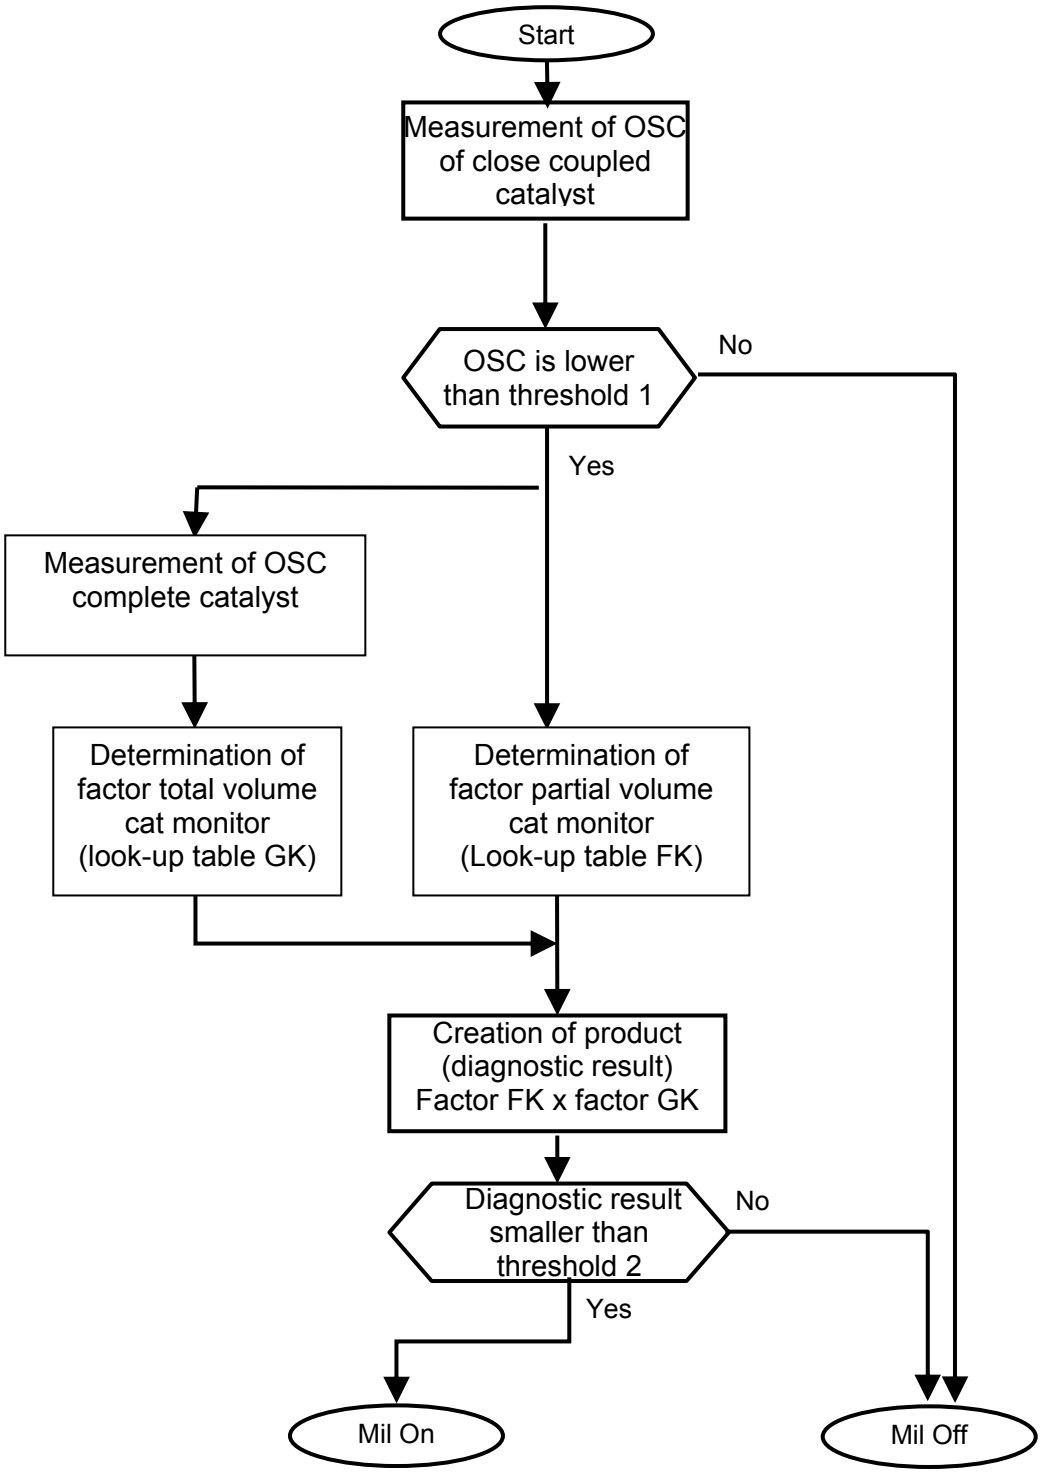

Figure 4: Flow chart front and main catalyst monitoring

Processing:

After the measurement of the OSC, the OSC value is normalized to the OSC value of the borderline catalyst, which is taken from a map, depending on the exhaust gas mass flow and catalyst temperature.

The final diagnostic result is calculated by averaging several normalized OSC values and comparing the result to the threshold. The measurement of OSC can be carried out consecutively or stepwise.

1.2.2 Secondary parameters

All secondary parameters listed below have to be fulfilled for a calibrated duration:

- O2 Sensors ready for operation
- Catalyst temperature in calibrated range
- Maximum permissible catalyst temperature change < threshold
- Axial temperature distribution of catalyst within range (the catalyst temperatures are modeled in several layers)
- In case the lowest temperature of all the layers falls below a threshold for a certain time (cool down time), this temperature must be exceeded for another time period (re-heatup time) before the diagnostic is re-enabled (radial warming after cooling-down must be ensured)
- The low-pass filtered minimum temperature > threshold (ensures thorough radial warming in warm-up phases even after cooling down caused by overrun fuel cut-off phases)
- Delta exhaust mass flow < threshold
- Exhaust gas mass flow in calibrated range
- Deviation of actual lambda from setpoint lambda < threshold
- Lambda controller not at minimum or maximum
- Requested lambda value for diagnostic routine is achieved
- Engine speed in calibrated range
- Engine load in calibrated range
- SAS not active
- Canister purge flow is low

1.2.3 In-Use Monitor Performance Ratio

The incrementing of the numerator, the denominator and the ratio calculation for the catalyst monitoring is executed by the IUMPR kernel function. Like all monitors, for which a standardized track and report of the in-use performance is required, the catalyst monitor reports to the IUMPR kernel function via status flags - see the description of the IUMPR kernel function.

Incrementing the numerator

In determining the numerator we must differentiate between the exhaust systems and the diagnostic strategies.

For the system with the total volume catalyst monitoring as well as for the system with partial volume catalyst monitoring with only two oxygen sensors available for the diagnostic concept (one before the overall catalyst volume and one after the overall catalyst volume), only the OSC of the overall catalyst system can be measured.
This is why the PASS result is not faster than a FAIL result for the catalyst diagnostic. Hence, this is a symmetric diagnostic and the numerator can be incremented after the required number of diagnostic cycles.

For the PASS result, the measured primary catalyst OSC only needs to exceed a first threshold.
For the FAIL result, additionally to the primary catalyst OSC measurement the OSC measurement of the overall catalyst volume is activated. Hence the time required for the FAIL result is longer than the time required for the PASS result and is actually prolonged by the time necessary for the overall catalyst volume measurement. Therefore, in case a PASS result for the primary catalyst is achieved, the numerator is not incremented before the time, that would have been necessary for the FAIL result of the total volume catalyst monitor has passed after the primary catalyst PASS result.
This time period is calculated such that the 3-fold rich mixture charge of the borderline catalyst and the 1.65-fold lean mixture charge of the borderline catalyst into the actual catalyst would have occurred with a lambda adjustment of a fictive conditioning phase and an oxygen charge phase, based on the subsequent exhaust gas mass flow.

Hence, the numerator for the measurement of the primary catalyst cannot be incremented before the above described time period has passed.

When measuring both the primary and the overall catalyst volumes the numerator is incremented immediately after the diagnostic has finished.

Incrementing the denominator

The denominator is incremented when the monitor is not inhibited due to stored faults and the general denominator conditions have been fulfilled for the current driving cycle.

2 HEATED CATALYST MONITORING

not applicable

3 MISFIRE MONITORING

3.1 General description

The method of engine misfire detection is based on evaluating the engine speed fluctuations.

One crankshaft segment can be assigned to the combustion event of one cylinder. A combustion event that has not occurred or has not occurred completely leads to a drop in engine speed and engine torque compared to normal operation. As a result, the segment times of the crankshaft increase. The segment times are measured using a sensor at the crankshaft and the engine speed fluctuations are determined. The following figure illustrates the example of misfire due to missing spark.

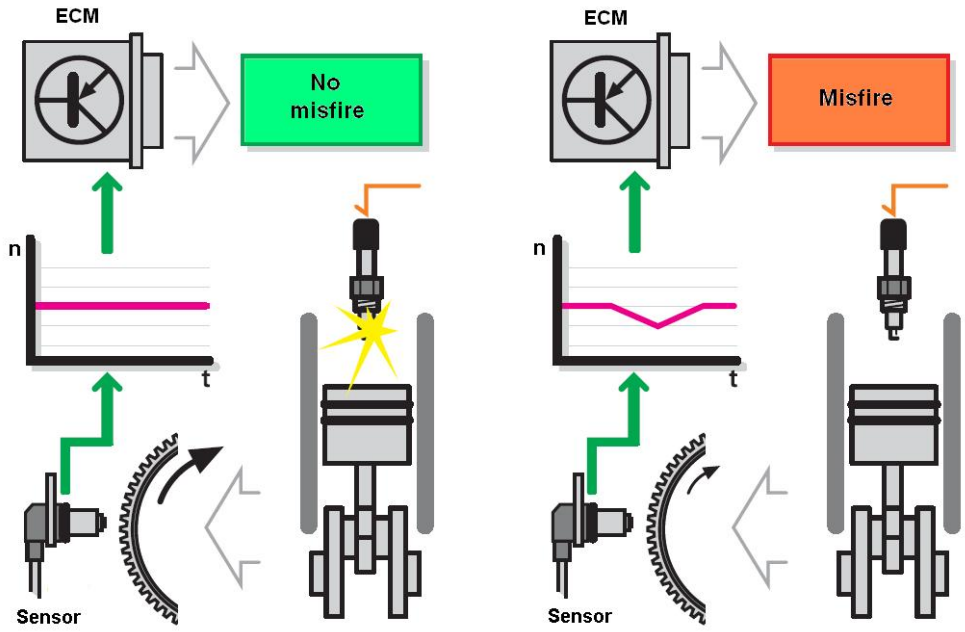

Figure 5: principle of misfire detection

3.2 Monitoring strategy

To detect a misfire, the engine speed fluctuations are assessed. The number of misfire events is counted and compared against a defined threshold value.

3.3 Enable conditions

- After engine start: the number of combustion events exceeds a defined threshold (2 crankshaft revolutions)
- (2 crankshaft revolutions)
- Engine speed within a defined range
- Engine torque >= threshold value (taking the positive torque condition according to the regulations into account)
- Intake air temperature > threshold value (this enable condition is disabled)
- Engine temperature at engine start > threshold value (this enable condition is disabled)
- Deceleration fuel cut-off not active
- Rough road condition not detected

3.4 Malfunction criteria

The crankshaft segment times are measured and these measurements are used to calculate the engine roughness values. If the engine roughness value is greater than a calculated threshold value, a misfire fault is detected. The threshold value for the engine roughness consists of a base value determined by means of gear-dependent characteristic engine-speed and load maps. According to the currently selected gear, the corresponding characteristic map is used (this applies to manual and automatic transmissions). During the engine warm-up a correction value, which depends on the engine temperature, is added to the base value.

If misfiring is present in more than one cylinder (e. g. a combustion and a misfire alternately), due to the respective engine roughness criterion, the detection capability based on the engine roughness value can decrease compared to single misfiring cylinders. For this reason the periodicity of the engine roughness values is used as additional information. The engine roughness values are filtered and a new multiple filter value is generated. In this way, multiple misfire events can be detected reliably.

The adaptation of the sensor wheel tolerances and the characteristic engine behavior are interpreted for defined engine-speed and load ranges, if no misfire has been detected. The robustness of the misfire monitor increases with the adaptation progress. The adaptation values are stored in a non-volatile memory and are included in the calculation of the engine roughness.
If the enable conditions are fulfilled, two counters are incremented when misfiring has been detected. This serves to distinguish between emission relevant misfiring and catalyst-damaging misfiring.
During intervals of 1,000 crankshaft revolutions the detected misfire events are counted for each cylinder. If the total sum of the detected misfire events is greater than a defined threshold, the fault “emission relevant misfire” is detected.
During intervals of 200 crankshaft revolutions the detected misfire events are counted and weighted for each cylinder. The weighting factor is determined by a characteristic map which is dependent on engine load and speed. If the total sum of the detected misfire events is greater than a defined threshold, the fault “catalyst-damaging misfire” is detected.
After each interval, the misfire counters are reset.

4 EVAPORATIVE SYSTEM DIAGNOSIS

4.1 Leakage check

4.1.1 General description

The leakage diagnosis procedure is a pressure check of the EVAP system. In order to perform the check, the EVAP system will be sealed and pressure applied by the leakage diagnosis pump (LDP). The pressure variation time is analyzed by the ECM.

4.1.2 Monitoring function description

The diagnosis procedure consists of the following steps:

1. Tank pressure check

The first step of leakage diagnostics is the pressure check of fuel tank system by testing the reed switch. In case of an open reed switch, the fuel tank system has sufficient pressure for the sealed check and no further pressure has to be supplied to the fuel tank system by the LDP.
The diagnosis is waiting until the EVAP purge valve is opened in order to purge the carbon canister. In case the reed switch remains open or the reed switch stuck open, the reed switch is defective.

In the case the reed switch is closed, the LDP is switched on in order to supply pressure to the fuel tank system and the diagnostic is continued with the step 2 to 3 (as described below).

2. LDP Self-check procedure

Closed check
LDP control is disabled and the reed switch has to be closed otherwise the reed switch is defective.
Close to open check
LDP control is switched on once and the diaphragm has to move to the upper position. The time is measured between closed and open position of diaphragm detected by the reed switch. When the final upper position of diaphragm is reached in a certain time, then the check will be passed.

3. Leak check of EVAP system

Fast pulse
After the self check procedure, the LDP control supplies pressure to the fuel tank system with a pressure dependent number of compression strokes in a certain time. In order to supply pressure to the fuel tank system, the LDP can perform compression strokes in several attempts.
EVAP system sealed check, measure stroke and measure phase
The decrease of fuel tank pressure is measured via time of diaphragm movement followed by a compression stroke. Within a certain time, the LDP control is determined within at least four measurement strokes. The averaged time is a measure for the tightness of fuel tank system.

4.1.3 Flow chart leakage check

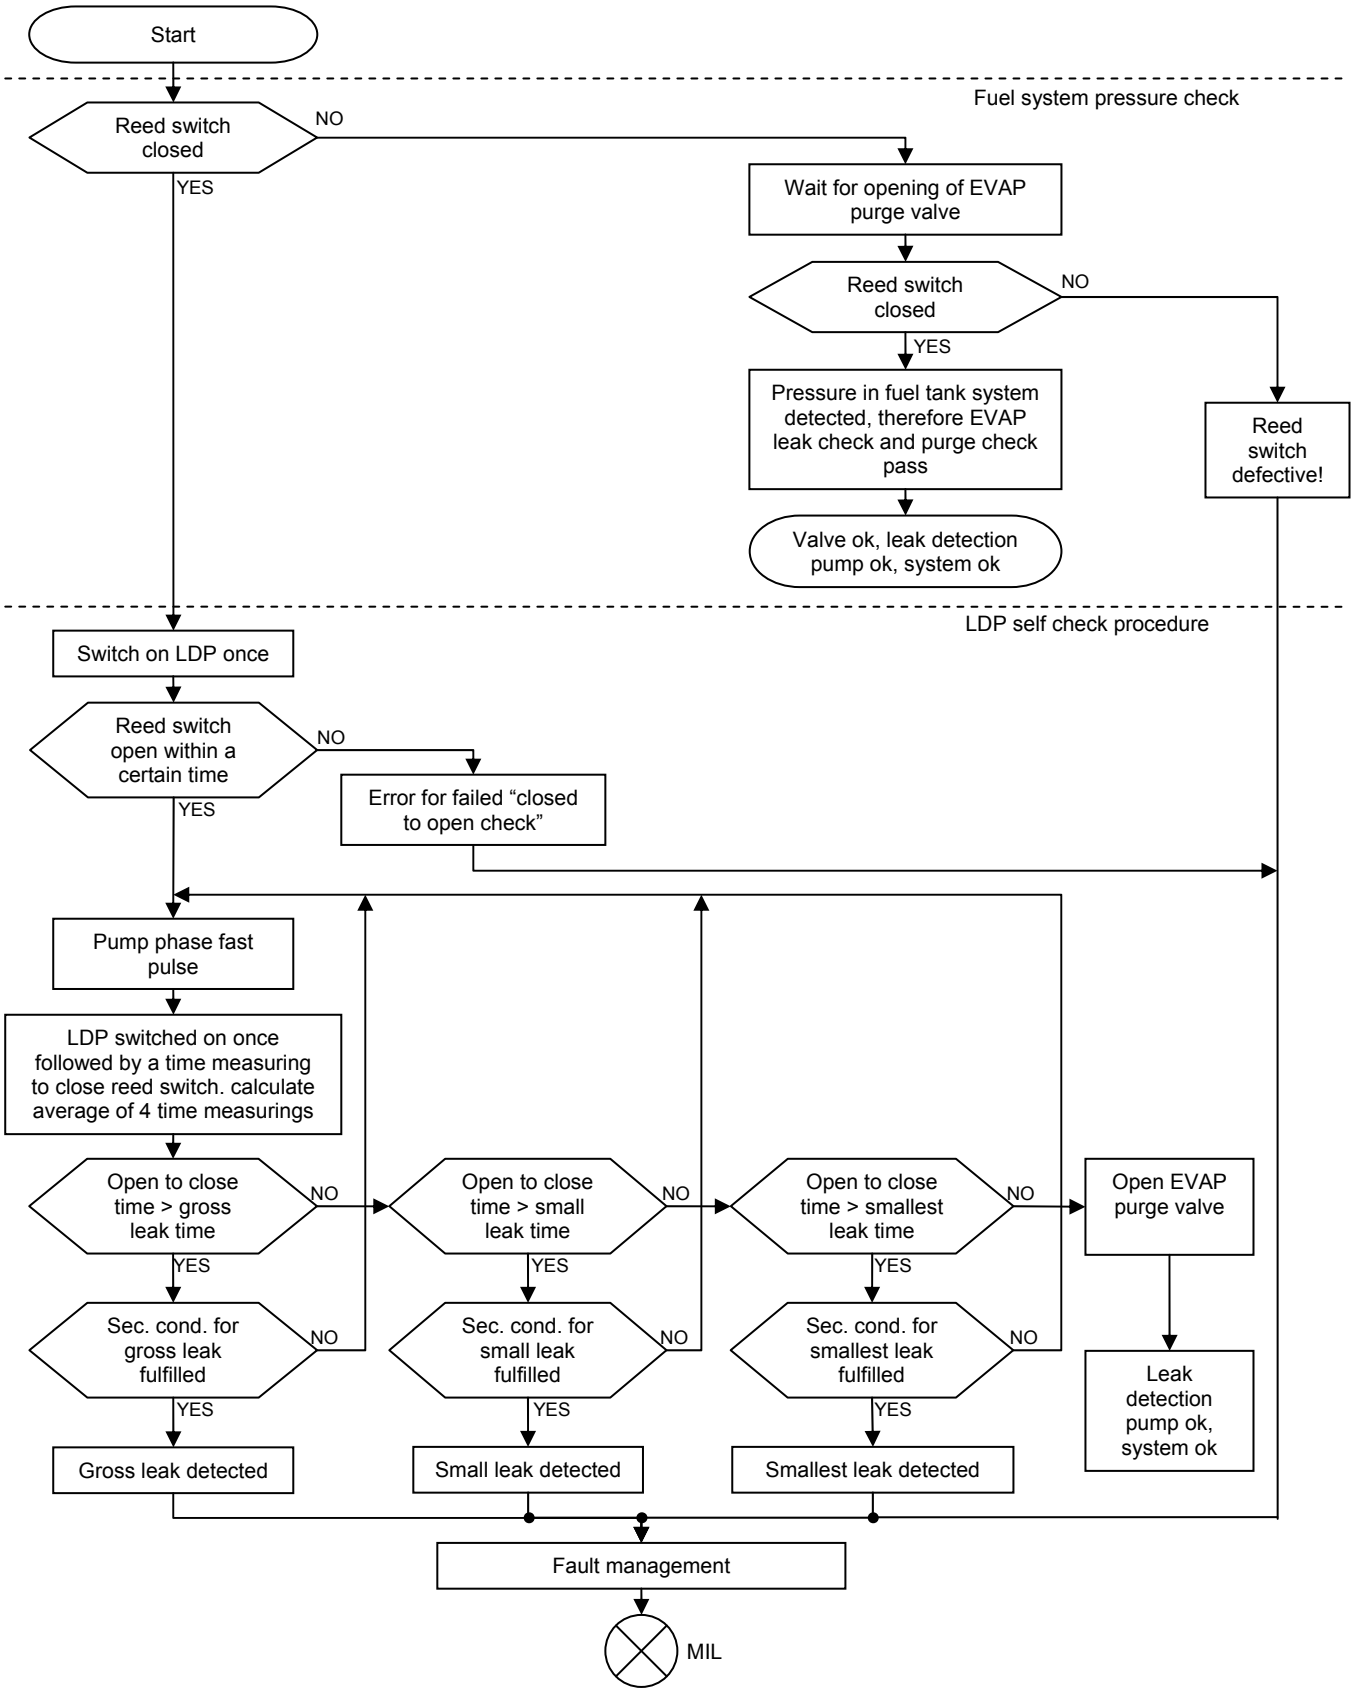

Figure 7: Flow chart leakage check

4.2 Purge Check

4.2.1 General description

The fuel tank has an integrated ventilation system in order to enable a pressure equalization between the tank and the environment when temperature variations occur or when fuel is added to or extracted from the tank. To prevent fuel evaporation to the atmosphere, a charcoal canister is installed between the tank and the atmosphere, which absorbs discharged hydrocarbons contained in the fuel vapor. As the charcoal canister has a limited storage capacity, it has to be discharged after defined time intervals. This is realized by temporarily opening a connection between the charcoal canister and the intake manifold for a short period of time. After the canister purge valve is opened, ambient air is drawn in through the charcoal canister due to the vacuum in the intake manifold. The stored hydrocarbons are discharged and enter the combustion chamber together with the ambient air. The additional air and fuel charges during the canister purge phases lead to a mixture deviation, which is compensated by the ECM.

The evaporative system monitor is carried out once per driving cycle. During part load conditions, the purge valve is commanded open and the response of the lambda control is monitored. If no clear mixture response can be detected after the majority of a defined number of checks has been run, a fault is suspected and an air check is carried out in the next idle speed situation. If no clear response of the idle speed control on the additional air charge occurs after the switch-open command of the canister purge valve at idle speed, a faulty flow rate in the evaporative system is detected and the corresponding entry in the fault memory is set.

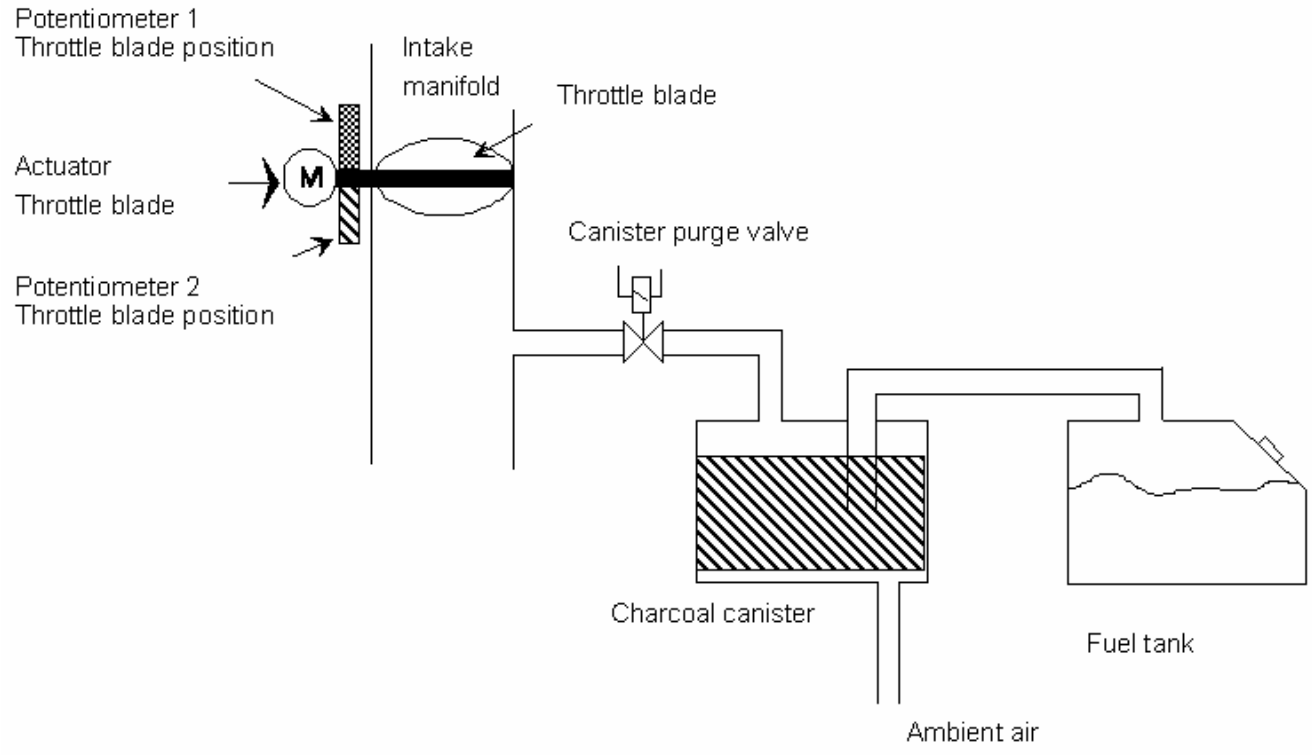

Figure 8: Operating principle of the Evaporative system

4.2.2 Monitoring Strategy

The part load check is the comparison between the mixture deviation that is present during the opening process of the canister purge valve and a threshold value. The idle speed check is the comparison between the ratio of expected mass air flow/actual mass air flow and a threshold value, performed while the purge valve is open.

4.2.3 Enable Conditions

- Canister purge integral greater than threshold value (depending on engine start temperature)
- Integrated air mass greater than threshold value (depending on engine start temperature)
- Engine coolant temperature and limp-home mode temperature greater than threshold value
- Altitude less than 2700 m above sea level
- Ambient temperature greater than threshold value
- Lambda control in a closed control loop condition
- Engine speed deviation less than threshold value

4.2.4 Malfunction Criteria

Depending on the load condition of the engine and the charge state of the charcoal canister, opening the canister purge valve leads to a mixture deviation (lean or rich), which is detected and compensated by the ECM.

If all enable conditions are fulfilled at part load, the current mixture value is stored as a reference value and the canister purge valve is commanded open according to a given characteristic curve. During the opening process, the current mixture value of the lambda control system is continuously compared with the reference value. If the absolute value of the mixture deviation does not reach a defined threshold value, the canister purge valve may be defective, or the mixture composition currently coming from the charcoal canister does not lead to response in the lambda control. Thus, initially a fault suspicion is generated and an air check is requested for the next idle speed situation. To avoid unnecessary idle speed phases in vehicles with a start/stop system, a fault suspicion is generated not before a defined number of mixture checks without a PASS result have been carried out.

At idle speed, the additional air charge caused by the open canister purge valve leads to an increase in engine speed, which is compensated by the idle speed control by means of closing the throttle valve.

At idle speed, the canister purge valve is commanded open according to a given characteristic curve. When a sufficient opening percentage of the purge valve is reached, a relative mass air flow value is generated from the expected mass air flow values without any canister purge valve activity and the actual mass air flow value. If the relative mass air flow value does not reach a defined threshold value, a faulty flow rate in the evaporative system is detected.

4.2.5 Flow charts

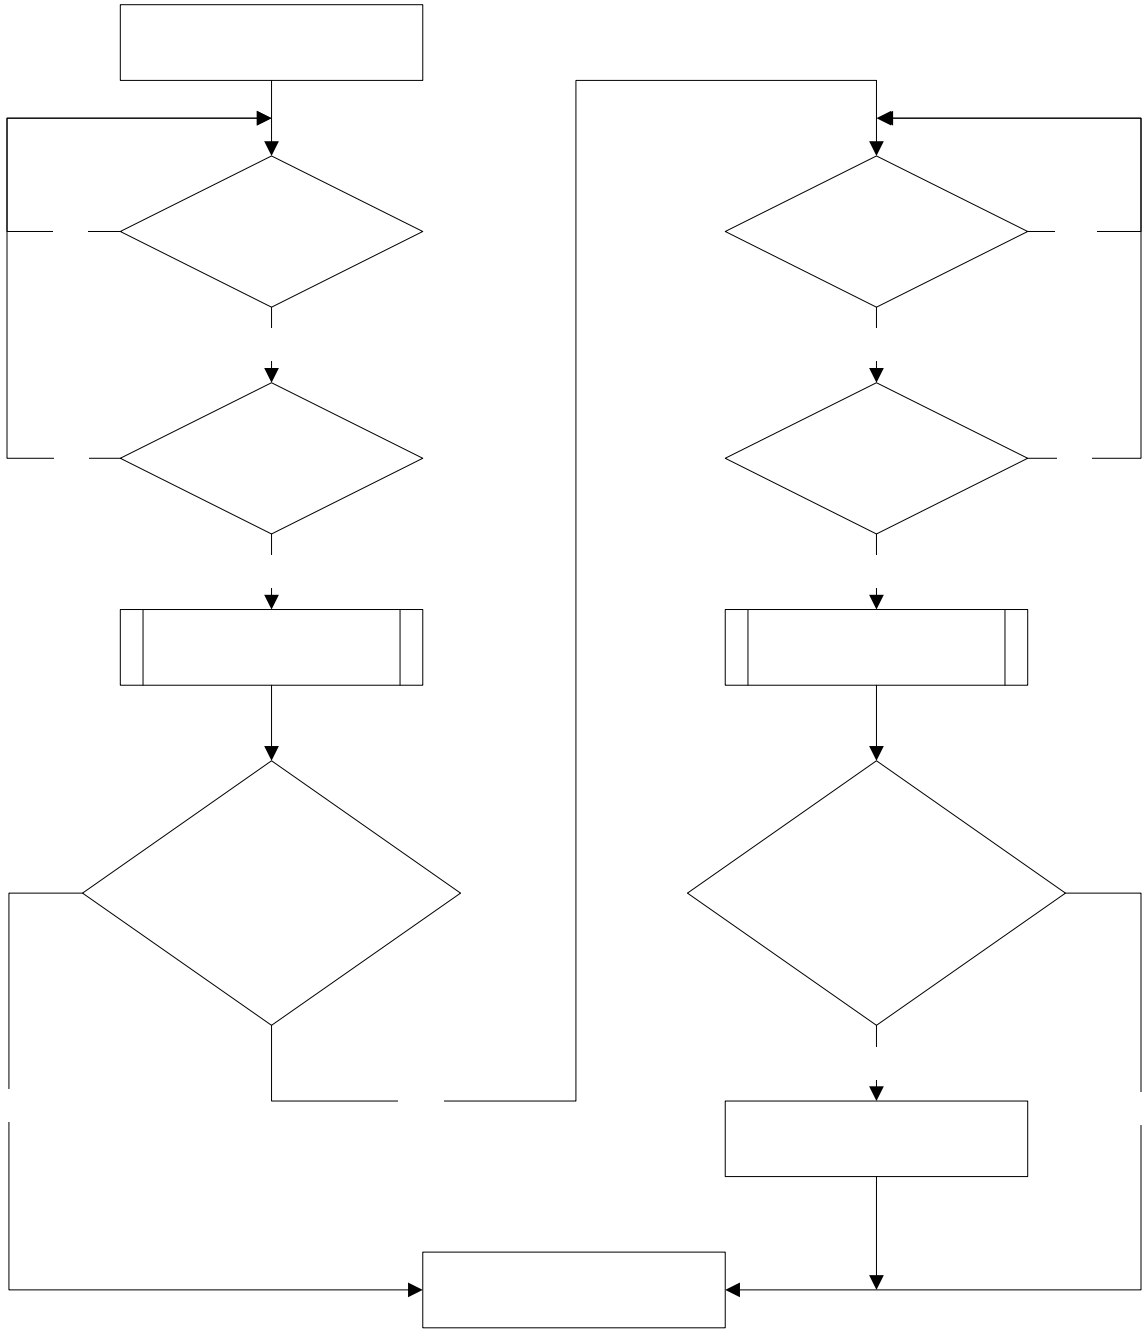

Figure 9: Overview of the Evaporative System Monitoring

For details of the Mixture check and the Air check see the following two flowcharts.

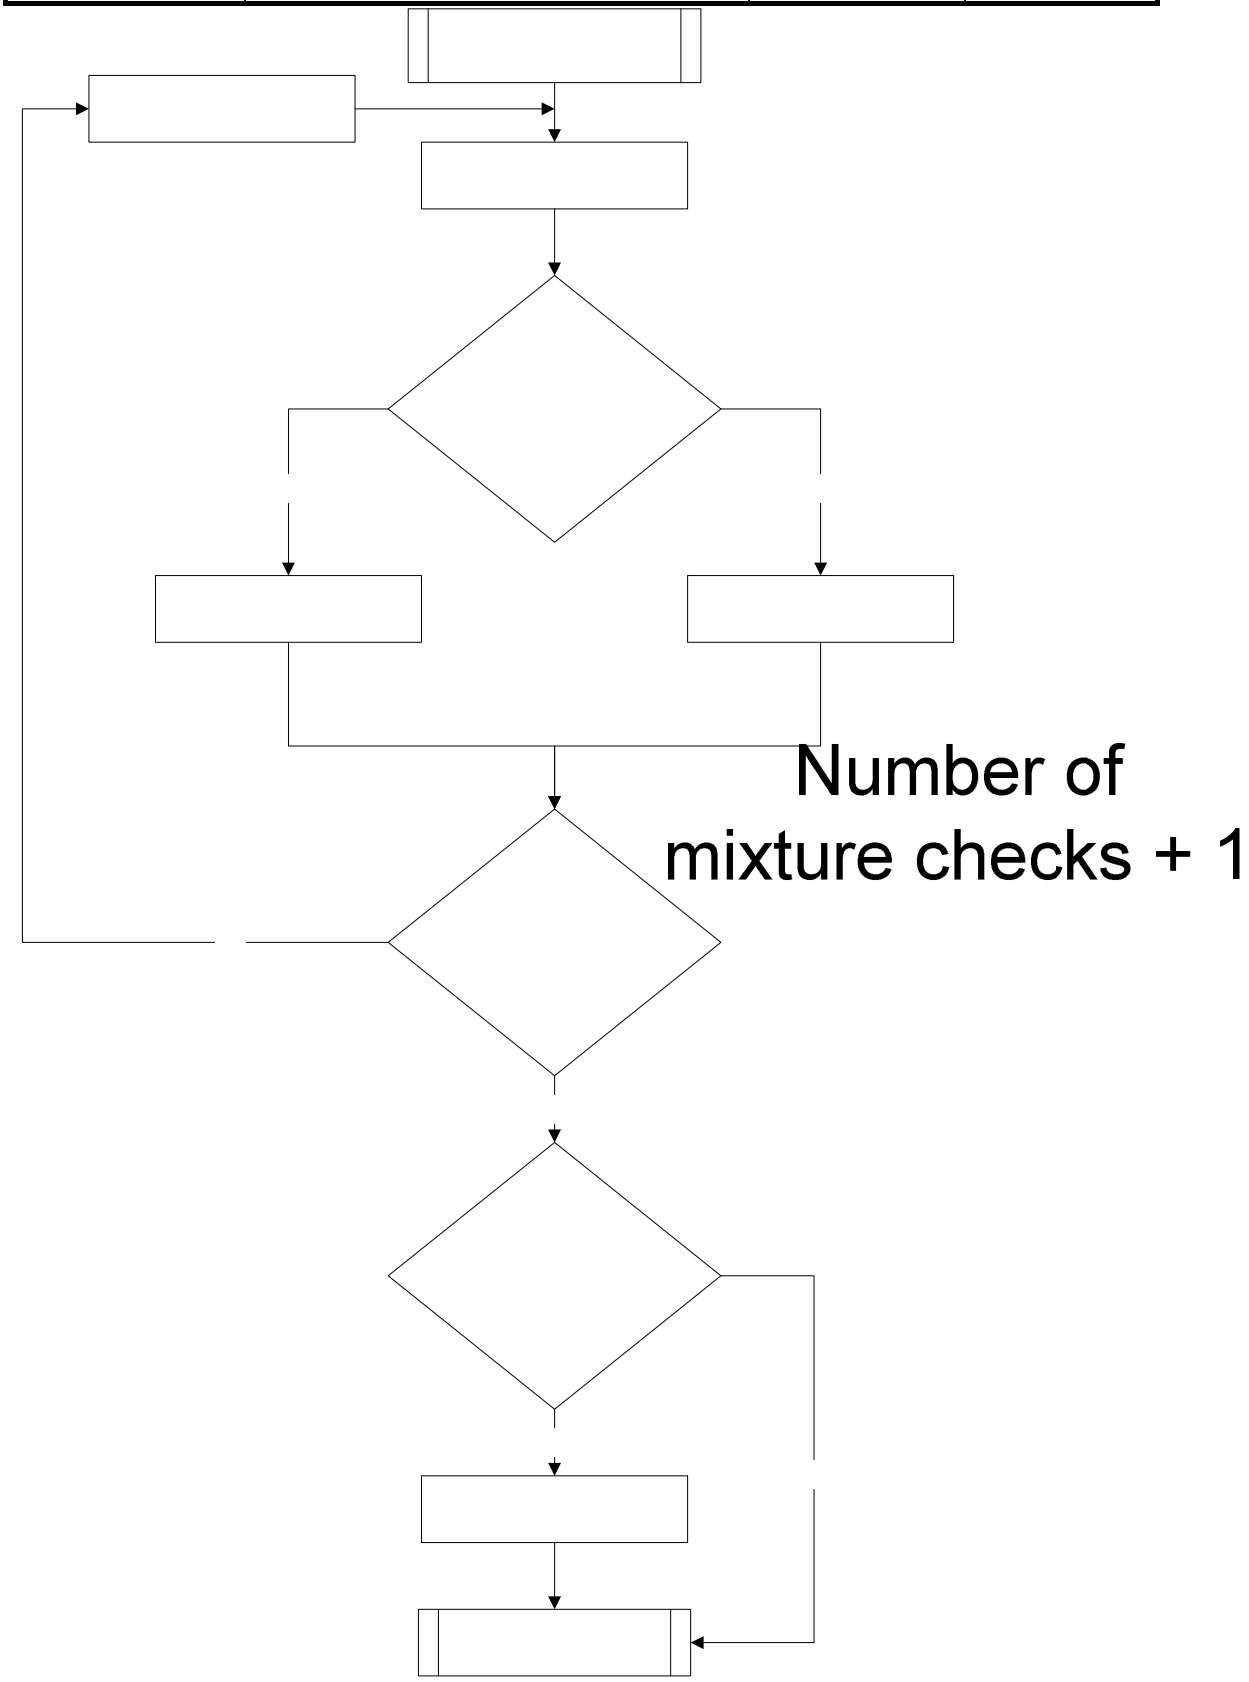

Figure 10: Mixture check (Part load check)

Yes

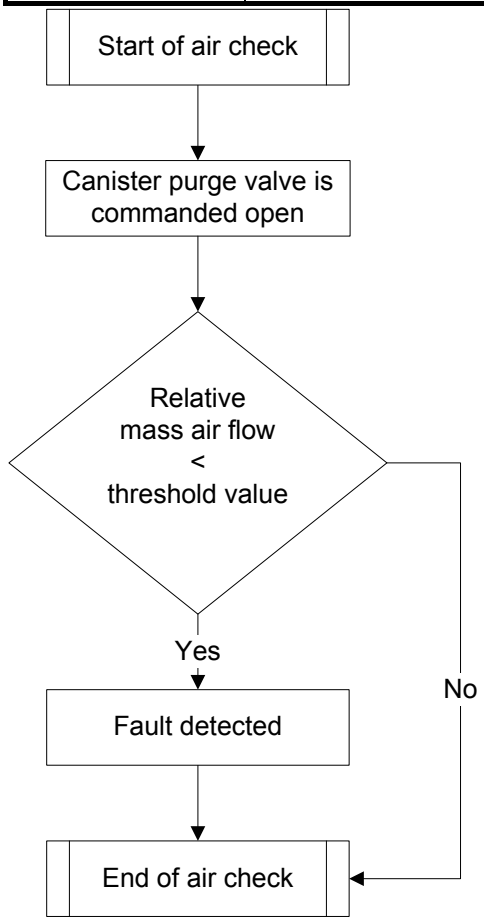

Figure 11: Air check (Idle speed check)

4.2.6 In-Use Monitor Performance Ratio

Incrementing the numerator:
The numerator is incremented by one when the diagnostic has ended and a fault could have been detected. The enable conditions are monitored by a shadow counter, which causes the numerator to increment whenever the diagnostic could have run.

Incrementing the denominator:
The denominator is incremented by one when the conditions for incrementing the denominator according to CCR (d) (4.3.2) (D) „Evaporative System Denominator“ are fulfilled

5 SECONDARY AIR SYSTEM MONITORING

Not applicable.

6 FUEL SYSTEM MONITORING

6.1 General specific description of lambda control strategies

To minimize the emissions of motor vehicles, an exhaust gas aftertreatment system is installed after the combustion engine.

This system consists primarily of the following components: oxygen sensors, which measure the exhaust gas composition in the gas phase, and the catalytic converters, which ensure the active conversion of the combustion residues emitted by the engine.

Additionally to these hardware components, a control system is required.
The purpose of this control system is to ensure an exhaust gas composition that enables a maximum conversion rate of the released emissions by the exhaust gas aftertreatment system that is installed after the combustion engine.

As shown in the illustration below, the signals from the oxygen sensors are transmitted to the engine control module (ECM) and serve for further engine management calculation.
As an example, the following figure shows a system with one catalyst near the engine and one underfloor catalyst.

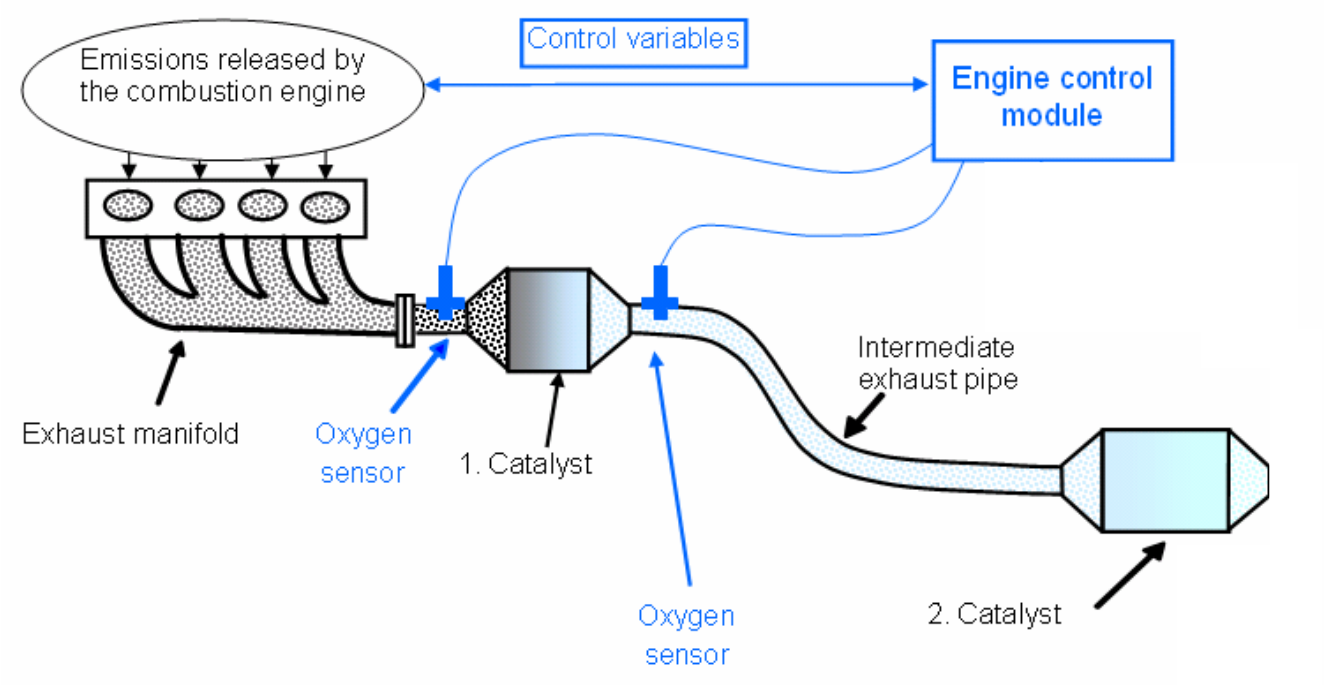

Figure 12: Exhaust gas aftertreatment components

As mentioned before, the purpose of the lambda control system is to adjust the fuel injected to the engine. This produces an exhaust gas composition that enables an optimum conversion rate to be achieved by the hardware configuration of the exhaust gas aftertreatment system.

The adjustment of the exhaust gas composition is achieved by slightly varying the amount of fuel injected into the combustion chambers of the engine.

Due to the chemical reactions, the achievable conversion rate of the catalyst is subject to several limitations. Considering the functional principle of the lambda control system, the restrictions that must be considered for a catalyst with operational temperature, must be taken into account.

One of the main influencing criteria that must be considered is that a catalytic converter (catalyst) can only enable the chemical conversion of the exhaust gas components contained in the exhaust gas flow.
The chemical reactions are the OXIDATION of carbon monoxide (CO) and hydrocarbons (HC) and the REDUCTION of nitrogen oxides (NOx).

Due to the reaction process, oxygen is used during the oxidation, and it is released during the reduction. Hence, the effect of the carbon monoxide (CO) and the hydrocarbon (HC) conversion rate will be reduced drastically when the exhaust gas composition lacks oxygen (lambda < 1).

With a surplus of oxygen in the exhaust gas (lambda > 1), the conversation rate of nitrogen oxides (NOx) reduces, accordingly.
See this behavior in the following figure.

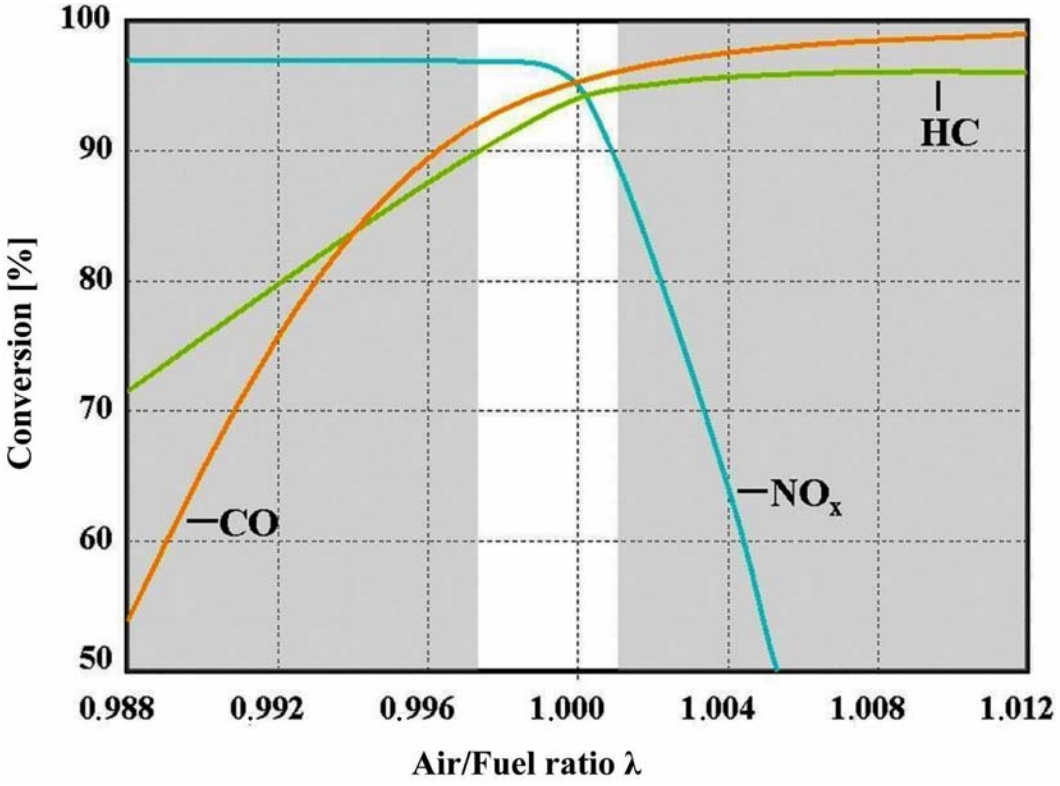

Figure 13: Conversion rate with respect to air/fuel ratio

Additionally, insufficient or excessive oxygen resulting from temporary deviations of the optimum exhaust gas composition can be compensated by taking oxygen from the oxygen stored within the catalyst or storing it there, correspondingly.

This process, however, is only feasible within the maximum Oxygen Storage Capacity (OSC) of the catalyst.
The corresponding correlation is shown on the next page.

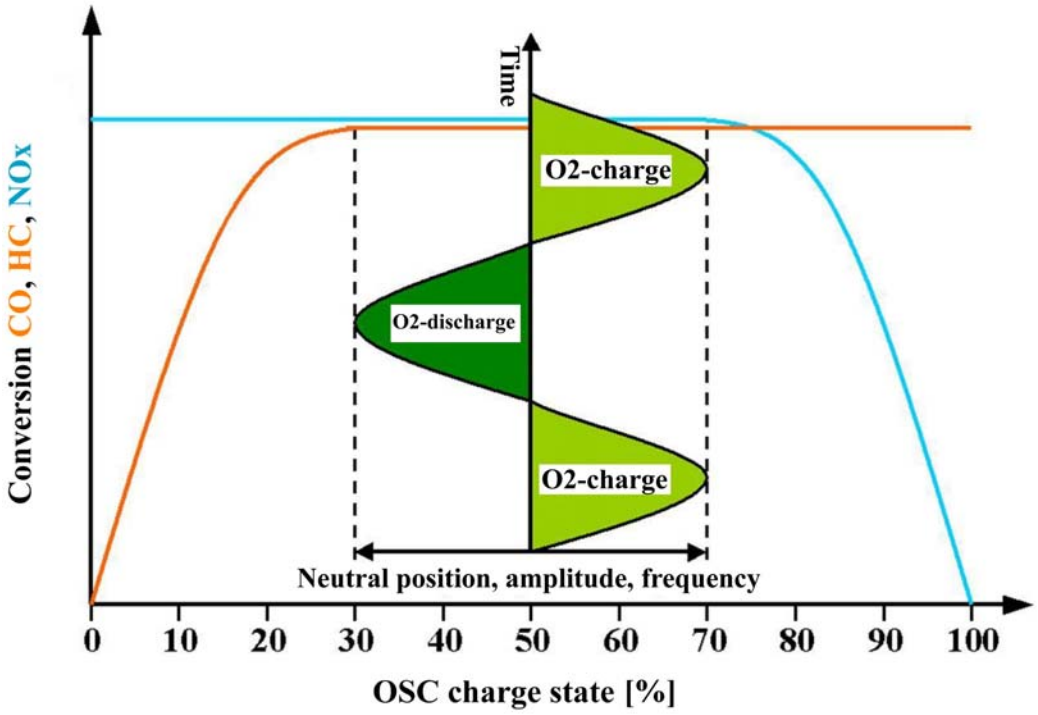

Figure 14: Conversion rate with respect to OSC oxygen storage state

To summarize, the task of the lambda control, which leads to a mixture control eventually, can be described as the provision of the catalyst with a mixture composition that ensures the maximum conversion of the exhaust gas components even with varying engine conditions (varying loads and speeds).

The exhaust gas composition post the catalyst is measured by a binary oxygen sensor.
See the following corresponding characteristic sensor curve.

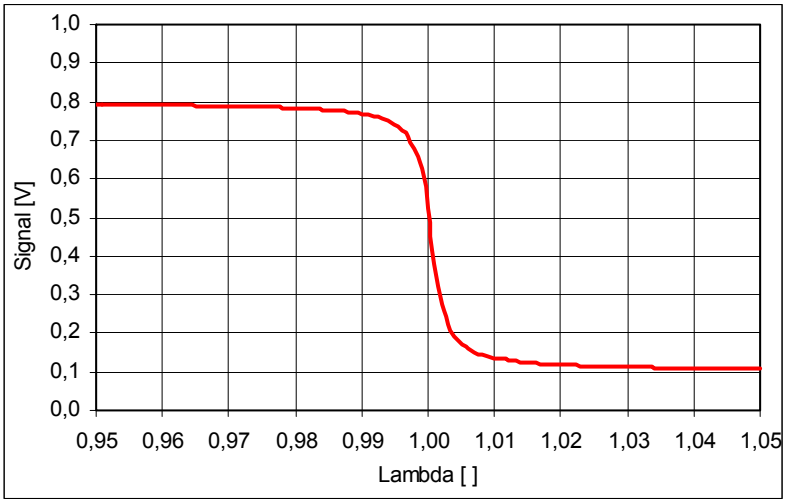

Figure 15: Signal of the binary oxygen sensor with respect to lambda

The next figure illustrates the response of the oxygen storage, by showing the lambda signal downstream of the catalyst with respect to the charge state of the oxygen storage.

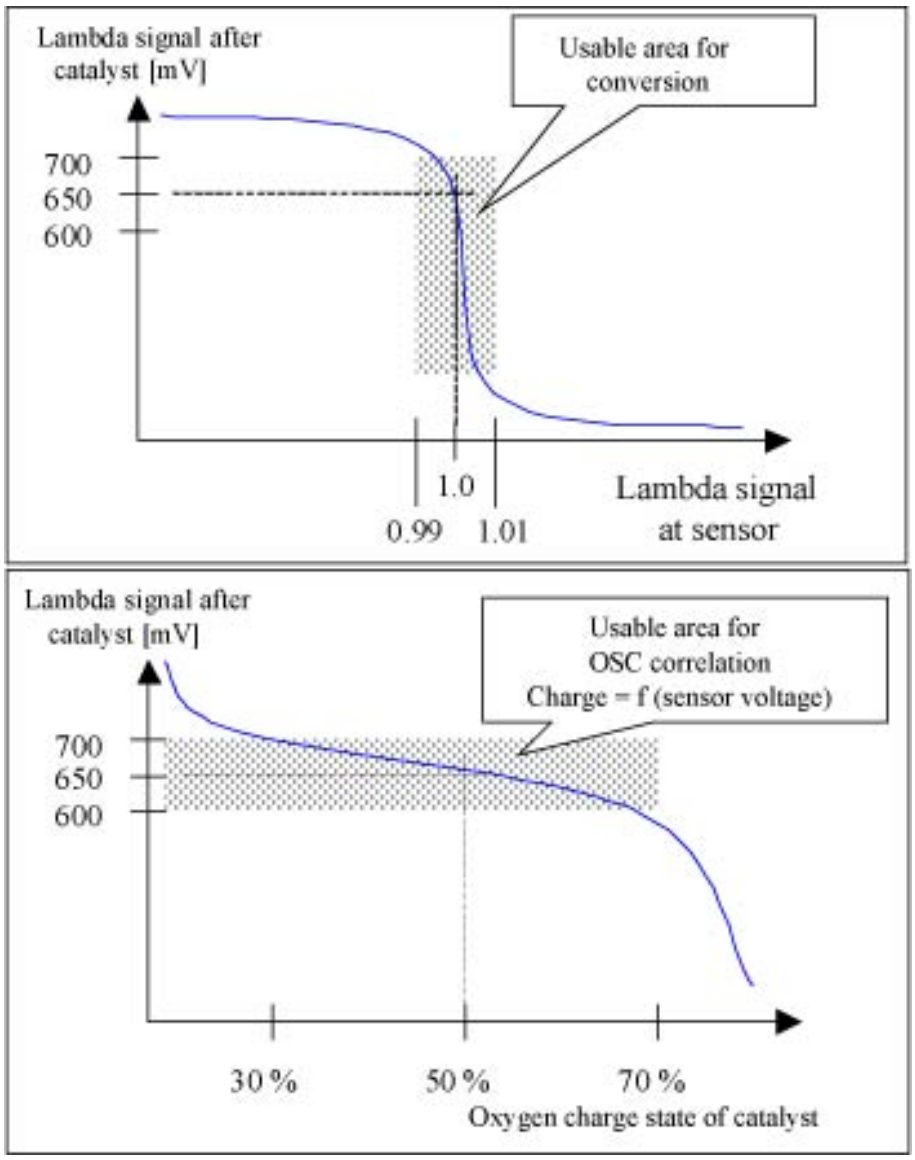

Figure 16: Signal of the binary oxygen sensor with respect to lambda and with respect to the oxygen storage state of the catalyst

6.1.1 Principle of Operation of a Balanced Modulation Control

One disadvantage of a fixed frequency control is that it can only respond to a change of the oxygen charge state by means of the control loop downstream of the catalyst, the so-called trim control.

The correlation between the sensor voltage and the oxygen charge state of the catalyst can also be seen from the graph of Figure 16: Signal of the binary oxygen sensor with respect to lambda and with respect to the oxygen storage state of the catalyst

Hence, a disturbance in the charge state of the catalyst oxygen storage cannot be adjusted before the conversion performance of the catalyst is affected, and thus not before the binary oxygen sensor downstream of the catalyst has detected a deviation from the setpoint lambda value downstream of the catalyst.

Using balanced modulation control, the disadvantage of the fixed frequency control, that it can only respond to a deviation of the oxygen charge state with a delay by adjusting the oxygen sensor voltage downstream of the catalyst, is compensated by the balancing of the charge state of the oxygen storage. This means that a disturbance in the charge state of the oxygen storage can be adjusted before the catalyst's conversion performance decreases, which would cause a change of the sensor voltage downstream of the catalyst.

Hence, the difference between the balanced modulation control and the fixed frequency control is that in the case of the balanced modulation control, the control variable is the charge state of the catalyst oxygen storage, rather than the lambda value upstream of the catalyst.
Therefore, after a disturbance, the control does not immediately adjust the lambda value to 1, but the charge state of the oxygen storage is adjusted to the setpoint value.
This behavior is illustrated in the following figures

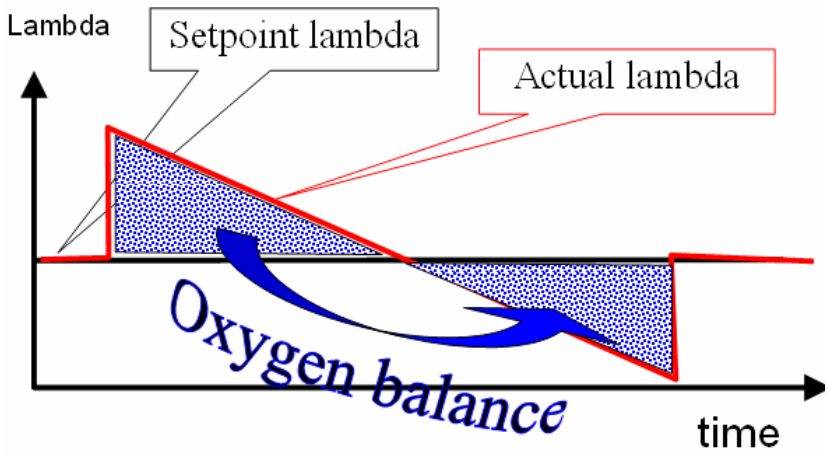

Figure 17: Control parameters for the control variable "oxygen charge state"

Figure 17 shows the principle that, after a disturbance the lambda value is not immediately re-adjusted to 1, but in the present case of a lambda deviation to "lean", the oxygen charge is first adjusted to "rich" with an oxygen discharge of the same amount.

In this way it can be guaranteed that the charge state of the oxygen storage after the disturbance and after the adjustment is identical to the state before the disturbance, owing to the balanced lambda control, see following figure

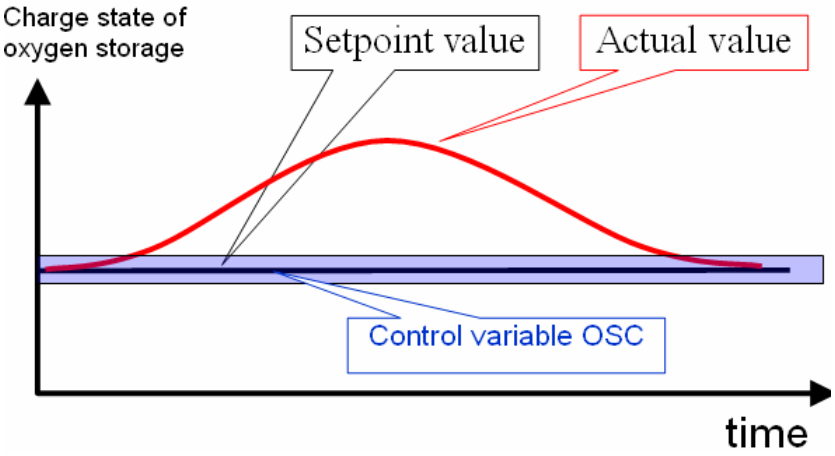

Figure 18: Influence on the charge state of the oxygen storage for the control variable "oxygen charge state"

Figure 18 also shows that the control variable is defined by a setpoint charge state of the oxygen storage.

This given setpoint charge state of the catalyst can be stored in a characteristic map, with respect to the exhaust gas mass and the aging state of the catalyst.

Exhaust gas mass / Catalyst aging	10 kg/h	50 kg/h	100 kg/h	150 kg/h
OSC 100 %	50	48	45	42
OSC 50 %	45	40	38	35
OSC 25 %	40	38	35	30
OSC 10 %	35	30	25	20

Figure 19: Characteristic map: setpoint oxygen charge state of catalyst with respect to the exhaust gas mass and the catalyst aging

The advantage of such a control is, that with a more precise adjustment of the charge state of the oxygen storage, a reduced NOx conversion of the catalyst can be prevented, especially when the oxygen storage is overcharged.

The comparison of the illustrations with and without OSC balancing shows this behavior.

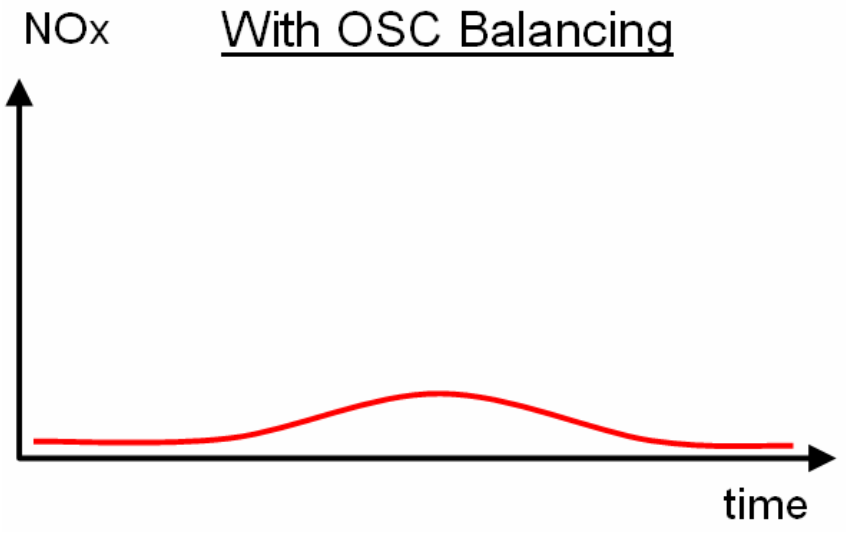

Figure 20: Influence of the change of the oxygen storage charge state on the NOx emissions for control variable "oxygen charge state"

The comparison of the deviation of the sensor voltage downstream of the catalyst shows that the effect of the disturbance of the exhaust gas composition upstream of the catalyst can be adjusted faster with the balancing and that as a result, the rear oxygen sensor signal reaches the setpoint value earlier.

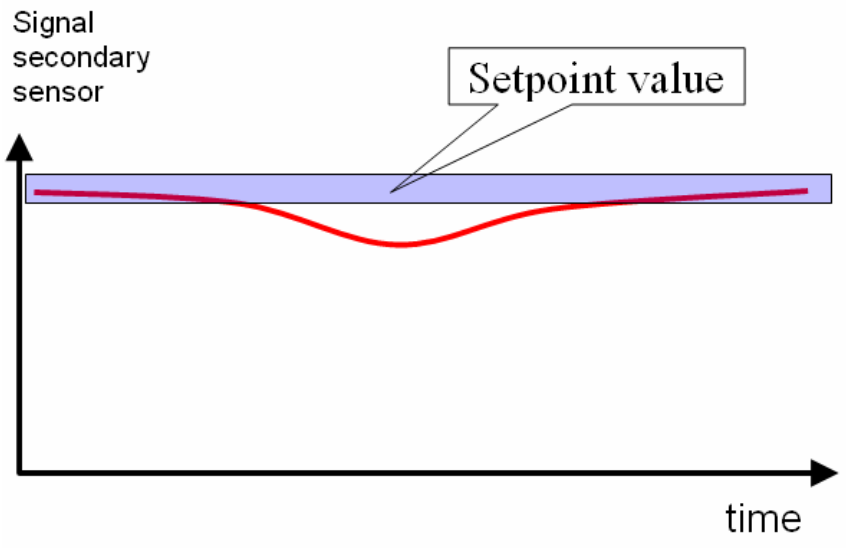

Figure 21: Deviation of the sensor voltage downstream of the catalyst with oxygen balancing

Hence, by generating a state observer which models the charge state of the oxygen storage, a disturbance can be adjusted, before the catalyst conversion is affected.

In the following figure, the state observer is represented by the catalyst model integrator.
The charging level of the catalyst model integrator is compared to a setpoint value, and subsequently, the control difference is fed to the balance controller.
The output of the balance controller, in turn has an influence on the setpoint lambda value.

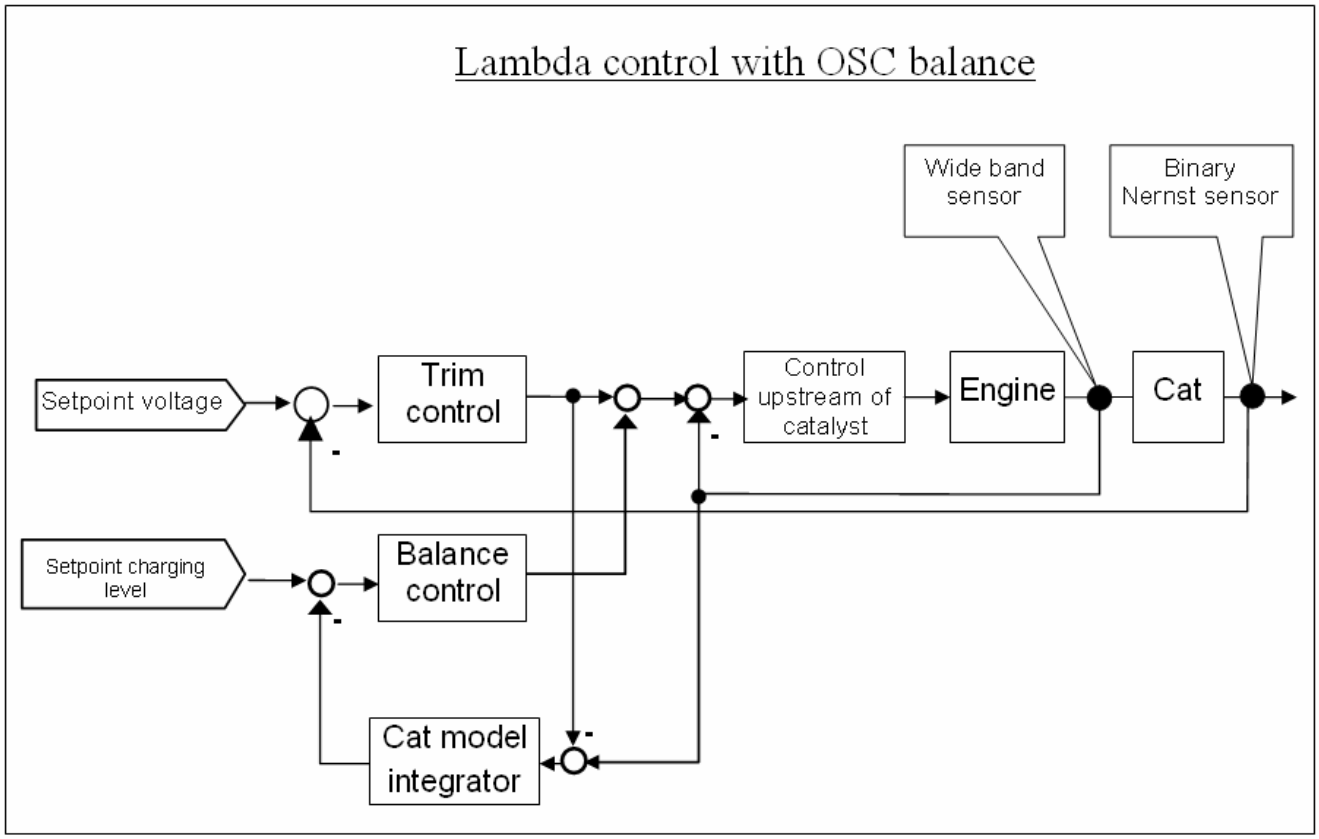

Figure 22: Control with balancing

6.1.2 Influence of the Oxygen Charge State of the Catalyst on the Conversion

The following diagrams explain the correlation between the oxygen charge state of the catalyst and the conversion of the exhaust gas components.
The oxygen storage contained in the catalyst is symbolically illustrated in the catalyst drawings.

The big red “balls” in the catalyst drawings of the following illustrations represent a completely charged oxygen storage state, while the big grey “balls” represent a completely discharged oxygen storage state.
The oxygen storage is represented in the illustration by different oxidation levels of the ceroxide, being CeO2 and Ce2O3.

The oxidation of carbon monoxide and of unburnt hydrocarbon compounds results in a discharge of the oxygen storage, while the reduction of nitrogen oxides results in a charge of the oxygen storage.

The following figure shows the state of the catalyst when it is charged with 50 percent of oxygen and when a stoichiometric exhaust gas mixture (lambda = 1) is supplied to it.
Both the conversion rates of the exhaust gas components that are oxidized (HC, CO), and the conversion of the exhaust gas components that are reduced (NOx), are very high, and the exhaust gas mixture leaving the catalyst is stoichiometric.

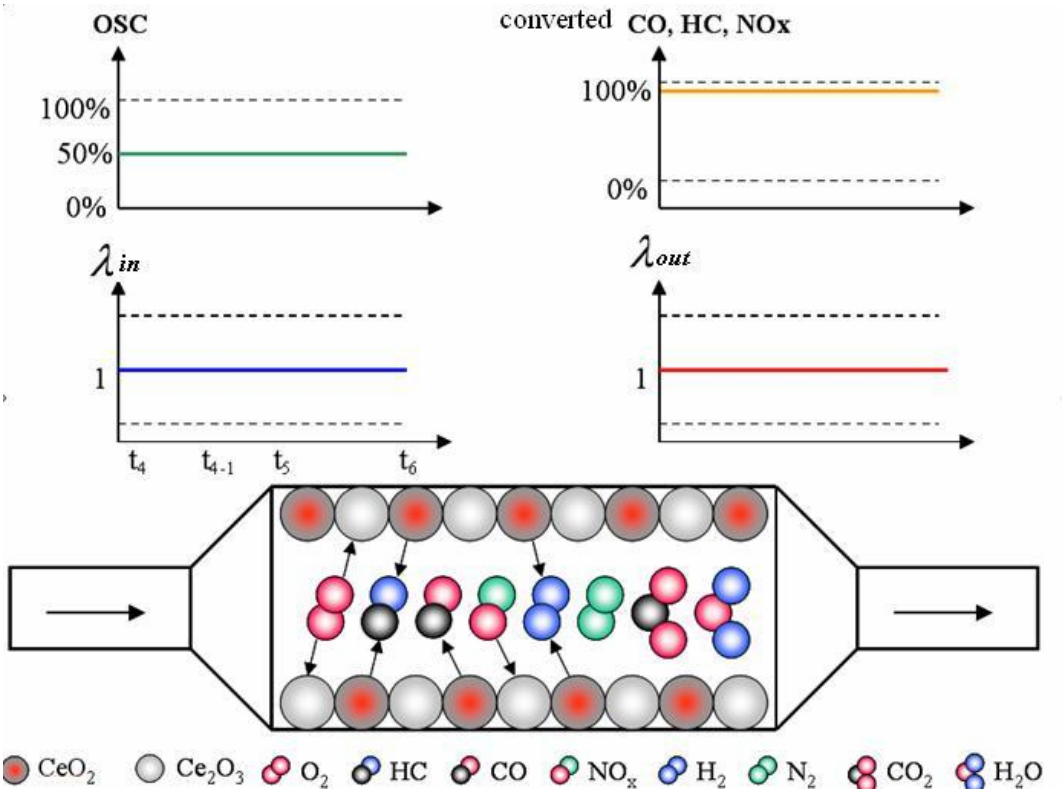

Figure 23: Catalyst state with lambda = 1 applied

The next figure shows the state of the catalyst when a rich exhaust gas mixture was supplied to it, and subsequently a lean exhaust gas mixture is supplied to it.
Until the time t1, the catalyst was supplied with a rich exhaust gas mixture, which is why the oxygen storage was empty at the time t1.
The more lean exhaust gas mixture that is supplied to the catalyst, the more the oxygen storage is charged, starting at the gas entrance location.
As long as the oxygen storage is not completely charged, the exhaust gas composition downstream of the catalyst is lambda = 1, in spite of being supplied with lean exhaust gas.

In addition to that, a good NOx conversion is present when the oxygen storage is partially charged, despite being supplied with lean exhaust gas.

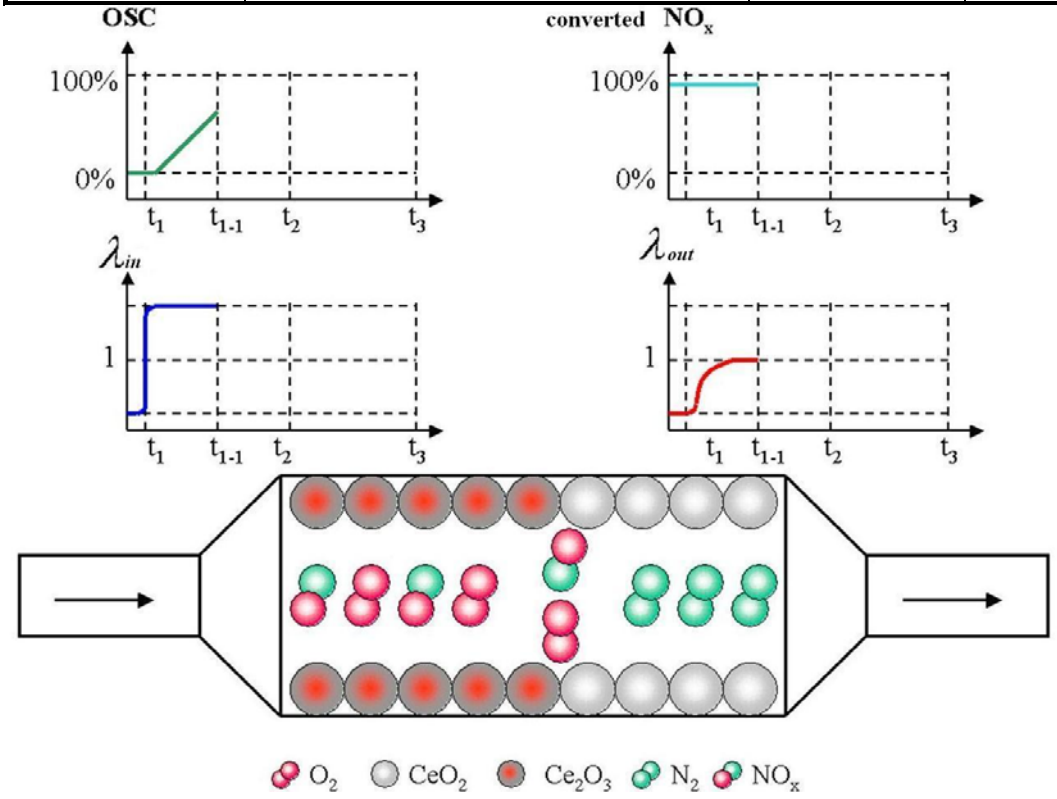

Figure 24: Catalyst state at start R2L

From the time t_2 onwards, the oxygen storage of the catalyst is completely charged with oxygen (see figure below). At the time t_2, a lean exhaust gas composition is present downstream of the catalyst, and a drastic drop in the NOx conversion occurs.

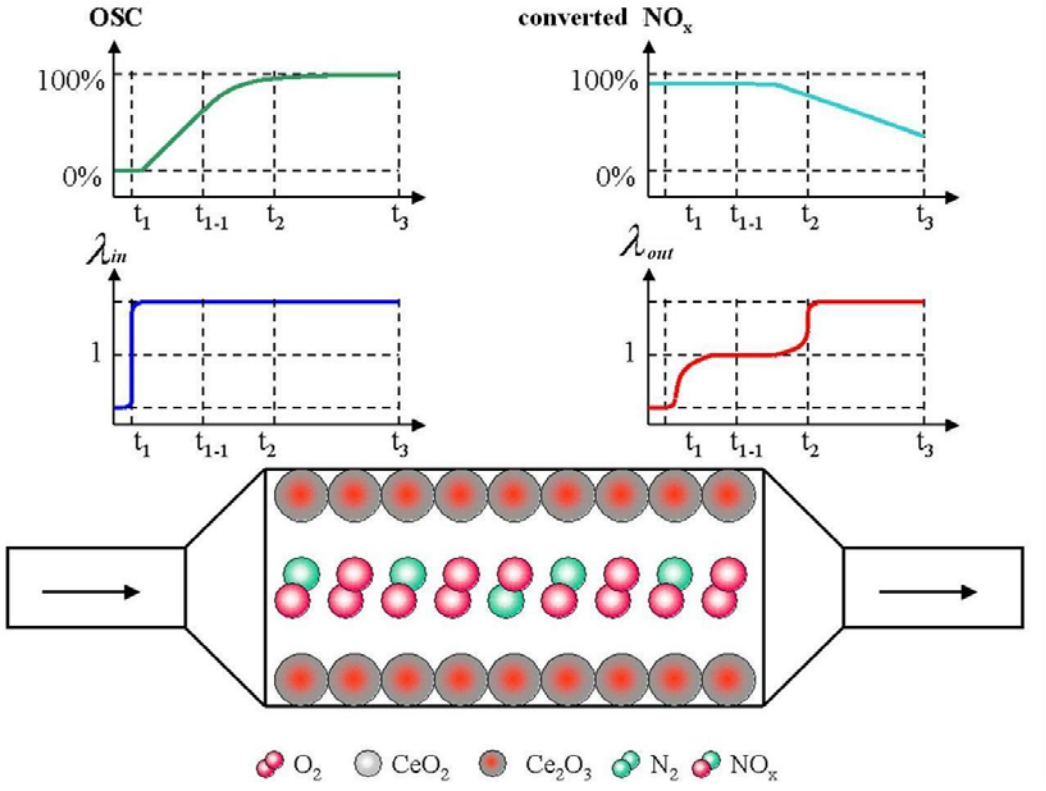

Figure 25: Catalyst state at end of lean phase

The transition from lean to rich corresponds to the transition from rich to lean (see figure below).

At the start of the changeover, a stoichiometric exhaust gas composition is present, in spite of the supply of a rich exhaust gas mixture to the catalyst.
This is due to the fact that the oxygen required for the oxidation of the unburnt hydrocarbon compounds and the carbon monoxide can be extracted from the oxygen storage of the catalyst.
This is why a constant discharging of the oxygen storage can be observed.
During this phase, the conversion rate of the unburnt hydrocarbon compounds and the carbon monoxide is at a high level.

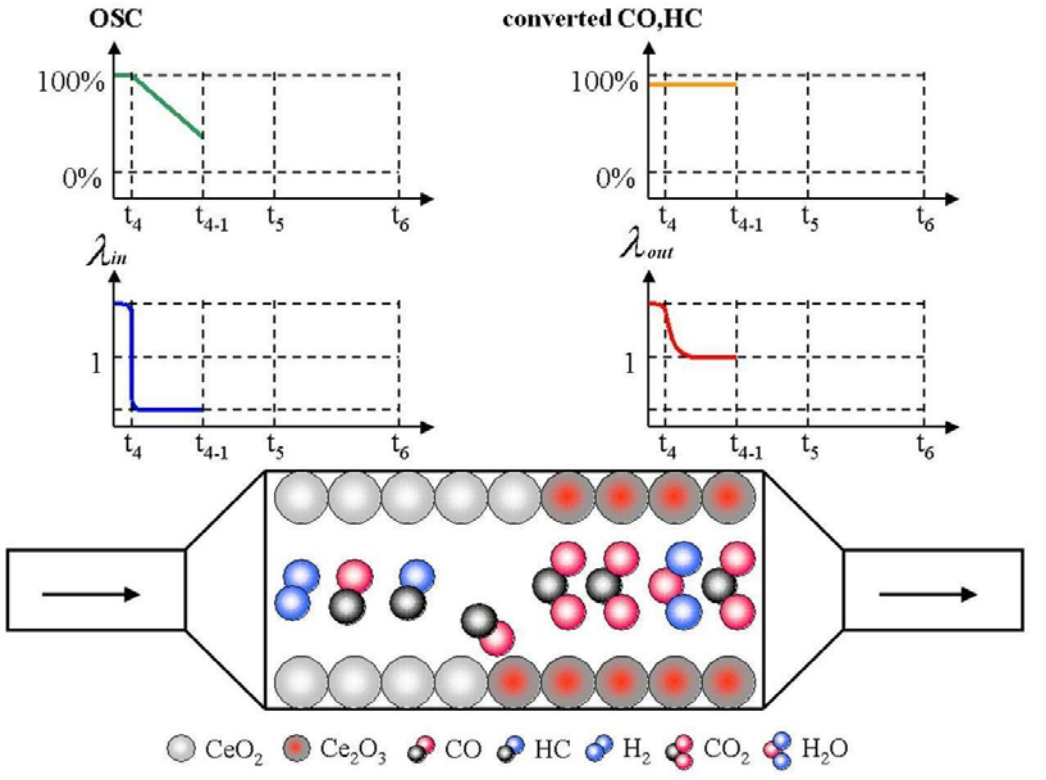

Figure 26: Catalyst state at start L2R

An increasing oxygen storage discharge results in a decrease of the conversion performance, and a rich lambda signal downstream of the catalyst.
As the oxygen storage of the catalyst is discharged, it is no longer possible to extract the oxygen required for the oxidation from the oxygen storage, and as a result, the conversion performance of the catalyst, concerning the components which have to be oxidized, decreases.
The following figure shows the respective processes.

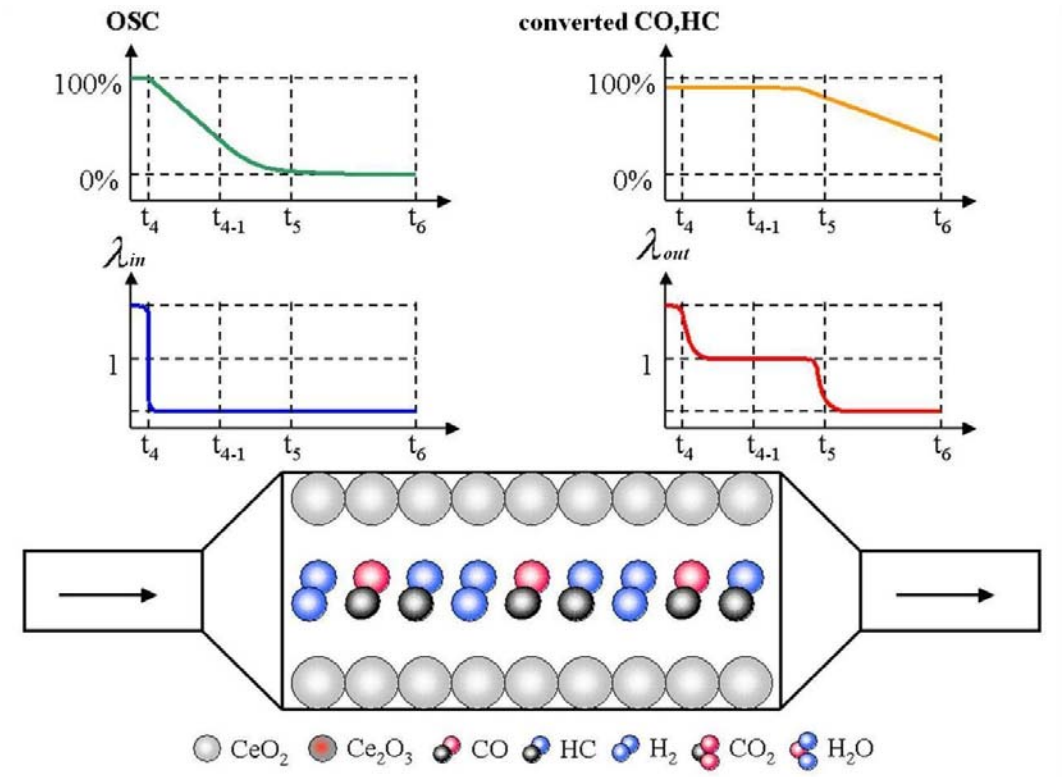

Figure 27: Catalyst state at end of rich phase

The aim of the balanced lambda control is to prevent the oxygen storage from being completely charged or discharged, and thus to prevent the conversion rate from being reduced.

6.2 Air / fuel system monitoring

6.2.1 General description

Fuel Injection System
In comparison to conventional systems the gasoline is not injected into the intake manifold but directly into the combustion chamber.
Due to the higher pressure level in the combustion chamber, e.g. during the compression stroke, a high pressure fuel injection system is used.

Mixture Pilot Control
The air flow sucked in by the engine the engine speed and fuel pressure are measured. These signals are used to calculate an injection signal. This mixture pilot control follows fast load and speed changes.

Lambda-controller
The ECM compares the oxygen sensor signal upstream the catalyst with a reference value and calculates a correction factor for the pilot control.

6.2.2 Monitoring function description

Adaptive pilot control
Drifts and faults in sensors and actuators of the fuel delivery system as well as unmeasured air leakage influence the pilot control. The controller corrects amplitudes increases. If there are different correction values needed in different load speed ranges, a certain time passes until the correction is complete. The correction values will be determined in three different ranges.

Fuel trim
The basic air/fuel ratio control using the signal from the front O2 sensors(s) is corrected by an adaptation calculation. This adaptation results in a factor which is applicable for the whole working range. (e.g. 20%)
A further trim control based on the signal(s) from the rear O2 sensor(s) is correcting the adaptation factor. Therefore this trim control is working in the same way in the whole range.
If the trim control reaches the allowed limit (e.g. 2%) the fault code for fuel delivery trim control is set.
Any deviation from the characteristic curve of oxygen sensor upstream catalyst due to poison will be detected by the control loop downstream catalyst.

6.2.3 Chart and flow charts air / fuel system monitoring

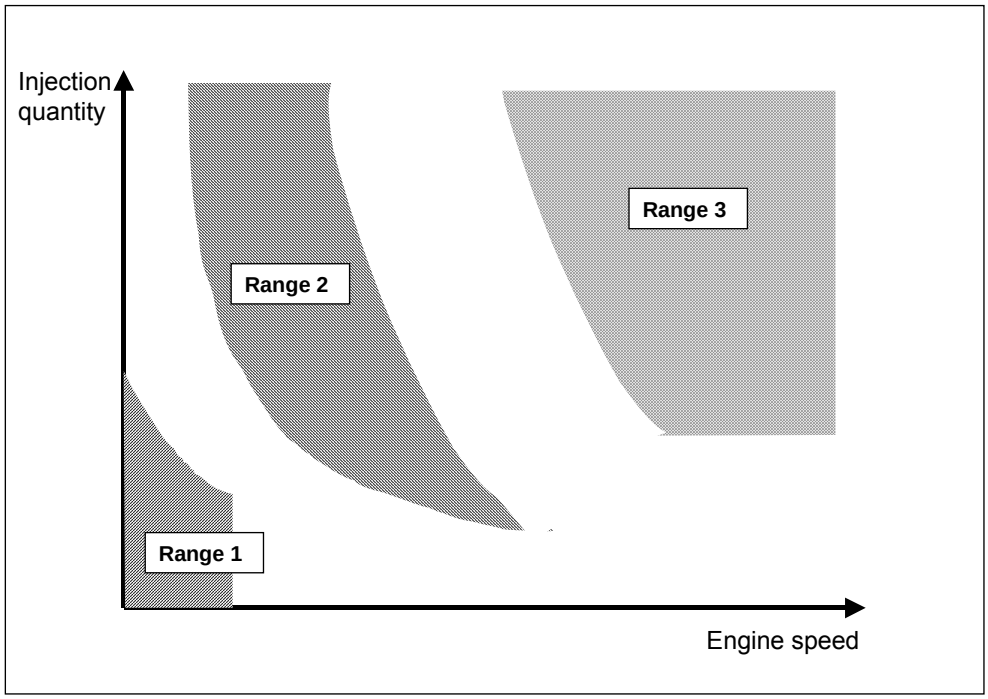

Figure 28: Fuel trim – injection quantity / engine speed

Lambda deviations in **range 1** are compensated by an additive correction value multiplied by an engine speed term. This creates an additive correction per time unit.

Lambda deviations in **range 2** are compensated by multiplication of a factor.

Lambda deviations in **range 3** are compensated by multiplication of a factor (optional depending on individual calibration).

A combination of all two (three) ranges will be correctly separated and compensated.

Each value is adapted in its corresponding range only. But each adaptive value corrects the pilot control within the whole load/speed range by using a linear interpolation formula. The stored adaptive values are included in the calculation of the pilot control just before the closed loop control is active.

Diagnosis of the fuel delivery system
Faults in the fuel delivery system can occur which cannot be compensated for by the adaptive pilot control.
In this case, the adaptive values exceed a predetermined range.
If the adaptive values exceed their plausible ranges, then the MIL is illuminated and the fault is stored.

Flow chart: fuel trim

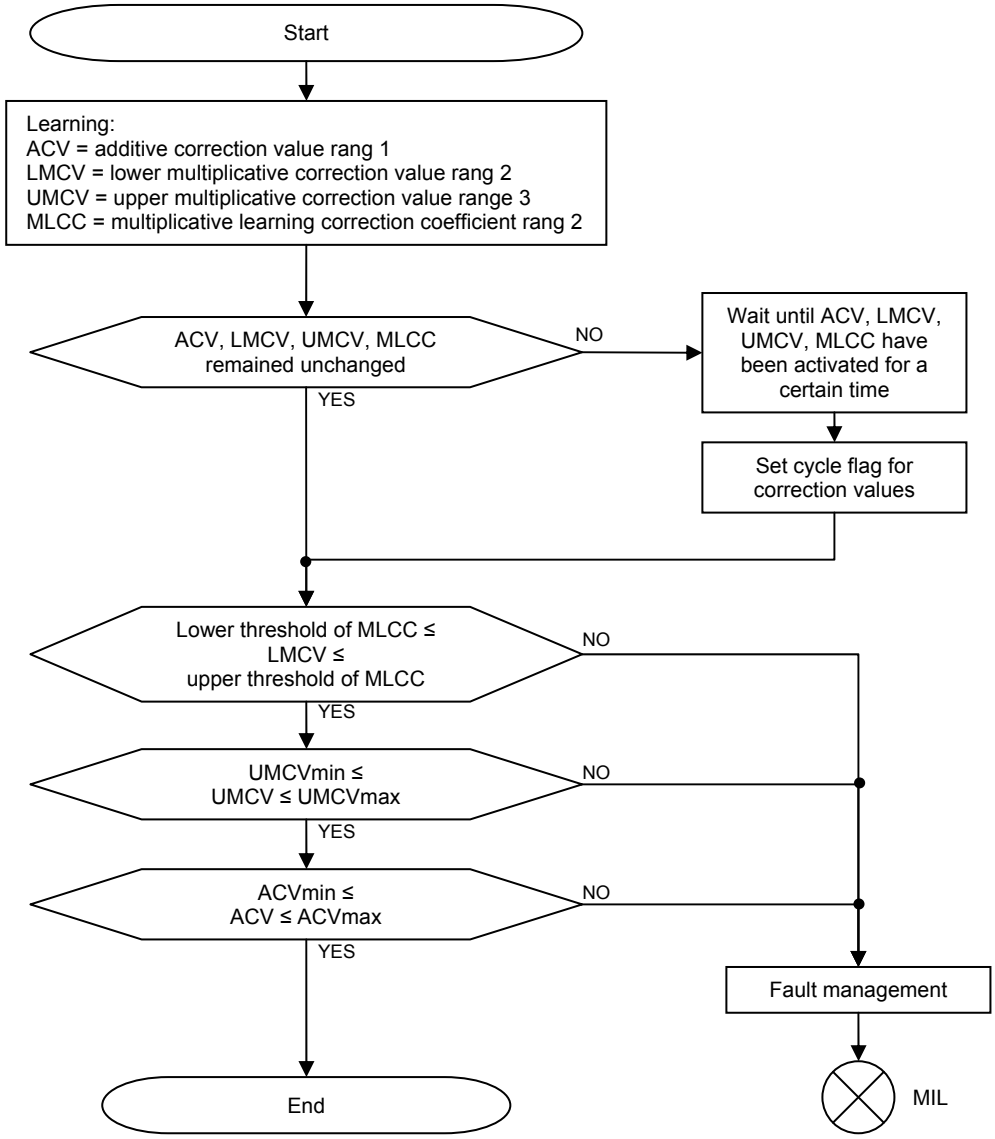

Figure 29: Flow chart fuel trim (part 1)

Flow chart: fuel trim (part 2)

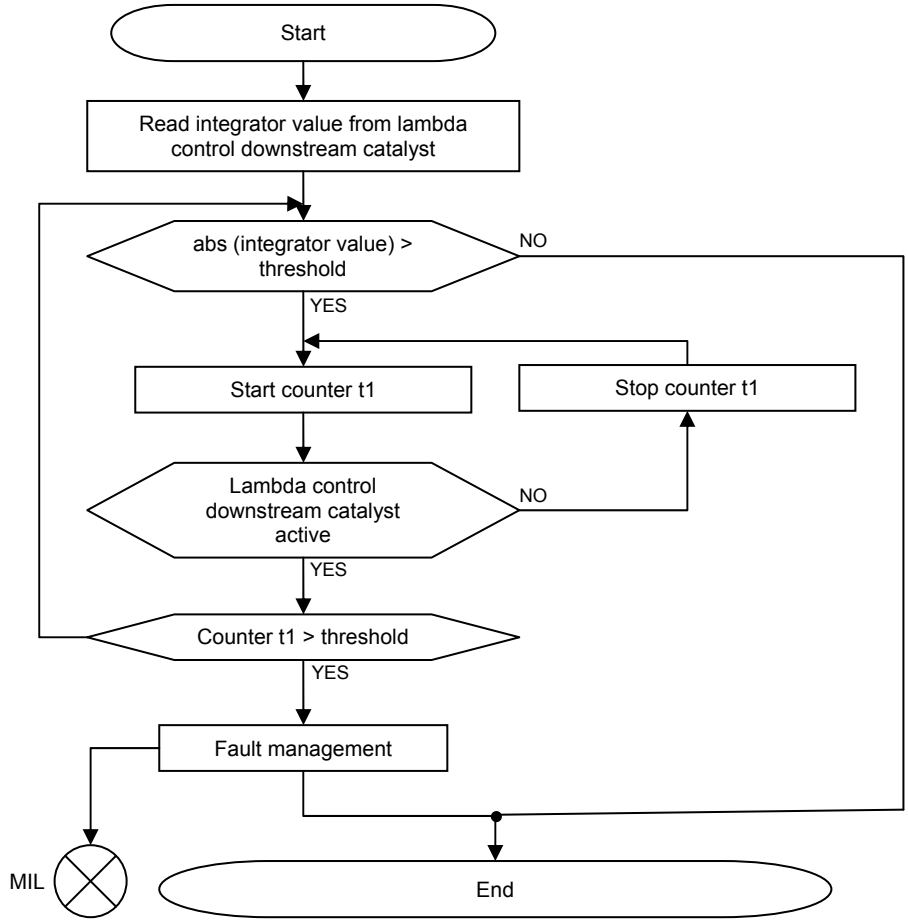

Figure 30: Flow chart fuel trim (part 2)

6.2.4 Similar conditions for fuel system

The fuel system monitor runs in different ranges of the engine map. Faults at idle are detected in the Range 1, faults off idle in the Range 2 and if applicable faults at higher load in a Range 3. It depends on the engine type whether it is necessary to use a third range.

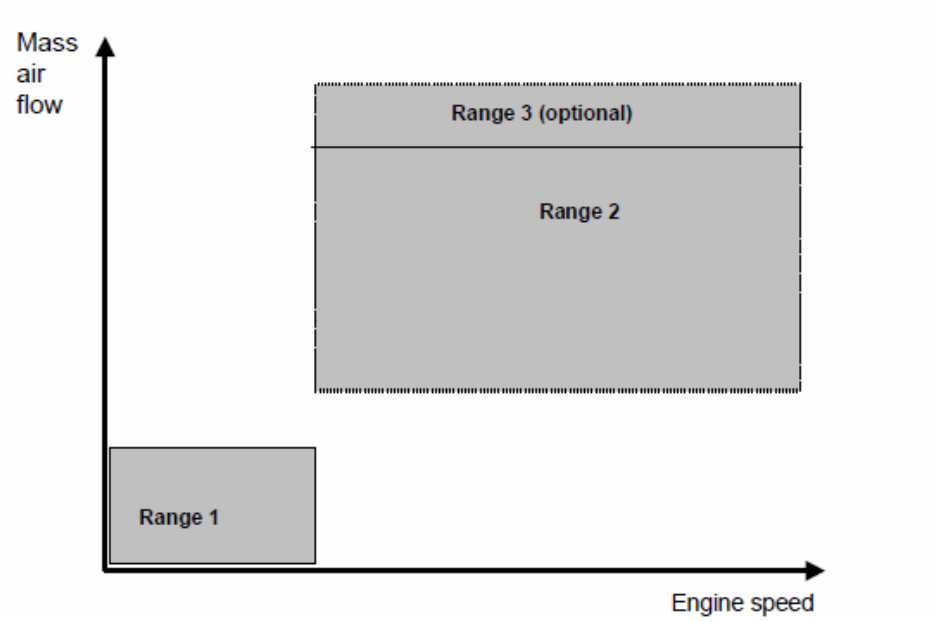

Figure 31: Similar conditions – mass air flow / engine speed ranges

The OBD system uses two ranges, Range 1 and Range 2. Although monitoring runs only within the two ranges the results are not independent from each other.
A pending code found in one of the ranges would be confirmed in either of the ranges. Healing of a pending or confirmed code needs pass results in both ranges.
Consequently any decision leads to the same P-code, valid in the whole working range:

- P0171 System too lean
- P0172 System too rich

Extended monitoring range for fuel delivery system trim control DTC

The basic air / fuel ratio control using the signal from the front oxygen sensor is corrected by an adaptation calculation. This adaptation results in a facto that is applicable for the whole working range of the fuel adaptation, e.g. 24% - 65% load and 1500 – 4000rpm engine speed.

A further trim control based on the signal from the rear oxygen sensor is correcting the adaptation factor. Therefore, this trim control is working in the same way in the whole range. If the trim control reaches the allowed limit the fault code for fuel delivery trim control is set.

Applying the whole range would allow to confirm or erase a fault code under different conditions than first detected and thus come to a faster decision. Using this whole range for monitoring this function rather than the limits given in sect (c)(33), as seen in the following graph:

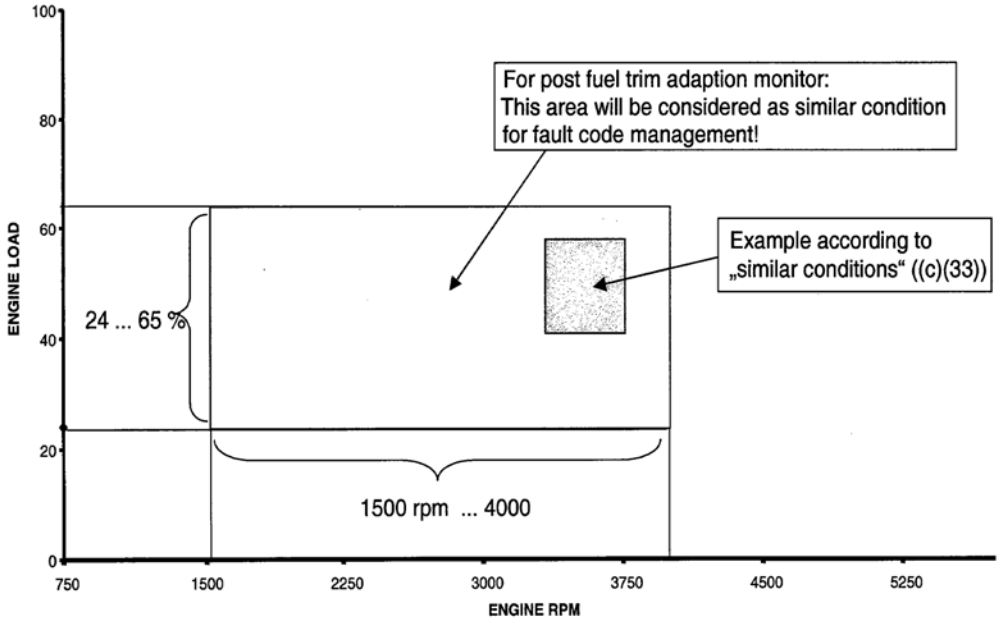

Figure 32: Monitor window – post fuel trim adaptation

7 EXHAUST GAS SENSOR MONITORING

General description

The Lambda control loop consists of a linear oxygen sensor upstream catalyst and one or two binary oxygen sensors downstream front catalyst (and post main catalyst). The secondary control loop (downstream of the catalysts) corrects deviations of the upstream oxygen sensor.

Upstream oxygen sensor (wide band sensor)

The wide band oxygen sensor (other commonly used names are LSU or UEGO) measures the oxygen content and the lambda value of the exhaust gas. Because of its continuous characteristic line the wide band sensor is applicable for the upstream catalyst position. This kind of sensor is able to measure a wide range of lambda (e.g. 0.65 … λ … air).
The wide band oxygen sensor has an integrated sensor heater. The heater performance is controlled by the ECM in order to maintain a certain sensor temperature. The sensor temperature is measured indirectly by the internal resistance.

The relevant output signal of a wide band sensor is the pump current (Ip). It is proportional to the lambda value.

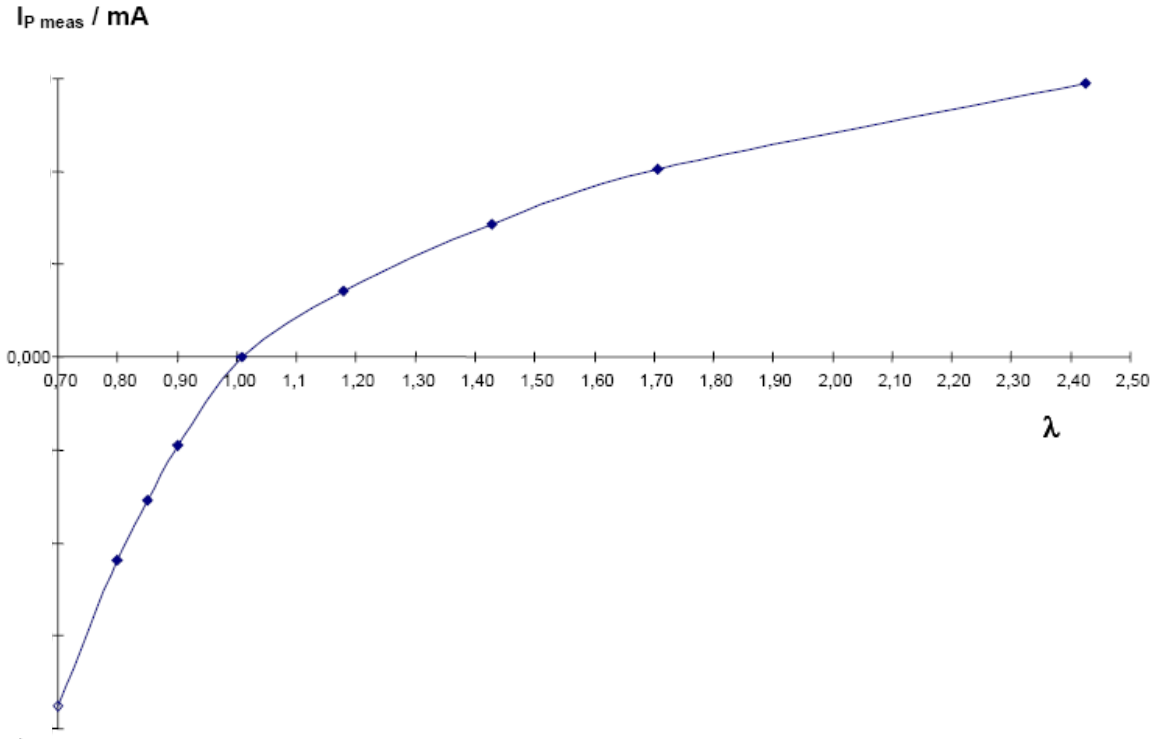

Figure 33: characteristic line of wide band sensors

Downstream oxygen sensor (binary sensor)
The binary oxygen sensor (other commonly used names are LSF or HEGO) measures also the oxygen content of the exhaust gas. The output voltage of this sensor is reading a level of > 0.45 V for a rich exhaust gas constitution. In case of a lean exhaust gas constitution, the sensor reads voltages < 0.45 V. For stoichiometric mixture (Lambda = 1) the characteristic line of the binary sensor has a steep gradient.

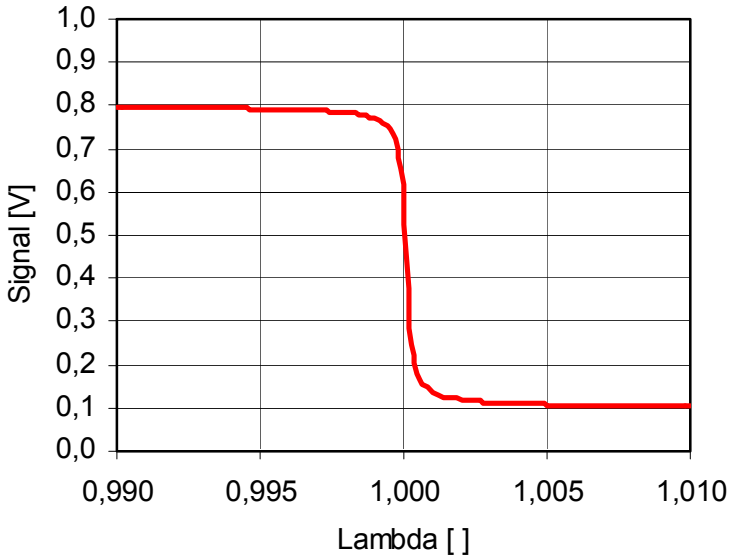

Figure 34: characteristic line of binary sensors

The binary sensor is located downstream the catalyst and is used for catalyst monitoring, monitoring of the upstream oxygen sensor and secondary fuel trim. There is also a sensor heater integrated to ensure a sufficiently high operating temperature.

All sensors are monitored by several single monitoring procedures as follows.

7.1 FO2 Sensor dynamic

Different failure types of wideband oxygen sensors may affect the sensor characteristics:

- **Clogged protection tube:**
  diffusion of exhaust gas into measurement chamber is being slowed down
  → slower sensor signal transition, being detected by front O2 Sensor dynamic
- **Crack in pumping cell:**
  typically results in rich shift of the signal
  → being detected during fuel cut-off
- **Crack in reference cell:**
  typically results in lean shift of the signal
  → being detected by rear fuel trim monitoring
- **Poisoning of sensor ceramic surface:**
  diffusion of exhaust gas into ceramic element is being slowed down
  → slower sensor signal transition, being detected by front O2 Sensor dynamic check

7.1.1 Oxygen sensor, signal too slow, P0133, P0153,

bank 1: P0133, bank 2: P0153;

This function monitors the dynamic behavior (responding properties) of a continuous wideband LSU oxygen sensor, which is located upstream of the catalyst (primary oxygen sensor). Slow dynamic sensor behavior may lead to a rise of exhaust gas emissions, and, on the other hand, the results of other monitoring functions that use the signal of the primary sensor (such as the catalyst monitor) may be falsified, or the corresponding monitoring function disabled.

7.1.1.1 Monitoring Strategy

The monitoring function detects symmetrical and asymmetrical faults in the primary oxygen sensor that may be caused by either slow transition or delayed response. The area ratios for each direction and the ratios of the maximum gradients of the actual signal and the setpoint signal for each direction are used as evaluation criteria.

7.1.1.2 Enable Conditions

- Oxygen sensor has reached operating temperature (typically 720 °C)
- A calibratable waiting period is exceeded after the operational readiness was set
- Relative fuel quantity from transition compensation < threshold value
- Volume flow rate of carbon canister purge < threshold value
- Canister purge diagnostic is inactive
- Tank leakage diagnostic is inactive
- Catalyst temperature > threshold value
- No fuel cut-off to any cylinder, all injection valves are activated
- Engine coolant temperature > threshold value
- Engine speed, load, and exhaust gas delay time constant in defined range
- Evaporative system not active, or time of activation > threshold value
- Currently no gear change in process
  This enable condition is optionally calibratable, i. e. it is only active when it is required. For details, see the Summary Table
- Gradient of the engine load ≤ threshold value
- “Open circuit in the pump current circuit” monitoring function is completed
- Second lambda control loop not active
- Forced lambda modulation not active

7.1.1.3 Malfunction Criteria

The monitoring function utilizes surges in the amount of fuel injected, and compares the actual oxygen sensor signal with the expected oxygen sensor signal. For this purpose, two corresponding, comparable areas and maximum gradients are calculated. One of the areas and the respective maximum gradient are determined on the basis of the actual sensor signal, the other area and the respective maximum gradient are determined on the basis of the expected sensor signal.

Starting with the response to a fuel surge, the area between the inverted signal and a horizontal line, which begins at the point of the start value, is calculated during a defined time period. Within the same time frame the maximum gradient of the signal is calculated.

Then a quotient from the actual area and the expected area and a quotient from the maximum gradients are calculated. The slower the oxygen sensor responds, the lower the absolute value of the quotient value calculated from these values and/or the two gradients will be. While the area ratio and the gradient ratio are reduced in the case of a slowly rising signal, only the area ratio is reduced in the case of a delayed signal rise. The gradient ratio remains largely unaffected as long as the response of the actual signal occurs within the measurement window. If no response within the measurement window occurs, as in the case of very large faults, both ratios equal zero.
Typically, the monitoring function utilizes an active modification of the setpoint lambda value.
There are two kinds of surges, R2L surges and L2R surges. Single uni-directional surges with a calibratable waiting period between two surges, are applied.

Several options are generally possible when using the fuel surges as a means of activation:

- The monitoring function executes its own lambda modification. This enables double surges with R2L and L2R modifications or single uni-directional surges with a calibratable waiting period between two surges (this strategy is applied starting with MY 2010).
- Measuring the two flanks during the lambda modification of the active catalyst monitoring function (this strategy is planned for future model years)
- Measuring the R2L flank during overrun fuel cut-off and measuring the L2R flank during catalyst purge (rich operation) after overrun fuel cut-off (currently not taken into account)

The options listed above may be applied individually by coding.

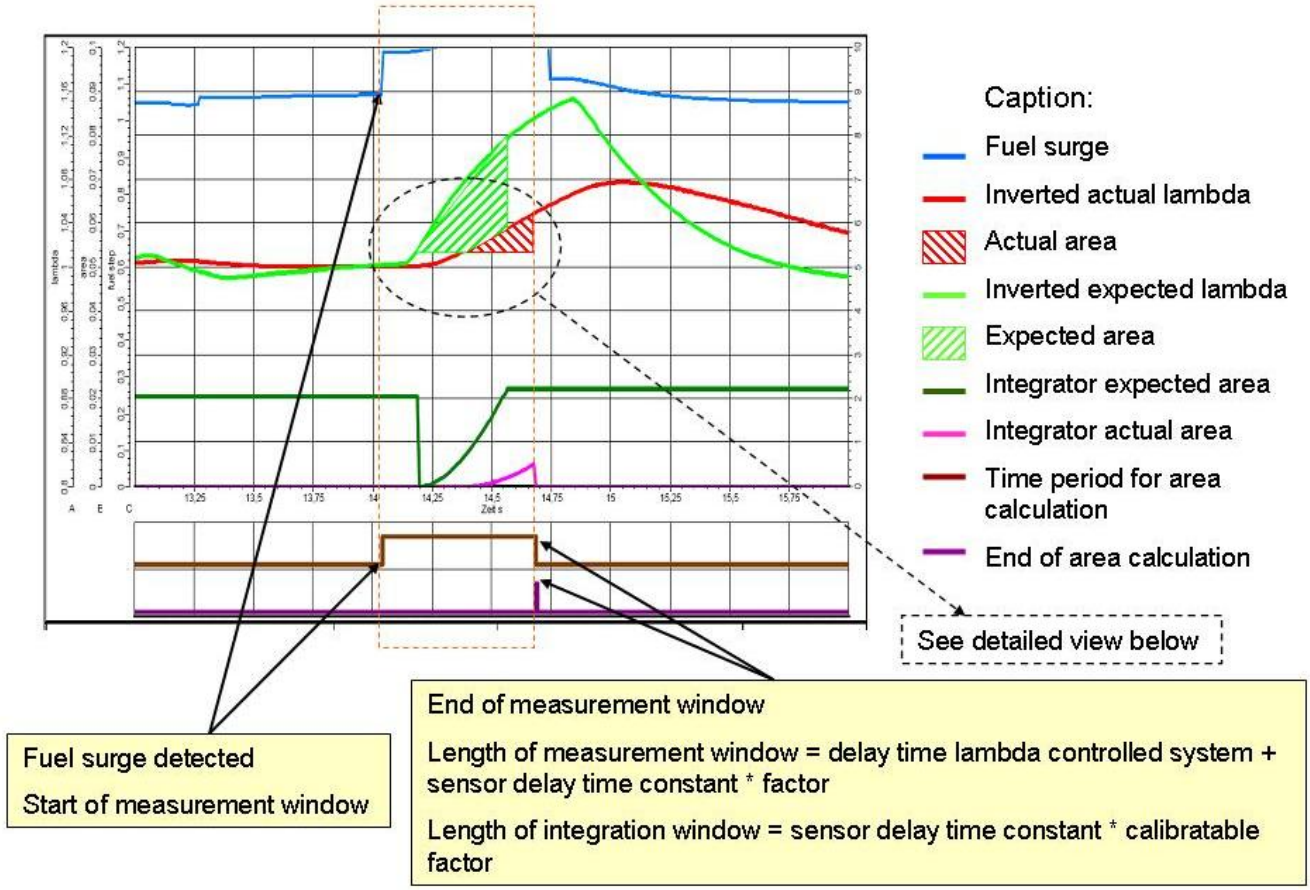

Figure 35: Principle of the response rate integral calculation

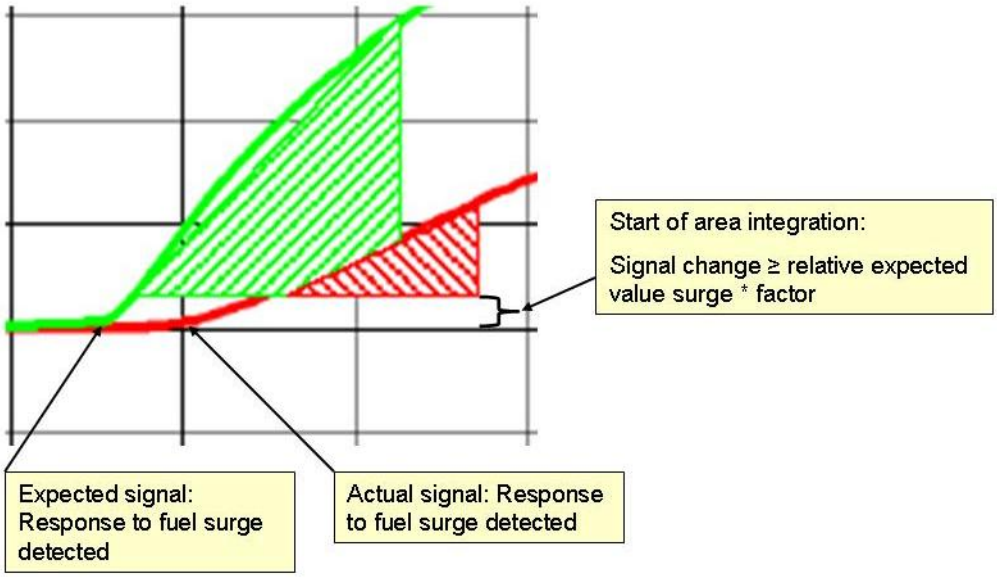

Figure 36: Detailed view

The figure shows a fault case where the length of the integration window of the setpoint signal is calculated according to the formula above. The length of the integration window of the actual signal, however, is defined by the end of the common measurement window for both areas as seen in Figure 35: Principle of the response rate integral calculation(brown line).

The Active Modification of the Setpoint Lambda Value and its Marginal Conditions

When the enable conditions are fulfilled, the monitoring function requests a modification of the setpoint lambda value. First, a negative Δλ value is requested (enrichment). When the areas and the gradients are calculated, a positive Δλ value is requested (enleanment). The lambda value is conditioned prior to each surge of the setpoint lambda value. Prior to a L2R surge, a lambda value of approximately 1 is applied. Prior to a R2L surge, a rich pre-conditioning is carried out, i. e. the mixture is set to slightly rich (λ = 0.98 to 0.99). This reduces the NOx exhaust emissions caused by the R2L modification.

Important Marginal Conditions for a Surge of the Setpoint Value
A slow oxygen sensor may cause the lambda controller to oscillate. When this occurs, the L2R modification is done when the slope moves towards "rich", anyway. When an R2L modification is done, the slope of the control action also has to move in the same direction, i. e. towards "lean" (synchronization).

Explanation
Due to the enleanment caused by the control action, the requested enrichment may not achieve the injection of the desired fuel quantity, when the modification of the setpoint lambda value is not synchronized with the control action. As a result, the necessary modification to measure the dynamic response of the sensor cannot be achieved. In case a slow oxygen sensor causes the lambda controller to oscillate, the falling slope of the control action line shows that the delayed sensor signal is responding to a preceding enrichment, i. e. the signal is moving towards "rich". The sensor signal is moving in the right direction, but not as a result of the previously initiated surge. Therefore a dynamic measurement may lead to a false result (e. g. an unjustified pass result).

Further Marginal Conditions for a Surge of the Setpoint Value

- The forced modulation of the continuous lambda control and the second control loop are disabled.
- The current control difference does not exceed a threshold value.
- The intensity of control action has increased several times in succession
  or
  The intensity of control action has not exceeded a threshold value for longer than a time threshold.
- The total effect of the setpoint lambda value modification and/plus the operational control action must not exceed the maximum permissible enrichment or enleanment for the corresponding control action
- When the L2R modification starts, the difference between the current lambda value and the minimum permissible lambda value must be 1.5 x Δλ of the setpoint value surge L2R. When the R2L modification starts, the difference between the current lambda value and the maximum permissible lambda value must be 1.5 x Δλ of the setpoint value surge R2L.

Calculating the Setpoint Value and the Actual Value of the Inverted Lambda Signal

The area integrals and the maximum gradients are calculated by inverting the setpoint and the actual values of the sensor signal. A low pass filter, which uses a calibratable time constant, is applied to the inverted measured oxygen sensor signal. The filter protects against high-frequency disturbances, which might distort the area integral triggering and the gradient calculation triggering. The setpoint value signal is initially delayed by an exhaust gas delay time element. Subsequently, a low pass filter, which uses the sensor delay time constant, is applied to the setpoint signal. As with the actual signal, a low pass filter, which uses a filter constant, is applied to the setpoint signal again, in order to guarantee its comparability with the actual signal.

Calculating the Area Integrals and the Area Ratio (Dynamic Raw Values)

This describes the calculation of the R2L surge. The L2R surge is calculated in the same manner. For a single measurement, the extent of the surge has to be large enough to measure and thereby to initiate the integration of the setpoint and the actual area.

Detecting a Fuel Surge

To initiate the calculation of the area integrals and the gradients, a relative fuel surge has to be detected. This fuel surge is detected when the difference between the current value and the previous fuel factor value exceeds a calibratable threshold value. Once a fuel surge is detected, both the setpoint and the actual value must respond within a certain time frame.
The time frame for the area integration is calculated when the fuel surge starts. This time frame is calculated from the exhaust gas delay time (gas travel time to the location of the oxygen sensor). The delay time is multiplied with a factor that depends on the sensor delay time constant, which depends on the operating point (engine speed and load / exhaust gas mass flow). The time constant corresponds to the signal increase of an error-free sensor.
The oxygen sensor signal can be expected to react shortly after the end of the exhaust gas delay time. Integration is subsequently started and it continues for the duration of the time constant. This process occurs in both the setpoint and the actual signal. When the actual signal does not respond at the expected time, the integration cannot be executed throughout the entire time frame of the time constant. The area and consequently the dynamic value, decrease.
Due to tolerances in the exhaust gas delay time parameters of the lambda control, the measurement window does not start after the end of the total delay time, but when 80 percent of the current delay time has passed. Tolerances in the sensor delay time constant have to be compensated for by varying the length of the measurement window, using the multiplication factor.

Area Integration of the Expected Inverted Oxygen Sensor Signal (Setpoint Value)
The area integration of the expected inverted signal is initiated when the first response to a fuel surge is detected. For this purpose, the maximum and the minimum values (depending on the direction of the flank change) of the inverted setpoint lambda signal are continuously calculated. These calculations are made after a fuel surge is detected from the lambda controller's response, as described above. An initial response is detected when the signal has changed from the expected signal excursion by a certain factor (typically 0.05 to 0.2). When this condition is satisfied, the area integration and a time counter, which determines the integration period, start. The integration period is calculated from the product of the current time constant and a constant, calibratable factor. When the time counter value is greater than or equal to this integration time, the area calculation is stopped.

Calculating the Maximum Gradient of the Expected Inverted Oxygen Sensor Signal (setpoint value)
The gradient of the expected inverted signal is calculated only after a response to the fuel surge can be detected. For this purpose, the maximum and the minimum values (depending on the direction of the flank change) of the inverted setpoint lambda signal are continuously calculated. These calculations are made after a fuel surge is detected from the lambda controller's response, as described above. An initial response is detected when the signal has changed from the expected signal excursion by a certain factor (typically 0.05 to 0.2). Once this condition is fulfilled, the calculation of the gradient is started, beginning with continuously calculating the difference between the current value and the previous value in 10 ms calculation steps, and calculating the maximum value from the individual gradients of the calculation steps.

Area Integration of the Measured Inverted Oxygen Sensor Signal (Actual Value)
The inverted actual lambda signal is calculated mostly analogously to the integration of the setpoint area. In this case also, the maximum or the minimum value of the inverted setpoint lambda signal is continuously calculated when a fuel surge is detected. Then, the time frame for the integration and the time counter are started when the signal has changed by a calibratable factor, compared to the expected signal excursion. The time frame for the integration is also stopped when the time counter reaches a value calculated from the product of the current time constant and the same calibratable factor, as it is used for calculating the setpoint area.
If there is an excessive delay in the oxygen sensor’s response, no response to the fuel surge will be detected in the actual signal. As a result, no area integration can be done, and the area value for the actual signal is set to zero. Thus, the current area ratio also equals zero.

Calculating the Maximum Gradient of the Measured Inverted Oxygen Sensor Signal (actual value)
The maximum gradient of the measured inverted lambda signal is calculated in the same way as the maximum gradient of the setpoint value.

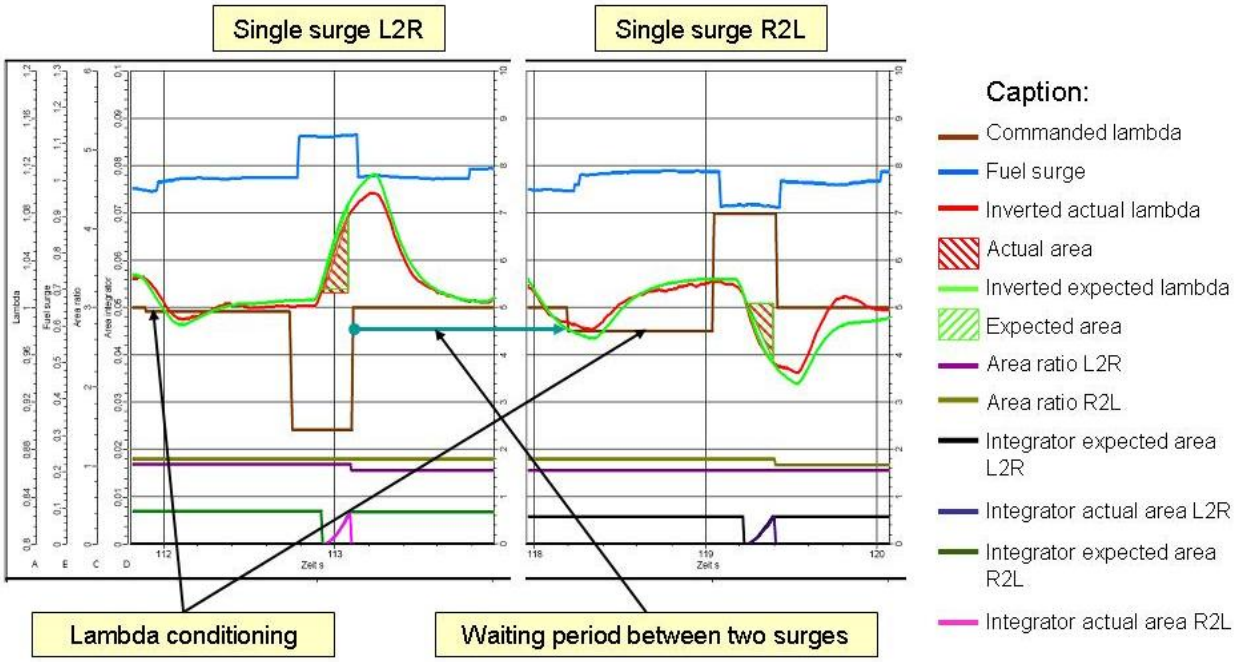
Generating the Diagnostic Values for each Direction
The diagnostic values are calculated for both the falling and the rising flank, respectively. The calculation incorporates the quotient of the actual value integral area (numerator) and the setpoint value integral area (denominator), as well as the quotient of the maximum gradient of the actual value (numerator) and the maximum gradient of the setpoint value (denominator).

Subsequently, the individual area ratios for each direction can be corrected using a factor from a characteristic curve which is a function of the engine temperature (typical factor: 50 °C = 1.5; 90 °C = 1.0).

Explanation: When the engine has not yet completely warmed up, the applied fuel mixture surge reaches the location of the sensor only partially as a result of the fuel being adsorbed to the intake manifold and/or the combustion chamber (surface film). These effects are not considered when modeling the system to be controlled, which is used for generating the target signal. Hence, they have to be taken into account in the diagnostic procedure in order to avoid diagnostic errors with faultless sensors.

From these values, which are calculated as described above, filtered values are generated. The filtered values are the diagnostic values that are used to make fault decisions.

Measurement with faultless oxygen sensor



Measurement with 250 ms symmetrical delayed response (lag time)

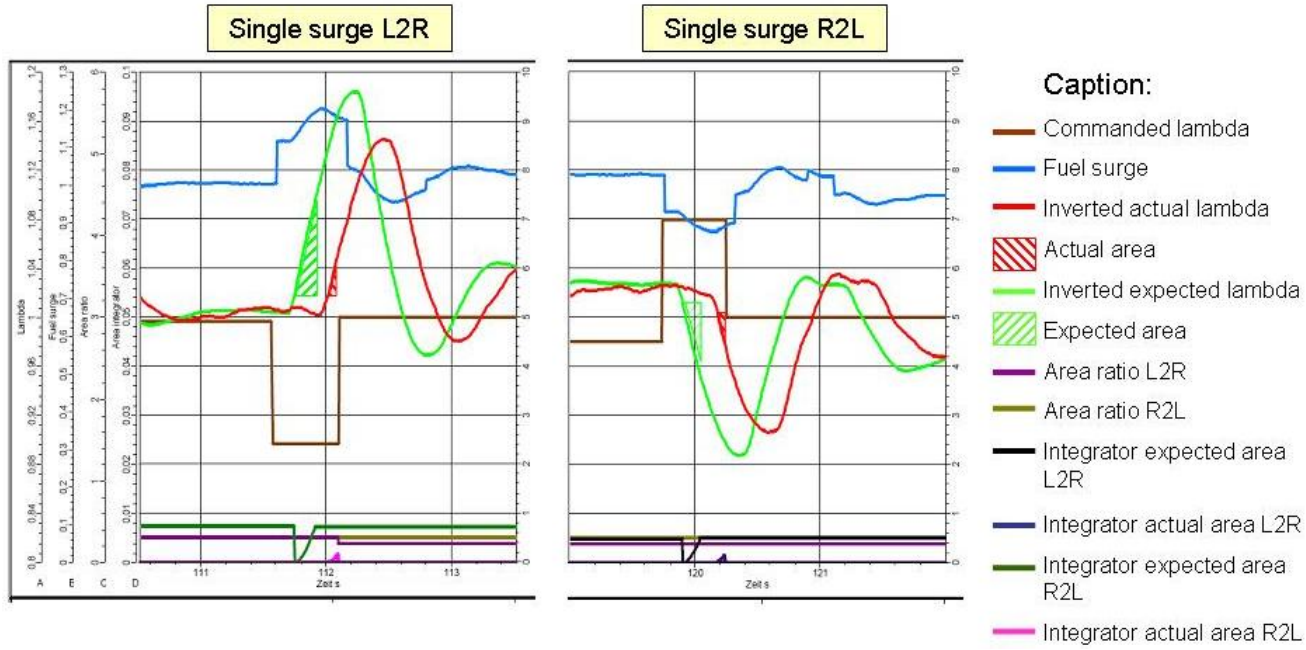


Figure 37: Primary, heated oxygen sensor - Examples for determining the area in an error-free system and in a system with a 250 ms delay

The areas in the examples are determined by successive single R2L and L2R surges.

Calculating the Filtered Dynamic Values

From the values that are calculated for the falling and the rising flanks filtered values are generated. These filtered values are the diagnostic values which are used to make fault decisions.

The event filter constant for the first measurement is 1, which means that the filter is actually initialized with the first measurement value. With each further single result, this filter value decreases by the reciprocal value of the number of measurements. Thus, in each step an average is generated for the individual results that are present up to this point. The reason for this approach is the expectation that the oxygen sensor dynamic does not change substantially between two individual measurement steps (assuming continuous ageing) and therefore all results should be weighted equally.

Potential Results

As a diagnostic value for each direction is calculated for both the area ratio and the gradient ratio, within certain limits it is possible to calibrate different fault thresholds for the different fault types, according to their impact on emissions.

Case 1: Pass Result

In order not to have to carry out unnecessary monitoring cycles with active lambda modification in the case of a good sensor dynamic and thus, to provide monitoring time for other monitors more quickly, the number of measuring samples to attain does not have to be as high as in the fault case.

After each individual measuring sample, verification is made to determine whether it is still possible for the dynamic value to drop below the highest fault threshold with further measurements being taken. If this is no longer possible, the monitor is ended with a pass result.

The sensor is dynamically OK,

if the value of the R2L area ratio multiplied by the quotient of the current counter value for the R2L area ratio and the number of measurements necessary for a fault result (Z1) is greater than the threshold value for the asymmetrical delay fault

and

if the value of the L2R area ratio multiplied by the quotient of the current counter value for the L2R area ratio and the number of measurements necessary for a fault result (Z1) is greater than the threshold value for the asymmetrical delay fault.

and

if the value of the R2L gradient ratio multiplied by the quotient of the current counter value for the R2L gradient ratio and the number of measurements necessary for a fault result (Z1) is greater than the threshold value for the gradient ratio

and

if the value of the L2R gradient ratio multiplied by the quotient of the current counter value for the L2R gradient ratio and the number of measurements necessary for a fault result (Z1) is greater than the threshold value for the gradient ratio.

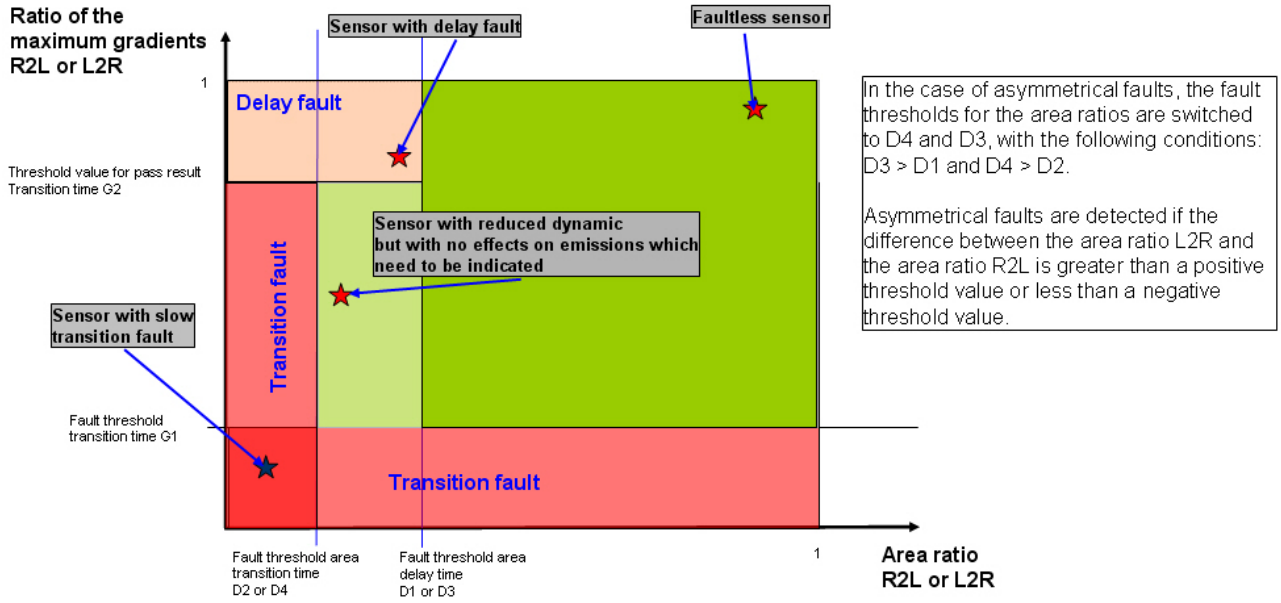

Figure 38: Overview Fault threshold values

Case 2: Fail result due to a symmetrical delay fault
If the difference between the dynamic values of the area ratios for the R2L flank and the L2R flank is greater than a minimum threshold value or less than a maximum threshold value, a symmetrical fault is detected.

- If the higher one of the two counters (for the R2L flank and the L2R flank) exceeds a threshold value Z1 (typically 4 to 6)

and

- the corresponding gradient ratio (for the R2L flank or the L2R flank) exceeds an upper threshold value G2

and

- the corresponding area ratio (for the R2L flank or the L2R flank) falls below the fault threshold value for the symmetrical delay fault D1,

the sensor is dynamically defective, the monitor is ended and a dynamic fault is stored.

Case 3: Fail result due to a symmetrical slow transition fault
If the difference between the dynamic values of the area ratios for the R2L flank and the L2R flank is greater than a minimum threshold value or less than a maximum threshold value, a symmetrical fault is detected.

- If the higher one of the two counters (for the R2L flank and the L2R flank) exceeds a threshold value Z1 (typically 4 to 6)

and

- the corresponding gradient ratio (for the R2L flank or the L2R flank) exceeds a lower threshold value G1

and

- the corresponding gradient ratio (for the R2L flank or the L2R flank) falls below a second, higher threshold value G2,

and

- the corresponding area ratio (for the R2L flank or the L2R flank) falls below the fault threshold value for the symmetrical transition fault D2,

or

- the corresponding dynamic value for the gradient ratio (for the R2L flank or the L2R flank) falls below the threshold value G1,

the sensor is dynamically defective, the monitor is ended and a dynamic fault is stored.

Case 4: Fail result due to an asymmetrical delay fault

If the difference between the dynamic values for the R2L flank and the L2R flank is less than a minimum threshold value or greater than a maximum threshold value, an asymmetrical fault is detected.

- If the higher one of the two counters (for the R2L flank and the L2R flank) exceeds a threshold value Z1 (typically 4 to 6)

and

- the corresponding gradient ratio (for the R2L flank or the L2R flank) exceeds an upper threshold value G2

and

- the corresponding area ratio (for the R2L flank or the L2R flank) falls below the fault threshold value for the asymmetrical delay fault D3,

the sensor is dynamically defective, the monitor is ended and a dynamic fault is stored.

Case 5: Fail result due to an asymmetrical slow transition fault

If the difference between the dynamic values for the R2L flank and the L2R flank is less than a minimum threshold value or greater than a maximum threshold value, an asymmetrical fault is detected.

- If the higher one of the two counters (for the R2L flank and the L2R flank) exceeds a threshold value Z1 (typically 4 to 6)

and

- the corresponding gradient ratio (for the R2L flank or the L2R flank) exceeds a lower threshold value G1

and

- the corresponding gradient ratio (for the R2L flank or the L2R flank) falls below a second, higher threshold value G2

and

- the corresponding area ratio (for the R2L flank and the L2R flank) falls below the threshold value for the asymmetrical transition fault D4

or

- the corresponding dynamic value for the gradient ratio falls below the threshold value G1,

the sensor is dynamically defective, the monitor is ended and a dynamic fault is stored.

7.1.1.4 Flowchart

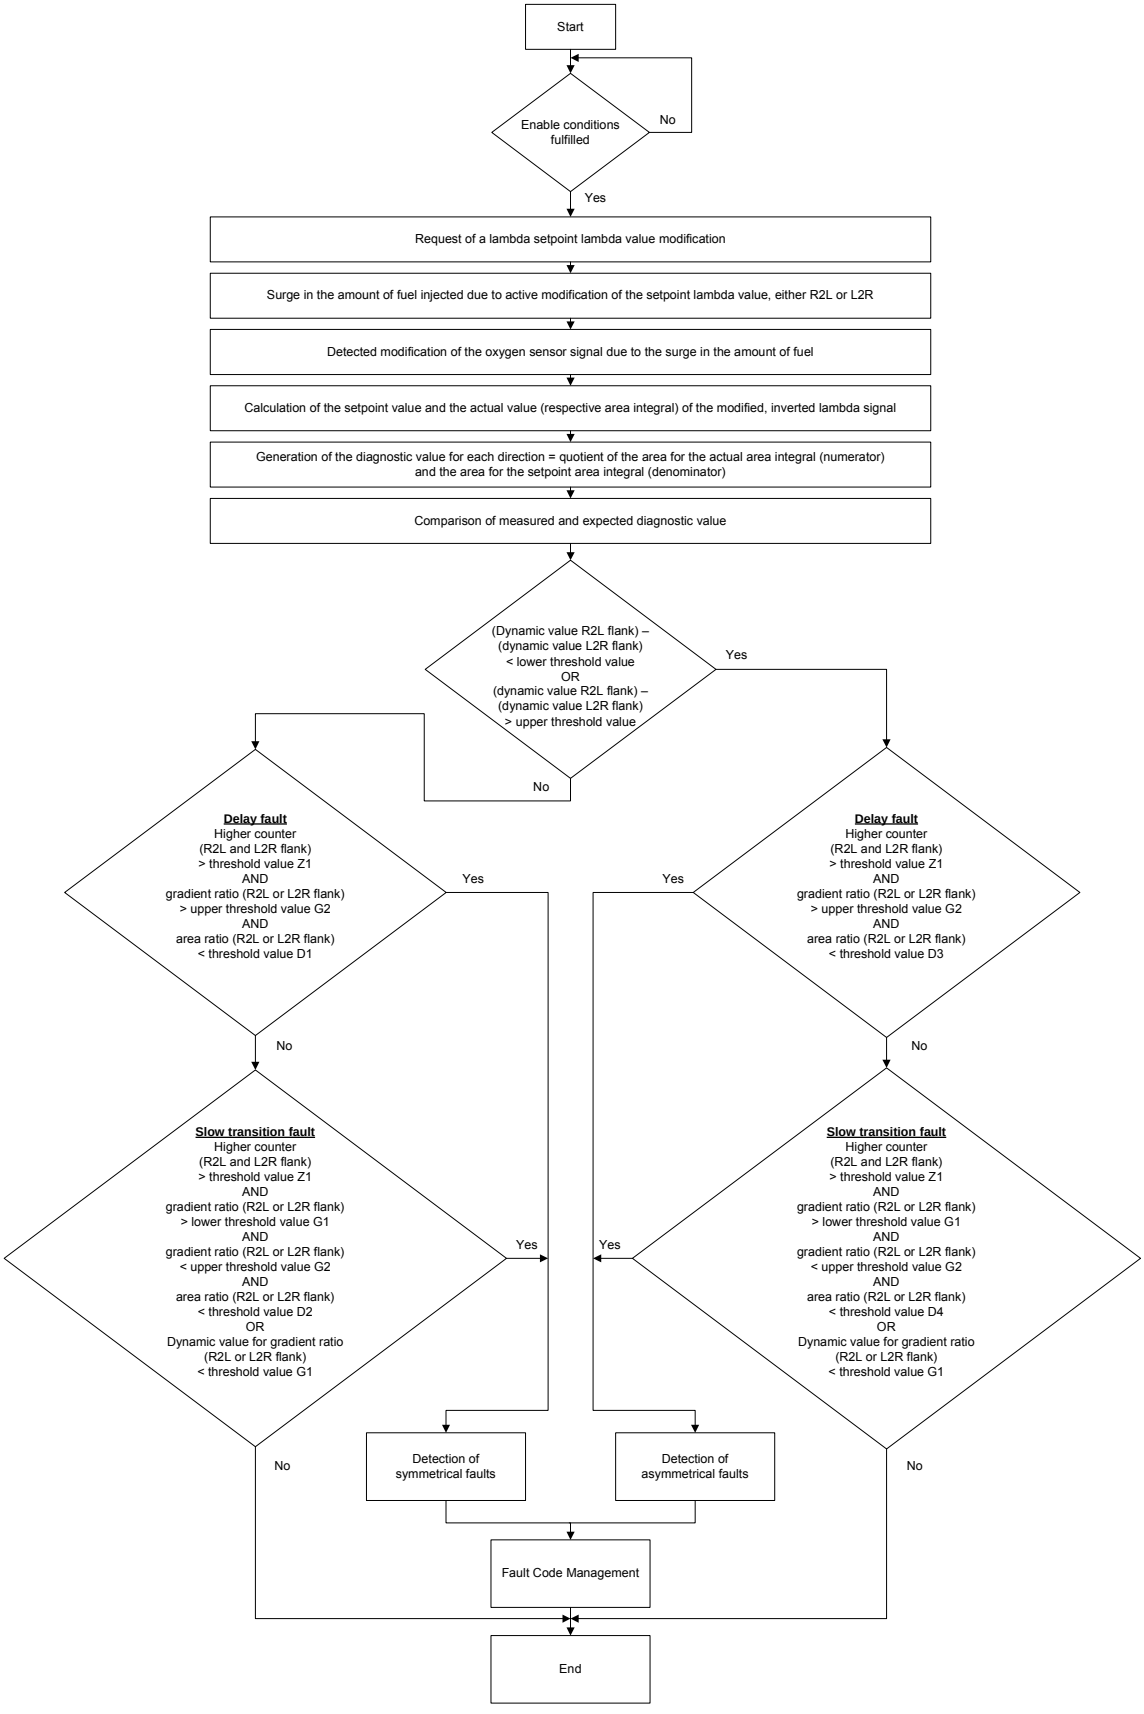

Figure 39: Flowchart Oxygen sensor, signal too slow, P0133, P0153

7.1.1.5 In-Use Monitor Performance Ratio

The incrementing of the numerator and the denominator, and the ratio calculation for the response rate monitor of the primary heated oxygen sensor are executed by the IUMPR kernel function. In accordance with all monitors requiring a standardized track and report of the in-use performance, the rate response monitor of the oxygen sensor reports to the IUMPR kernel function via status flags – see the description of the IUMPR kernel function.

Incrementing the numerator

Measurements with a properly working oxygen sensor can usually be taken quickly and without any disturbances. A slow oxygen sensor increases the measuring time only insignificantly. The measurements, however, are interrupted more frequently. Therefore, the time required for fault detection and hence for incrementing the numerator has to be simulated by a shadow counter.

A time counter is started, whenever the enable conditions and the conditions for the signal evaluation/validation are fulfilled, and when the waiting period between two fuel surges has elapsed. This time counter is repeatedly increased each 100 ms, until a calibrated threshold value is exceeded. This fault-case measuring time must be adapted to the worst case fault. When this time period for one event has elapsed, an event counter is incremented. When the event counter exceeds a threshold value in an error-free system, the condition "numerator complete" is set.

The numerator for the sensor dynamic diagnostic is also incremented, when an actual fault is detected.

Incrementing the denominator

The denominator is incremented, when the standardized conditions during a current driving cycle, in accordance with CCR (d) (4.3.2.) (E) (ii), are fulfilled, and when the monitoring function is not affected or inhibited by already stored faults or faults of sensors that are necessary to determine the denominator.

Yes

7.2 FO2 Sensor circuit continuity check

7.2.1 Diagnosis of electrical faults at the FO2 Sensor

Lambda control can be disabled only when at least a pending fault code (service $07) has been entered in the fault code memory. Several operating conditions exist, under which faulty components can be pinpointed only after a time delay. Lambda control must however be disabled when fault symptoms are detected.

This diagnostic function detects and sets a general electrical fault. The actual fault which is accompanied by a second entry into the fault code memory is then pinpointed afterwards by the appropriate diagnostic function. This second fault entry could either be a sensor line error or a heater fault of the upstream O2 sensor. In order to ensure timely MIL illumination (two-in-a-row principle) the general electrical fault is also set when a sensor line error or a heater fault of the upstream O2 sensor is set.

A general electrical fault of the upstream heated oxygen sensor will be set either

- when the internal resistance of the O2 sensor's Nernst cell is implausibly high or the ceramic temperature of the FO2 sensor is implausibly low. All of the following monitoring conditions must be fulfilled in both cases:
  - the exhaust gas temperature model is valid
  - the modeled exhaust gas temperature at the upstream O2 sensor's location lies above a calibrated minimum
  - the FO2 sensor's heater is enabled/switched on and throttle fuel cut-off condition doesn't exist
  - the FO2 sensor's heater diagnostic has not been inhibited (battery voltage supply)
  - no errors from the FO2 sensor's heater power stage
  - no faults of the FO2 sensor's evaluation IC
  - no short circuits of the FO2 sensor
- or when the FO2 sensor's IC Nernst voltage line diagnostic is performed via its IC diagnostic and an interruption of this line is detected.
- or when the FO2 sensor's virtual ground line diagnostic has been performed via its IC diagnostic and an interruption of this line is detected
- or when the FO2 sensor's heater circuit diagnostic is performed and a heater fault is detected.

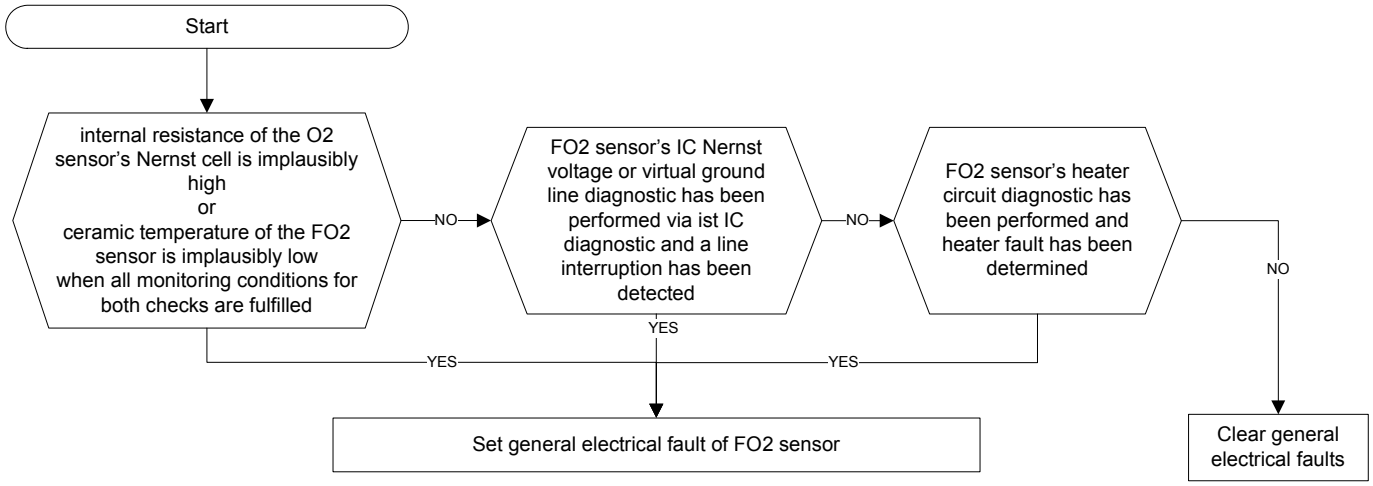

Figure 41: Flow chart diagnosis of electrical faults at the FO2S

7.2.2 Diagnosis of evaluation IC of the FO2 Sensor

This chapter describes the sum of all possible evaluation IC checks of the FO2 sensor.
The hardware of the Oxygen sensor consists of an IC (CJ 125) with the capability of self-diagnostics. The diagnosis of the evaluation IC of the heated upstream oxygen sensor (HO2S) detects electrical faults of the UN (Nernst voltage), VM (virtual ground), IA (compensation) and IP (pump) signal lines. The picture below shows the signal lines between the IC (CJ125) and the HO2 sensor. These electrical faults could result from short circuits to battery, or ground and signal interruptions. Short circuits are detected by a self-diagnosis of the CJ125. Line interruptions are identified by observing the system. The diagnosis monitors communication between the CJ125 IC and the electronic control unit and also performs a rationality check of the supply voltage as well as the adaptation values of the IC's electrical compensations. The CJ125 communicates with the ECU via a serial port interface (SPI). The evaluation IC's diagnosis runs continuously.

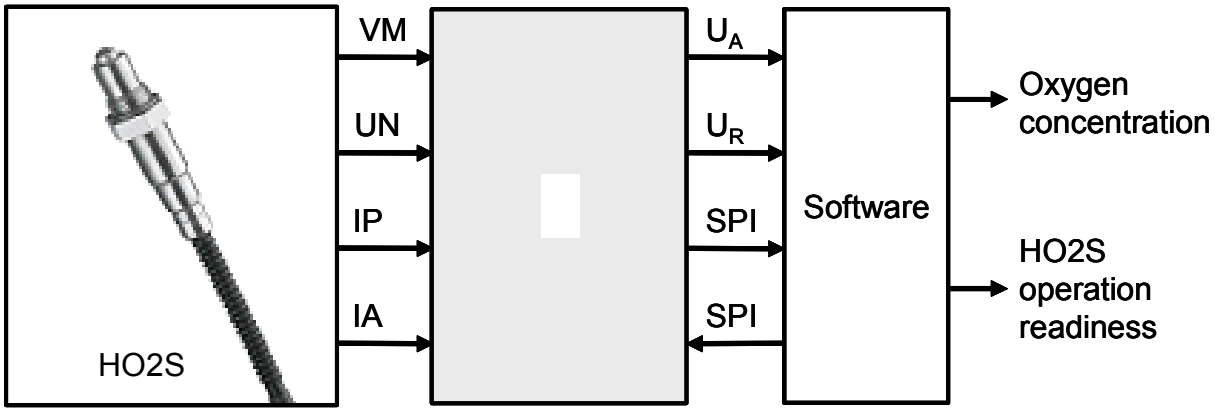

Figure 42: Overview signal lines of heated O2 Sensor

General Monitoring conditions

- engine start has finished
- battery voltage is within diagnostic range
- engine speed has exceeded the calibrated minimum threshold

1. Open circuit - VM line interruption (LSUVM)

Monitoring conditions - VM line interruption

- all general monitoring conditions are fulfilled
- offset corrected voltage of the FO2 sensor respectively lies above and below the lower and upper plausible output voltage Ua of the CJ125 IC required for detecting a VM line interruption
- internal resistance of the galvanic (or Nernst) cell of the HO2S lies above a calibrated threshold after a calibrated period of time
- the exhaust gas temperature at the FO2 sensor's vicinity lies below the calibrated permissible maximum for detecting a VM line interruption
- the FO2 sensor's heater power stage toggles on and off
- the FO2 sensor's pump voltage has not been switched-off
- heater control active for a calibrated period of time
- no FO2 sensor power stage error
- the following conditions have to be fulfilled altogether for a calibrated period of time
  - heater enabled
  - engine is running
  - heater control is switched-on
  - no fuel cut-off lasting longer than a calibrated period of time
  - battery voltage exceeds calibration

1.1 VM line interruption due to heater coupling check (LSU 4.2)

This check is performed for the HO2S type LSU 4.2.

The pump- or limit-current of the Nernst cell no longer flows when there is a VM line interruption. This results in an extremely high resistance, which remains even when the O2 sensor is sufficiently hot. The O2 sensor's ceramic temperature doesn't rise although the system reacts by increasing the heating power. A further effect is the coupling of the duty cycle signal of the heater into the O2 signal. Heater couplings resulting from switching are counted. The counter is incremented each time the voltage signal rises or falls with an artificial gradient which doesn't represent exhaust gas flow. A signal fault is set when the counter exceeds the calibrated threshold.

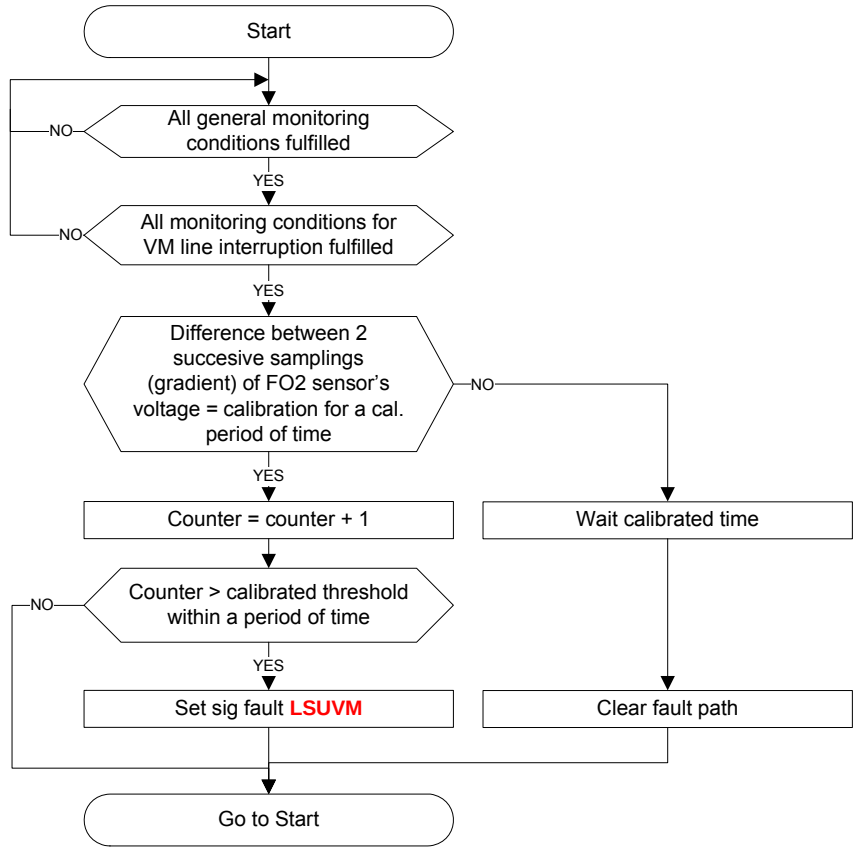

Figure 43: Flow chart VM line interruption (heater coupling check)

1.2 VM line interruption due to internal resistance of Nernst cell check (LSU 4.9)

This check is performed for the HO2S type LSU 4.9.

The pump- or limit-current of the Nernst cell no longer flows when there is a VM line interruption. This results in an extremely high resistance which remains even when the O2 sensor is sufficiently hot. The O2 sensor's ceramic temperature doesn't rise although the system reacts by increasing the heating power. A malfunction is detected and a signal fault is set when the internal resistance of the galvanic (or Nernst) cell exceeds a calibrated threshold after a calibrated period of time.

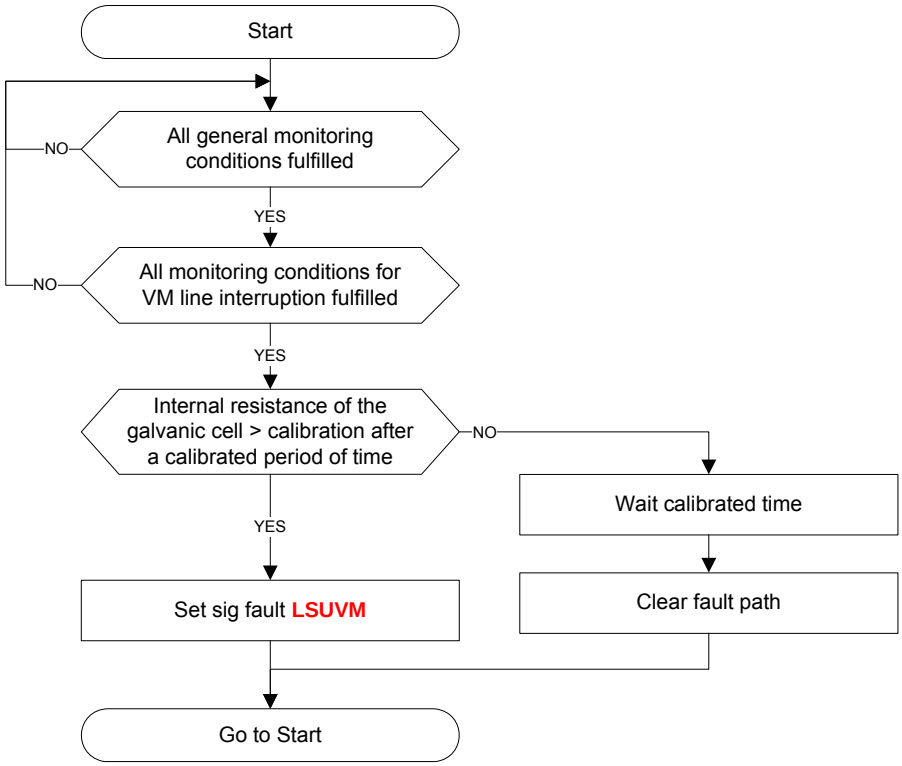

Figure 44: Flow chart VM line interruption (internal resistance of Nernst cell check)

2. Open Circuit - UN line interruption LSUUN

A UN line interruption leads to an irrationally high UR signal as well as an undefined output voltage UA - see fig.1. A signal fault LSUUN is set when the offset corrected voltage of the upstream HO2S lies above the upper (or below the lower) plausible output voltage UA of the CJ125 IC required for detecting a UM line interruption.

Monitoring conditions - UN line interruption

- all general monitoring conditions are fulfilled
- no power stage error of the FO2 sensor's heater
- FO2 sensor's pump voltage has not been switched-off
- internal resistance of the FO2 sensor's Nernst cell exceeds calibrated threshold (after enough time has been allowed for all transient events, induced during the determination of the FO2 sensor's internal resistance, to settle down)
- heater control active for a calibrated period of time

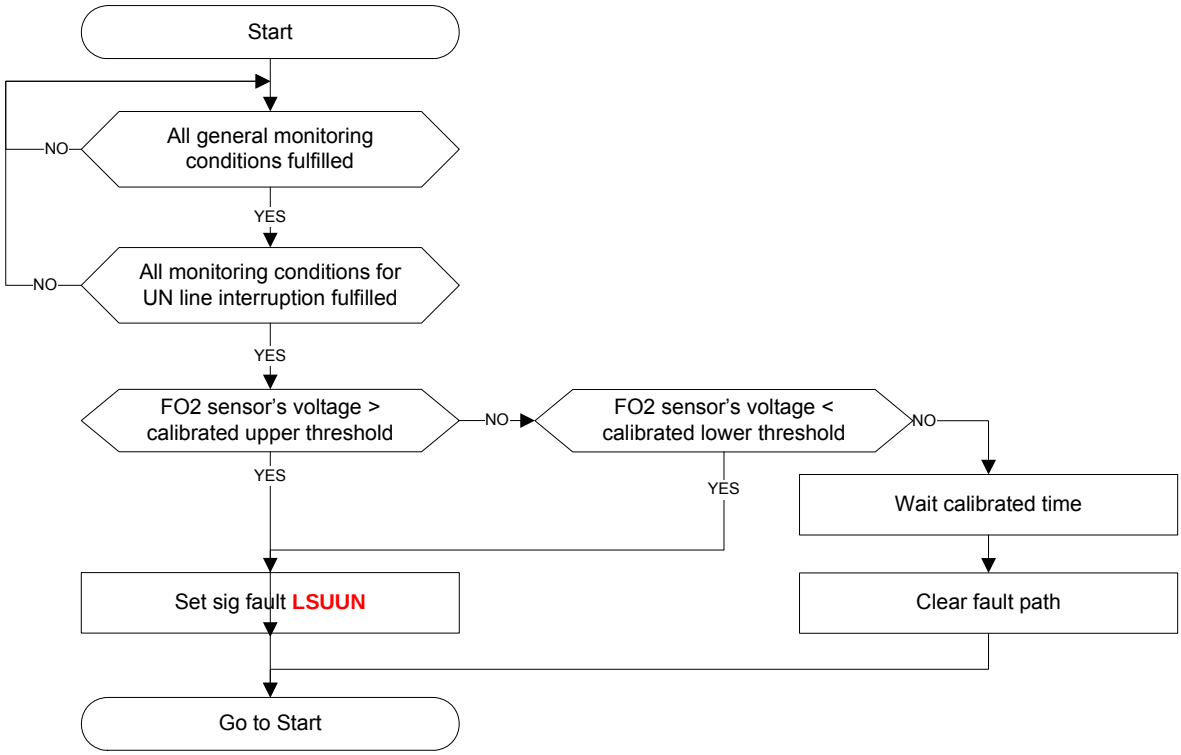

Figure 45: Flow chart UN line interruption

3. Open Circuit - IA line interruption LSUIA

An IA line interruption leads to a non-plausible large oxygen sensor voltage signal in a fuel cut off condition. A signal fault LSUIA is set after a calibrated delay time, if the oxygen sensor's voltage is greater than or equal to a calibrated threshold**.** The fault is set after an additional calibrated time if the fuel tank is empty or in an unknown state.

Monitoring conditions - IA line interruption

- all general monitoring conditions are fulfilled
- fuel cut off condition exists
- modeled exhaust gas temperature at the upstream side of the main catalyst is less than a calibrated value
- FO2 sensor's pump voltage has not been switched-off
- oxygen sensor has reached its operating temperature

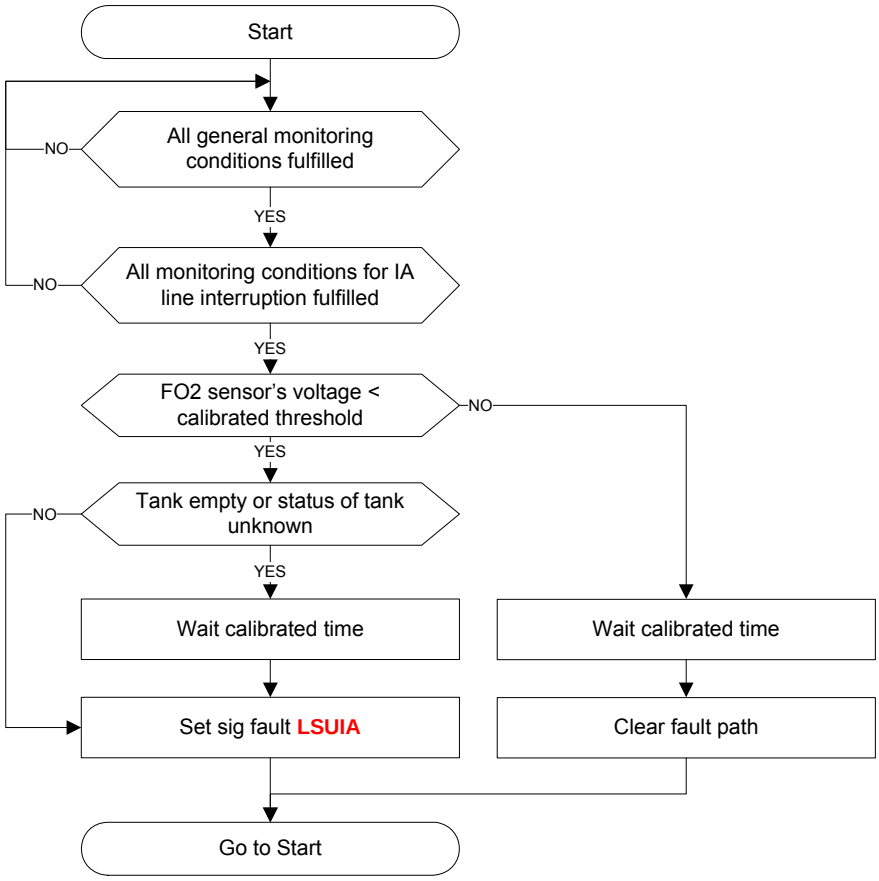

Figure 46: Flow chart IA line interruption

4. Open Circuit - IP line interruption LSUIP

The pump current of the FO2 sensor, which flows through the IP line, is equivalent to the oxygen concentration in the exhaust gas. An IP line interruption means the pump current will be permanently equal to zero. The output voltage UA of the CJ125 IC will remain constant and corresponds to the normalized A/F ratio of one (lambda=1). UA no longer varies with the oxygen concentration in the exhaust gas. An IP line interruption is detectable via three methods:

- Detection during fuel cut off condition
- Detection by mixture enrichment or lean-off
- Detection by closed-loop control to a nom. A/F value that differs from one

4.1 Detection during fuel cut off condition

The fuel cut off condition is an operating mode with a nominal A/F ratio > 1. A plausibility fault is set when during fuel cut-off condition, the value of the oxygen sensor's voltage is less than a calibrated threshold for a calibrated period of time.

Monitoring conditions for detection during fuel cut-off

- all general monitoring conditions are fulfilled
- FO2 sensor has reached its operating temperature
- fuel cut-off condition exists for at least 3 seconds
- FO2 sensor's pump voltage has not been switched-off
- canister purge system diagnosis has been performed and no faults were detected
- all monitoring conditions have been fulfilled for a period of time.

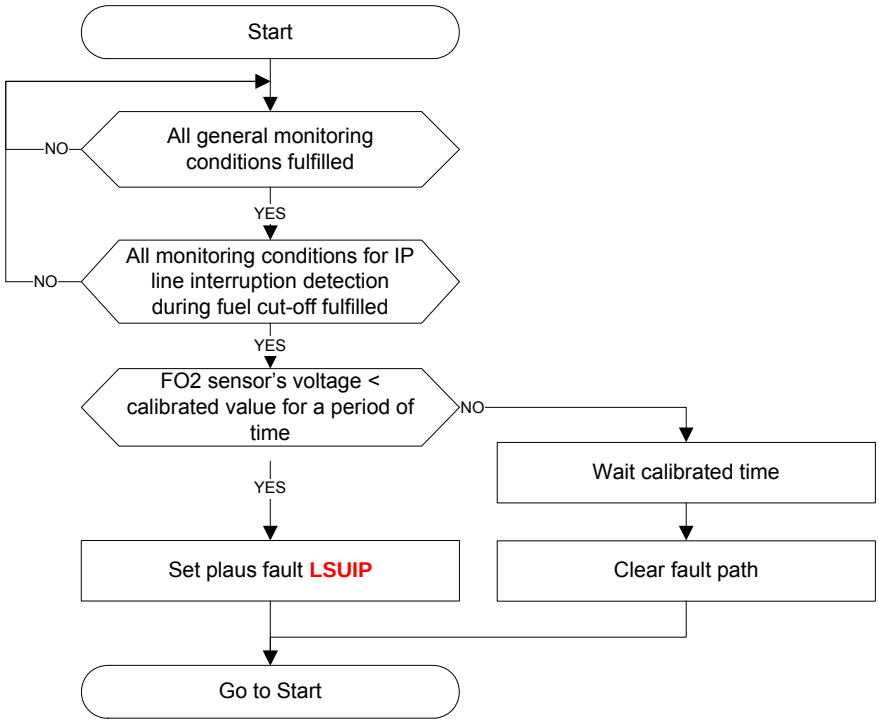

Figure 47: Flow chart IP line interruption (during fuel cut off condition)

4.2 Detection by mixture enrichment or lean-off

A maximum fault is set when the absolute difference between the A/F controller's output value at the moment the FO2 sensor's voltage springs into the calibrated range (i.e within 1.5V) and the A/F controller's output value thereafter, exceeds the calibrated maximum allowable excursion in that calibrated range.

Monitoring conditions for detection via mixture enrichment or lean-off

- all general monitoring conditions are fulfilled
- FO2 sensor has reached its operating temperature
- A/F ratio closed loop control is activated
- oxygen sensor's voltage is within the calibrated range
- electrical trimming of the FO2 sensor is inactive
- end of start control in the heater control function
- artificial fuel system modulation is active
- the artificial fuel system's modulation amplitude is greater than or equal to a calibrated threshold for a calibrated period of time
- no initialization of A/F ratio closed loop control factor
- no lean-off protection set
- proportional portion of the A/F closed loop control on the downstream side of the catalyst has not been activated
- catalyst heating not activated
- FO2 sensor's pump voltage has not been switched-off

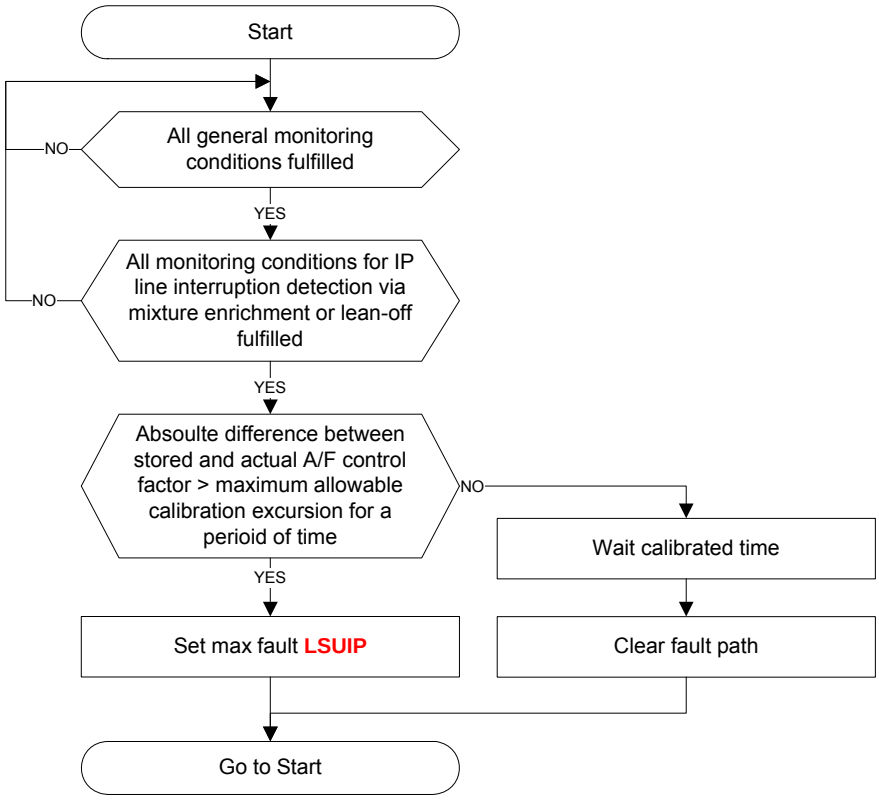

Figure 48: Flow chart IP line interruption (by mixture enrichment or lean-off)

4.3 Detection by closed-loop control to a nom. A/F value that differs from one

A IP signal fault is set when the normalized nominal A/F ratio (lambda) differs from one (lies beyond a calibrated range) and the oxygen sensor's voltage lies within a calibrated range during the time required for the integrated exhaust gas mass flow to exceed a calibrated threshold.

Monitoring conditions for detection by closed-loop control to a nom. A/F value that differs from one

- all general monitoring conditions are fulfilled
- Lambda (A/F ratio) closed-loop control is activated
- oxygen sensor has reached its operating temperature
- the heater of the FO2 sensor has no faults
- FO2S response rate diagnosis didn't detected a fault
- FO2S pump voltage has not been switched-off
- electrical trimming of the FO2S is inactive

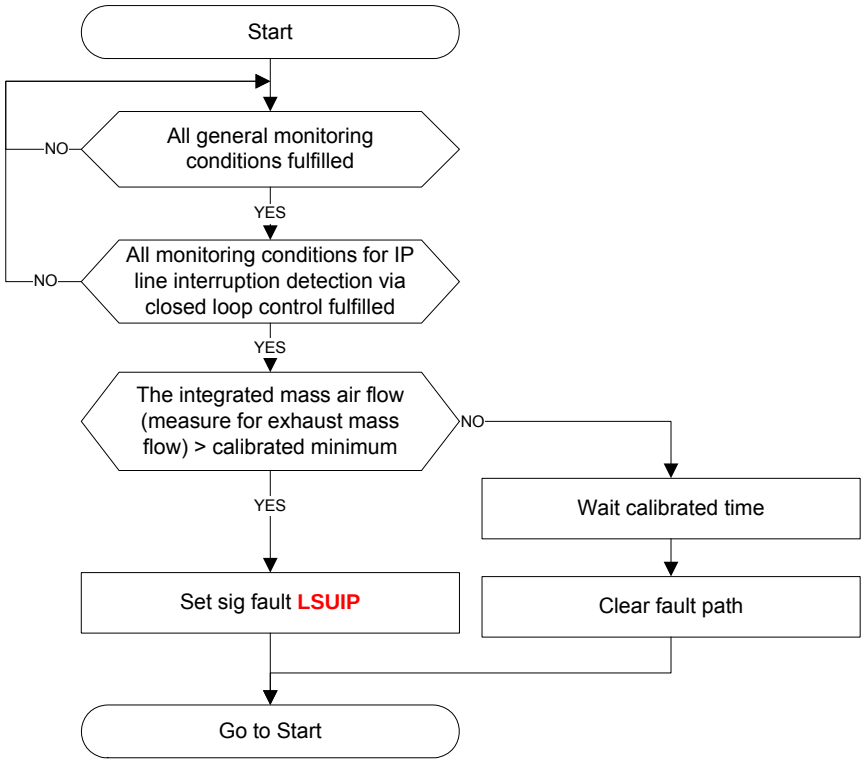

Figure 49: Flow chart IP line interruption (by closed-loop control to a nom. A/F value)

5 Short circuits to ground or to battery voltage LSUKS

Short circuits are detected by a self diagnosis of the CJ125 IC. An integrated voltage comparator at each and every pin of the HO2 sensor's CJ125 IC, detects and sets a maximum or a minimum fault if the voltage at that pin respectively lies above a calibrated maximum or below a calibrated minimum for a calibrated period of time.

Explicitly, a maximum fault is set either when

- the HO2 sensor's voltage at the VM pin exceeds a calibrated plausible maximum or
- the HO2 sensor's' voltage at the UN pin exceeds a calibrated plausible maximum or
- the HO2 sensor's' voltage at the IA or IP pin exceeds a calibrated plausible maximum.

Likewise, a minimum fault is set either when

- the HO2 sensor's voltage at the VM pin lies below a calibrated plausible minimum or
- the HO2 sensor's voltage at the UN pin lies below a calibrated plausible minimum or
- the HO2 sensor's voltage at the IA or IP pin lies below a calibrated plausible minimum.

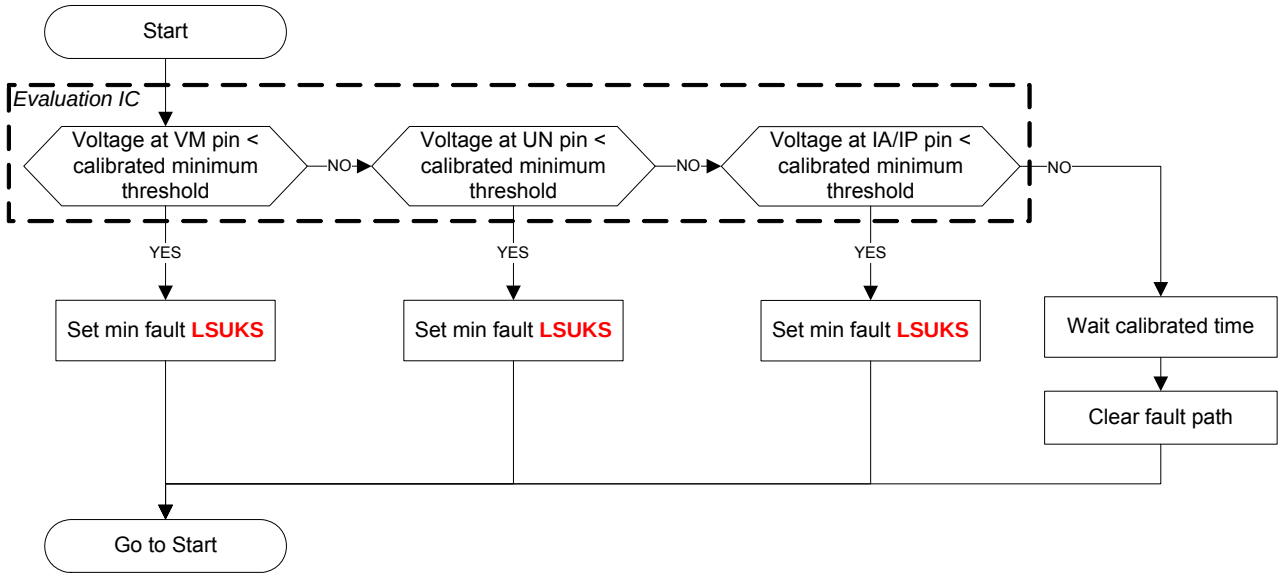

Figure 51: Flow chart Evaluation IC short circuit to ground

6. Monitoring of communication between the Evaluation-IC CJ125 and the Micro-controller of the ECM ICLSU

6.1 Non-plausible commands counter

The CJ125 evaluation IC communicates with the main processor of the ECM via a serial port interface. They both send data to each other. Interference on the SPI bus leads to non-plausible signals. These non-plausible signals, which persist even when the data is re-transmitted, are tracked by incrementing an internal error counter. A signal fault is set when the counter exceeds a calibrated threshold.

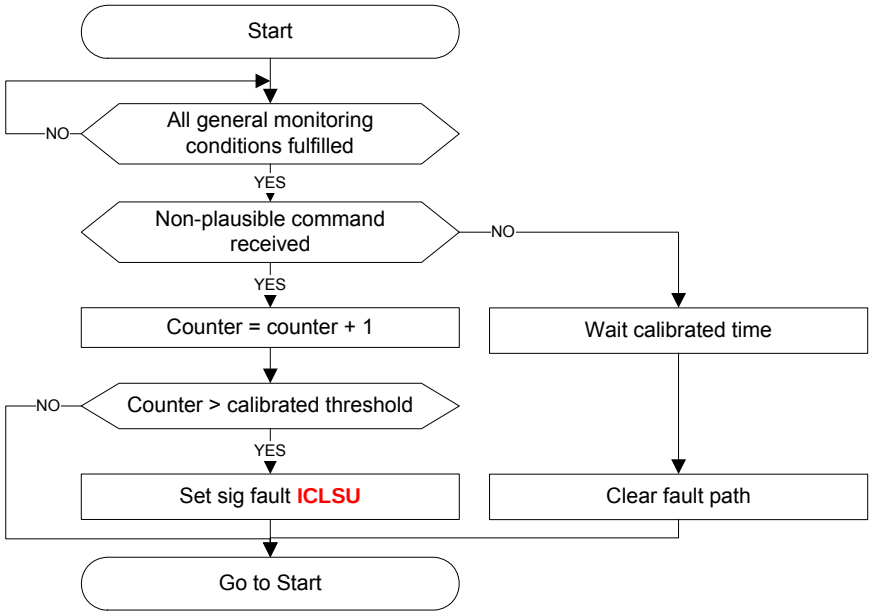

Figure 52: Flow chart communication Evaluation IC (non-plausible commands counter)

6.2 Comparison of initialization and mirror register

A further communication monitor compares the old value of the initialization register, which is backed up in a mirror register, with its current value after a rewrite. A plausibility fault is set after a calibrated period of time, if the current value of the initialization register isn't equal to that of its mirror register.

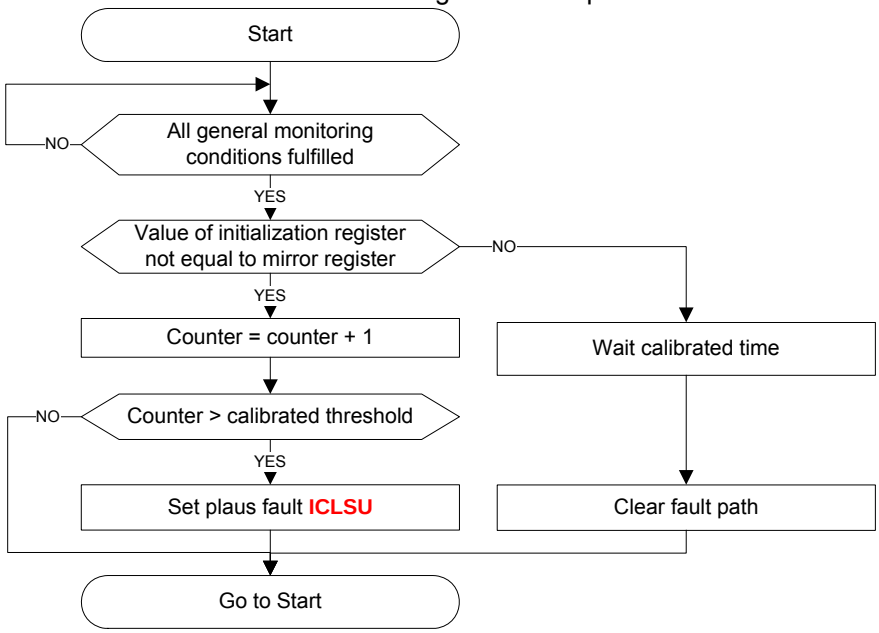

Figure 53: Flow chart communication Evaluation IC (Comparison of the registers)

7. Low supply voltage of the CJ125 IC ICLSU

The CJ125 IC is specified for supply voltages > 9V. It possesses a supply voltage detection module. Low supply voltages lead to faulty diagnosis at the voltage comparators. A minimum fault is set when the supply voltage drops below 9V. The supply voltage monitor is aborted if the monitoring conditions are not fulfilled.

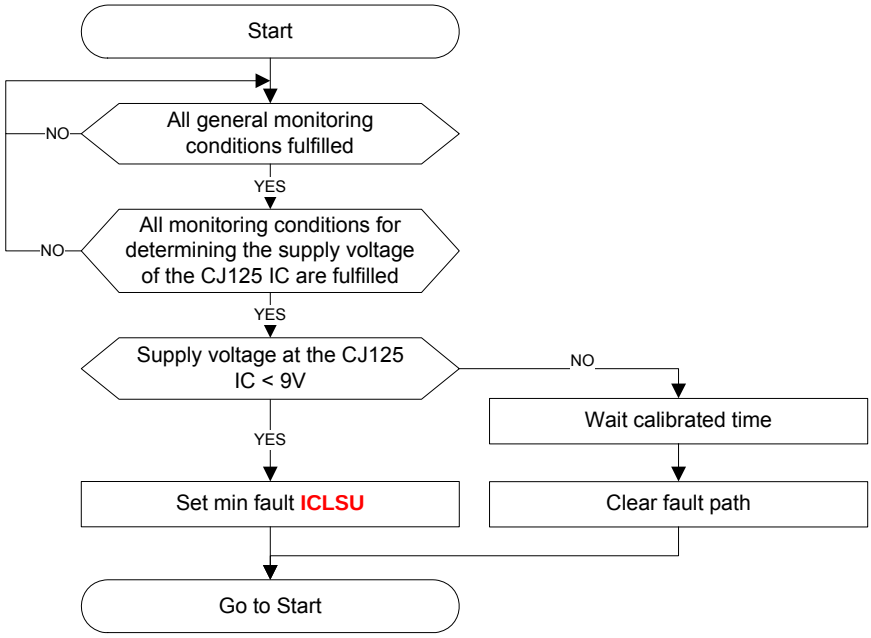

Figure 54: Flow chart Low supply voltage of the CJ125 IC

8. Electrical trimming ICLSU

Electrical trimming of the oxygen sensor is performed in order to determine and store the difference between the expected and the actual pump-current-proportional output voltage. This difference stems from hardware tolerances. Electrical trimming is carried out once after engine start and once in the idle mode during a calibrated period of time. A maximum fault is set when after electrical trimming the adaptation value for the corresponding curve (normal and rich) exceeds a calibrated maximum**.**

Monitoring conditions for electrical trimming

- engine start has finished
- engine is in idle mode.

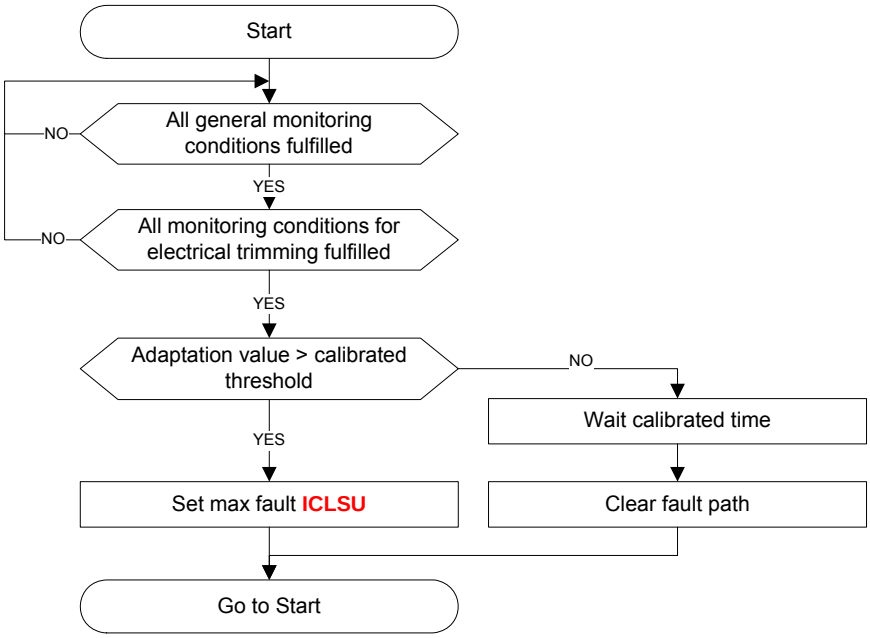

Figure 55: Flow chart electrical trimming of FO2 sensor

7.3 FO2 Sensor rationality check

This chapter describes the sum of all possible rationality checks of the upstream HO2S.

7.3.1 Offset check

This diagnostic function continuously checks the heated upstream oxygen sensor's (HO2S) response signal by comparing it with that of the downstream oxygen sensor or by utilizing technical parameters of the engine control system. A faulty sensor signal is implied when the characteristic lambda curve derived from the upstream HO2S's response signal (see figure below) indicates an air-fuel mixture that is leaner or richer than that expected from the nominal curve.

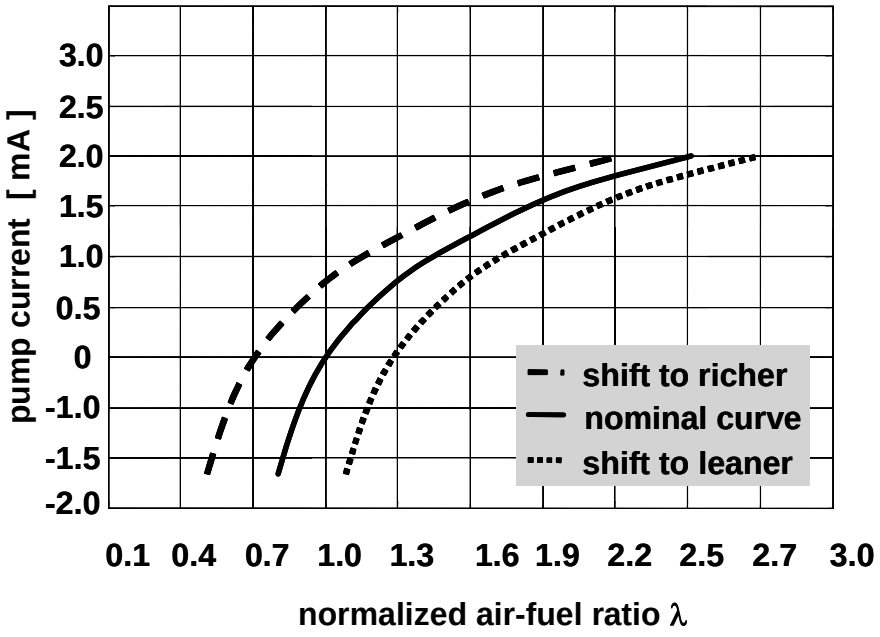

Figure 56: Shift in the characteristic lambda curve of FO2 sensor response signal

The integral component of the downstream lambda controller is interpreted as a sensor/fueltrim system fault. A shift is acceptable (because of tolerances) only when it lies between a calibrated minimum and maximum threshold value.
If the integral component of the downstream lambda controller exceeds the calibrated maximum 'sensor' threshold value for a calibrated debouncing delay, an unacceptable 'shift to lean' is detected and a maximum fault (**PLLSU**) is set.
If the integral component of the downstream lambda controller exceeds the calibrated maximum 'fueltrim' threshold value for a calibrated debouncing delay, an unacceptable 'shift to lean' is detected and a maximum fault (**FTDLA**) is set.
If the integral component of the downstream lambda controller lies below the calibrated minimum 'sensor' threshold value for a calibrated debouncing delay, an unacceptable 'shift to rich' is detected and a minimum fault (**PLLSU**) is set.
If the integral component of the downstream lambda controller lies below the calibrated minimum 'fueltrim' threshold value for a calibrated debouncing delay, an unacceptable 'shift to rich' is detected and a minimum fault (**FTDLA**) is set.

Note:
Normally the rationality check monitors aging effects of the HO2S or other effects in the exhaust system. This aging effects develop very slow. Due to this reason the integral component of the downstream lambda controller will change slow too. Emissions are quite well during this behavior. If the integral component exceeds an irrational threshold a 'fueltrim' fault is set. Such a malfunction can not be found in one FTP test cycle.
To detect suddenly occurring faults a step function is implemented. On basis of the control difference of the rear sensor voltage and the control value of the downstream lambda controller a predicted magnitude of failure is made which results in a strongly reduced diagnosis time. Such 'sensor' malfunctions can be.

Monitoring conditions for offset check

- engine start has finished
- no critical misfire rate
- lambda control active for calibrated period of time
  - after critical misfire rate **or**
  - in case of second driving cycle to confirm P-code
- diagnoses of downstream HO2S performed without any fault
- diagnosis of upstream HO2S' voltage performed without faults
- diagnosis of 'exchanged upstream HO2S' performed without faults
- no fault of 'heater influence on upstream HO2S' diagnostic
- no fault of 'upstream HO2S' response rate' diagnostic
- no fault of 'CJ125 evaluation IC of the upstream HO2S' diagnostic (i.e. no electrical faults and no communication errors)
- no fault of 'upstream HO2S heater' diagnostic
- no fault of 'upstream HO2S heater power stage' diagnostic
- no lean shift fault in last driving cycle without cooled off sensor
- no fault debouncing active
- downstream HO2S switches from lean to rich or vice versa during debouncing
- enabled by diagnostic scheduler

7.3.2 Plausibility check with help of upstream and downstream O2S signals

The following checks determine, in selected operating points, if the deviation of the upstream HO2S signal is out of certain limits using upstream and downstream oxygen sensor signals and closed loop controller condition as main parameters.

Plausibility check - shift to lean

A shift of the upstream HO2S characteristic lambda curve towards lean will cause a rich A/F ratio at the downstream HO2S. Because of an airtight exhaust system the mixture at position of upstream HO2S and the mixture at position of downstream HO2S has to be equal. So lean mixture at upstream and rich mixture at downstream HO2S is not rational and shows a malfunction.
The following methods are performed.

Method A1 - shift to lean

If the upstream HO2S measures a lean mixture and the downstream HO2S measures a rich mixture and the monitoring conditions are simultaneously fulfilled, a malfunction is detected and a plausibility fault PLLSU is set after debouncing.

Method A1 - shift to lean - monitoring conditions

- both the upstream and downstream oxygen sensors are ready for operation
- one of the following 2 conditions is fulfilled
  A the following conditions are fulfilled
  - the lambda controller has reached its limit in the rich direction
  - debouncing is finished (see the following conditions):
    - integrated mass airflow exceeds calibrated threshold

  B the following conditions are fulfilled
  - diagnoses of downstream HO2S performed without any fault
  - the proportional component of the downstream lambda controller is active
  - the absolute value of the proportional component of the rear controller is greater than calibration and the integral component and the proportional component both have the same sign, or the absolute value of the proportional component is greater than (Integral component + calibration)
  - debouncing is finished (see the following conditions):
    - integrated mass airflow exceeds calibrated threshold

Method B1 - shift to lean

If the normalized A/F-ratio setpoint value of the upstream HO2S lies in a desired region (see monitoring conditions) and the downstream HO2S measures a rich mixture and the monitoring conditions are simultaneously fulfilled for a calibrated period of time a malfunction is detected and a plausibility fault PLLSU is set after debouncing.

Method B1 - shift to lean - monitoring conditions

- both the upstream and downstream oxygen sensors are ready for operation
- the lambda controller has not reached its limit in the lean direction
- diagnoses of downstream HO2S performed without any fault
- one of the following 2 conditions is fulfilled
  A the following conditions are fulfilled
  - desired normalized A/F-ratio setpoint value equals one
  - the absolute value of the proportional component of the rear controller is greater than calibration and the integral component and the proportional component both have the same sign, or the absolute value of the proportional component is greater than (Integral component + calibration).
  - the proportional component of the downstream lambda controller is active
  - debouncing is finished (see the following conditions):
    - integrated mass airflow exceeds calibrated threshold
    - downstream HO2S switches from lean to rich or vice versa

  B the following conditions are fulfilled
  - desired normalized A/F-ratio setpoint value exceeds calibrated threshold (lean region)
  - closed loop lambda control is active
  - debouncing is finished (see the following conditions):
    - integrated mass airflow exceeds calibrated threshold
    - downstream HO2S switches from lean to rich or vice versa

Plausibility check - shift to rich

A shift of the upstream HO2S characteristic lambda curve towards rich will cause a lean A/F ratio at the downstream HO2S. Because of an airtight exhaust system the mixture at position of upstream HO2S and the mixture at position of downstream HO2S has to be equal. So rich mixture at upstream and lean mixture at downstream HO2S is not rational and shows a malfunction.
The following methods are performed.

Method A2 - shift to rich

If the upstream HO2S measures a rich mixture and the downstream HO2S measures a lean mixture and the monitoring conditions are simultaneously fulfilled, a malfunction is detected and a signal fault PLLSU is set after debouncing.

Method A2 - shift to rich - monitoring conditions

- both the upstream and downstream oxygen sensors are ready for operation
- one of the following 2 conditions is fulfilled
  A the following conditions are fulfilled
  - the lambda controller has reached its limit in the lean direction
  - debouncing is finished (see the following conditions):
    - integrated mass airflow exceeds calibrated threshold

  B the following conditions are fulfilled
  - diagnoses of downstream HO2S performed without any fault
  - the proportional component of the downstream lambda controller is active
  - the absolute value of the proportional component of the rear controller is greater than calibration and the integral component and the proportional component both have the same sign, or the absolute value of the proportional component is greater than (Integral component + calibration)
  - debouncing is finished (see the following conditions):
    - integrated mass airflow exceeds calibrated threshold

Method B2 - shift to rich

If the normalized A/F-ratio setpoint value of the upstream HO2S lies in a desired region (see monitoring conditions) and the downstream HO2S measures a lean mixture and the monitoring conditions are simultaneously fulfilled for a calibrated period of time, a malfunction is detected and a plausibility fault PLLSU is set after debouncing.

Method B2 - shift to rich - monitoring conditions

- both the upstream and downstream oxygen sensors are ready for operation
- the lambda controller has not reached its limit in the rich direction
- diagnoses of downstream HO2S performed without any fault
- one of the following 2 conditions is fulfilled

  A the following conditions are fulfilled
  - desired normalized A/F-ratio setpoint value equals one
  - the absolute value of the proportional component of the rear controller is greater than calibration and the integral component and the proportional component both have the same sign, or the absolute value of the proportional component is greater than (Integral component + calibration).
  - the proportional component of the downstream lambda controller is active
  - debouncing is finished (see the following conditions):
    - integrated mass airflow exceeds calibrated threshold
    - downstream HO2S switches from lean to rich or vice versa

  B the following conditions are fulfilled
  - desired normalized A/F-ratio setpoint value lies below calibrated threshold (rich region)
  - closed loop lambda control is active
  - debouncing is finished (see the following conditions):
    - integrated mass airflow exceeds calibrated threshold
    - downstream HO2S switches from lean to rich or vice versa

7.3.3 Diagnosis of O2 sensor voltage (FO2S not in exhaust system)

This chapter describes the sum of all possible LSU voltage checks of the upstream HO2S.

The diagnosis performs a range check of the voltage VA of the output signal of the heated wide band upstream oxygen sensor (HO2S) after amplification by the CJ125 integrated circuit. VA depends on the characteristics of the oxygen sensor itself and those of the peripheral circuitry of CJ125.

Generally, in homogenous or homogenous-lean engine operation the measured output voltage VA lies clearly below the voltage read when the oxygen sensor lies in ambient air. If the measured Voltage VA exceeds the calibrated ambient air voltage but lies below a calibrated maximum voltage, all for a calibrated period of time, a malfunction is detected and a plausibility fault (**ULSU**) is set. .

A fault could be triggered if an electrically connected oxygen sensor is not properly mounted in the exhaust system.

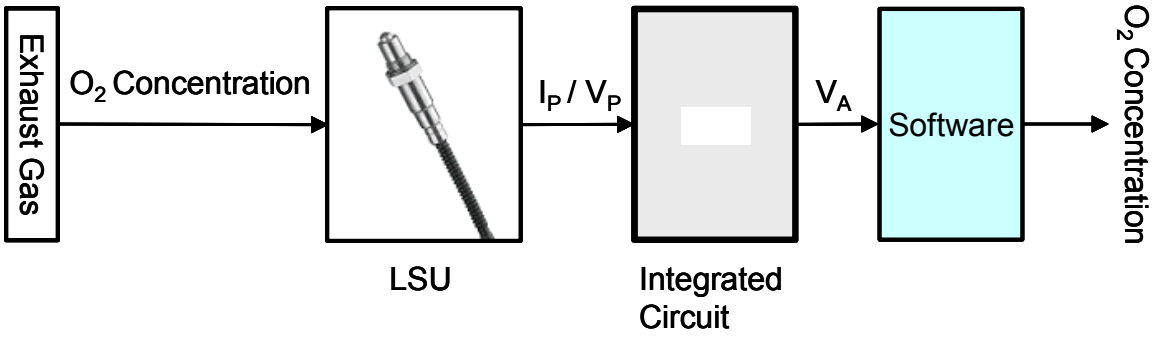

Figure 60: Overview voltage diagnosis of the FO2 sensor

Monitoring conditions

- all injection valves are active
- engine start is finished
- upstream oxygen sensor has reached operating temperature
- upstream oxygen sensor is ready for operation
- set point value of normalized air-fuel ratio lies below threshold value
- no lean shift fault in last driving cycle without cooled off sensor
- fuel tank level has been validated
- AIR injection not active
- no fault of crankshaft ventilation diagnosis
- diagnosis of ‘evaluation IC of the upstream HO2S’ performed without faults
- enabled by the diagnostic scheduler

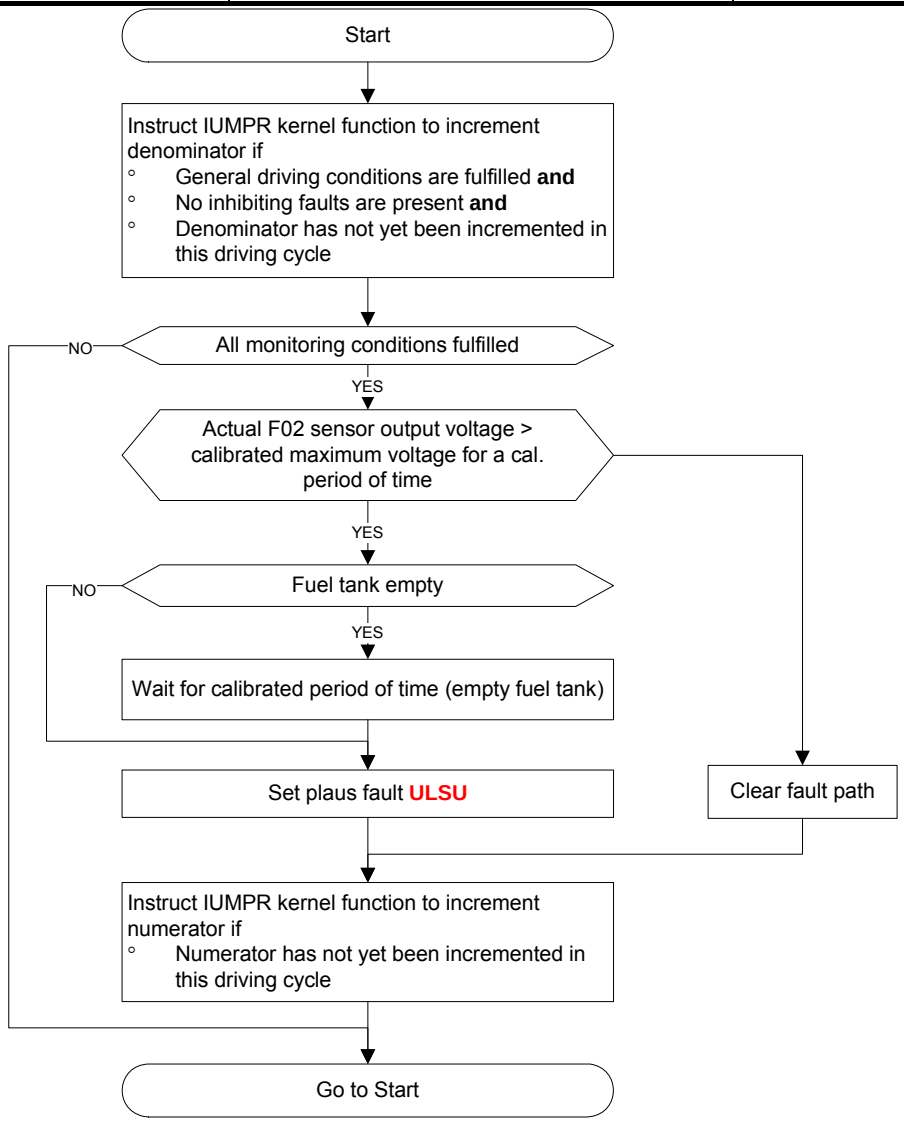

Figure 61: Flow chart diagnosis of O2 sensor voltage

7.3.4 Heater Coupling Check

This monitoring function will detect any short circuits between sensor heater and the Nernst cell of the Oxygen sensor by watching the Lambda signal. The Lambda value variation is checked by the ECM. The heater is operated by a pulsating signal with a frequency of two Herz. The sensor signal characteristic is checked for noises with a significant level and a frequency of the heater operation. If the level of noises is greater than a threshold, a low resistance short-cut between heater and pump current or the current of the Nernst cell is detected.

7.4 FO2 Sensor heater

For proper function of the Oxygen sensors, their ceramic elements must be heated. A non-functioning heater delays or prevents the sensor readiness (LSU) for closed loop control and thus influences emissions.
The heating up is controlled by the heater control.
The heater control loop is integrated within the oxygen sensor hardware and has to achieve a target temperature of about 750 °C of the ceramic element.

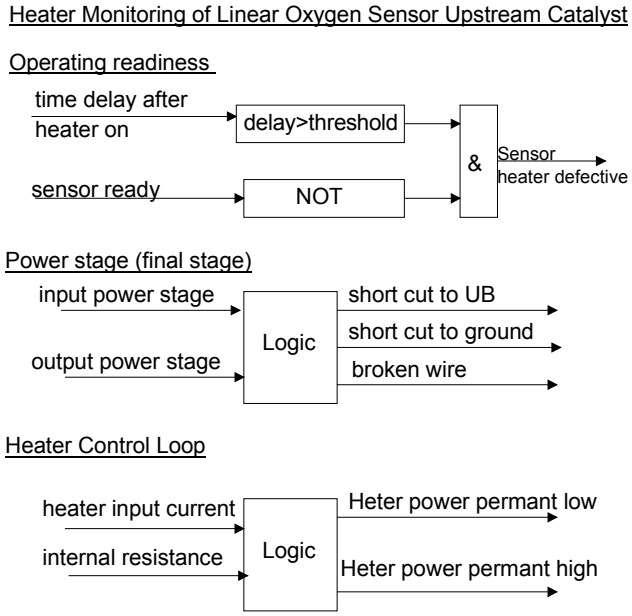

Figure 62: Characteristics -Switch on of sensor heater is ECM controlled

This chapter describes the sum of all possible heater checks of the upstream HO2S.
The operating temperature of the HO2S depends on the type used. Internal heating is required when the heat dissipated from the exhaust gas isn't sufficient to maintain the HO2S at its operating temperature. The extra power required for heating depends on the deviation from the operating temperature. It can be controlled by varying the duty cycle factor of the heater.

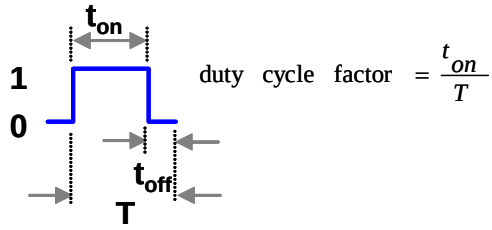

Figure 63: Duty cycle factor of the heater

7.4.1 Calibration resistor check

A reliable Nernst cell temperature determination is ascertained by referencing a calibration resistor. The resistance of this calibration resistor mounted in the ECM is constant.
If the difference between its nominal and measured value exceeds a calibrated threshold for a calibrated period of time, a malfunction is detected and a signal fault **HSV** (heater sensor voltage) is set.
If the signal fault is present, a proper Nernst cell temperature determination will be impossible.

Monitoring conditions for calibration resistor check

- battery's voltage lies within calibrated range
- engine start has finished
- engine is running
- temperature upstream catalyst exceeds dew-point
- heater of upstream oxygen sensor is ready for operation
- no faults of diagnosis of 'Evaluation IC of the upstream HO2S'

7.4.2 Temperature check of Nernst cell after engine start

The oxygen sensor's ceramic temperature is determined by measuring the internal resistance of its Nernst cell. If the ceramic temperature of the sensor lies below a calibrated minimum after a calibrated period of time, a malfunction is detected and a plausibility fault is set.

Monitoring conditions for temperature check after engine start

- the heater control is active
- all injection valves are activated
- internal resistance calculation (with respect to heater control) is possible
- no faults of diagnosis of 'Evaluation IC of the upstream HO2S'
- no HO2S power stage faults
- battery's voltage lies within calibrated range
- engine start has finished
- engine is running
- temperature upstream catalyst exceeds dew-point
- no fault of calibration resistor check
- engine soak time exceeds calibrated threshold
- engine start temperature exceeds calibrated threshold
- enabled by the diagnostic scheduler
- diagnosis enabled time for 'temperatur check of Nernst cell after engine start' not elapsed

7.4.3 Maximum heater output check

If the target temperature of the oxygen sensor's ceramic isn't reached during controlled operation, the duty cycle factor of the output function will converge towards one. A duty-cycle factor equal to one for a long period of time is implausible and prohibited.

If, with maximum heater output, the temperature of the oxygen sensor's ceramic lies below a calibrated threshold for a calibrated period of time, a malfunction is detected and a maximum fault **HSV** is set

Monitoring conditions for maximum heater output check

- battery's voltage lies within calibrated range
- diagnosis of 'Evaluation IC of the upstream HO2S' performed without faults
- the heater control is active
- calculated model of exhaust gas temperature is valid
- modeled exhaust gas temperature exceeds calibrated threshold
- no fuel cut-off
- engine start has finished
- engine is running
- temperature upstream catalyst exceeds dew-point
- no reduced heating power active
- no fault of power stage of upstream oxygen sensor heater
- enabled by the diagnostic scheduler

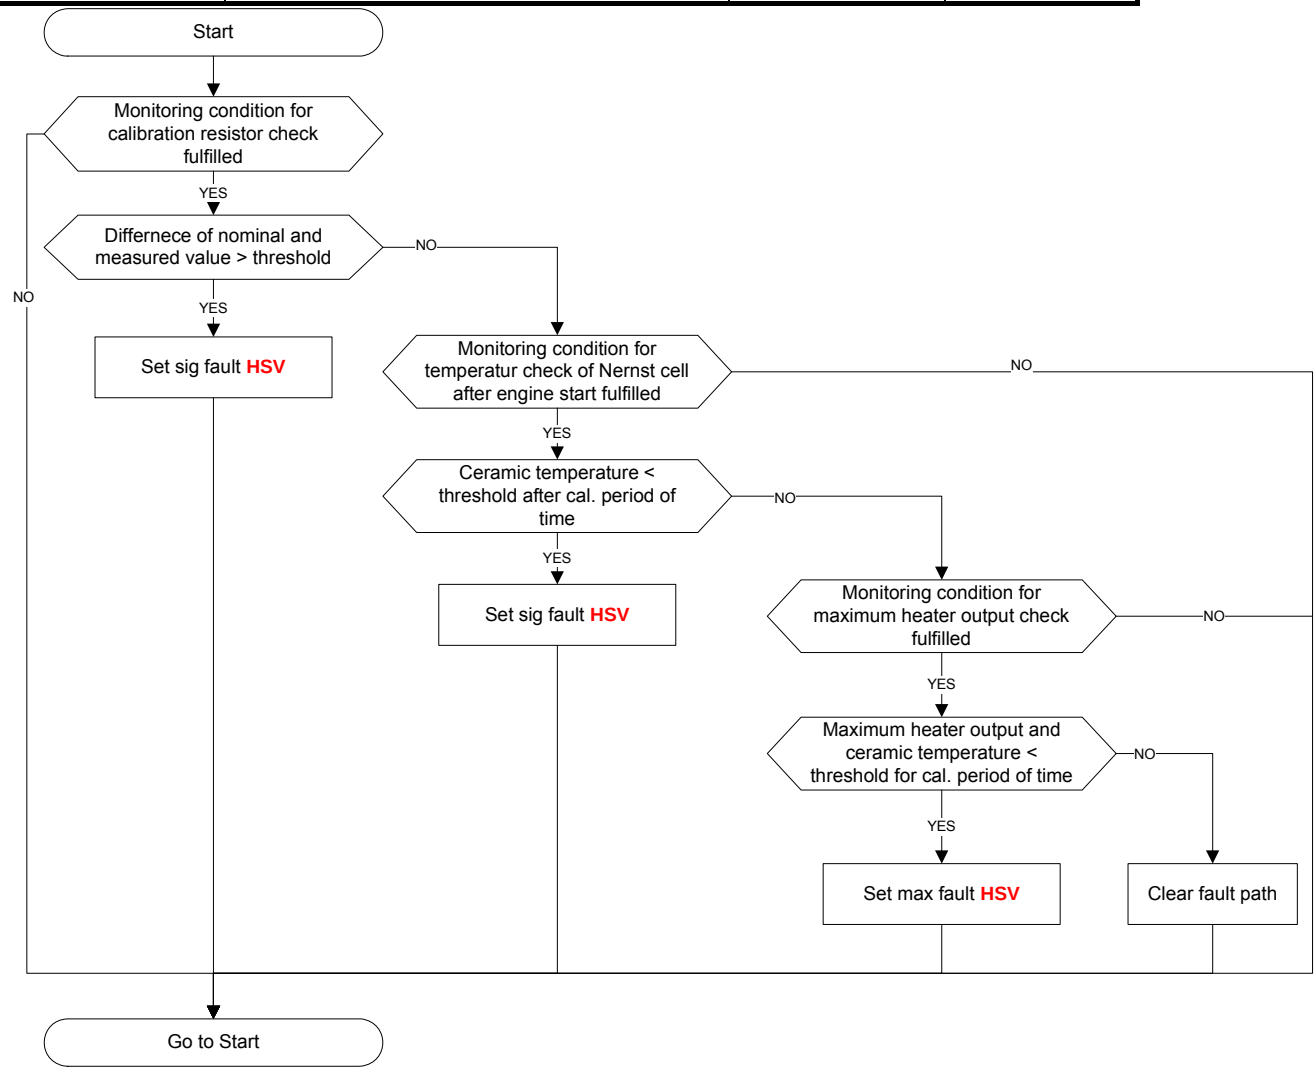

Figure 64: Flow chart FO2 sensor heater monitoring

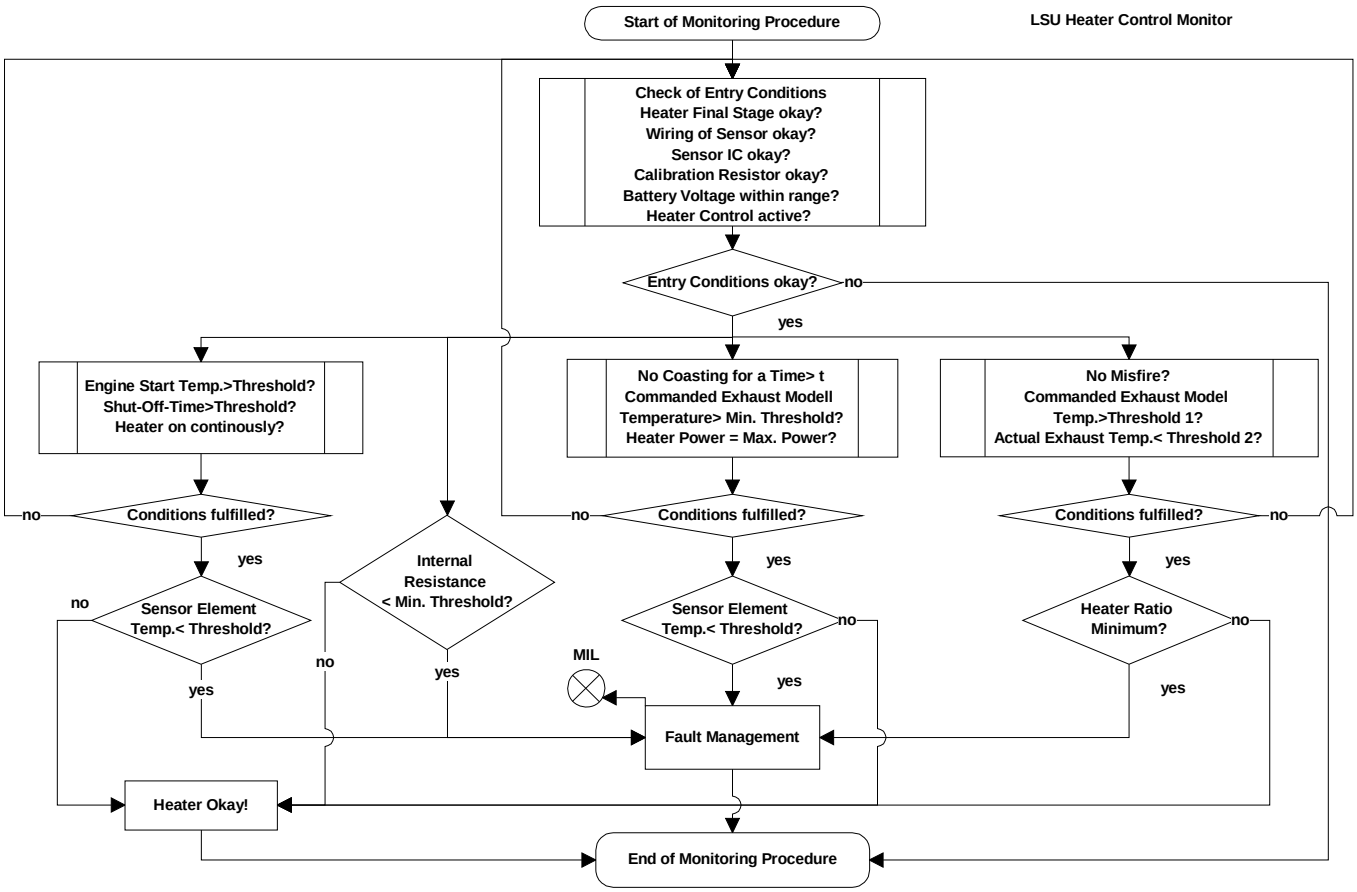

Figure 65: Flow chart O2 Sensor Heater Control upstream catalyst (1)

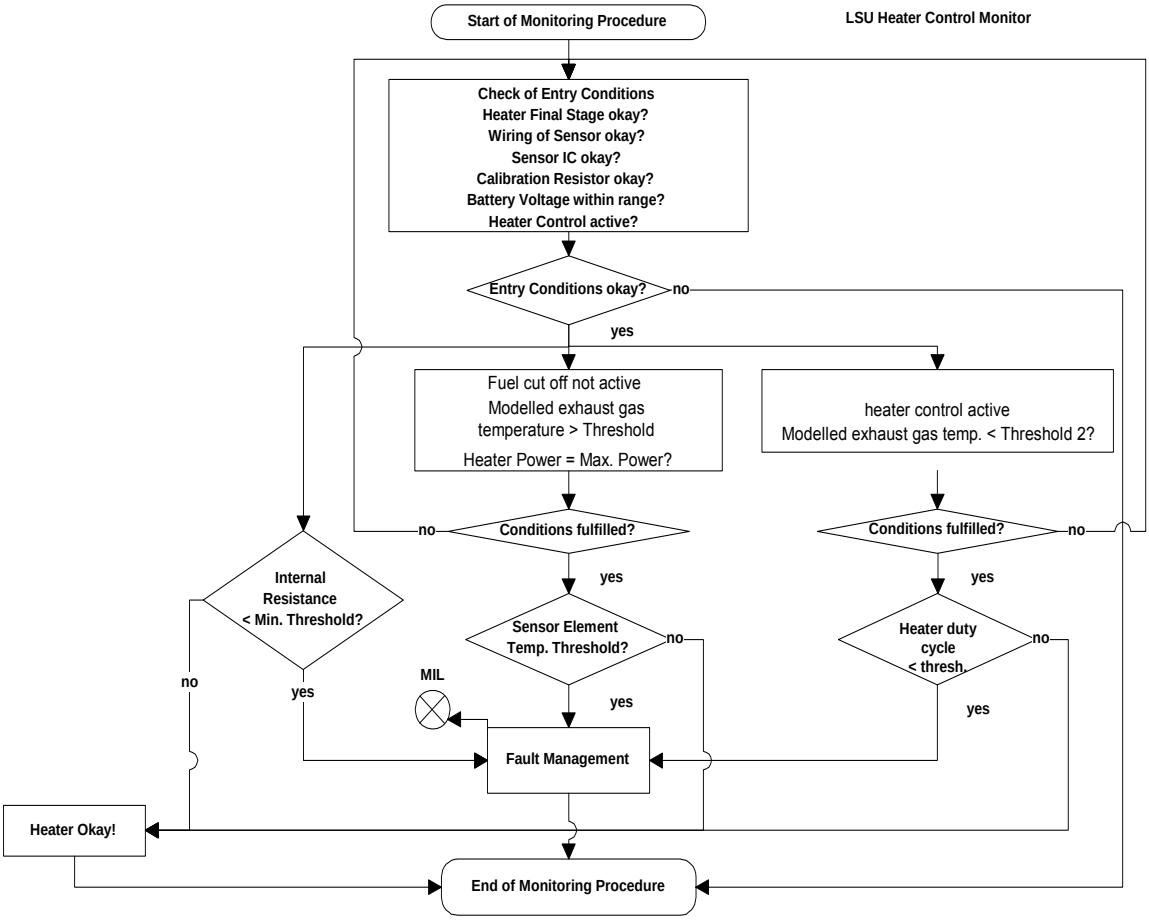

Figure 66: Flow chart O2 Sensor Heater Control upstream catalyst (2)

7.5 Rear downstream oxygen sensor (RO2S) dynamic

In case of oxygen sensor (LSF1, rear sensor) signal shows permanently “lean” voltage, ECM is forcing an enrichment of mixture. If sensor voltage shows still lean, a “stuck low” fault is detected.

In case of oxygen sensor (LSF1) signal shows permanently “rich” voltage, ECM enables lean out of mixture. If sensor voltage shows still rich, ECM is watching the sensor signal during the next coasting condition. In case of no signal change during coasting, a “stuck high” fault is detected.

The diagnosis of the aging of the rear O2 sensor consists of an oscillation check and a threshold check during fuel cut-off. The diagnosis runs continuously.

General Monitoring Conditions

- the canister purge system diagnosis has detected no faults
- no faults of the canister purge valve’s power stage diagnosis
- no battery voltage faults
- the downstream oxygen sensor connectors are correctly matched with their corresponding banks

7.5.1 Diagnosis of aging of RO2 Sensor - Oscillation check (rear sensor)

During normal engine operation the normalized A/F ratio and hence the voltage of the RO2 sensor oscillates about the set point value. The oscillation check triggers a test function if the measured voltage of the O2 sensor signal permanently lies below or above the set point value for a calibrated period of time. The test function applies a rich A/F mixture if the voltage is below the set point value or a lean A/F mixture if the voltage is above the set point value.
If the voltage doesn’t cross the set point value in the expected direction after applying a lean or rich A/F mixture, a malfunction is detected and a minimum or maximum fault **LASH** will be respectively set.

Monitoring conditions for oscillation check

- all general monitoring conditions have been fulfilled
- the proportional part of the mixture control system on the downstream side of the main catalyst has been activated
- the mass airflow is greater than calibration
- the canister purge valve is inactive
- fuel control error threshold has not been exceeded
- no critical misfiring rate.

7.5.2 Threshold check during trailing throttle fuel cut-off (rear sensor)

This check determines whether the voltage of the RO2 sensor signal exceeds a calibrated threshold for a calibrated period of time during fuel cut-off. A malfunction is detected and a signal fault **LASH** is set if this is true.

Monitoring conditions - threshold check during trailing throttle fuel cut-off

- all general monitoring conditions are fulfilled
- fuel cut-off for a calibrated period of time
- the required mass airflow for response rate determination has been reached
- no electrical faults of the downstream HO2S
- no electrical fault of the downstream HO2S’ heater
- no electrical fault of the downstream HO2S heater’s power stage
- the modeled exhaust gas temperature on the downstream side of the catalyst is above a calibrated threshold
- the downstream HO2S has been sufficiently heated up
- the dew-point temperature on the downstream side of the catalyst has been exceeded.

P0140	Open circuit ground wire	Circuit continuity
P0136	Heater coupling	Circuit continuity

7.6.1 System overview

The downstream oxygen sensor of the pre-catalyst is monitored.

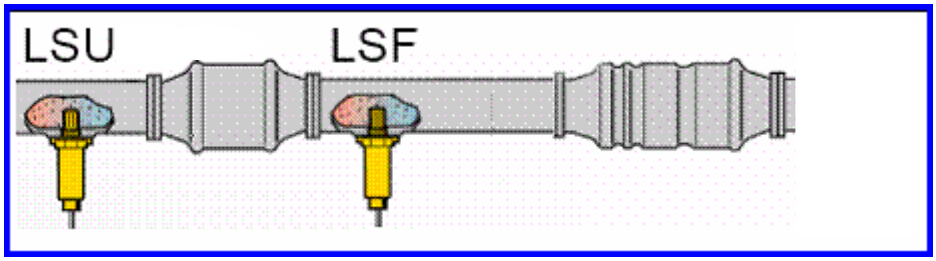

Figure 70: System Overview – downstream oxygen sensors

7.6.2 General description

The diagnostic monitors the two-step oxygen sensors in the exhaust system for wiring faults and effects of heater switching couplings onto the sensor signal. Short circuits to ground and to battery, and open circuits in the signal wiring and the ground wiring, are detected. If a fault is detected in a sensor, the operational readiness will be withdrawn.
The sensor voltage range for a faultless sensor is 0 to 1 Volt. As it is not possible to measure negative sensor voltages in the control unit, signal range exceedances can only be detected for voltages greater than 1 Volt. Since the sensor voltage for open circuits and shorts to ground remains within the plausible range, an additional evaluation criterion is required: the sensor voltage charged with a load impulse is measured, as it is also utilized to measure the internal resistance of a sensor.

7.6.2.1 General enable conditions (for all the following diagnostics)

Physical Enable Conditions

- ➔ Speed for running engine detected (typical speed > 80 rpm)
- ➔ Vehicle system voltage > threshold value (typically 11 V)

Enable Conditions for "Operational Readiness of the Oxygen Sensor fulfilled" (to cover the case that the sensor is faultless):

- ➔ The sensor voltage has exceeded the cold sensor range of +/- 450 mV (typically lower than 400 mV, or greater than 600 mV but lower than 1080 mV)

  → see illustration below
- ➔ Sensor is sufficiently heated. This criterion is defined as
  - o Sensor is sufficiently heated up AND
  - o Dew point in the vicinity of the sensor is exceeded (can optionally be calibrated)

OR

Enable Conditions for "Theoretical Operational Readiness of Oxygen Sensor fulfilled" (to cover the case that the sensor voltage does not exceed the voltage range due to an open circuit):

- ➔ The sensor is sufficiently heated for an extended defined time period AND
- ➔ The dew point in the vicinity of the sensor is exceeded (can optionally be calibrated)

Definition of a Sufficiently Heated Sensor

- ➔ The modeled exhaust gas temperature in the vicinity of the oxygen sensor exceeds a threshold value

  OR
- ➔ The heating power exceeds a threshold value for a defined time period

  AND
- ➔ No heater output stage fault is present in the current driving cycle (monitor is activated immediately after the sensor heating is activated)

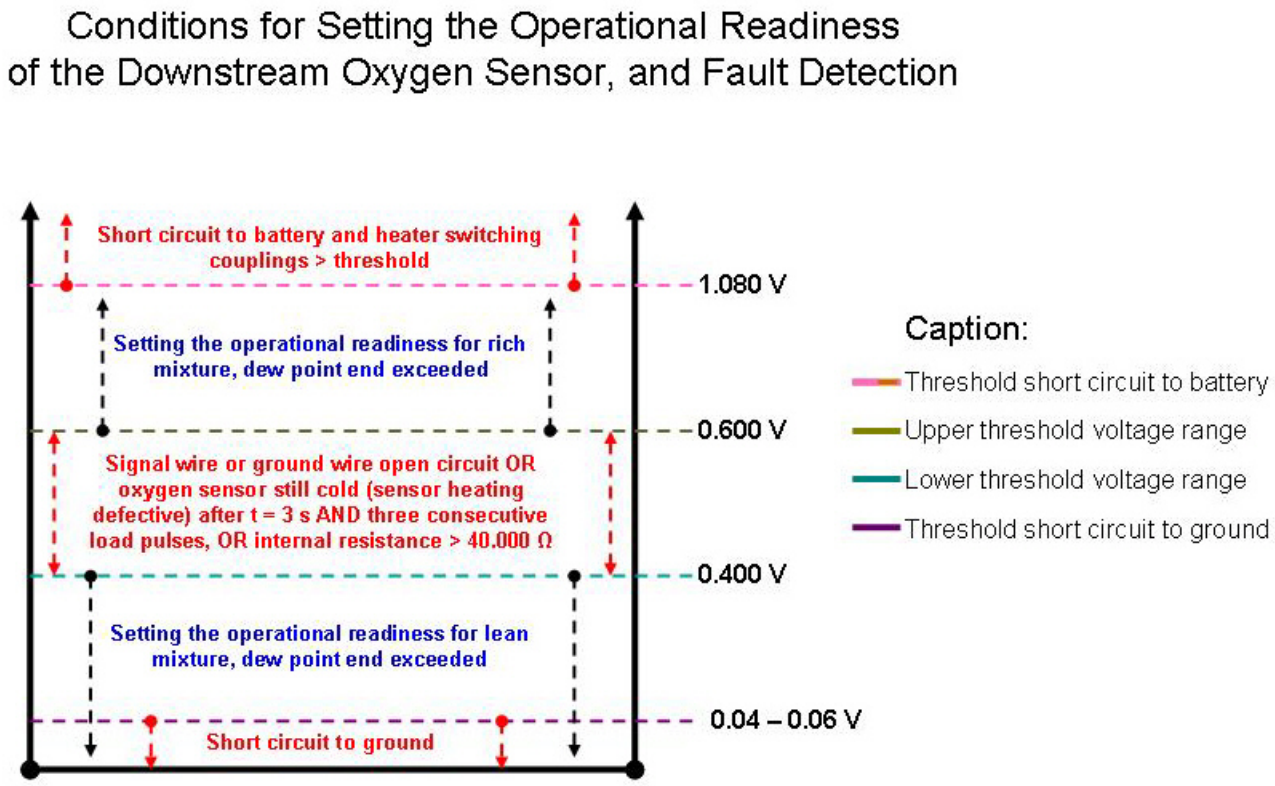

Figure 71: Conditions for setting the operational readiness of the RO2 sensor, and fault detection

7.6.2.2 Short circuit to battery, P0138

Additional enable condition for this diagnostic:

- Setpoint lambda value > 0.995

Monitoring strategy

Measurement and Evaluation of the Sensor Voltage

Malfunction criteria

In order to prevent sensor voltage peaks > 1 V caused by heater couplings, the diagnostic is not activated before the sensor has sufficiently heated up. These heater couplings occur quite frequently when two-point sensors with a planar sensor element are used.
The condition "sensor sufficiently heated" is set TRUE, when either the heating power exceeds a defined heating power threshold value or the modeled exhaust gas temperature exceeds a temperature threshold value for a defined time period, and when the completed heater output stage diagnostic has not detected a fault in the current driving cycle.
When, during sensor operation between slightly rich (λ > 0.995) and lean, a voltage is detected that exceeds a threshold value for a defined time period (typically 1.08 V), the fault P0138 for the rear sensor of bank 1 is set, and the operational readiness of the sensor is withdrawn.

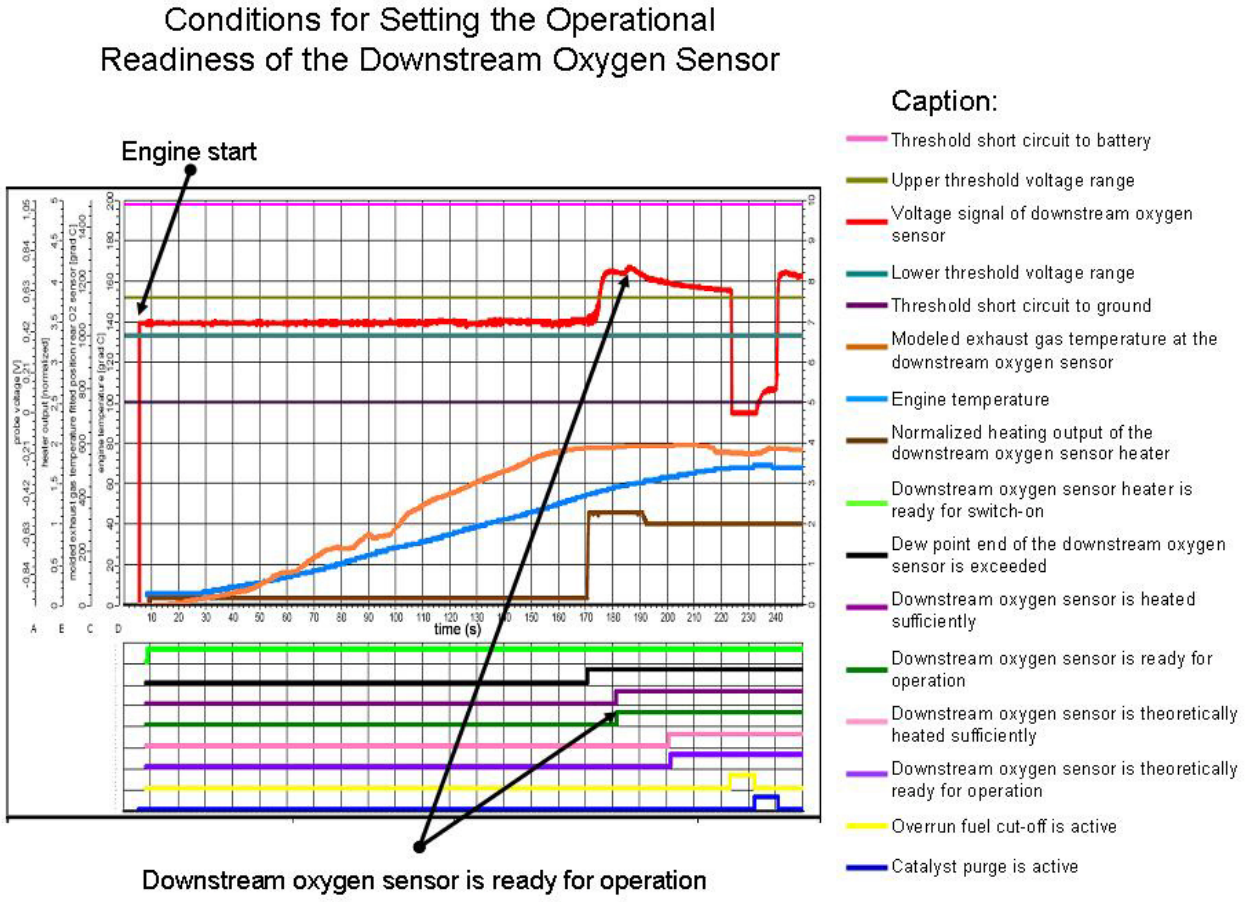

Figure 72: Conditions for setting the operational readiness of the downstream oxygen sensor

Flowchart

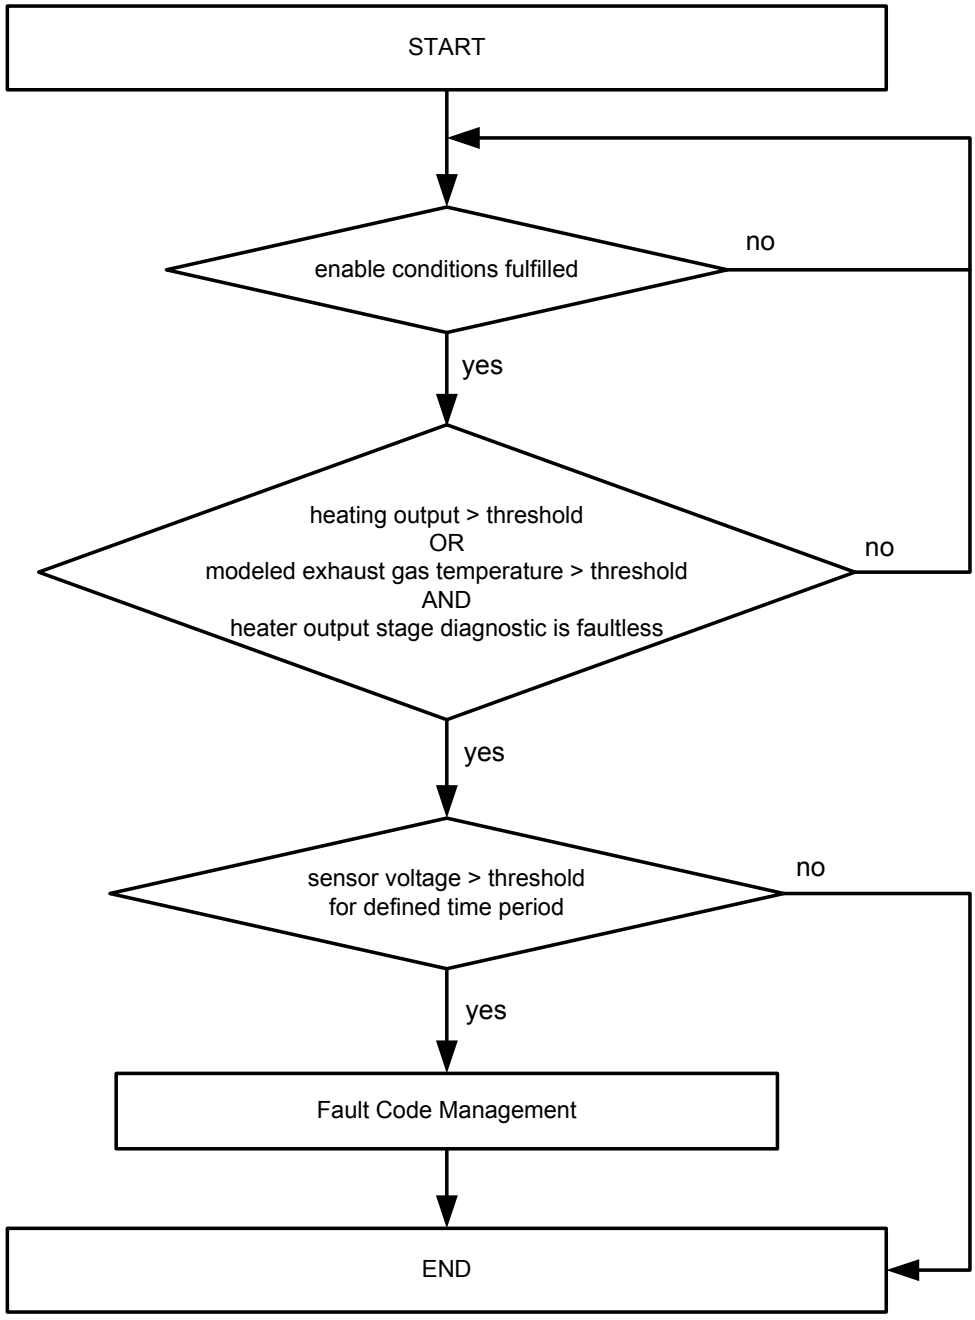

Figure 73: Flow chart short circuit to battery

7.6.2.3 Short circuit to ground, P0137

Additional enable conditions for this diagnostic:

- Overrun fuel cut-off inactive
- Catalyst purge inactive (after overrun phase)

Monitoring strategy

Measurement and evaluation of the sensor voltage, when charged with load pulses

Malfunction criteria

When the sensor voltage remains below a minimum threshold value (typically 40 to 60 mV) for a defined time period (typically 3 s), and if during this period neither overrun fuel cut-off nor catalyst purge after overrun is active, a fault is indicated and the corresponding flag is set. This fault indication triggers the request of three consecutive load pulses. For each of these load pulses, the unloaded and the loaded sensor voltages are measured.
When the mean value of the differences between the loaded and the unloaded sensor voltages is lower than a minimum calibratable threshold value, the fault P0137 for the rear sensor of bank 1, and the operational readiness of the sensor is withdrawn.
The measurement with load pulses corresponds to the measurement of the sensor internal resistance, as it is utilized for determining the sensor temperature, and for the heater diagnostic.

Determination of loaded / unloaded sensor voltage and internal resistance

The internal resistance of the oxygen sensor's Nernst cell can be determined by using a pulsed pump current. Since the internal resistance increases substantially when the heater is defective, or when the heating power is considerably decreased, with the exhaust temperature not being too high (typically T < 700 °C), the internal resistance is used, indirectly, to monitor the sensor heating. Additionally, the internal resistance may be used as a criterion for the electrical wiring diagnostic.

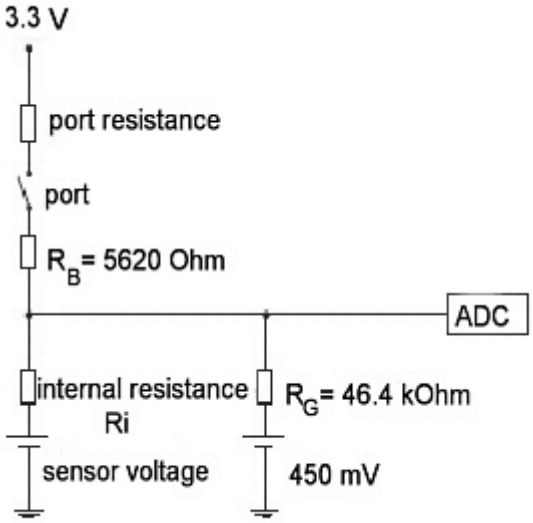

Figure 74: Electrical wiring for measuring unloaded / loaded sensor voltage, and for determination of internal resistance

The load resistance R_B is dimensioned in a way that a pump current of 0.5 mA flows into the oxygen sensor. Measuring the internal resistance is effected as follows:

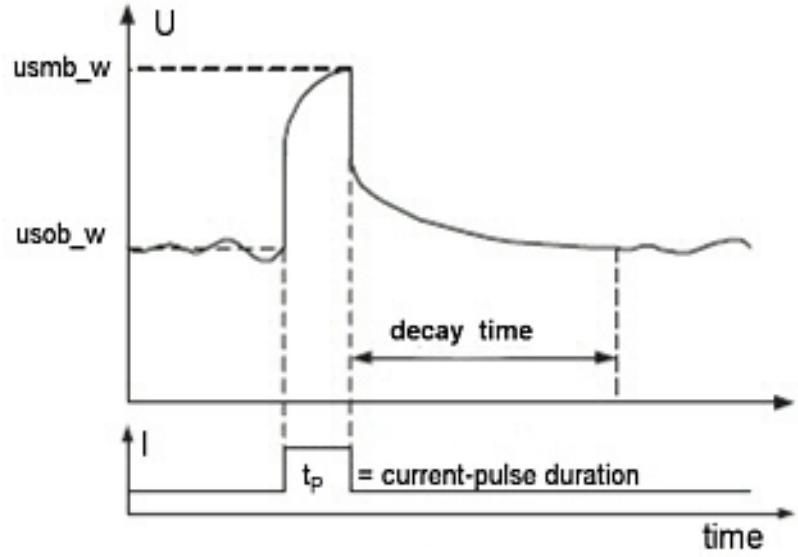

Figure 75: Principle of internal resistance measurement

In order to determine the internal resistance Ri of the Nernst cell, the unloaded and the loaded sensor voltages are measured. The last measured voltage value before the activation of the voltage pulse is stored. Applying the current pulse to the oxygen sensor causes a voltage drop at the internal resistance of the Nernst cell, and thus an increase in the sensor voltage.

The internal resistance is calculated by the following formula:

$$R_i' = \frac{usmb\_w - usob\_w}{3.3V - usmb\_w} \cdot R_B$$

usmb_w = loaded sensor voltage
usob_w = unloaded sensor voltage
R_B = load resistance

Flowchart

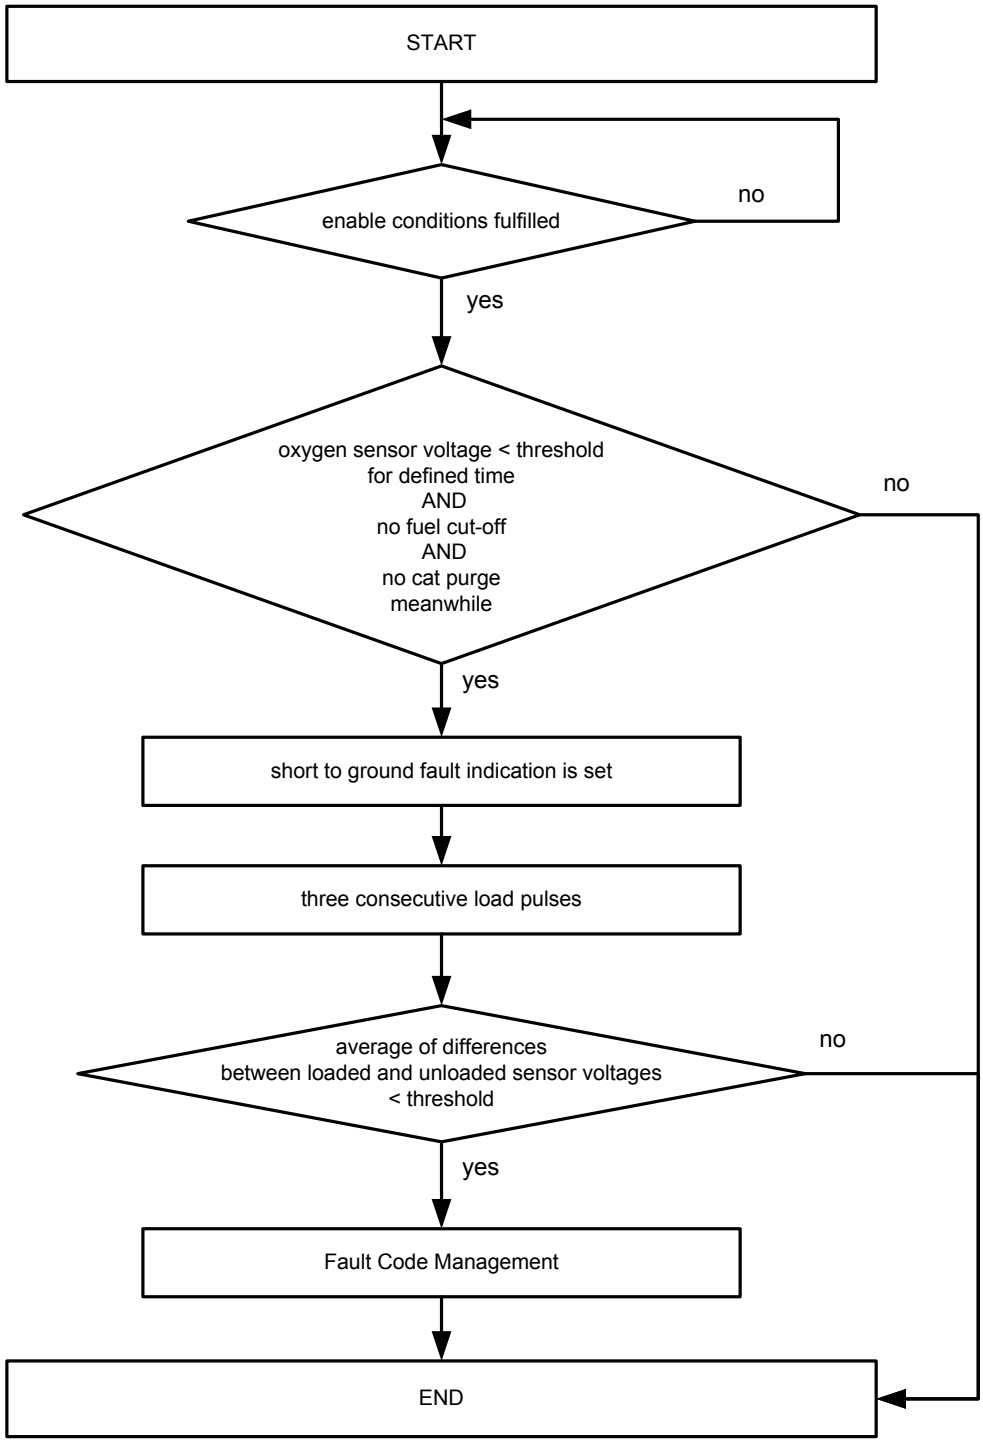

Figure 76: Flow chart short circuit to ground

7.6.2.4 Signal wire or ground wire, open circuit - P0140

Monitoring strategy
Due to the wiring arrangement in the ECU (high-resistance connection of the sensor to a counter voltage of 450 mV), exceedances of the +/- 450 mV voltage range indicate that the internal resistance of the Nernst cell has exceeded a defined threshold. Therefore, these exceedances of the above voltage range are also utilized to detect the operational readiness of the oxygen sensor.
Depending on the current exhaust gas composition in the exhaust system, the oxygen sensor voltage drops below the minimum (lean) voltage threshold value (typically 400 mV), or it exceeds the maximum (rich) threshold value (typically 600 mV), however remaining below the short circuit voltage threshold value (typically 1.08 V).

Malfunction criteria - signal wire, open circuit
When the sensor voltage remains within the voltage range of +/- 450 mV, the oxygen sensor is either too cold, or the signal wire is interrupted.
When the sensor voltage remains within the voltage range of approximately 400 to 600 mV after the sensor has reached its operational readiness, or the sensor has reached its theoretical operational readiness for a defined time period (typically 3 s), a fault is indicated.
This fault indication triggers the request of three consecutive load pulses. For each of these load pulses, the unloaded and the loaded sensor voltages are measured.
When the mean value of the differences between the loaded and the unloaded sensor voltages is greater than or equal to a threshold value, the fault P0140 for the rear sensor of bank 1 is set, and the operational readiness of the sensor is withdrawn.

Malfunction criteria - ground wire, open circuit
Additional enable condition for this diagnostic:

- To ensure that there is a valid measurement of the sensor internal resistance, the number of internal resistance measurements must exceed a threshold value (typically 6 to 10).

Using planar sensors, heater couplings onto the sensor signal may occur at high exhaust temperatures and an interrupted ground wire. Therefore the voltage does not necessarily have to remain within the +/- 450 mV range.

For this reason, another diagnostic path exists to reliably detect an interrupted ground wire. When the internal resistance exceeds a maximum threshold value (typically > 40.000 Ω) and the modeled exhaust gas temperature exceeds a maximum threshold value (typically 660 °C), the fault P0140 for the rear sensor of bank 1 is set, and the operational readiness of the sensor is withdrawn.

A fault must be assumed if the sensor voltage does not exceed the voltage range defined for a cold sensor, despite sufficient heating, for an extended time period (approx. 20 s), even if no open circuit fault has been detected by the current-pulse method. In this instance, the operational readiness is forced. This is to enable fault detection by the oscillation monitoring of the rear oxygen sensor and, consequently, a “stuck lean” fault is registered. Hence, it is even possible to detect a manipulation by simulating the presence of the sensor with a fixed voltage between 400 mV and 500 mV applied to the sensor signal pin.

Flowchart

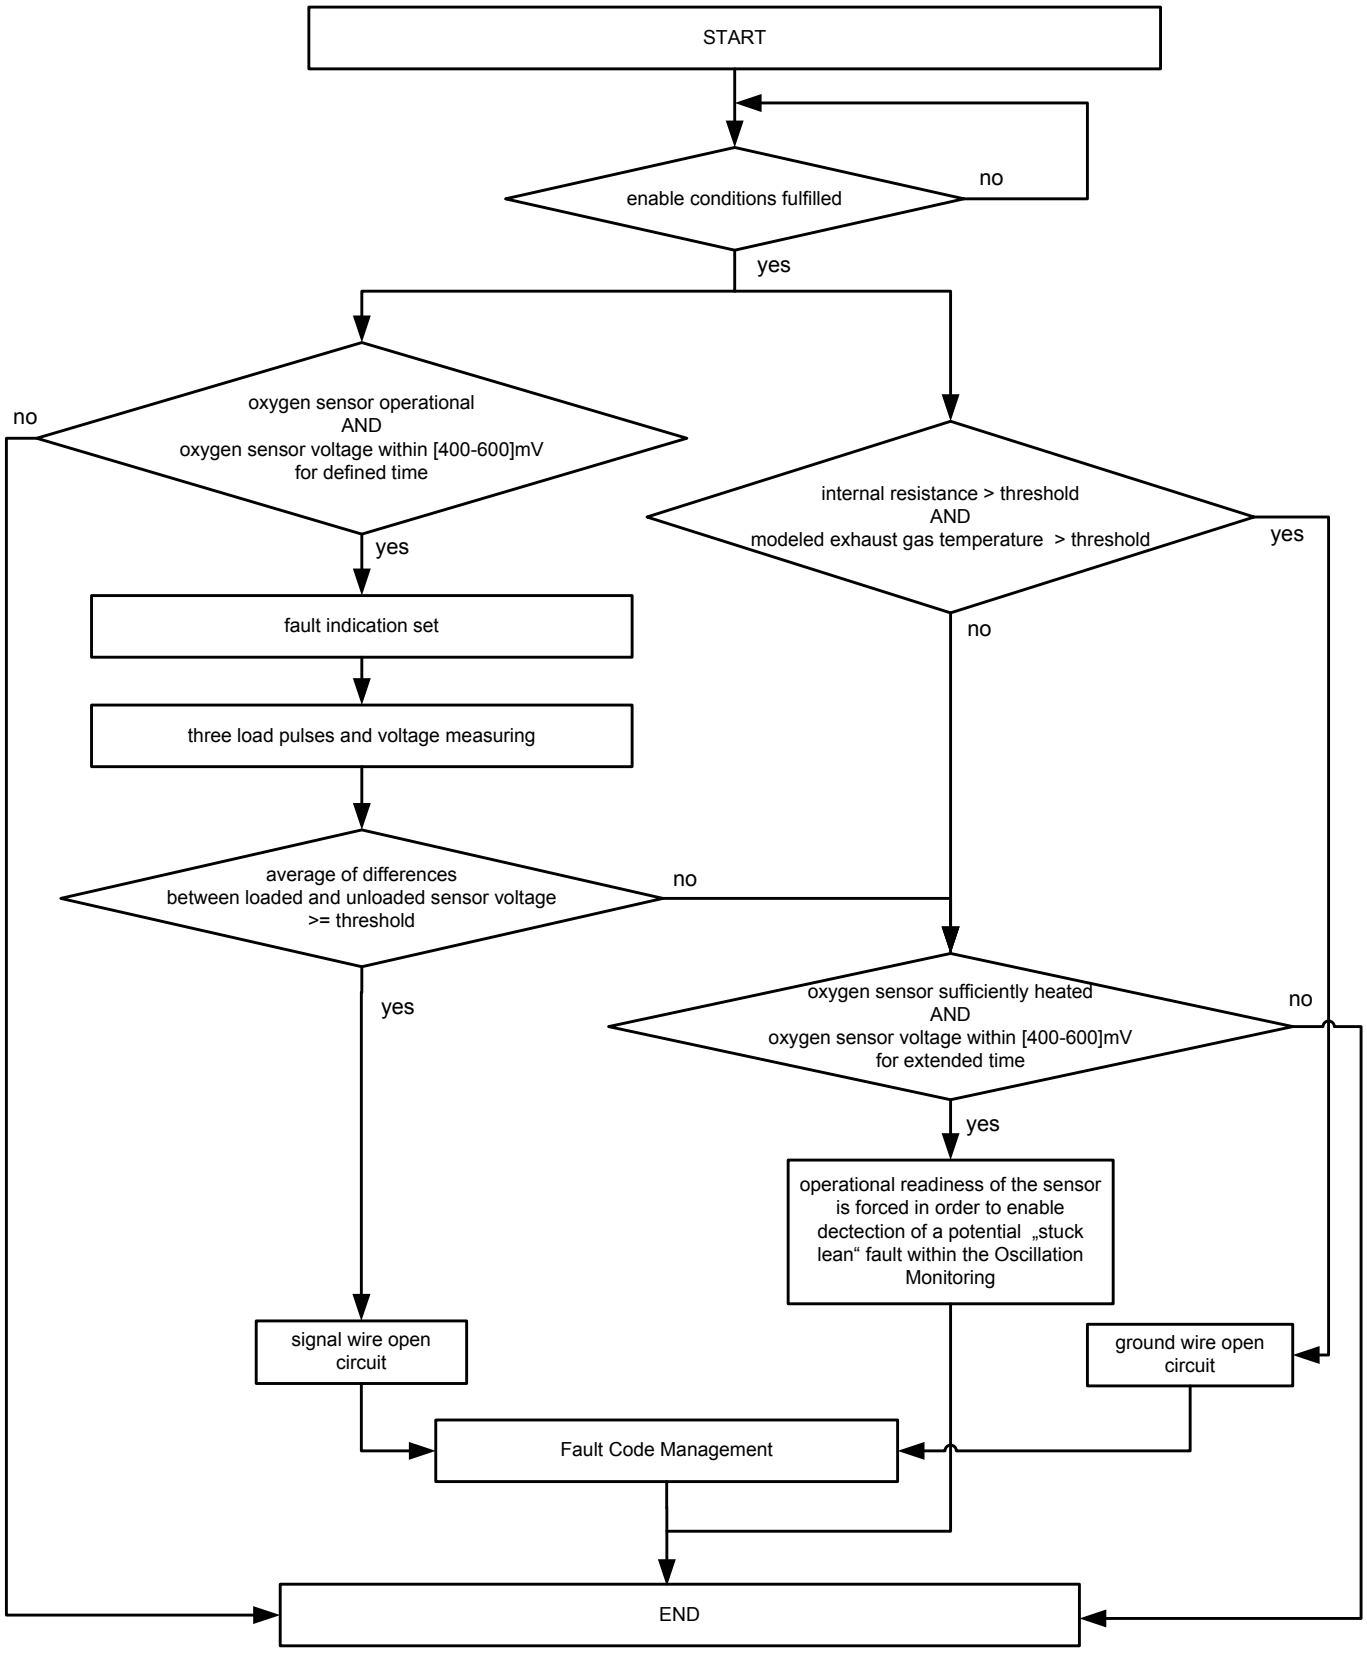

Figure 77: Flow chart signal or ground wire, open circuit

7.6.2.5 Coupling of the heater switching onto the sensor signal, P0136

Additional enable conditions for this diagnostic:

- In order to avoid diagnostic errors while the sensor is still too cold, the dew point in the vicinity of the sensor must have been exceeded for a calibrated time period.
  AND
- Heater activation is off (PWM signal)

Monitoring strategy

A short circuit between the oxygen sensor heater and the oxygen sensor signal wire may cause heater couplings, which disturb the sensor signal. This fault case cannot be detected by the short circuit to battery detection, as the measured sensor voltage is implausibly high for a short time only, when the heater is switched off. The heater coupling diagnostic is based on measuring the corresponding sensor voltage at heater switch-off and comparing it to a defined threshold value.

Malfunction criteria

If the above threshold value is exceeded, a counter is incremented. When this counter exceeds the respective threshold value, the fault P0136 for the rear sensor of bank 1 is set, and the operational readiness is withdrawn.

Flowchart

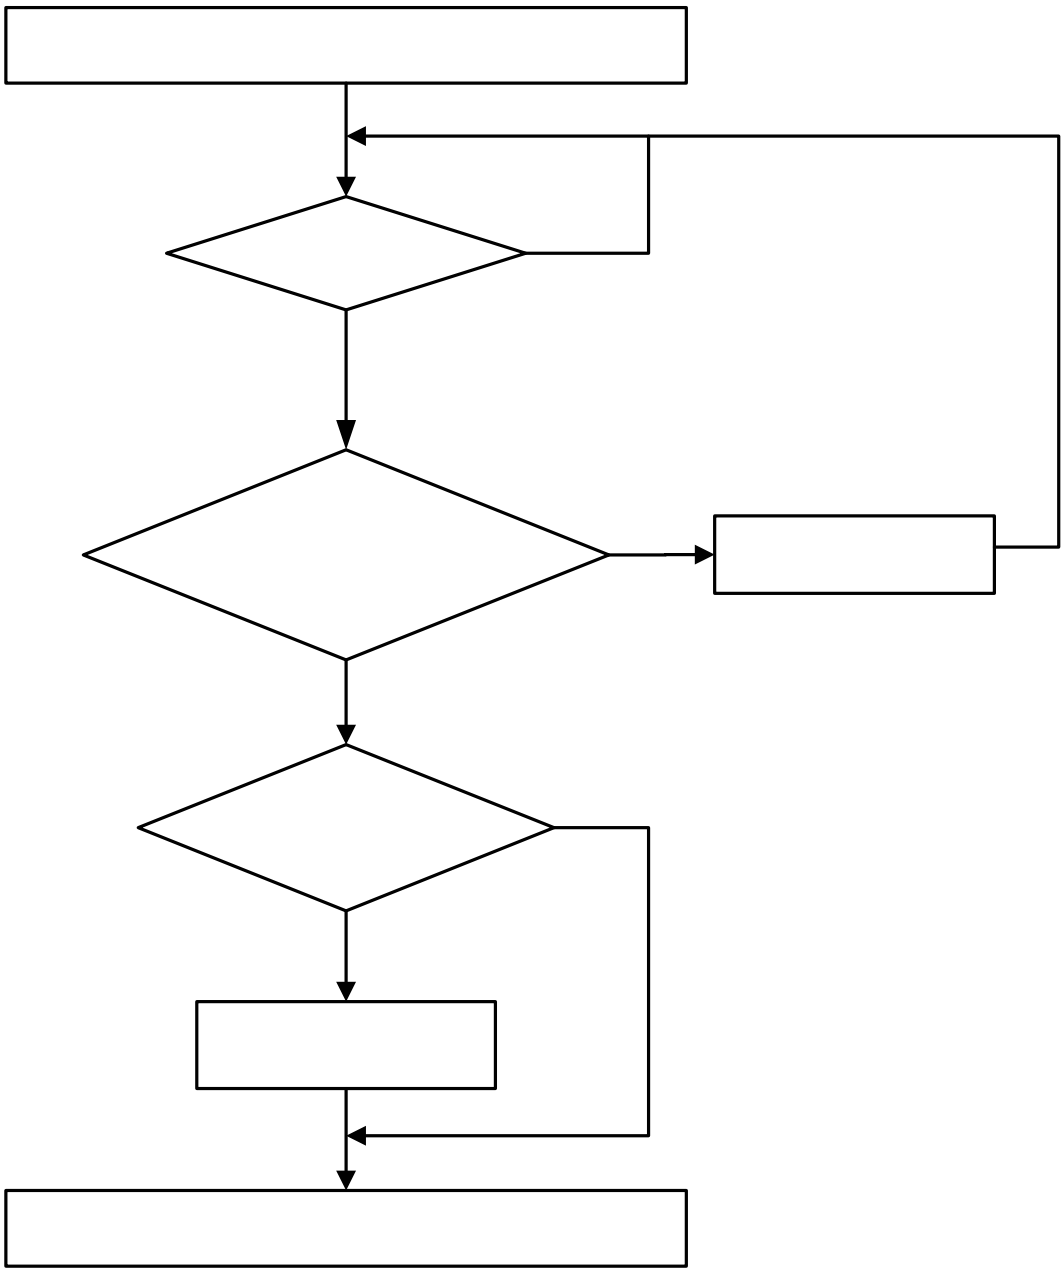

Figure 78: Flow chart coupling of the heater switching onto the sensor signal

enable conditon

7.6.3 In-Use Monitoring Performance Ratio

Since all above diagnostics are continuous monitors, neither numerators nor denominators are created.

y

7.7 RO2 Sensor response time and transition time monitoring

7.7.1 Response rate monitoring rear sensor

Aging, contamination or insufficient heating of the rear HO2S may slow down the sensor's response rate. A slow response rate could influence the catalyst diagnostic and can lead to higher emissions. Therefore this diagnostic function monitors the HO2S Response Rate. The monitor is designed to be executed repeatedly (multiple times) within the same driving cycle as long as the enable conditions are fulfilled or fulfilled again and consist of two monitoring functions. The Response Rate and the Transition Time monitoring function.
The diagnostic function is executed while fuel cut-off during coast down driving condition is present. The diagnostic results are updated depending on the driving profile and the length of the fuel cut-off period. Typical monitoring frequency during a FTP72 is at minimum one to two events, during the Unified Cycle approximately 5 events and during normal driving on road in customer's hand the typical frequency is 10 to 15 events (based on engineering evaluation of road-data).

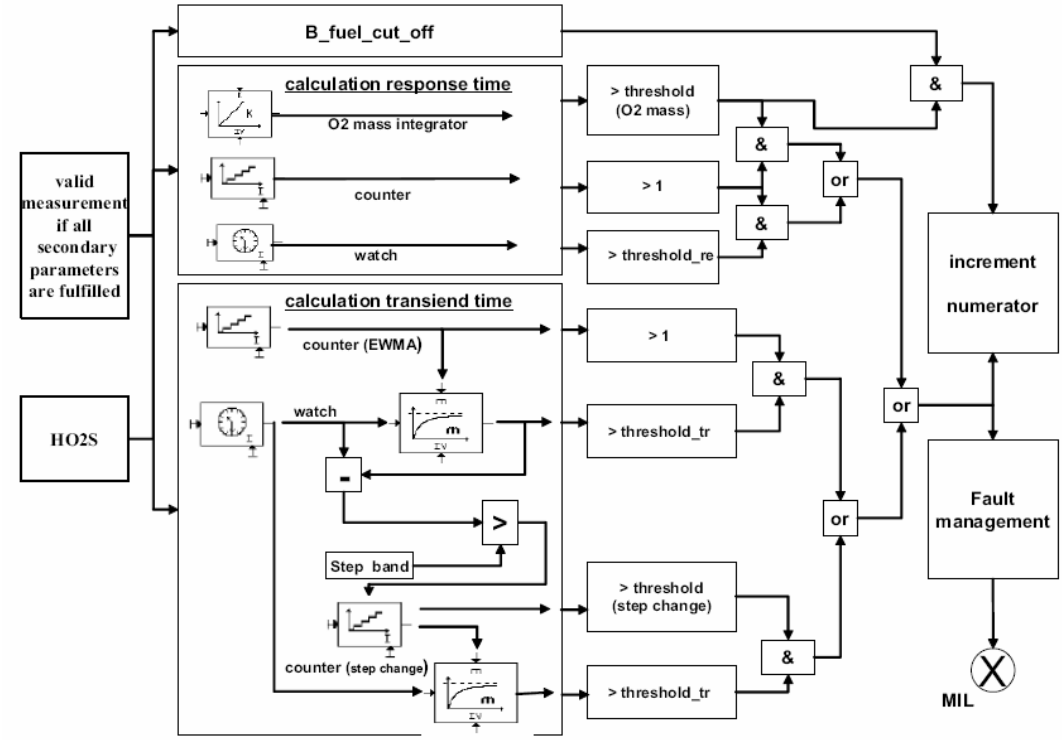

Figure 79: Rear sensor – Functional schematic diagram

Diagnostic Enable / Disable Conditions

Physical Parameters:

- HO2S ready
- Exhaust temperature post catalyst above an applicable level (typical value: 500°C) (dew point exceeded; to ensure homogeneous temperature distribution in the catalyst)
- Internal resistance of the HO2S is less than an applicable value
- HO2S voltage able to cross control level (typical value: 0.6-0.65V) of fuel trim (optional parameter)
- Exhaust mass flow exceeds an applicable value (typical value: ~15-25 kg/h)
- Slope of exhaust mass flow post catalyst is less than an applicable value ((typical value: Delta mass flow of ~10 kg/h)

Disable Conditions:

- Cycle flag of aging diagnostic HO2S post catalyst (lash) not set or failure(s) detected
- Cycle flag of EVAP purge diagnostic not set or failure(s) detected
- Cycle flag HO2S front catalyst not set or failure(s) detected
- No failures detected on final stage for O2S heater

Signal Evaluation / Validation:

For a robust monitoring function the HO2S signal needs to fulfill the following conditions ensuring a certain level of signal quality:

- HO2S voltage post catalyst exceeds a certain level (typical value: ~0.55-0.6V) before fuel cut-off occurs
- Fuel cut-off is present (Bit for this condition is set)
- HO2S in front of the catalyst is ready and shows definitely “lean” (e.g. Lambda is equal or greater than 10). The front HO2S signal range maximum value is equivalent to a Lambda of 16!
- The signal of the HO2S is monotone decreasing (outlier detection)*
- No HO2S faults detected by the dynamic diagnostic within the actual driving cycle

Outlier Detection

The outlier detection is necessary to exclude interferences of the catalyst during fuel cut-off conditions on the HO2S signal.

The rich-to-lean dynamic diagnostic of the H02S post catalyst is based on the physical / chemical effect that during fuel cut-off the Lambda value changes in a step response from Lambda equal one to a Lambda equal or greater than 10 indicating the Oxygen storage capability (OSC) of the catalyst is exceeded. In reality the signal behavior of the rear O2S shows occasionally during fuel cut-off a first decrease of sensor voltage to approximately 0.4 Volts, remains at that voltage level for a certain time and then falls again to a voltage of 0.1 Volts. In this specific case the measured transition time is above the fault threshold of the diagnostic but can not be counted as a O2S failure because the event is based on chemical reaction within the catalyst.

Explanation of chemical effect:

At the beginning of the fuel cut-off the CO post catalyst reaches a minimum level because of the increase of Oxygen available in the catalyst allowing an increase in CO-conversion rate into CO2, the O2S voltage decreases to approximately 0.4 Volts and stays at that level until the OSC of the catalyst is exceeded and the Oxygen level post catalyst increases causing another O2S voltage drop to approximately 0.1 Volts. This interference of the catalyst on the O2S voltage must be excluded from further evaluation by the monitor to prevent false failure detection by the response time diagnostic.

The described physical / chemical effect on the rear O2S signal is shown in figure below.

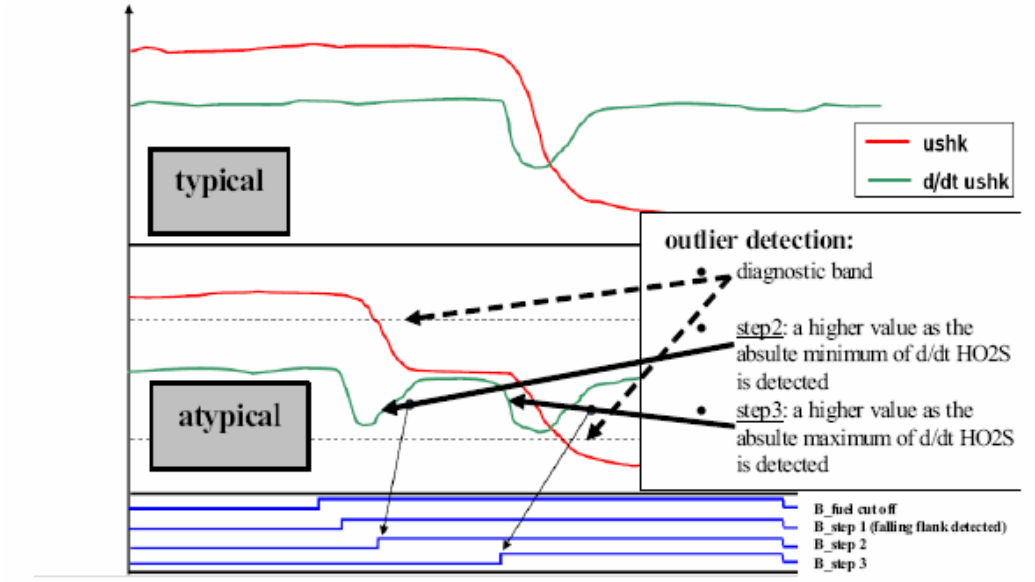

Figure 80: Rear HO2S – Outlier Detection Chart

7.7.2 Monitoring of the response time

Definition

Once fuel cut-off is present, the response time is defined as the O2S signal time needed to fall below a certain voltage level (typical value: ~0.15V). This part of the diagnostic replaces the former diagnostic of the O2S aging-monitor (DLSAHK) conducted during fuel cut-off.

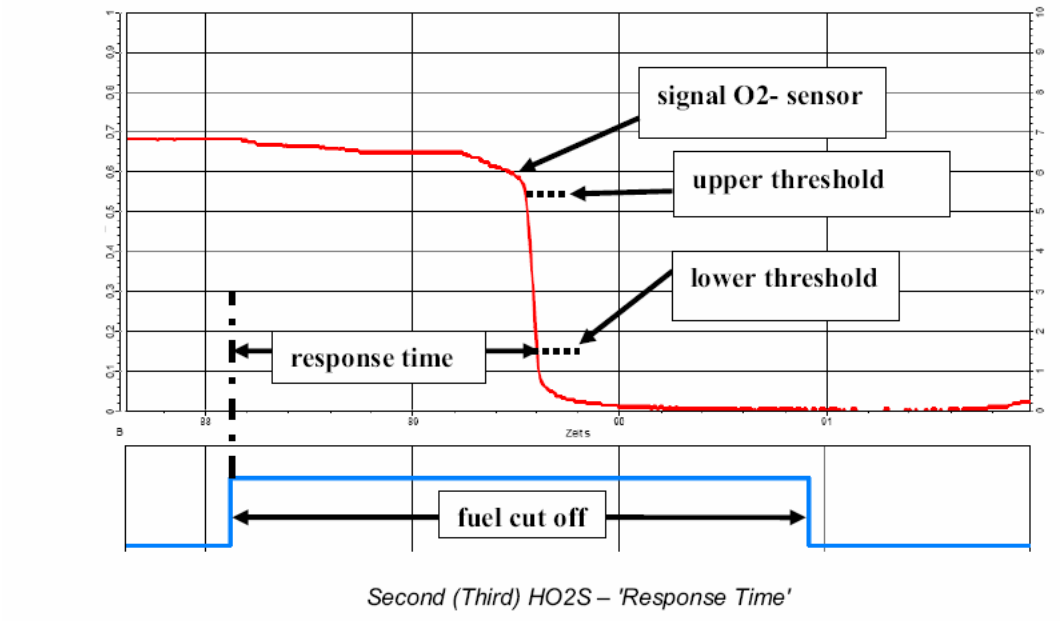

Figure 81: Monitoring of response time

Application of response time diagnostic

The main factors influencing the response time diagnostic are the exhaust mass flow, engine operating condition and the aging level of the catalyst. The maximum time allowed needs to be determined on the catalyst with the highest OSC value (e.g. new catalyst). The evaluation of the response time therefore is a measure whether the O2S signal is capable to show a voltage drop below a certain level within a certain time.
If the enable conditions are fulfilled and the O2S signal falls below an applicable voltage level (typical value: ~0.15 Volts) or the mass of Oxygen lead into the catalyst is above an applicable value (typical value: ~ 2.5 g O2) the measured value of response time is valid. Every valid value is evaluated and counted. The memory of response time and counted events will be cleared with power fail or with the OBD fault memory deleted by use of a Generic Scan Tool (GST).
If the event counter exceeds an applicable level the cycle flag can be set or in case of a response time measured exceeding the applicable fault threshold the diagnostic trouble code (DTC) is stored.

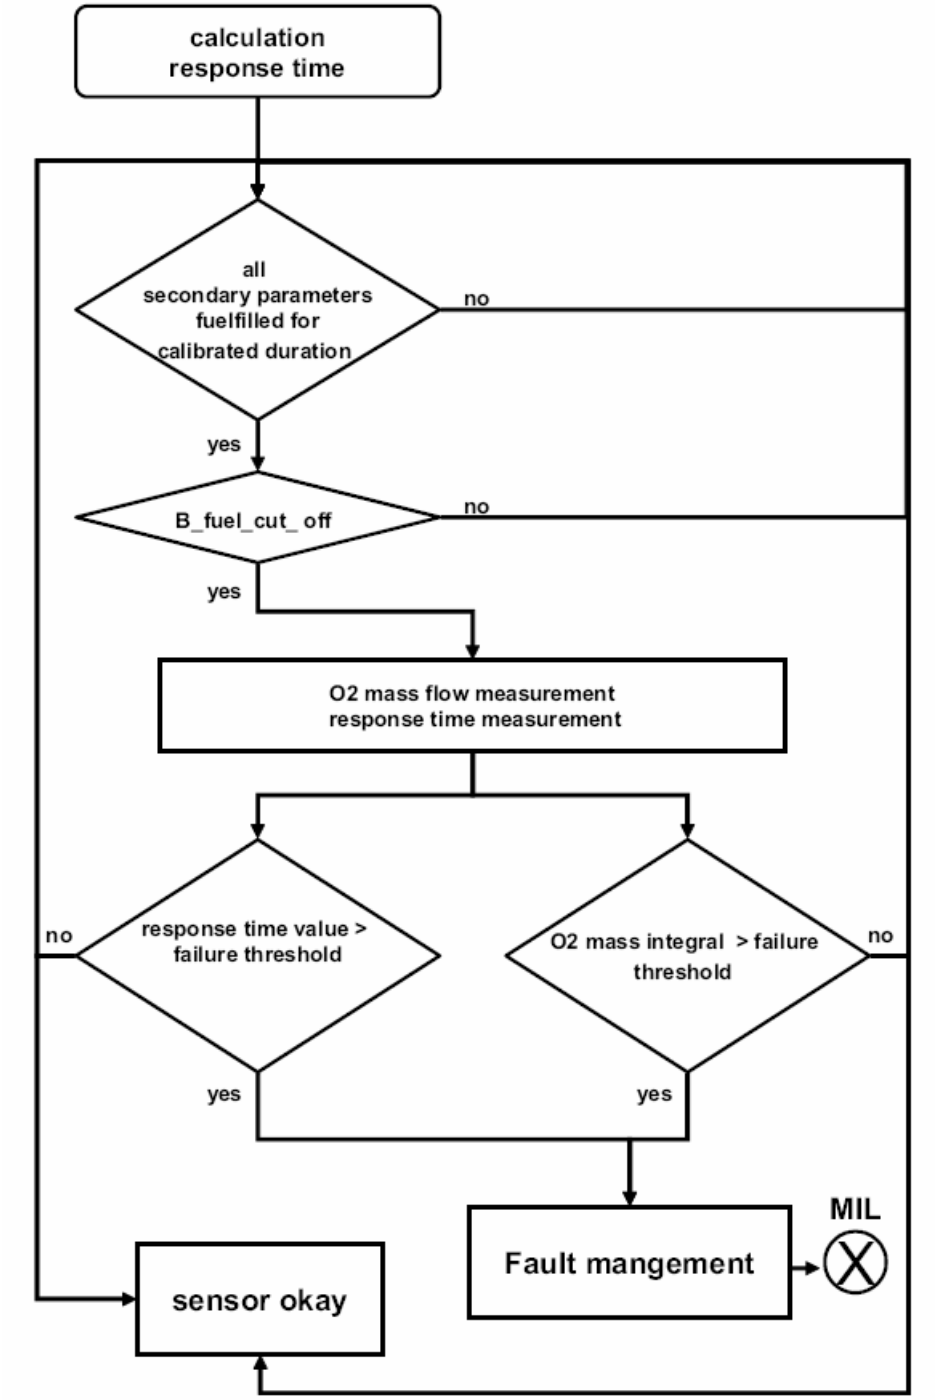

Figure 82: Rear sensor – Calculation RO2S response time check

7.7.3 Monitoring of transition time

Definition:

The transition time is defined as the time the O2S signal needs to pass-through an applicable voltage band (typical range: ~0.4-0.2V). This diagnostic function shall ensure that the reduced O2S signal dynamic (e.g. due to aging) exceeds a specified time threshold. This function is also used to improve the monitoring capability by minimizing the theoretical possibility of “false passes” of an aged catalyst caused by reduced HO2S dynamic.

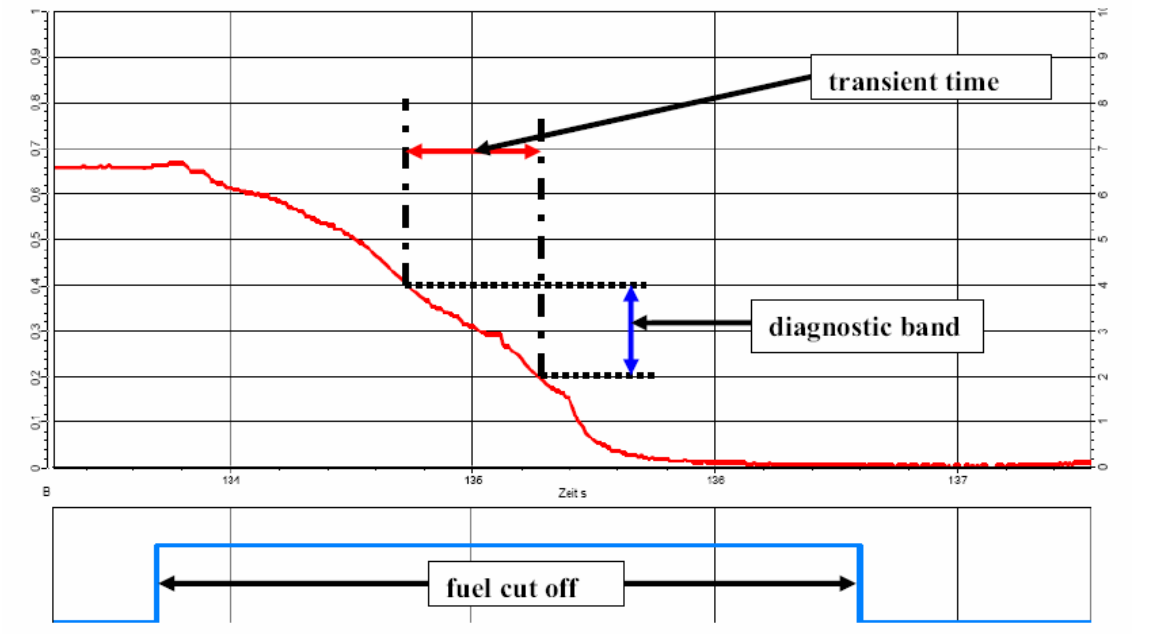

Figure 83: Rear Sensor – transition time

Application of transition time diagnostic

If all enable conditions are fulfilled and the difference between actual and stored transition time value is less than a calibrated value (typical value: ~0.3V) the valid measured value is filtered (moving average) and an event counter is increased. The filter features a “step change” capability in case of difference between actual measured transition time and previously stored transition time is greater than a calibrated value (typical value: ~0.3V) a second filter (arithmetic mean value) and a second event counter is used. This ensures an adequate system reaction in cases of suddenly occurrence of great deterioration in O2S dynamic by storing a diagnostic trouble code in a shorter time. The memory of transition time and counted events will be cleared with power fail or with the OBD fault memory deleted by use of a Generic Scan Tool (GST).

If the event counter exceeds an applicable level the cycle flag can be set or in case of the filtered transition time exceeding the applicable fault threshold the diagnostic trouble code (DTC) is stored.

The following schematic shows the principle of the diagnostics

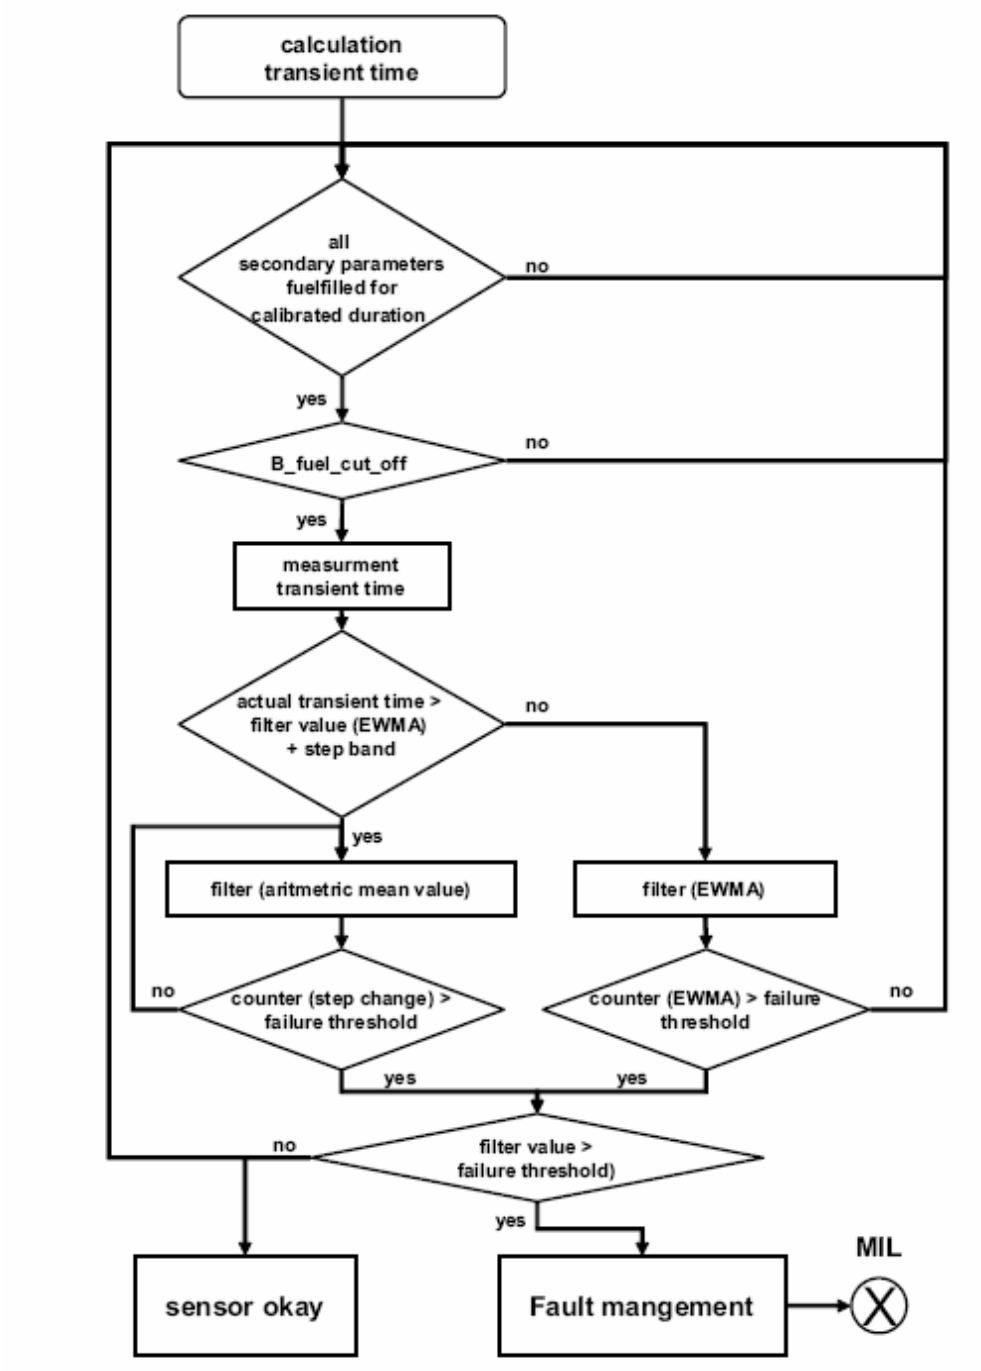

Figure 84: Rear sensor – Calculation RO2S transition time check

7.7.4 In-Use Monitoring Performance Ratio

The incrementing of the numerator, the denominator and the ratio calculation for the HO2S “Response Rate” monitor is executed by the “IUMPR-Kernel” as a subroutine. Like all monitors for which a standardized tracking and reporting of the in-use performance is required, the HO2S “Response Rate” monitor reports to the “IUMPR Kernel”-function via status flags.

Incrementing the numerator

The numerator is incremented, once per driving cycle in case of a fault is detected or if the Oxygen mass flow integral exceeds an calibrated value (typical value: ~2.5 – 3.5 g O2) and a certain number of valid measurements has been conducted (typical value: ~1 - 3 measurements).

Incrementing the denominator

The denominator is incremented if the standardized conditions are fulfilled within the actual driving cycle and the monitor is not inhibited due to already stored faults or faults detected on the sensors necessary to determine the denominator itself.

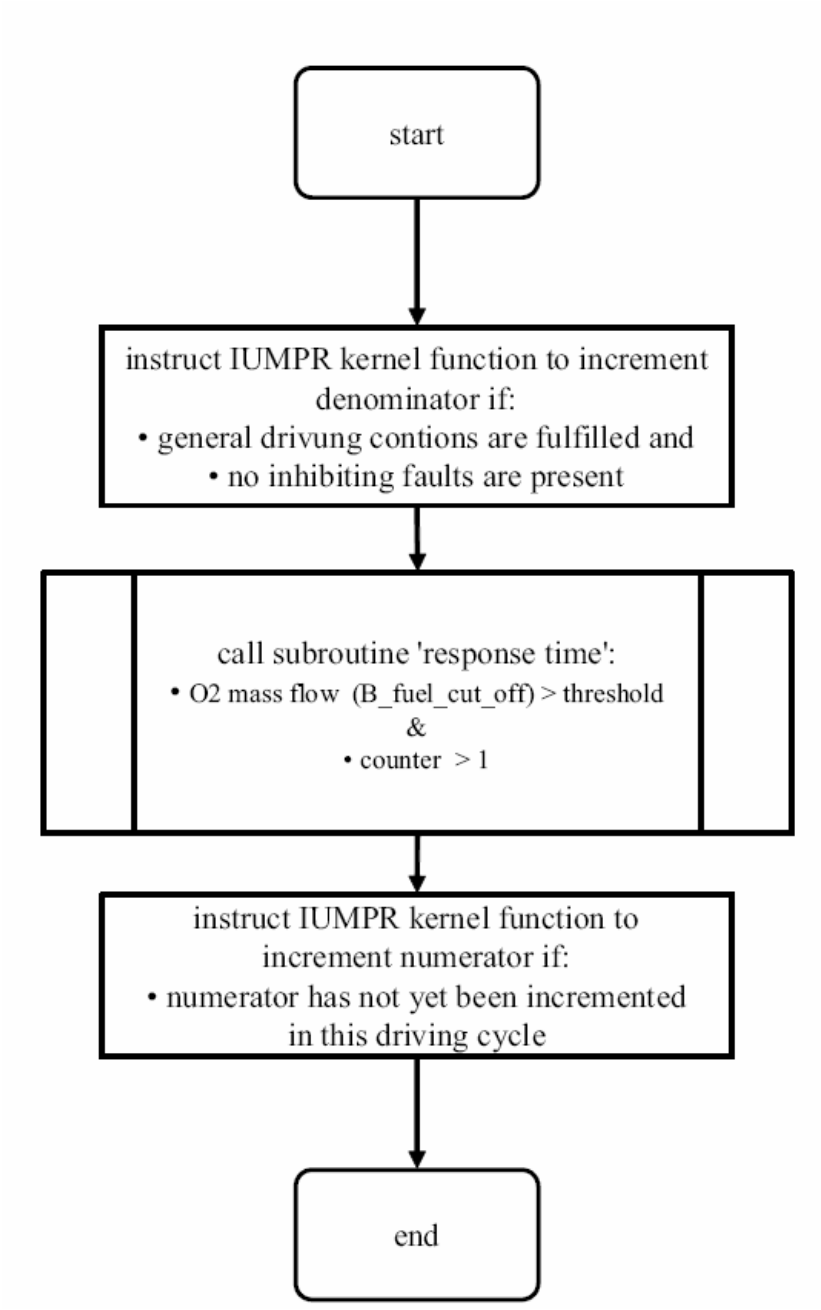

Figure 85: Rear sensor – main RO2S check

7.8 RO2 Sensor heater

For diagnostic of the sensor heater a specific current pulse is supplied via a load resistance and the voltage is measured. The intern resistance of the sensor heater is calculated with the voltage deviation. The result will be compared with a reference resistance map which considers ageing and sampling deviations. In case of internal resistance > map resistance the diagnosis stores a fault and the MIL will be illuminated.

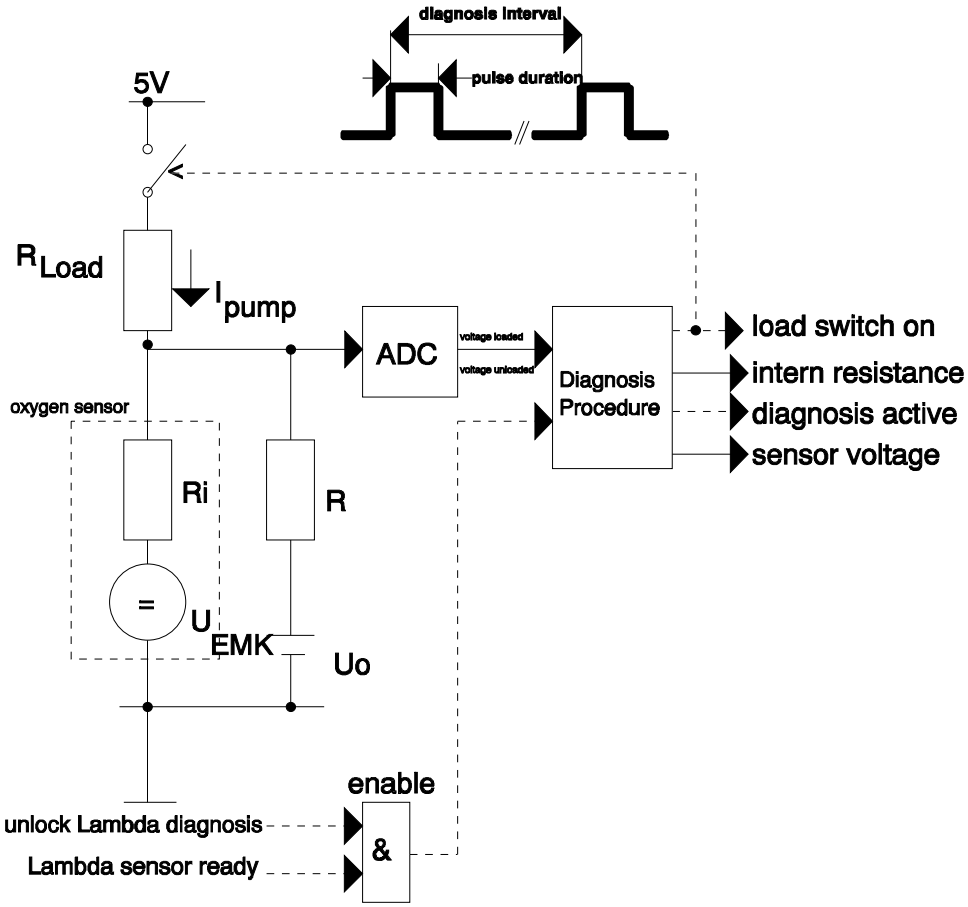

Figure 86: Monitoring structure RO2 Sensor heater

For proper function of the Oxygen sensors, their ceramic elements must be heated. A non-functioning heater delays or prevents the proper signal output for closed loop control and thus influences emissions. The heating up is controlled by the heater control.

This chapter describes the sum of all possible heater checks of the downstream HO2S.
The diagnosis of the heater of the downstream HO2S monitors the internal resistance of the Nernst cell. The internal resistance of the Nernst cell depends on both the electrical power of the heater and the exhaust gas temperature.

The resistance of the Nernst cell is measured and compared with the calculated temperature-dependant reference value. If the measured resistance exceeds the calculated reference value for a calibrated period of time, a malfunction is detected and a plausibility fault **HSH** (rear sensor) is set.

Monitoring Conditions

- no faults of power stage of RO2 Sensor heater
- no faults of RO2 Sensor
- modeled exhaust gas temperature at the vicinity of the downstream front catalyst O2 Sensor lies within calibrated range
- engine soak time exceeds calibrated threshold
- intake air temperature exceeds calibrated threshold
- battery's voltage lies within calibrated range
- engine is running
- engine start is finished
- voltage supply for heater of oxygen sensor is active
- measuring of internal resistance is active
- no signal interruption of RO2 sensor's ground
- no fuel cut-off
- enabled by the diagnostic scheduler

10 ENGINE COOLANT SYSTEM MONITORING

10.1 General description

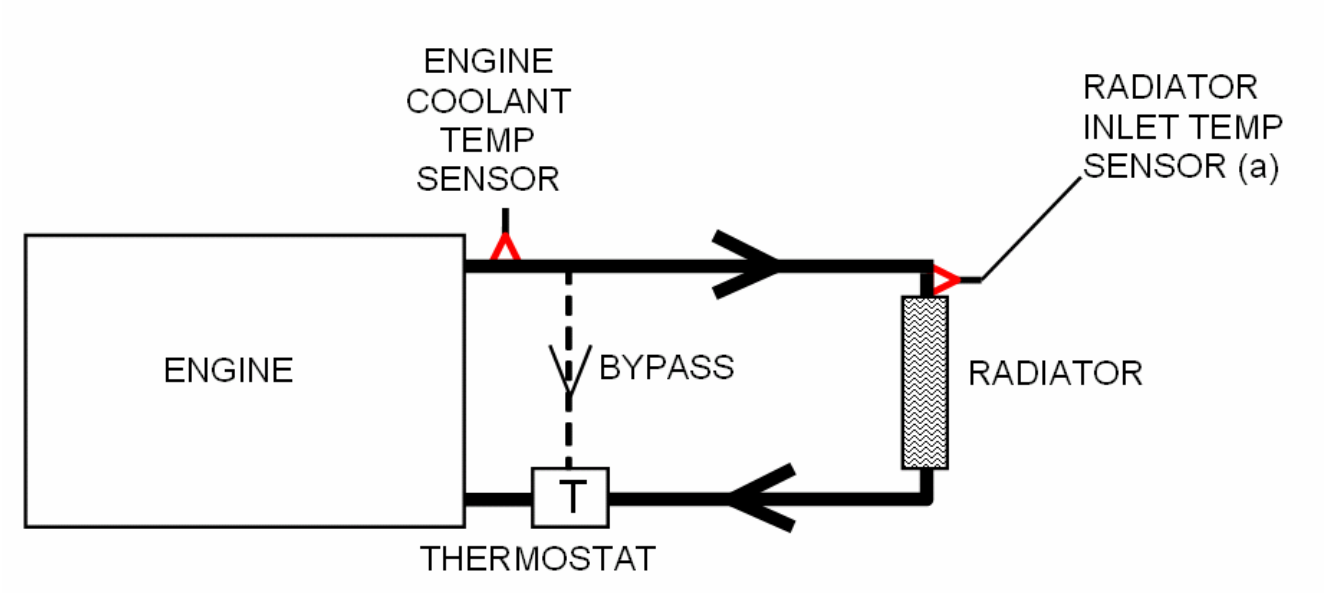
The engine cooling system consists of the following main parts:

- Radiator
- Engine Coolant Temperature Sensor
- Thermostat
- Bypass Cooling Circuit
- Main Cooling Circuit
- Radiator Temperature Sensor (certain OBD groups only)

During warm-up of the engine, the coolant flows first inside the bypass cooling circuit. After the coolant reaches a sufficient temperature the thermostat opens the main cooling circuit to integrate the engine coolant radiator.

The engine coolant temperature sensor measures a mixed temperature between the coolant coming from the bypass and main cooling circuits.

On some concepts, a radiator temperature sensor is used to measure the temperature at the inlet (OBD group BBE-V) of the radiator.



(a) OBD Group BBE-V only

Figure 89: Main elements of engine cooling system

10.2 Concepts without radiator temperature sensor

10.2.1 Monitor Functional Description

The engine cooling system monitoring strategy consists of two main diagnostic parts, shown in Figure 90.

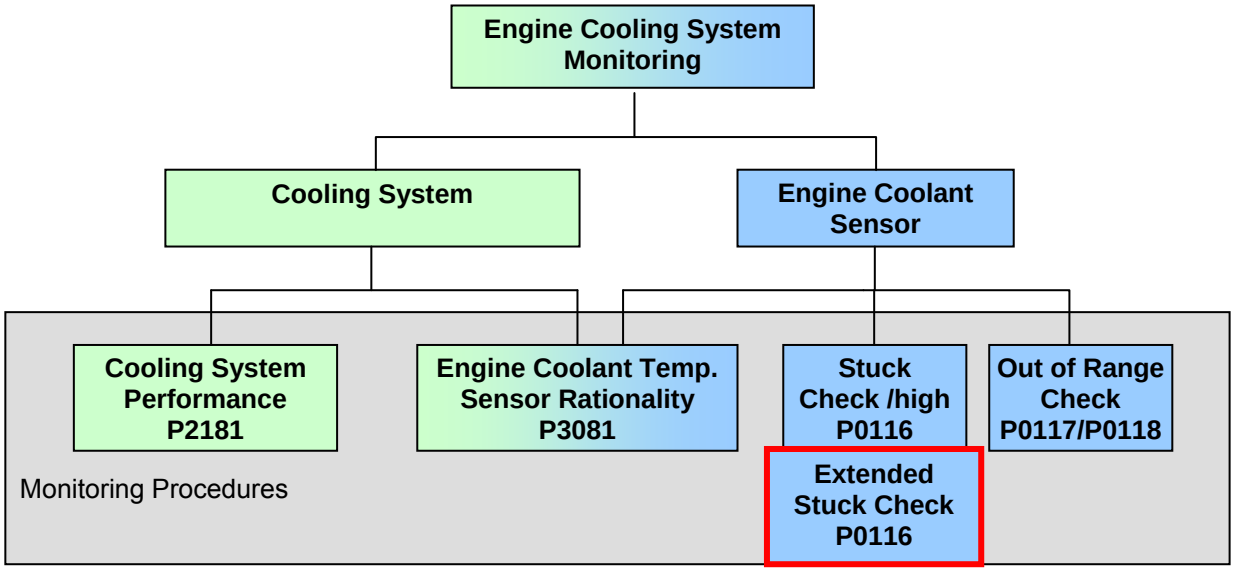


Figure 90: Engine cooling system monitoring strategy

Each engine cooling monitoring function has its own specific engine temperature range in which it will be enabled. Refer to Figure 91.

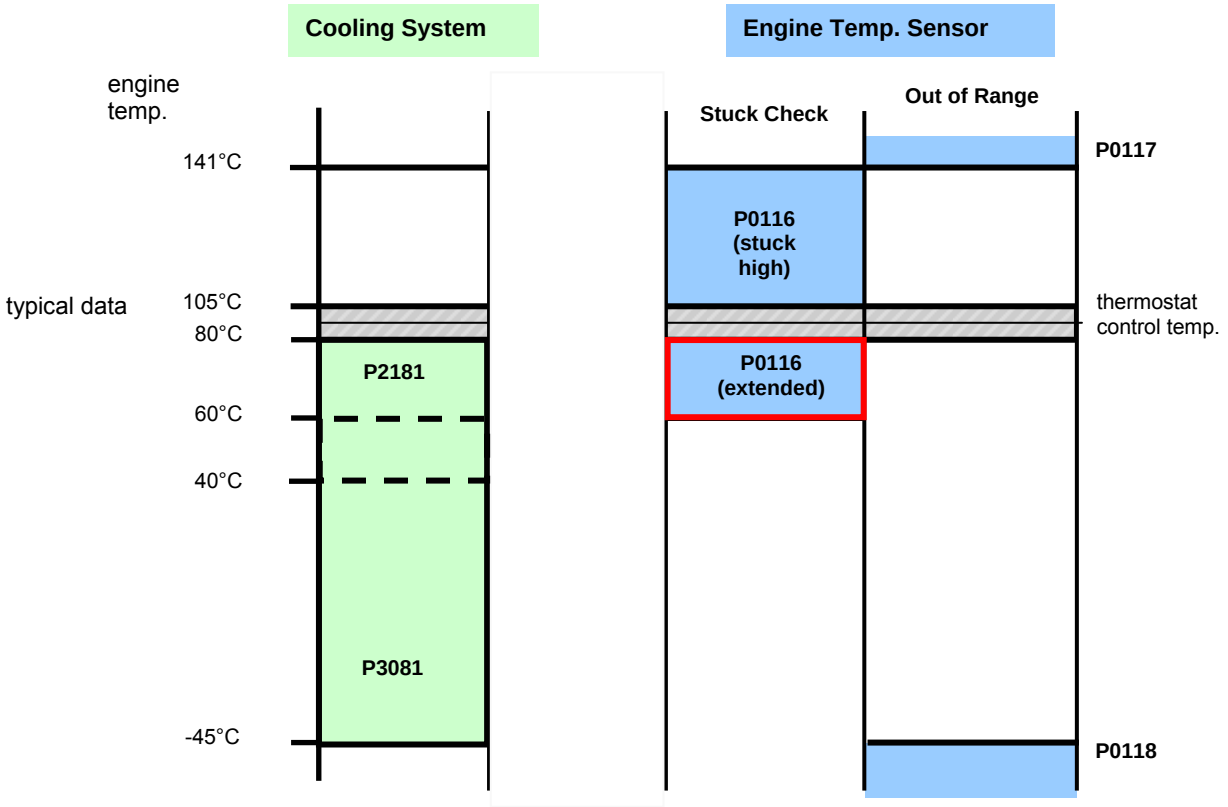

Figure 91: Engine temperature range

10.2.2 Cooling System Performance (P2181)

In case that the engine coolant temperature does not reach a certain value after a sufficient mass air flow under normal driving conditions, the cooling system performance is considered to be reduced. Refer to Figure 92 and Figure 93.

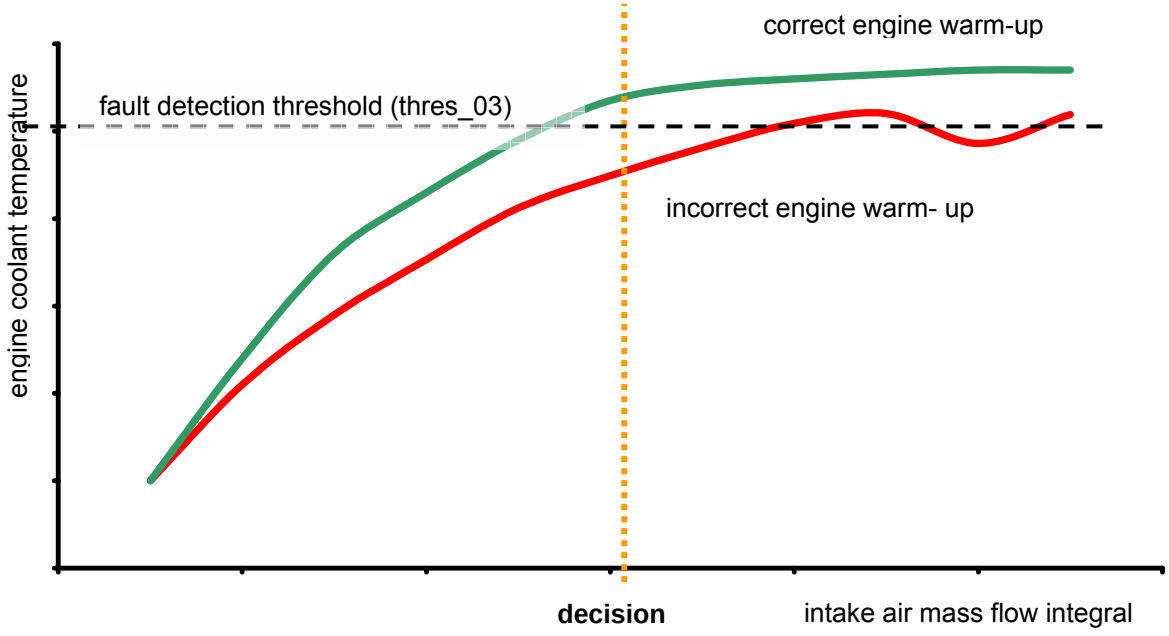

Figure 92: Cooling system performance chart

Flow chart cooling system performance (P2181)

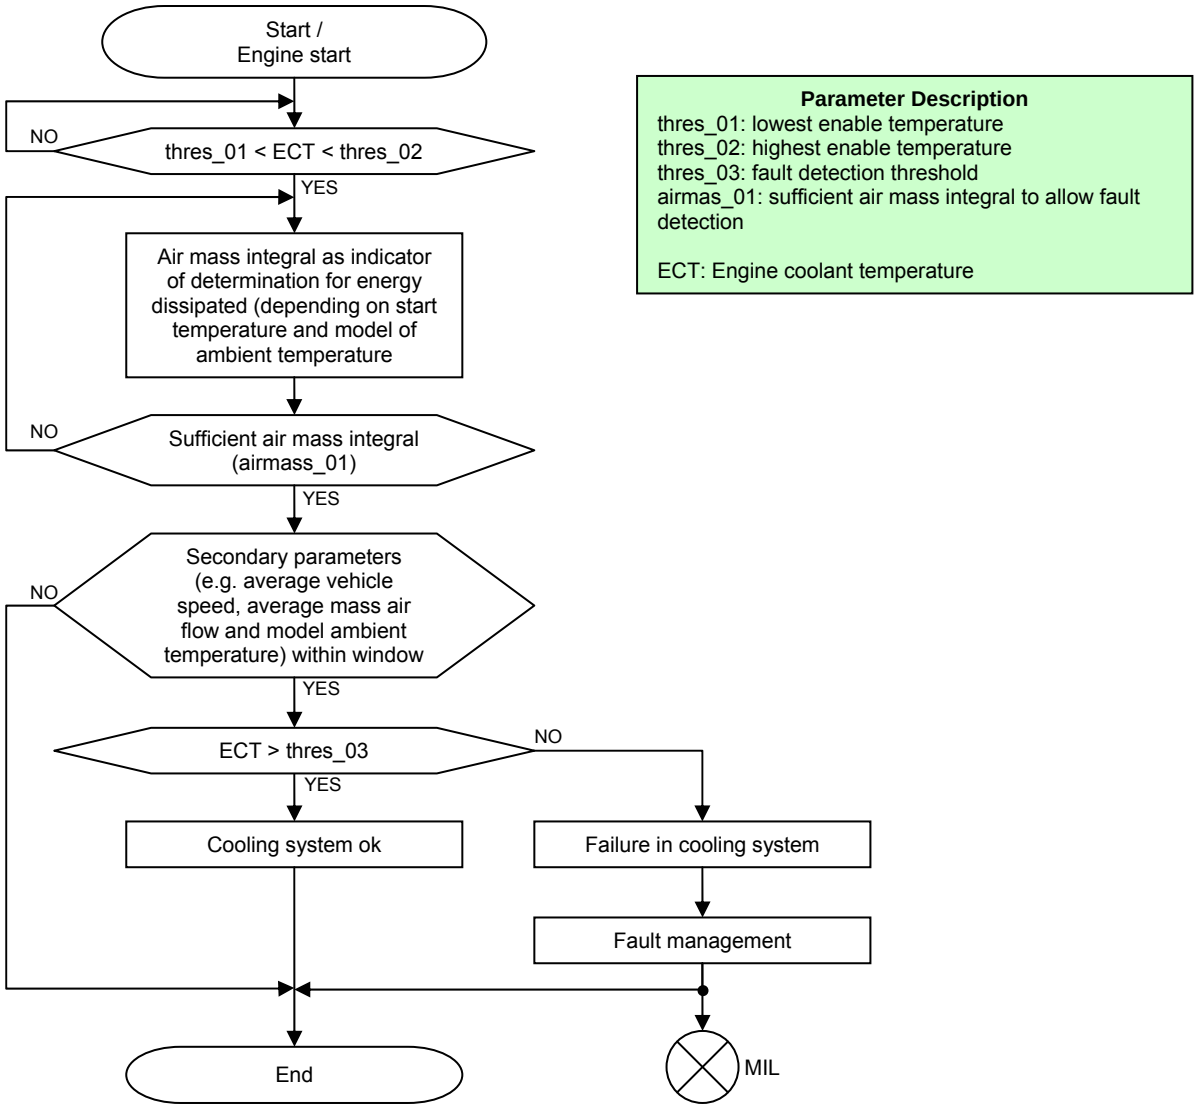

Figure 93: Flow chart cooling system performance monitoring

10.2.3 Engine Coolant Temperature Sensor Rationality (P3081)

In case that the engine coolant temperature does not fit to a reference model temperature in a certain range, the cooling system is defective or the sensor is not in a plausible range. Refer to Figure 94 and Figure 95.

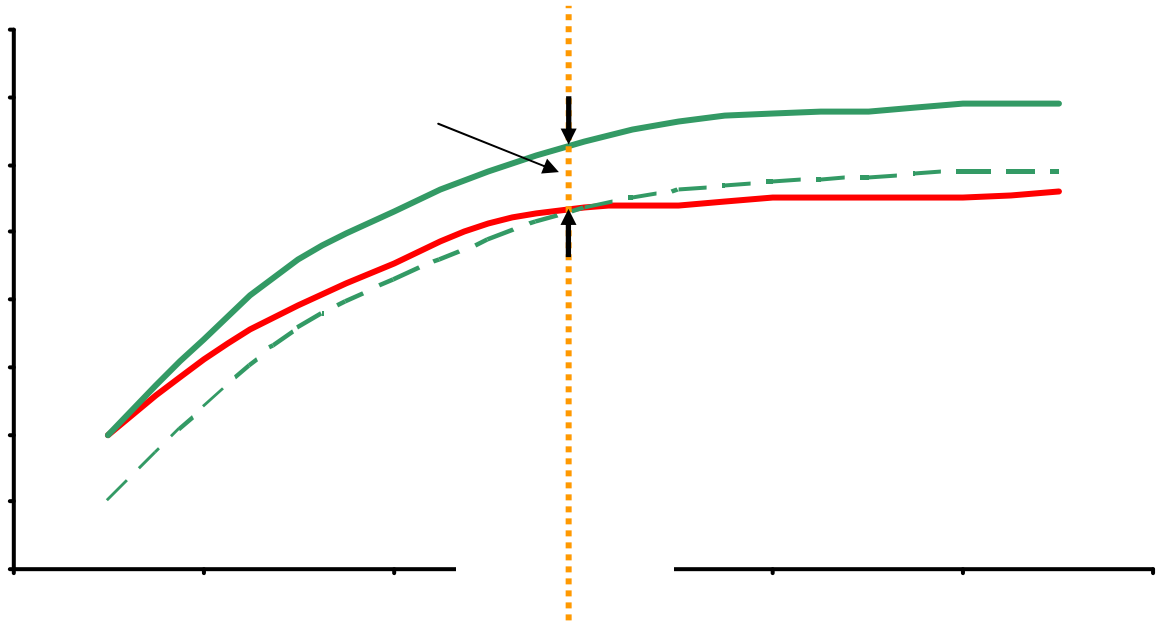

Figure 94: Coolant temperature Sensor Rationality Overview

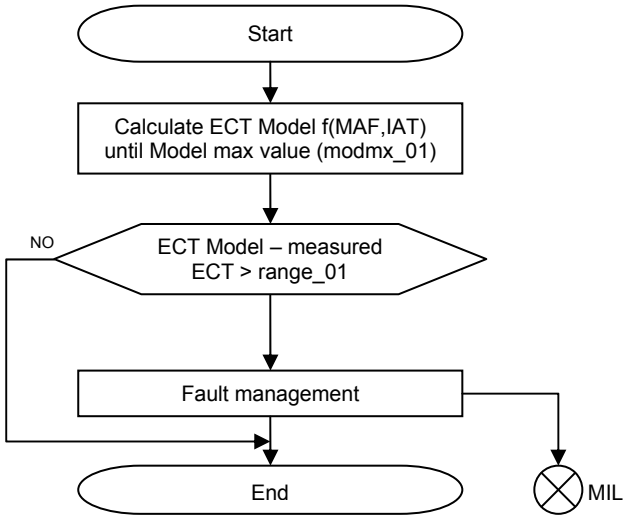
Flow chart coolant temperature sensor rationality (P3081)



Parameter Description
modmx_01: maximum reference temperature model value

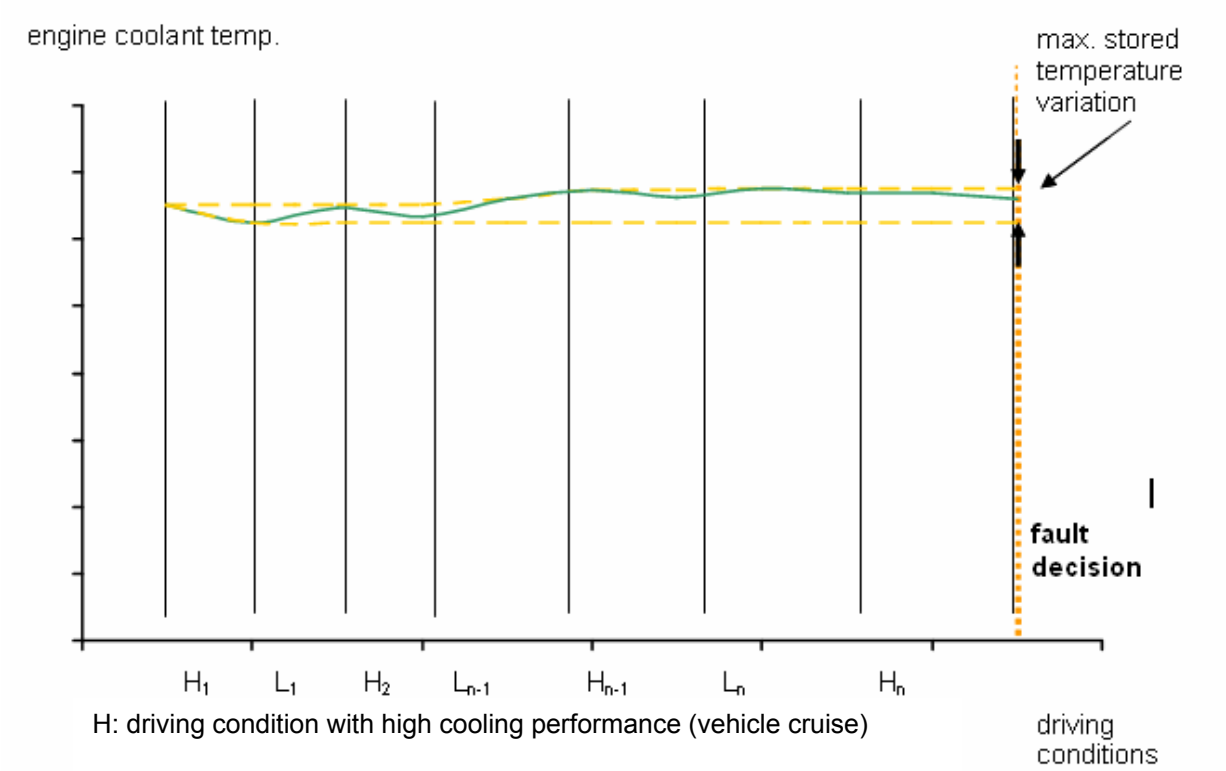
range_01: maximum deviation error to detect a malfunction

ECT: Engine Coolant Temperature
MAF: Mass Air Flow Sensor
IAT: Intake Air Temperature

Figure 95: Flow chart coolant temperature sensor rationality

10.2.4 Engine Coolant Temperature Sensor Stuck (P0116)

After engine start the system stores continuously the lowest and highest ECT above the thermostat control temperature for a driving cycle. In case that after several driving conditions the difference between ECT max and ECT min is lower than the threshold the sensor is stuck at a high (Figure 96) or low (Figure 97) value, depending on start temperature, respectively. Figure 98 is a flow chart of the function.



H: driving condition with high cooling performance (vehicle cruise)

L: driving conditions with low cooling performance (idle)

Figure 96: Coolant temperature Sensor Stuck High Overview

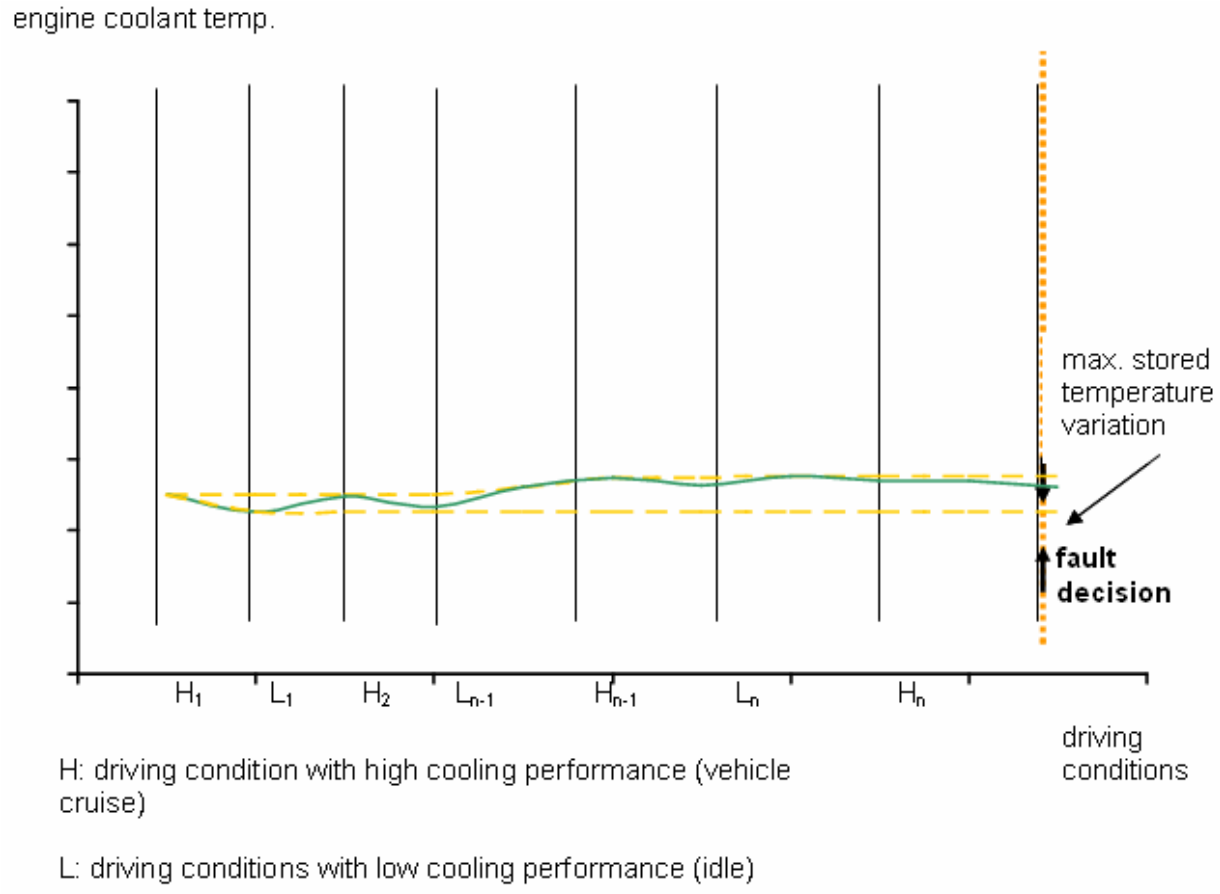


Figure 97: Coolant temperature Sensor Stuck Low Overview

Flow chart engine coolant temperature sensor stuck high (P0116)

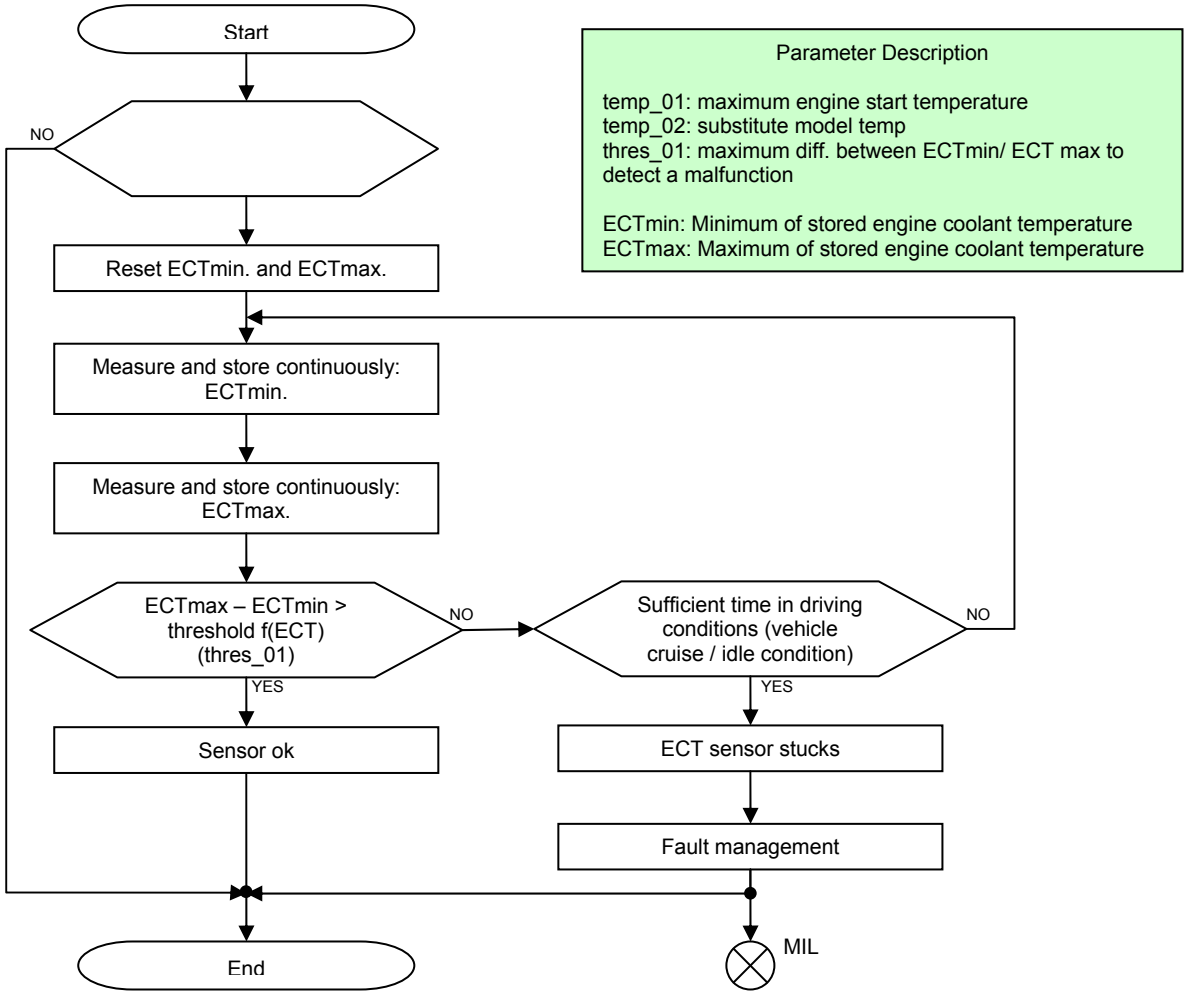

Figure 98: Flow chart engine coolant temperature sensor stuck high

10.2.5 Engine coolant temperature sensor extended stuck check (P0116)

After engine start the system stores continuously the lowest and highest ECT below the thermostat control temperature for a driving cycle. In case that after several driving conditions the difference between ECT max and ECT min is lower than the threshold the sensor stucks at low values.

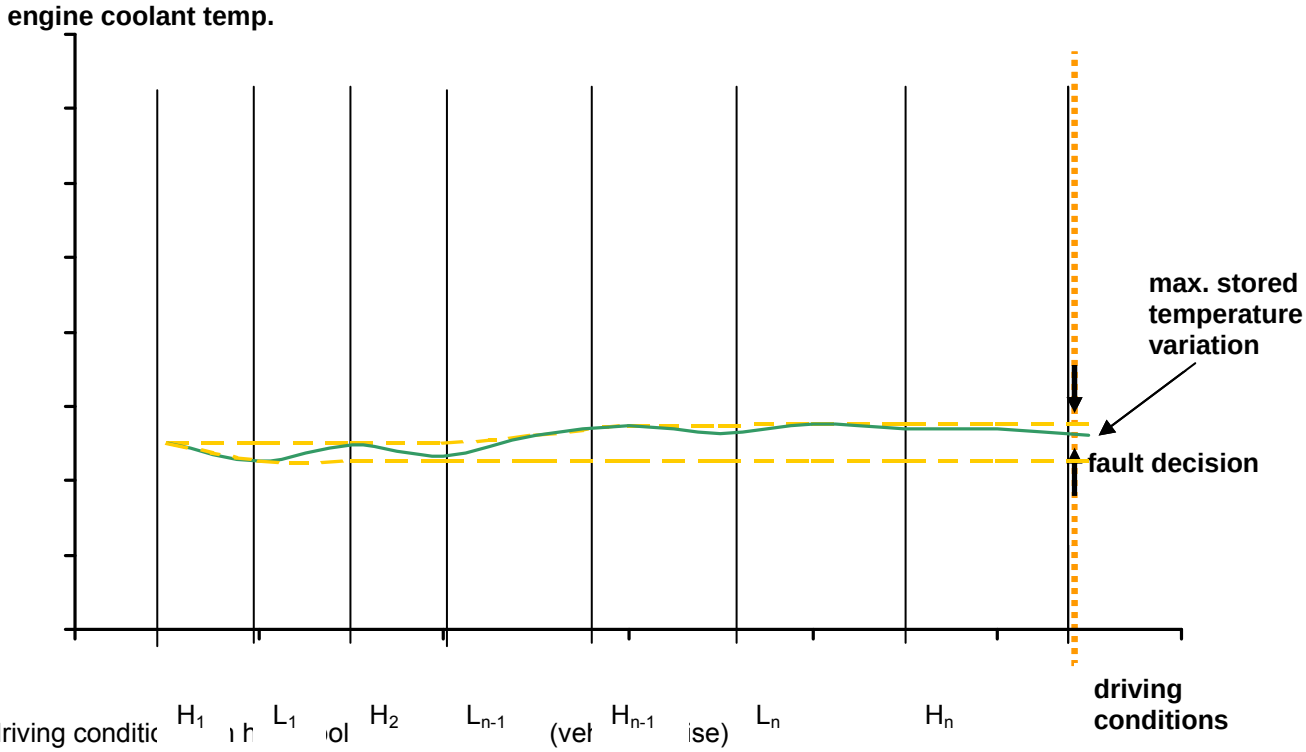

Figure 99: Engine coolant temperature sensor extended stuck check

Monitoring of ECT during driving and during engine shut off time

Monitoring during driving – Part I –

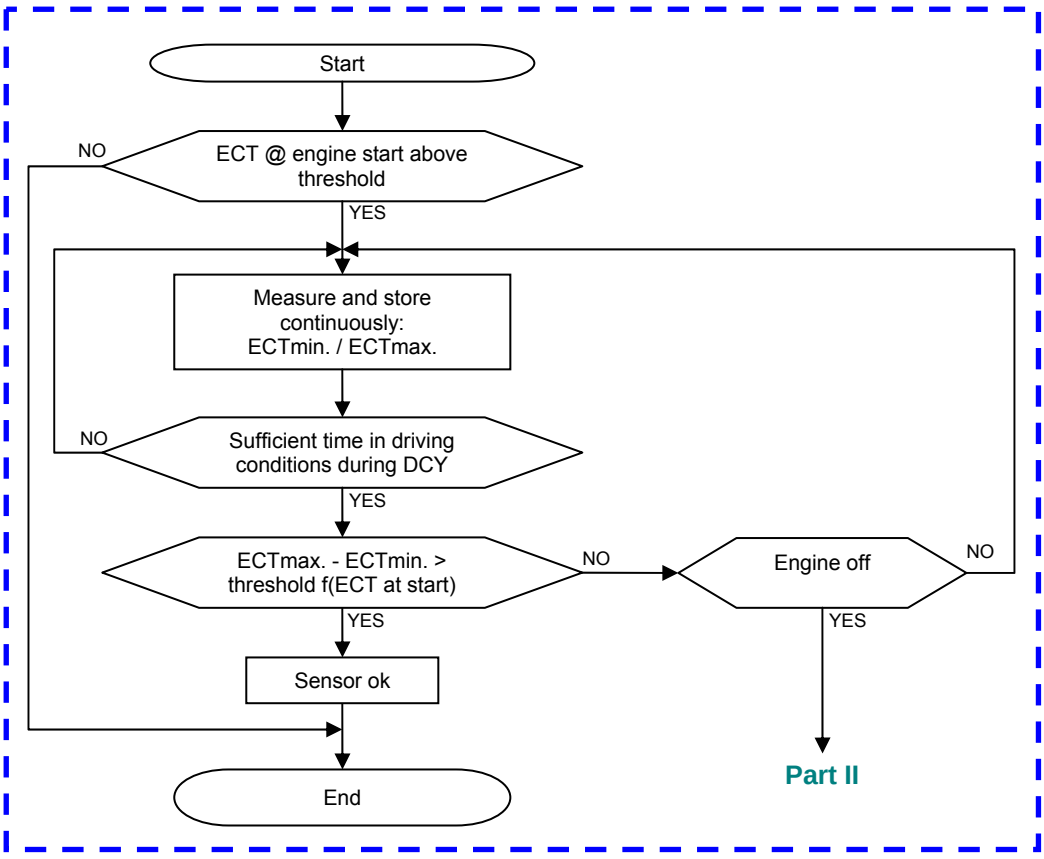

Figure 101: Flow chart monitoring of ECT during driving (part 1)

Monitoring after engine shut off – Part II –

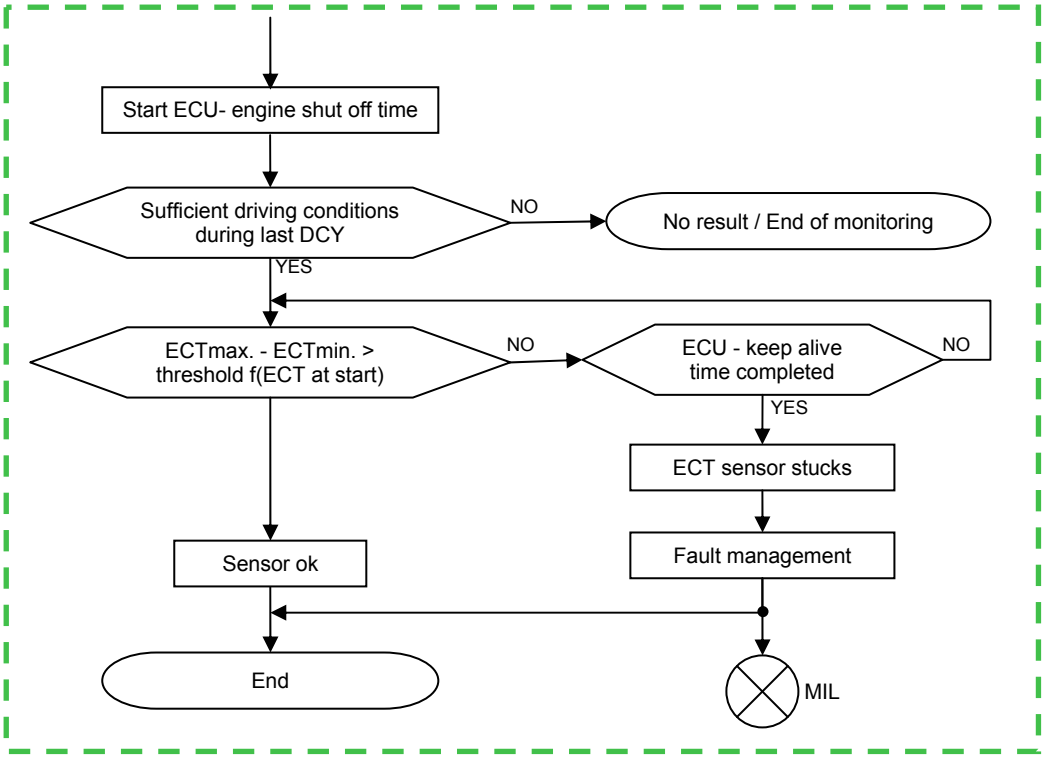

Figure 102: Flow chart monitoring after engine shut off (part 2)

10.2.6 Engine coolant temperature sensor out of range check (P0118 / P0117)

The signal of engine coolant temperature sensor is evaluated and considered to be electrically out of range if either the upper or the lower thresholds is exceeded.

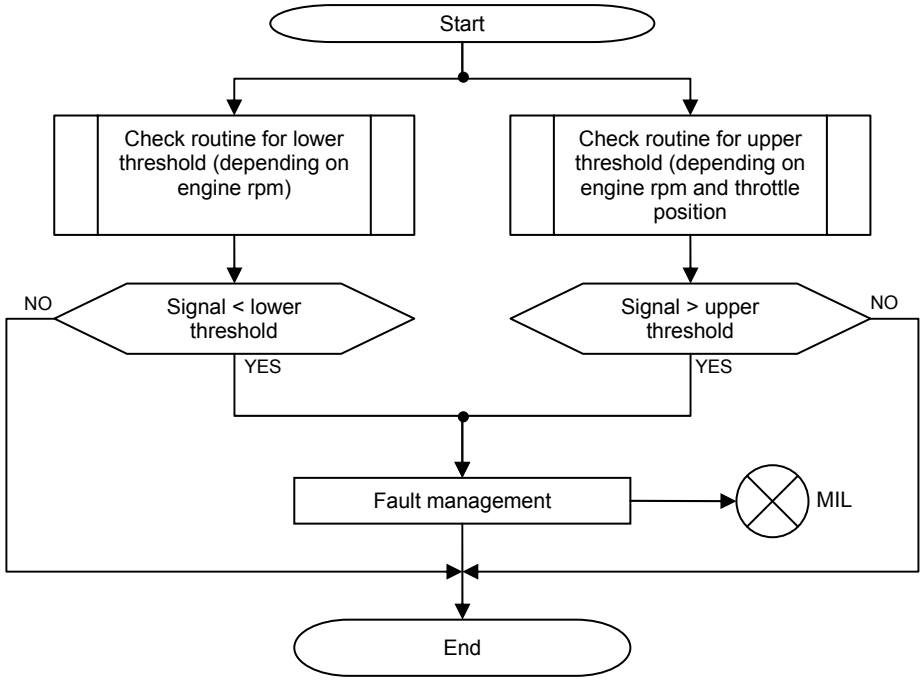

Figure 103: Flow chart engine coolant temperature sensor out of range check

10.2.7 Engine Coolant Temperature Sensor Rationality (P0116)

In case that the engine coolant temperature does not fit to a reference model temperature in a certain range, the cooling system is defective or the sensor is not in a plausible range. Refer to Figure 104 and Figure 105.

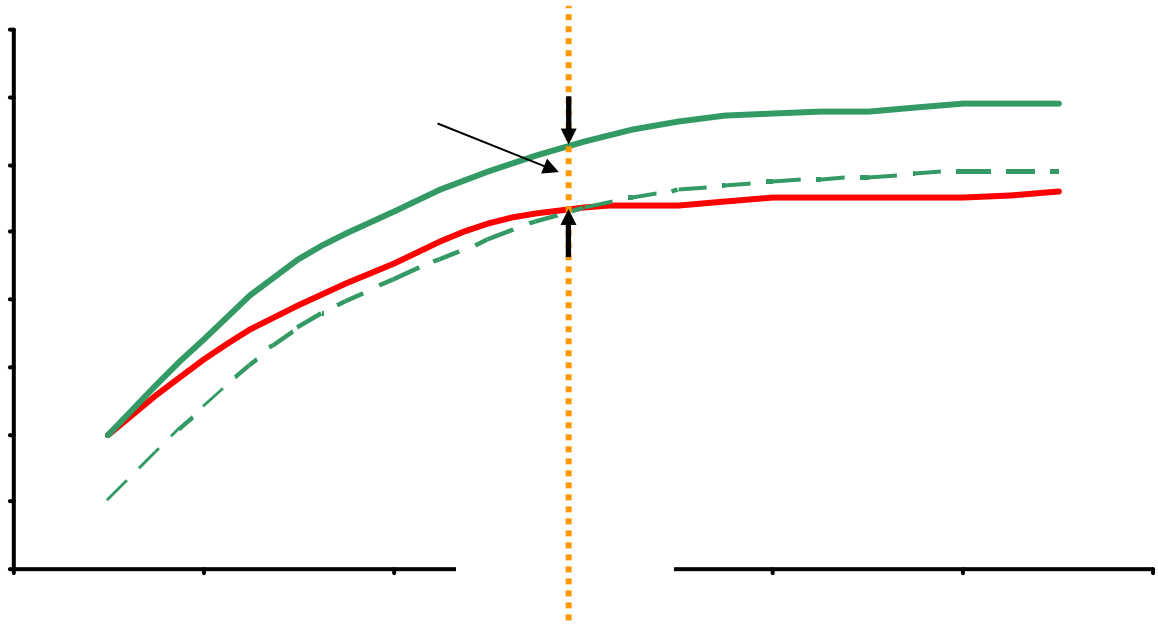

Figure 104: Coolant temperature Sensor Rationality Overview

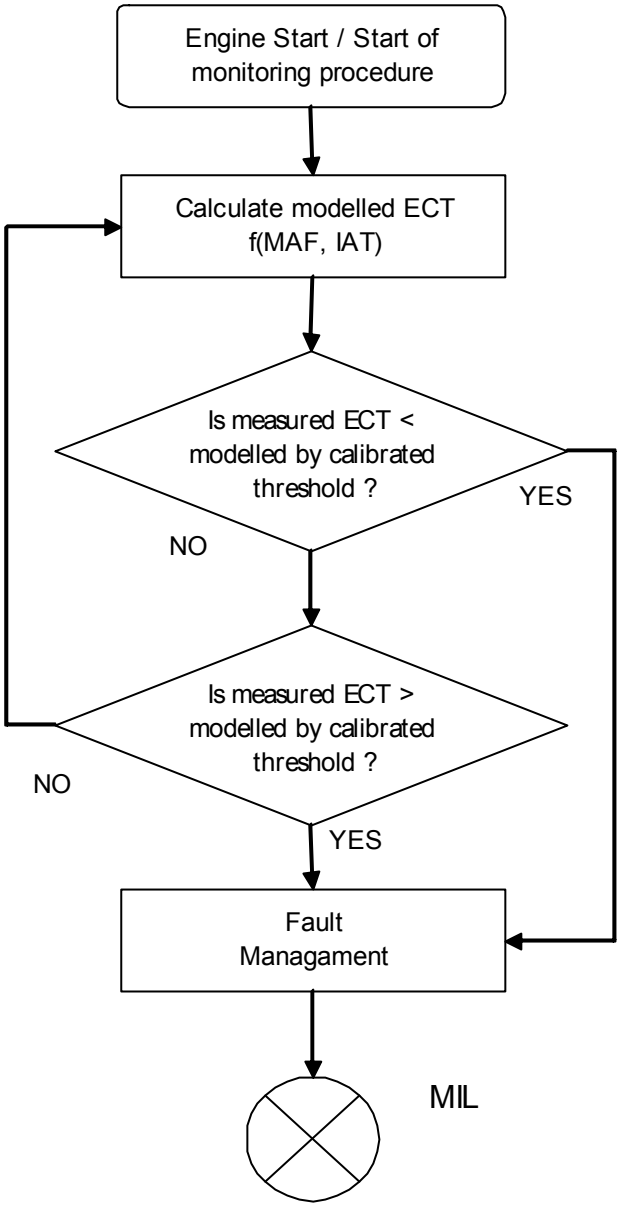

Figure 105: Flow Chart Coolant Temperature Sensor Rationality (P0116)

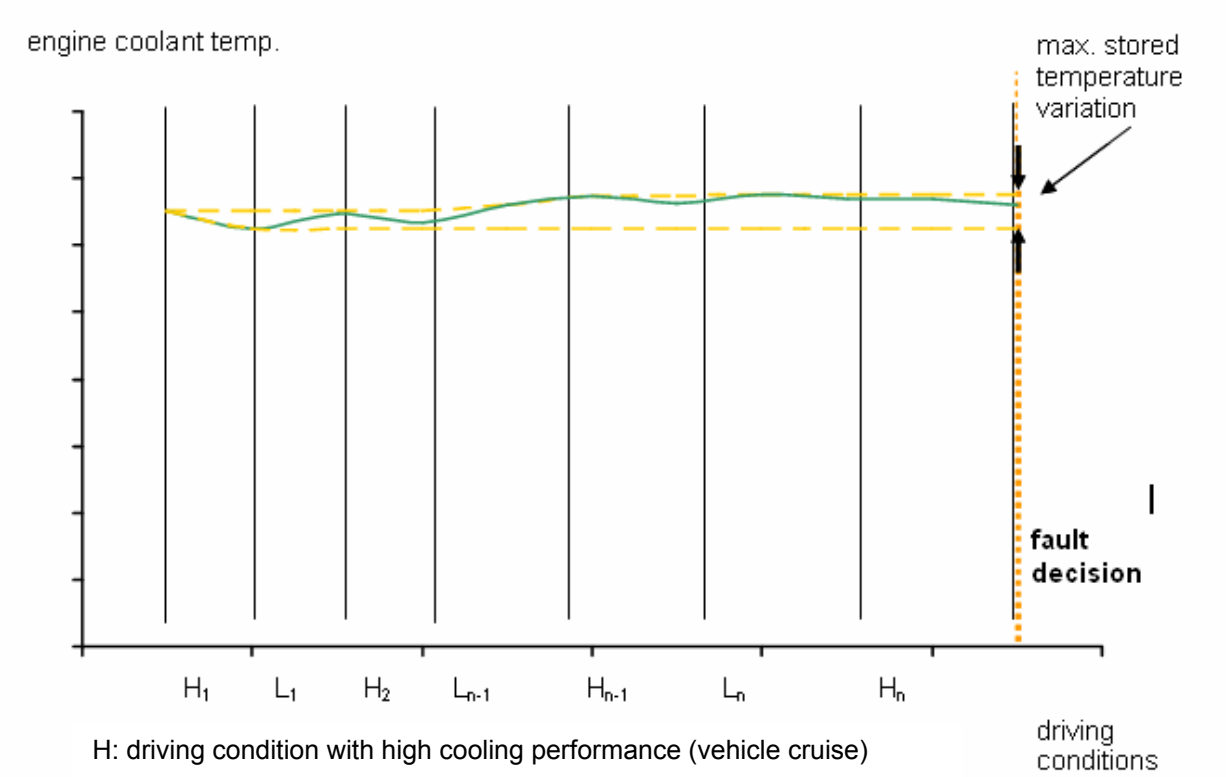
10.2.8 Engine Coolant Temperature Sensor Stuck (P0116)

After engine start the system stores continuously the lowest and highest ECT above the thermostat control temperature for a driving cycle. In case that after several driving conditions the difference between ECT max and ECT min is lower than the threshold the sensor is stuck, independent of start temperature (Figure 106). Figure 107 is a flow chart of the function.



H: driving condition with high cooling performance (vehicle cruise)

L: driving conditions with low cooling performance (idle)

Figure 106: Coolant temperature Sensor Stuck Overview

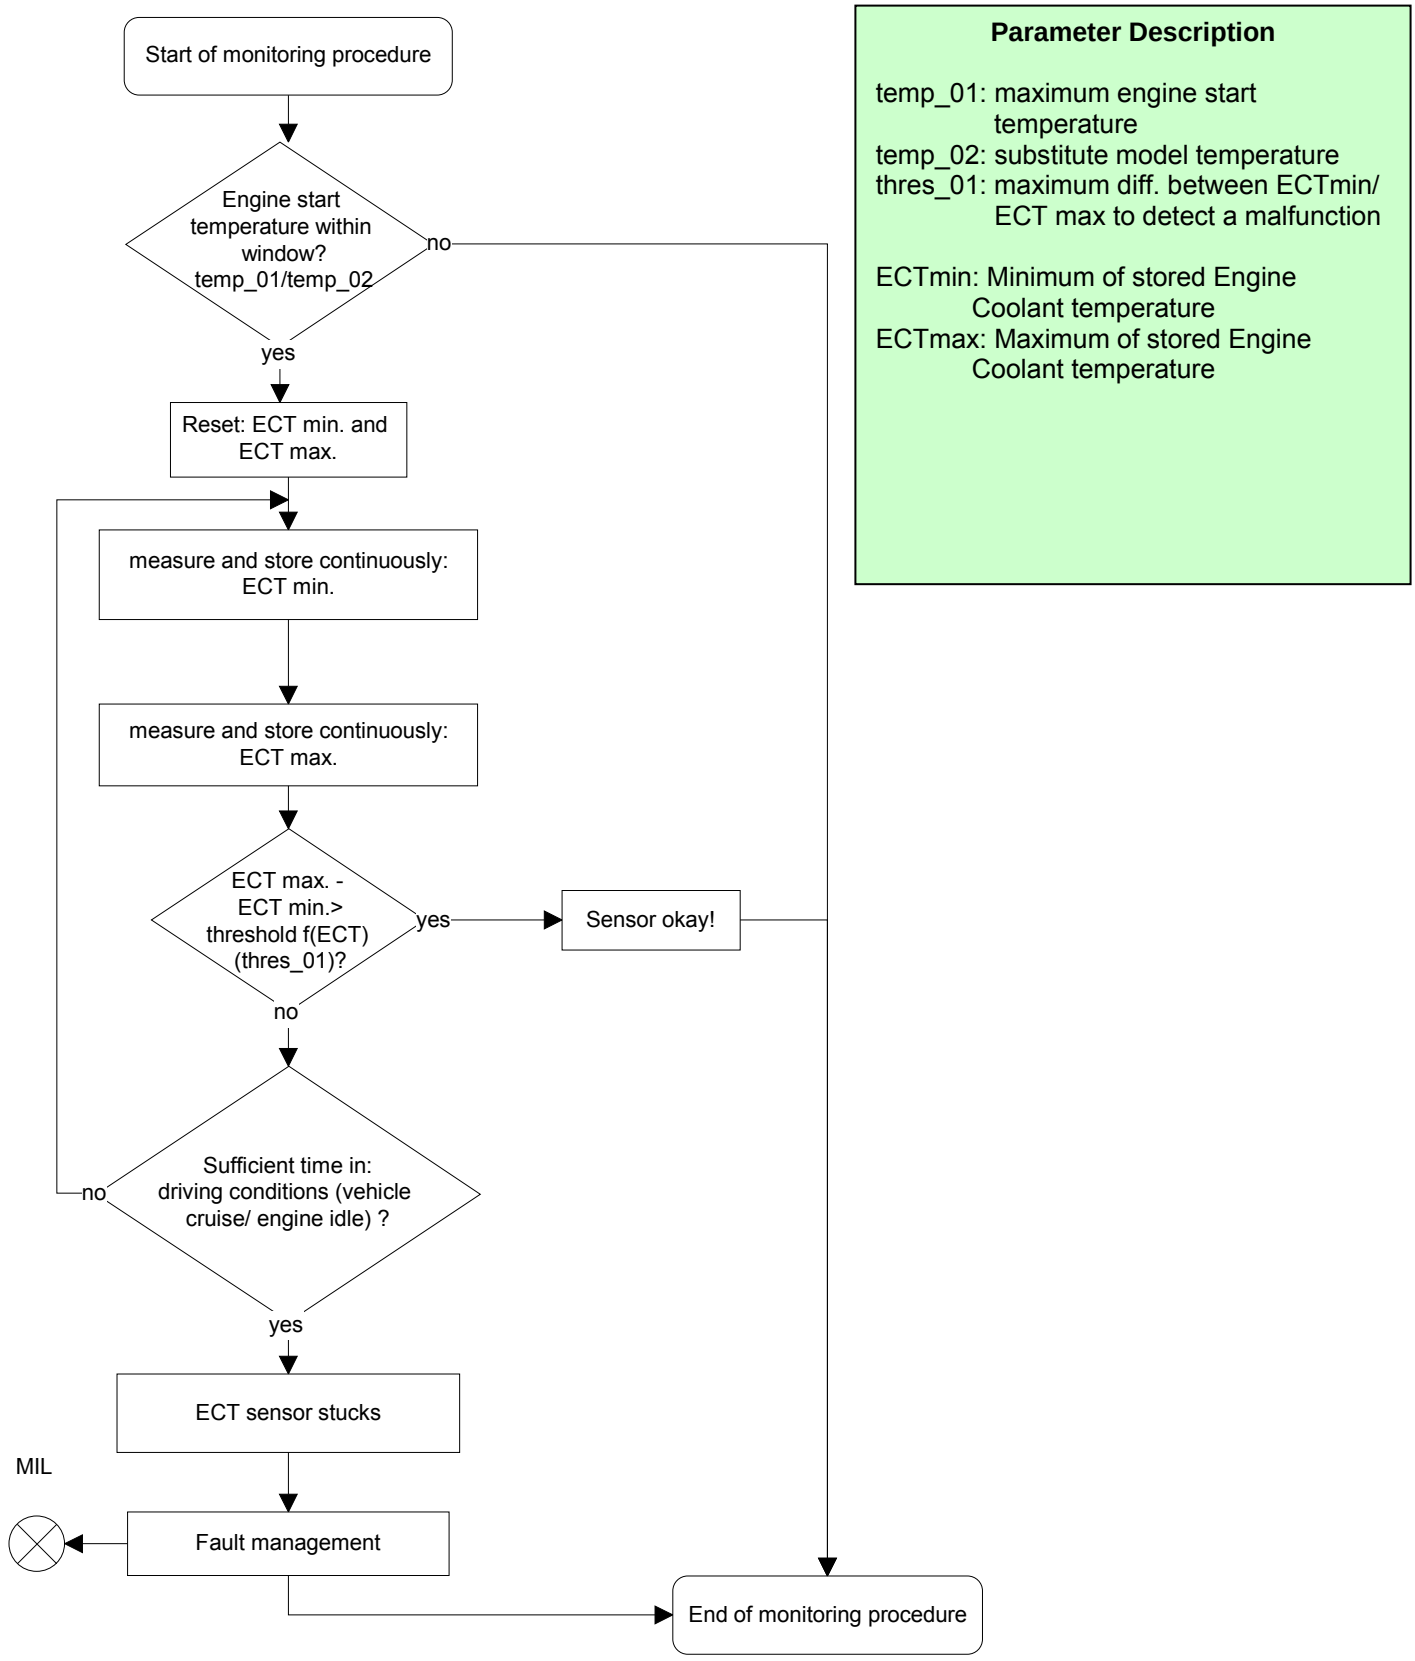


Figure 107: Flow Chart Engine Coolant Temperature Sensor Stuck (P0116)

10.2.9 Engine Coolant Temperature Sensor Out of Range Check (P0115 / P0117)

The signal of Engine Coolant Temperature Sensor is evaluated and considered to be electrically out of range if either the upper or the lower thresholds is exceeded.

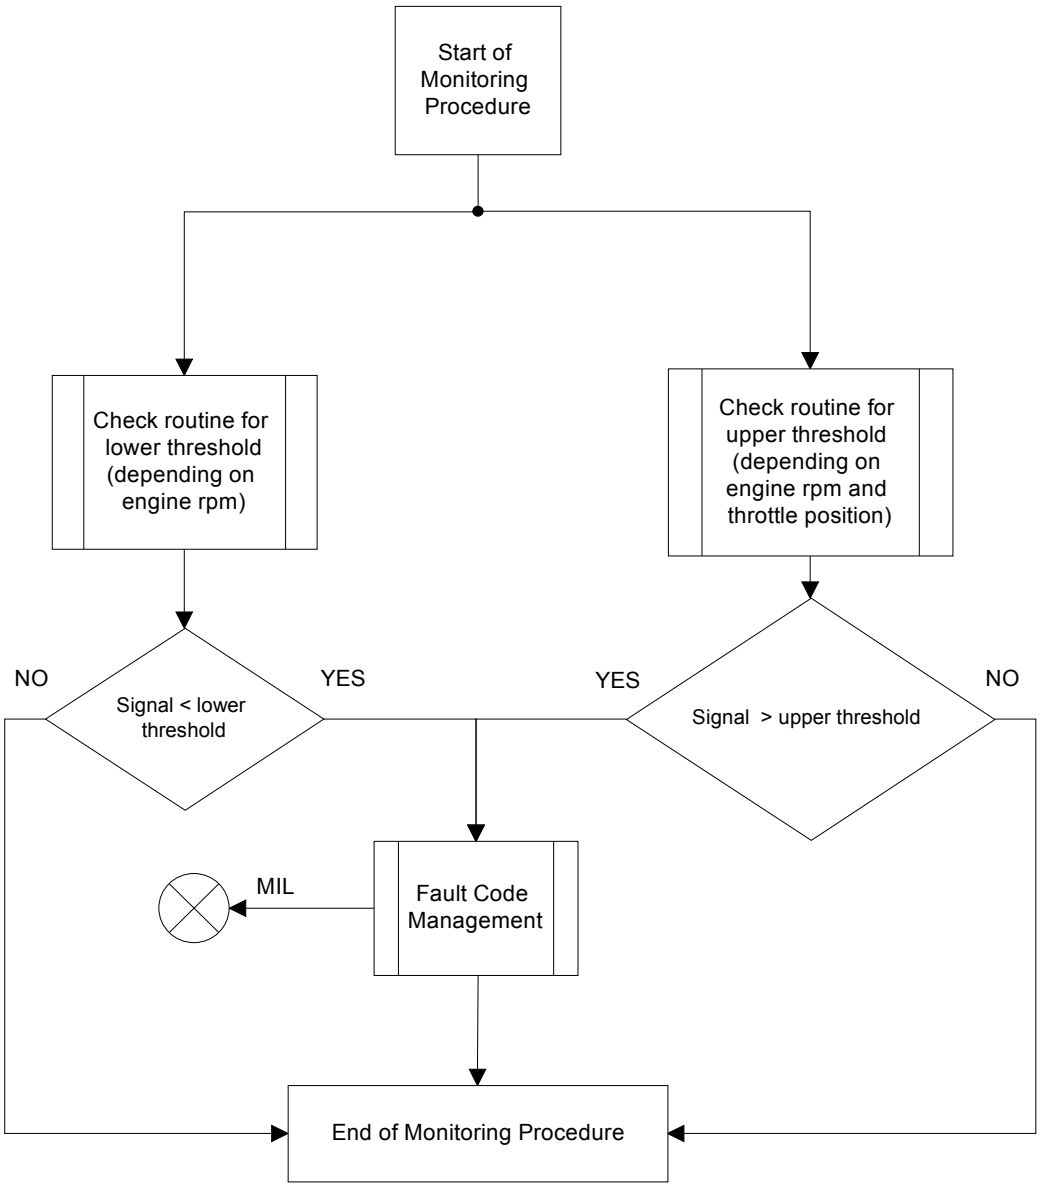

Figure 108: Flow Chart ECT Sensor Out of Range Check (P0115 / P0117)

11 COLD START EMISSION REDUCTION STRATEGY MONITORING

11.1 General Description

This strategy comprises several different measures, initiated by the ECM, in order to reduce cold start exhaust gas emissions. The key parameters in the cold start emission reduction strategy (CSERS) are controlled by components which are included in and covered by the OBD II system. Any malfunction of one of these components would be indicated by the MIL.

The strategy is utilized to attain the catalyst operating temperature as quickly as possible. In terms of emission control, the cold start phase corresponds to the catalyst heating phase:

- The idle speed is increased within the specially defined “engine idle state” during the cold start phase. This measure is called “catalyst-heating idle speed increase” (refer to chapter 15.4.2)
- The ignition timing is retarded during the entire cold start phase
- The VVT camshaft timing is adapted in order to achieve optimum cylinder charging efficiency (refer to chapter 13.4)
- A cold-start specific high pressure adaptation in the fuel system is executed (refer to chapter 6.3.3)

These cold start measures are monitored by comparing the individual measured values/ranges to modeled values/ranges. Error detection is based on identifying deviations that result from these comparisons.

The following components influence the key parameters for the warm-up strategy:

1. Injection valves
2. Throttle unit
3. MAF / MAP
4. Ambient pressure sensor
5. Intake air temperature sensor
6. Ignition coils
7. Variable valve timing system
8. Camshaft/crankshaft alignment
9. Phase sensor
10. Engine speed sensor
11. Fuel pressure sensor

11.2 Monitoring function description

All of the components listed above are monitored by the OBD system during cold start at least for circuit continuity.
The components with influence on injection and ignition are also monitored by the misfire diagnostic function during the cold start. For all concepts which are not applied to chapter 11.4 a pull-back on ignition retard is allowed only in certain range during a cold start condition. This range will be determined by definition of the maximum value for ignition retard.

11.3 Parameters of cold start condition

The parameters which determine cold start conditions are:
1. Mass air integral below threshold
2. Engine coolant start temperature within a range
3. Altitude below threshold

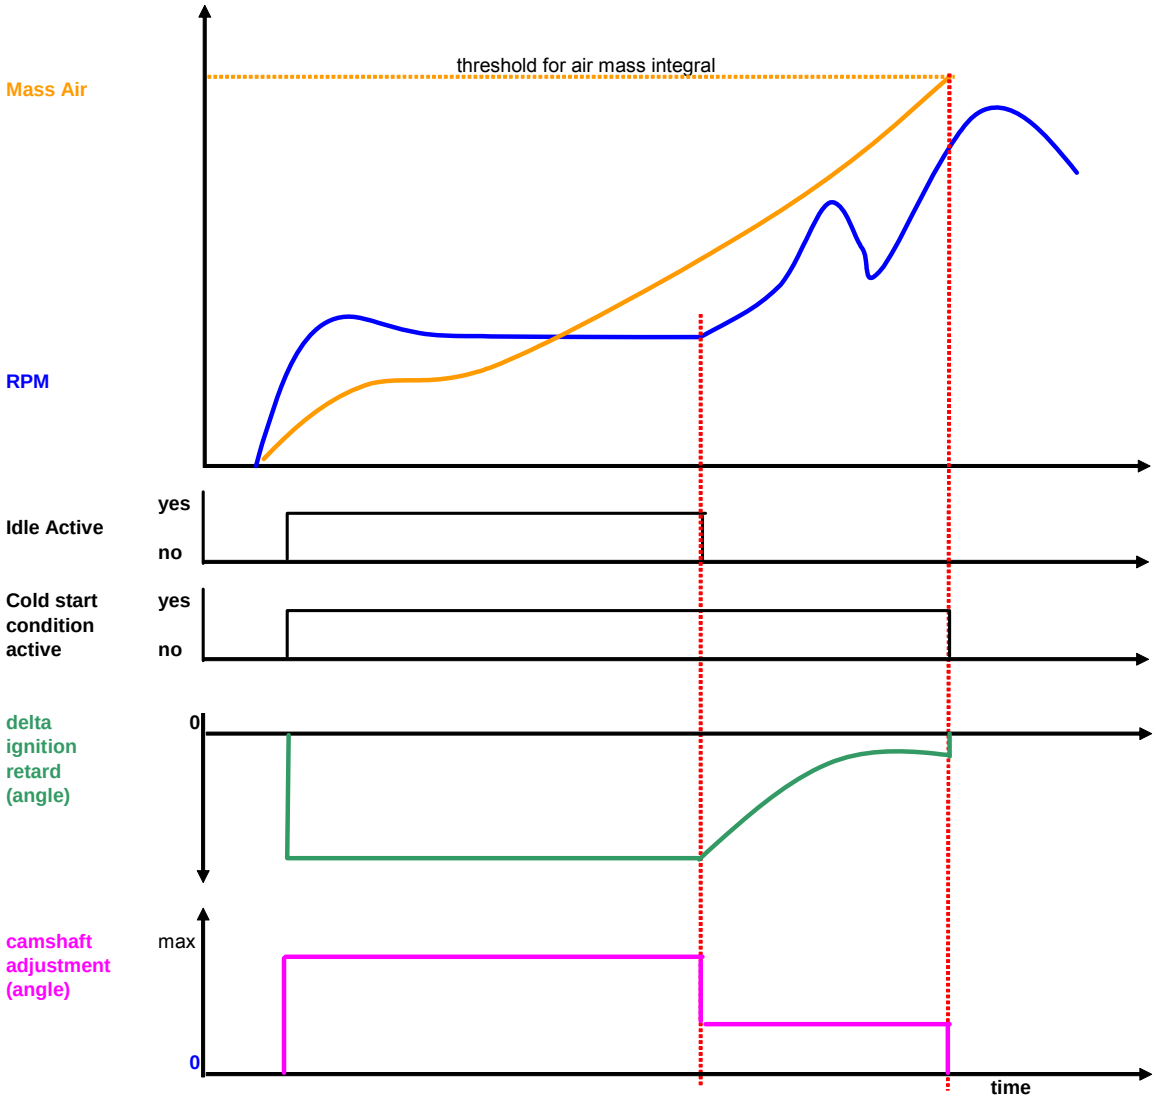

Figure 109: Cold start emission reduction strategy monitoring

11.4 Ignition timing monitor during cold start

The final ignition timing request is monitored, based on the ignition timing efficiency.
Monitoring of final commanded spark timing is based on monitoring spark efficiency during state “catalyst heating active”.
The spark timing monitor will be performed for two different engine operation modes:
“idle” and “off-idle” (minimum duration for each mode has to be exceeded).

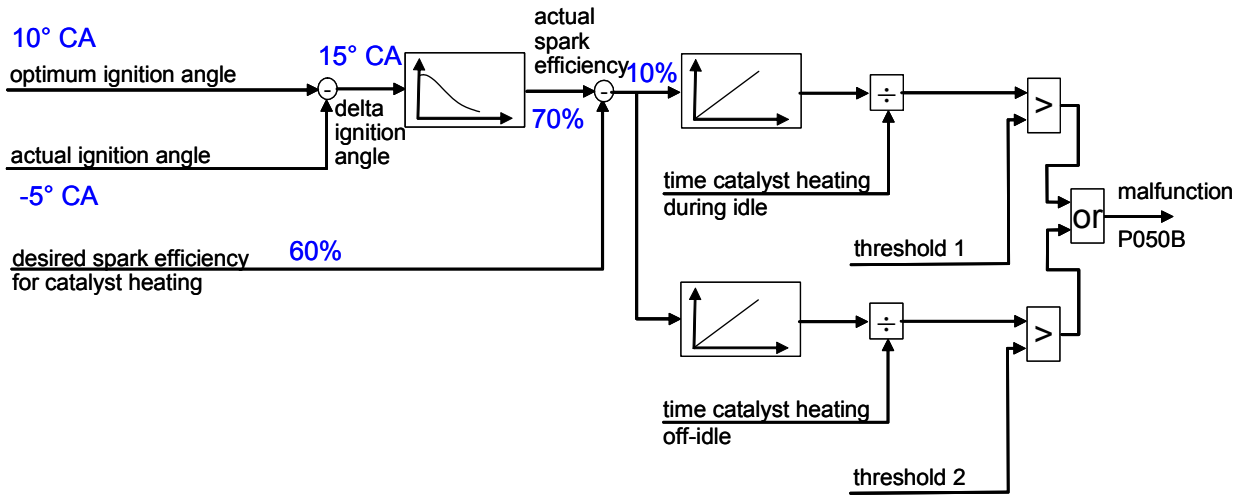

Figure 110: Overview - cold start ignition timing monitor

11.4.1 Signal Range Fault in Idle Speed Range: P050B

Monitoring Strategy
This monitoring function assesses whether the difference between the actual ignition timing efficiency and the setpoint ignition timing efficiency exceeds an upper defined threshold value in idle speed.

Enable Conditions
- Engine running in idle speed
- Ignition timing retard for catalyst heating is active
- Requested ignition timing efficiency < threshold value (enough spark retard commanded)

Malfunction Criteria
The monitoring function is activated only when the requested ignition timing efficiency is low enough that the monitoring threshold can be exceeded when a malfunction is present.
To detect a fault, the difference between the actual ignition timing efficiency and the setpoint ignition timing efficiency is integrated, and the corresponding time accumulated to generate a quotient of these two values in a later phase. The calculation of the integrator value and the time counter is temporarily stopped when the setpoint ignition timing efficiency exceeds a calibrated threshold value. As soon as the efficiency is again below this threshold value, the integration and the time counter are continued.
When a calibrated minimum dwell time in idle speed is reached and the catalyst heating phase has ended, the value of the quotient described above is determined and used as a basis for assessing faults. When the value of this quotient exceeds a calibrated threshold, a fault is detected.

Flowchart

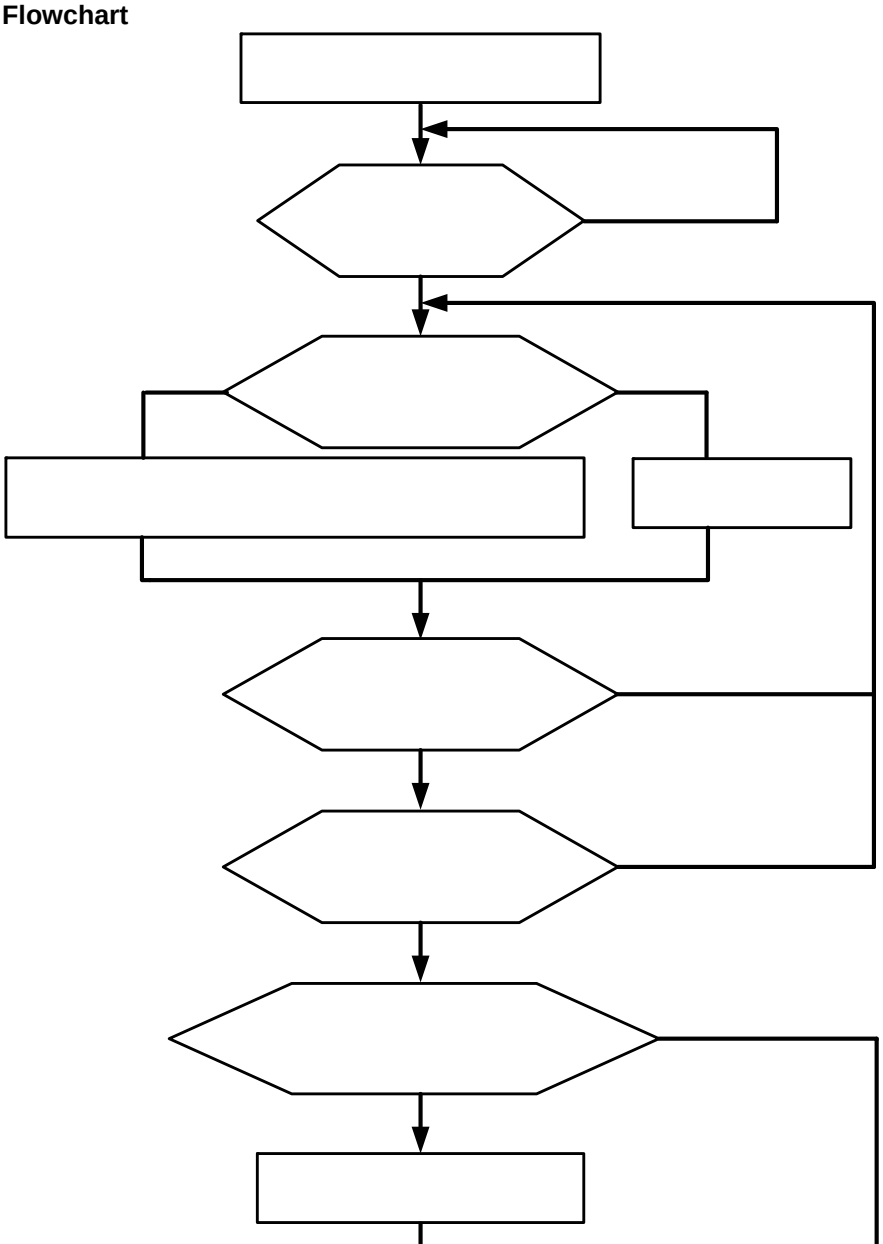

Figure 111: Flow chart ignition timing monitoring - idle speed

In-use monitoring performance ratio

Incrementing the numerator:
The numerator is incremented when the conditions for the defined "idle speed" operating state are fulfilled for longer than a calibratable minimum dwell time, and when the catalyst heating is completed.
Incrementing the denominator:
The denominator is incremented when the conditions for incrementing the general denominator are fulfilled, and when, in accordance with CCR (d) (4.3.2.) (E) (ii), retarded ignition timing for catalyst heating has been active for a cumulative time greater than or equal to ten seconds.

11.4.2 Signal Range Fault in Off-Idle Operation: P13EA

Monitoring Strategy
This monitoring function assesses whether the difference between the actual ignition timing efficiency and the setpoint ignition timing efficiency exceeds an upper or falls below a lower defined threshold.

Enable Conditions
- Engine running in off-idle
- Ignition timing retard for catalyst heating active
- Requested ignition timing efficiency < threshold value (enough spark retard commanded)

Malfunction Criteria
The monitoring function is activated only when the requested ignition timing efficiency is low enough that the monitoring threshold can be exceeded when a malfunction is present.
To detect a fault, the difference between the actual ignition timing efficiency and the setpoint ignition timing efficiency is integrated, and the corresponding time is accumulated to generate a quotient of these to values in a later phase. The calculation of the integrator value and the time counter are temporarily stopped when the setpoint ignition timing efficiency exceeds a calibrated threshold value. As soon as the efficiency is again below this threshold value, the integration and the time counter are continued.
When a calibrated minimum dwell time in off-idle operation is reached and the catalyst heating phase has been completed, the value of the quotient described above is determined and used as a basis for assessing faults. When the value of this quotient exceeds a calibrated threshold, a fault is detected.

Flowchart

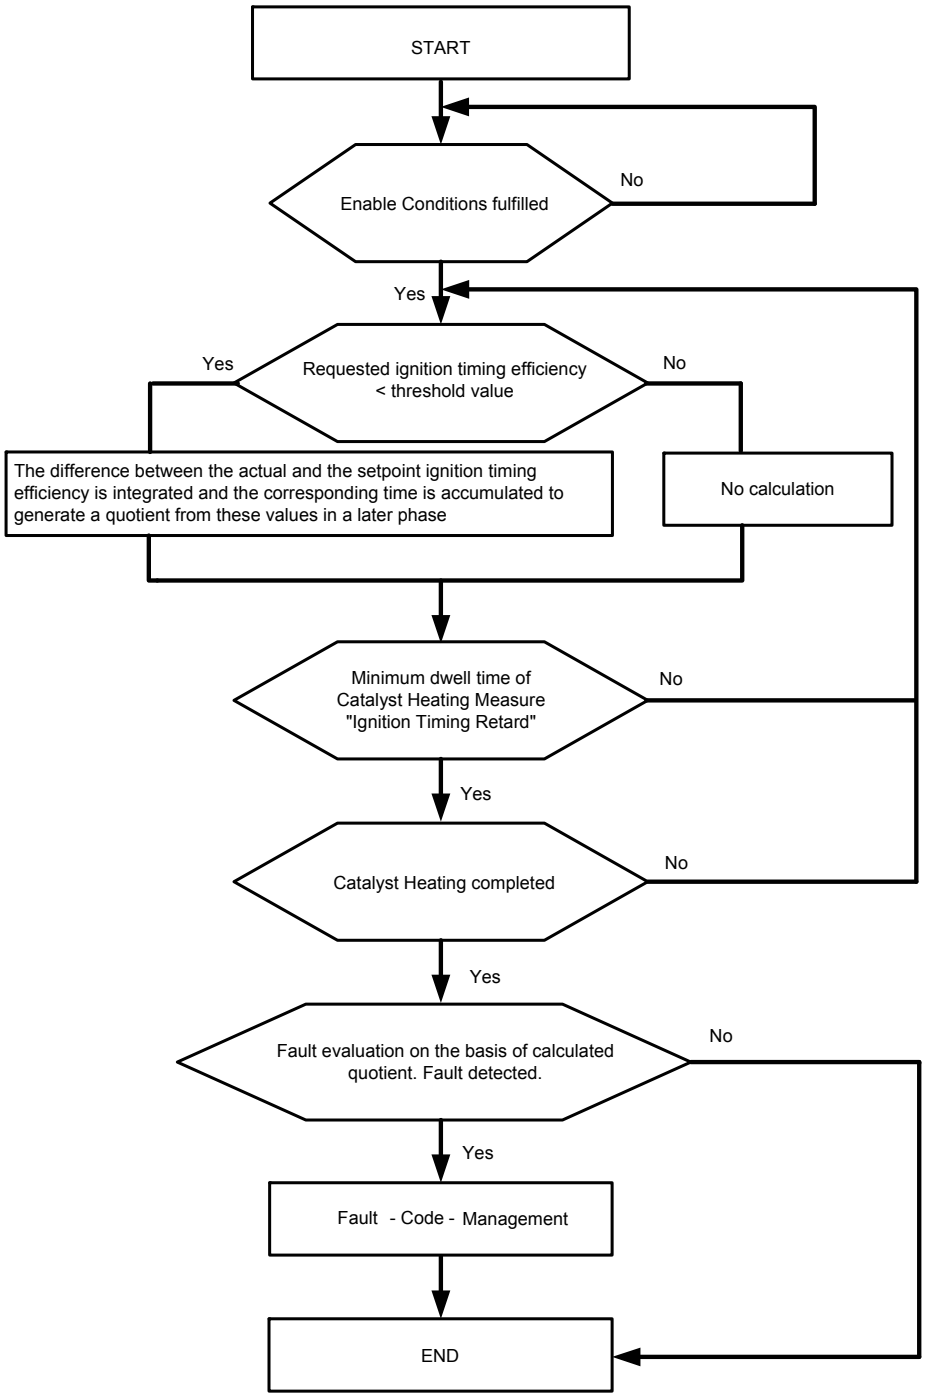

Figure 112: Flow chart ignition timing monitoring – off-idle

In-use monitoring performance ratio

Incrementing the numerator:

The numerator is incremented when the conditions for the defined "off-idle" operating state are fulfilled for longer than a calibrated minimum dwell time, and when catalyst heating is completed.

Incrementing the denominator:

The denominator is incremented when the conditions for incrementing the general denominator are fulfilled, and when, in accordance with CCR (d) (4.3.2.) (E) (ii), retarded ignition timing for catalyst heating has been active for a cumulative time greater than or equal to ten seconds.

12 AIR CONDITIONING (A/C) SYSTEM COMPONENT MONITORING

12.1 General Description

The engine control module recognizes the air conditioning status (on or off) as a torque request and compensates the engine torque demand accordingly.
The status of the air conditioning system does not result in use of a different strategy regarding ignition or fuel injection.
The components of the air conditioning system are not used for OBD functions and can not disable monitors.
This applies to both separate and integrated climatic control modules. Integrated climatic control modules may be a separated part of the ECM as “box in a box” unit.

12.2 Monitoring Concept

The air conditioning system is not monitored by the OBD II system for the following reasons:

- Sensors of the air conditioning system are not used within OBD as an input signal.
- Actuators of the air conditioning system are not used as an OBD output component.
- Air conditioning system components can not disable any of the OBD monitors.
- Any failure mode of the air conditioning system does not cause exhaust emissions to exceed 1.5 times the applicable standard.
- Possible failures of the air conditioning system may result in reduction or loss of cooling efficiency during SC03. In this case the vehicle runs with lower load and the emission would not increase.

Determination of the influence on exhaust emissions of the air conditioning (AC) under the condition of following failure modes:
1. AC switched/commanded on → AC compressor mechanically disabled
Result:
The FTP 75 / SC03 results are within normal variation on all concepts.
Therefore there is no other strategy used than the mentioned torque compensation.

2. AC switched/commanded off → AC compressor running always
Result:
The FTP 75 results are higher than the comparable results from a FTP 75 conducted according legal requirements caused by additional load. The FTP 75 results do not exceeded the applicable standard.
Therefore the failure modes of the AC do not exceed the criteria of “1.5 times of any applicable standard.

13 VARIABLE VALVE TIMING AND/OR CONTROL (VVT) SYSTEM MONITORING

13.1 Intake and Exhaust Camshaft Adjustment, Bank 1/2

13.1.1 General Description

The variable valve timing system allows displacement in a uniform direction of the valve timing of all the valves driven by each camshaft. Therefore the size and position of the valve overlap can be changed on engines with two overhead camshafts and adjusted to the individual gas exchange rate, thereby improving the operating characteristics at part load and full load.

Intake camshaft adjustment

Exhaust camshaft adjustment

Figure 113: Variable Valve Timing system

Monitoring of the camshaft adjustment continuously checks whether the camshaft adjustment angle reaches the setpoint value within a defined period of time following an adjustment request. At this point a distinction is made between two fault types: "camshaft adjustment too slow" and "camshaft adjustment setpoint value not attained".

13.1.2 Camshaft Adjustment Slow Response, P000A/P000B/P000C/P000D

Intake side, bank 1: P000A; intake side, bank 2: P000C
Exhaust side, bank 1: P000B; exhaust side, bank 2: P000D

Monitoring Strategy
The difference between the setpoint value and the actual value of the camshaft adjustment angle is compared against a threshold value at a defined point in time.

Enable Conditions
- Modeled oil temperature within a defined range
- Engine speed greater than threshold value
- Time after engine start greater than threshold value

Malfunction Criteria

If all enable conditions are fulfilled, a continuous comparison of setpoint and actual values will detect an adjustment request. If the difference between the setpoint and actual value exceeds a defined angle, the two values are stored. After a defined time interval the setpoint and actual values are compared again. If the difference between setpoint and actual values still exceeds a defined angle, a fault is diagnosed.

The setpoint values are continuously monitored from the time an adjustment request is detected until the fault diagnosis produces a result. If an adjustment request leads to a reversal of direction during this period, the current monitoring is canceled and restarted at the next adjustment request. If a fault is detected, the type of fault is determined after a defined monitoring period has elapsed. The actual value at the start of the monitoring is compared against the actual value at the end of the monitoring period. If the difference between the two actual values is greater than a defined threshold value, the fault "camshaft adjustment too slow" (slow response) is detected. If the threshold value is not exceeded, the fault "camshaft adjustment setpoint value not attained" (target error) is detected.

A fault is registered in the fault memory only if the fault has occurred a defined number of times, as ascertained by means of a fault counter that registers the monitoring results "camshaft adjustment too slow" and "camshaft adjustment setpoint value not attained". Following a fault entry the fault counter is reset.

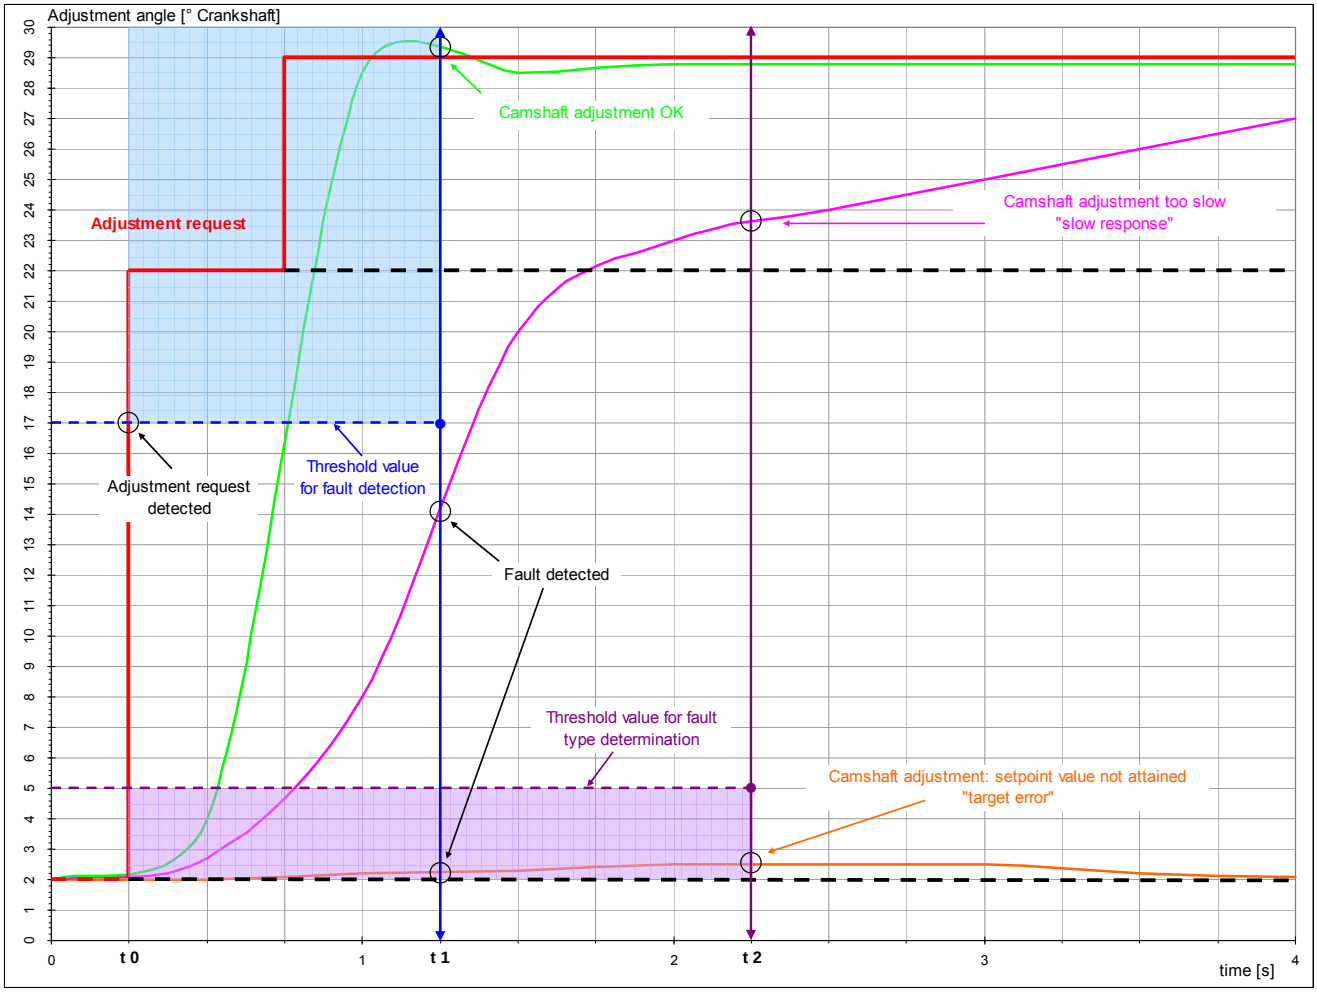

Figure 114: Camshaft adjustment monitoring mode of operation

Flowchart

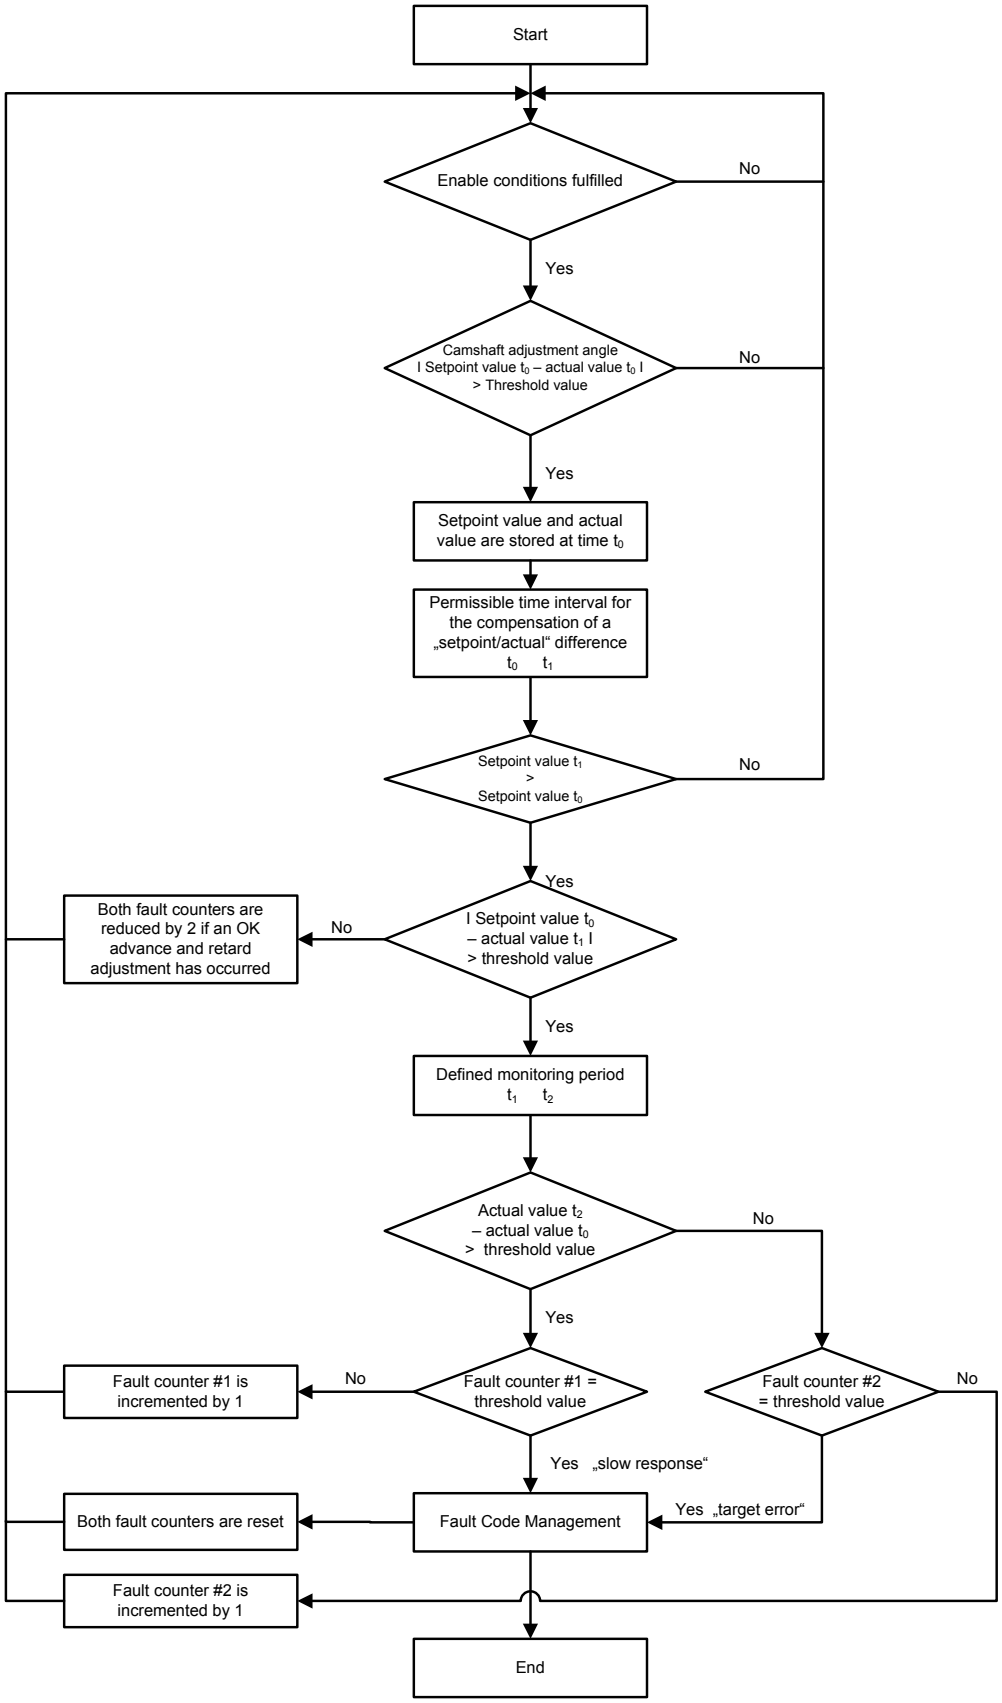

Figure 115: Flowchart of camshaft adjustment monitoring

In-Use Monitor Performance Ratio

Numerator:

The numerator is incremented by one after the cycle flag of the camshaft adjustment monitoring is set.

Denominator:

The denominator is incremented by one when the conditions for incrementing the general denominator according to CCR (d) (4.3.2.) (F) (ii) are fulfilled and the camshaft is changed by a defined value cumulatively for 10 s or twice for 2 s.

13.1.3 Camshaft Adjustment Target error, P0011/P0014/P0021/P0024

Intake side, bank 1: P0011; intake side, bank 2: P0021;
Exhaust side, bank 1: P0014; exhaust side, bank 2: P0024;

Monitoring Strategy

The difference between the setpoint value and the actual value of the camshaft adjustment angle is compared against a threshold value at a defined point in time.

Enable Conditions

- Modeled oil temperature within a defined range
- Engine speed greater than threshold value
- Time after engine start greater than threshold value

Malfunction Criteria

Monitoring of the camshaft adjustment continuously checks whether the camshaft adjustment angle reaches the setpoint value within a defined period of time following an adjustment request. At this point a distinction is made between two fault types: "camshaft adjustment too slow" and "camshaft adjustment setpoint value not attained".

If all enable conditions are fulfilled, a continuous comparison of setpoint and actual values will detect an adjustment request. If the difference between setpoint and actual values exceeds a defined angle, the two values are stored. After a defined time interval the setpoint and actual values are compared again. If difference between the setpoint and actual values still exceeds a defined angle, a fault is diagnosed.

The setpoint values are continuously monitored from the time an adjustment request is detected until the fault diagnosis produces a result. If an adjustment request leads to a reversal of direction during this period, the current monitoring is canceled and restarted at the next adjustment request. If a fault was detected, the type of fault is determined after a defined monitoring period has elapsed. The actual value at the start of the monitoring is compared against the actual value at the end of the monitoring period. If the difference between the two actual values is greater than a defined threshold value, the fault "camshaft adjustment too slow" (slow response) is detected. If the threshold value is not exceeded, the fault "camshaft adjustment setpoint value not attained" (target error) is detected.

A fault is registered in the fault memory only if the fault has occurred a defined number of times, as ascertained by means of a fault counter that registers the monitoring results "camshaft adjustment too slow" and "camshaft adjustment setpoint value not attained". Following a fault entry the fault counter is reset.

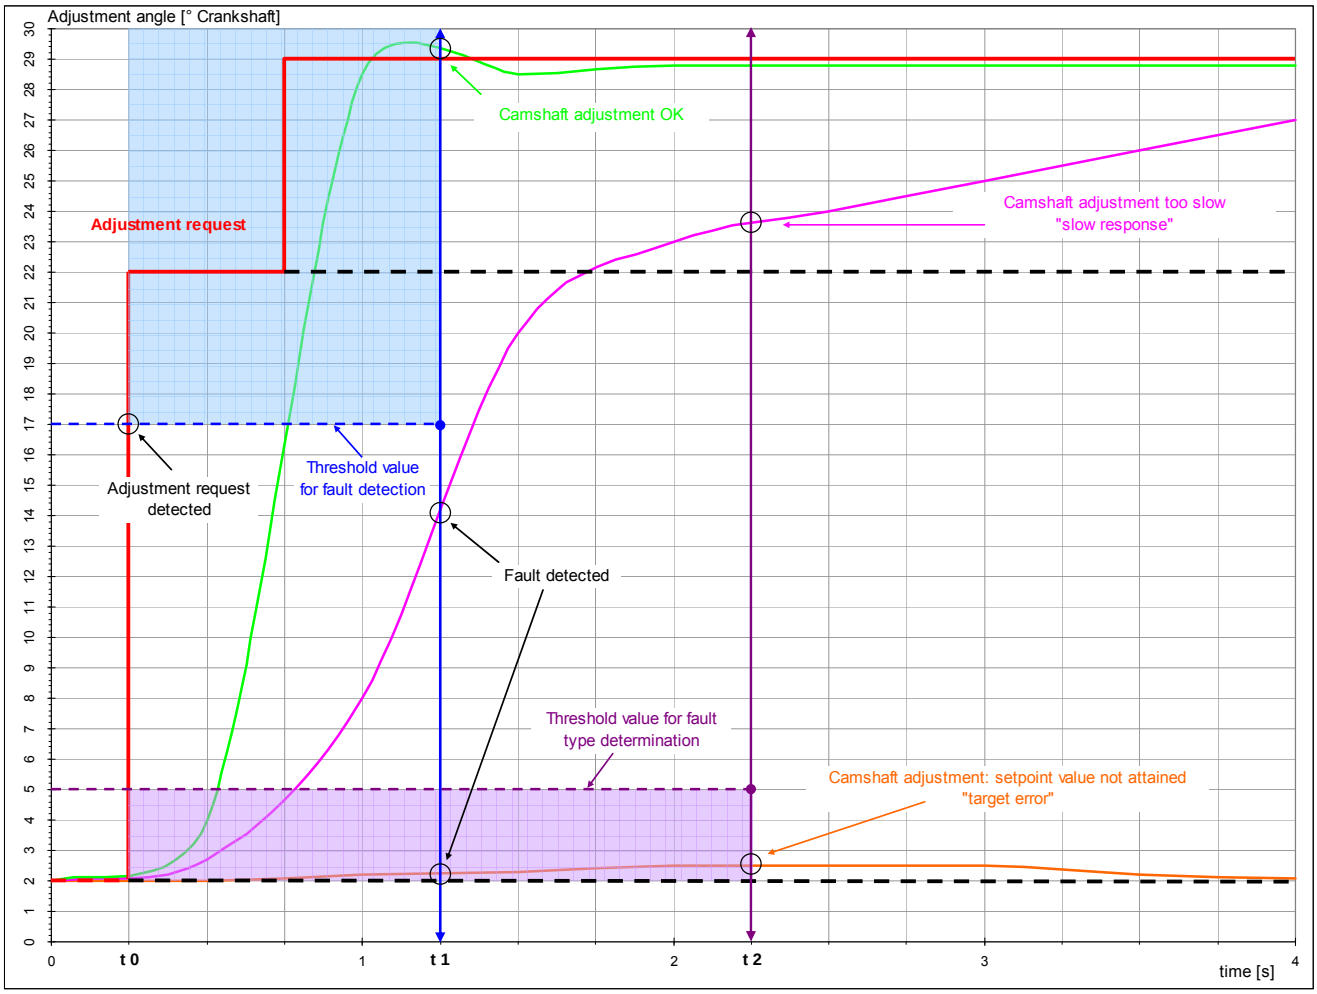

Figure 116: Camshaft adjustment monitoring mode of operation

Flowchart

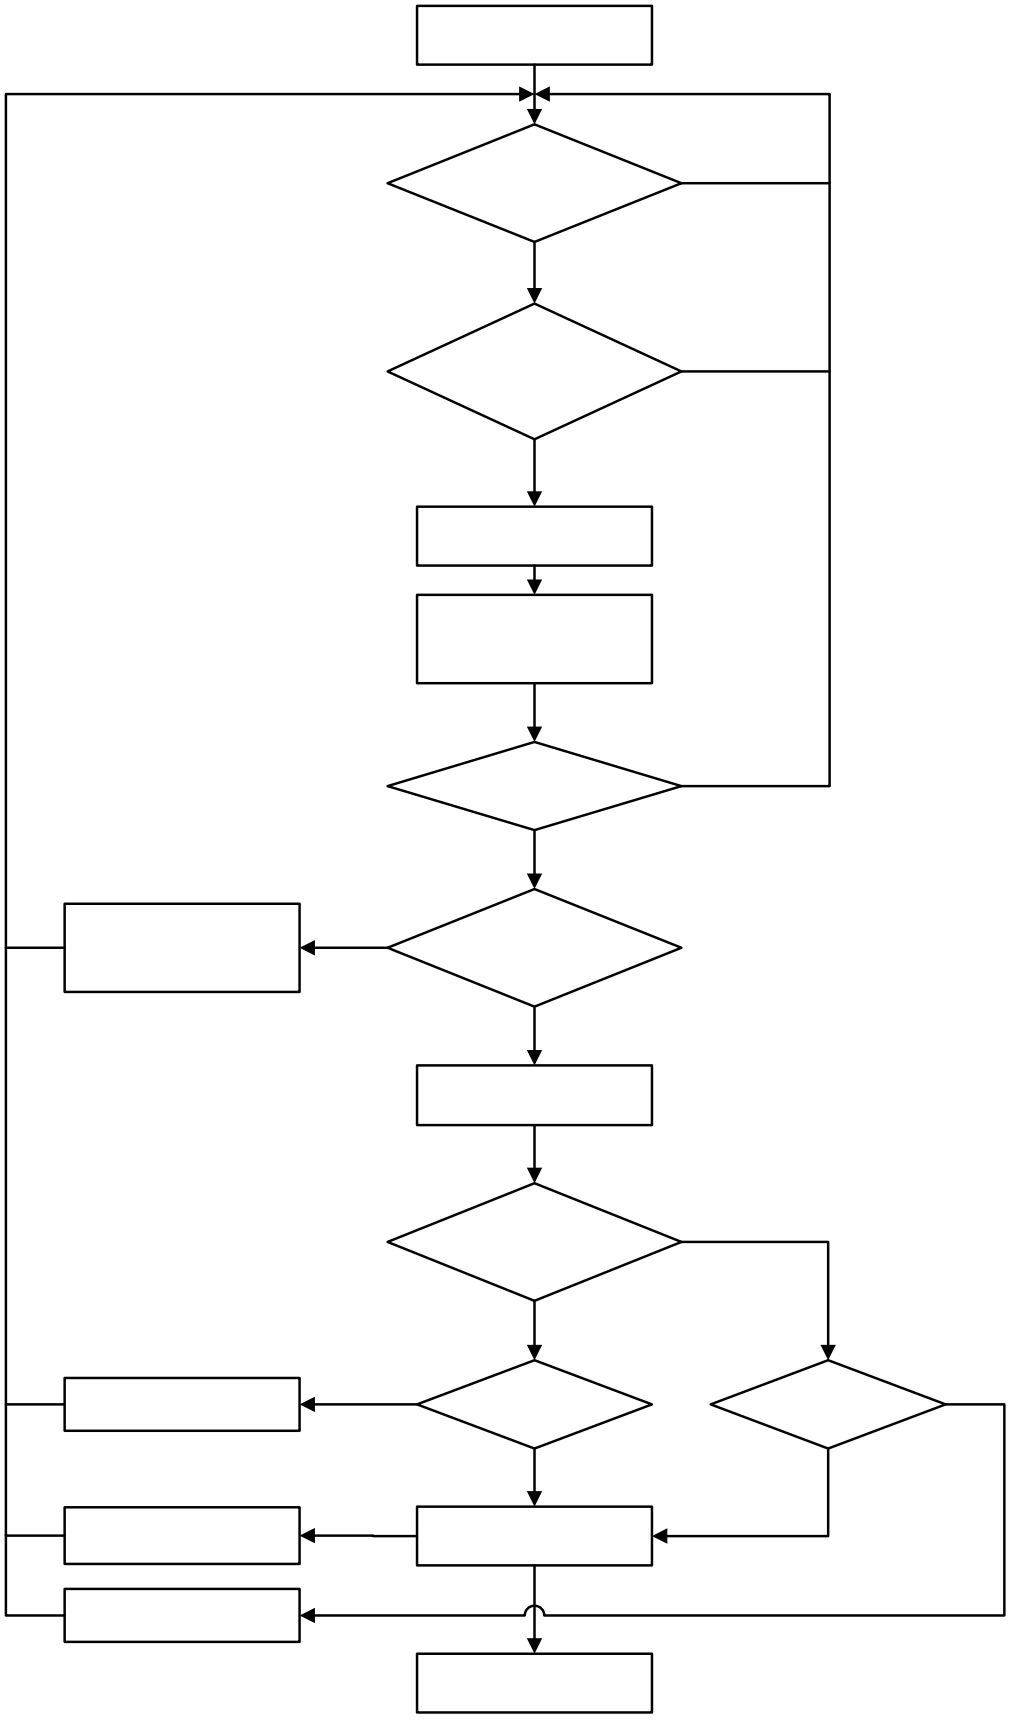

Figure 117: Flowchart of camshaft adjustment monitoring

In-Use Monitor Performance Ratio

Numerator:

The numerator is incremented by one after the cycle flag of the camshaft adjustment monitoring is set.

Denominator:

The denominator is incremented by one when the conditions for incrementing the general denominator according to CCR (d) (4.3.2.) (F) (ii) are fulfilled and the camshaft is changed by a defined value cumulatively for 10 s or twice for 2 s.

13.2 VVT system monitoring during cold start

The camshaft control is monitored by the camshaft timing monitoring function.
This function monitors whether the actual camshaft positions are close enough to the setpoint positions for the catalyst heating phase.

Signal Range Fault

Intake Side, Bank 1: P052A; Intake Side, Bank 2: P052C
Outlet Side, Bank 1: P054A; Outlet Side, Bank 2: P054C

Monitoring Strategy

This monitoring function assesses whether the difference between the actual camshaft position and the setpoint camshaft position exceeds an upper or falls below a lower defined threshold value for longer than a defined time period.

Enable Conditions

- Engine running
- Camshaft control activated
- Commanded camshaft timing correction for catalyst heating is active

Malfunction Criteria

A malfunction is detected when the camshaft actuator is blocked and the camshaft will not reach a setpoint value within a defined time period. To this purpose, the difference between the setpoint value and the actual value of each camshaft is compared to a calibrated threshold value which is determined based on the engine speed and the modeled oil temperature.

Flowchart

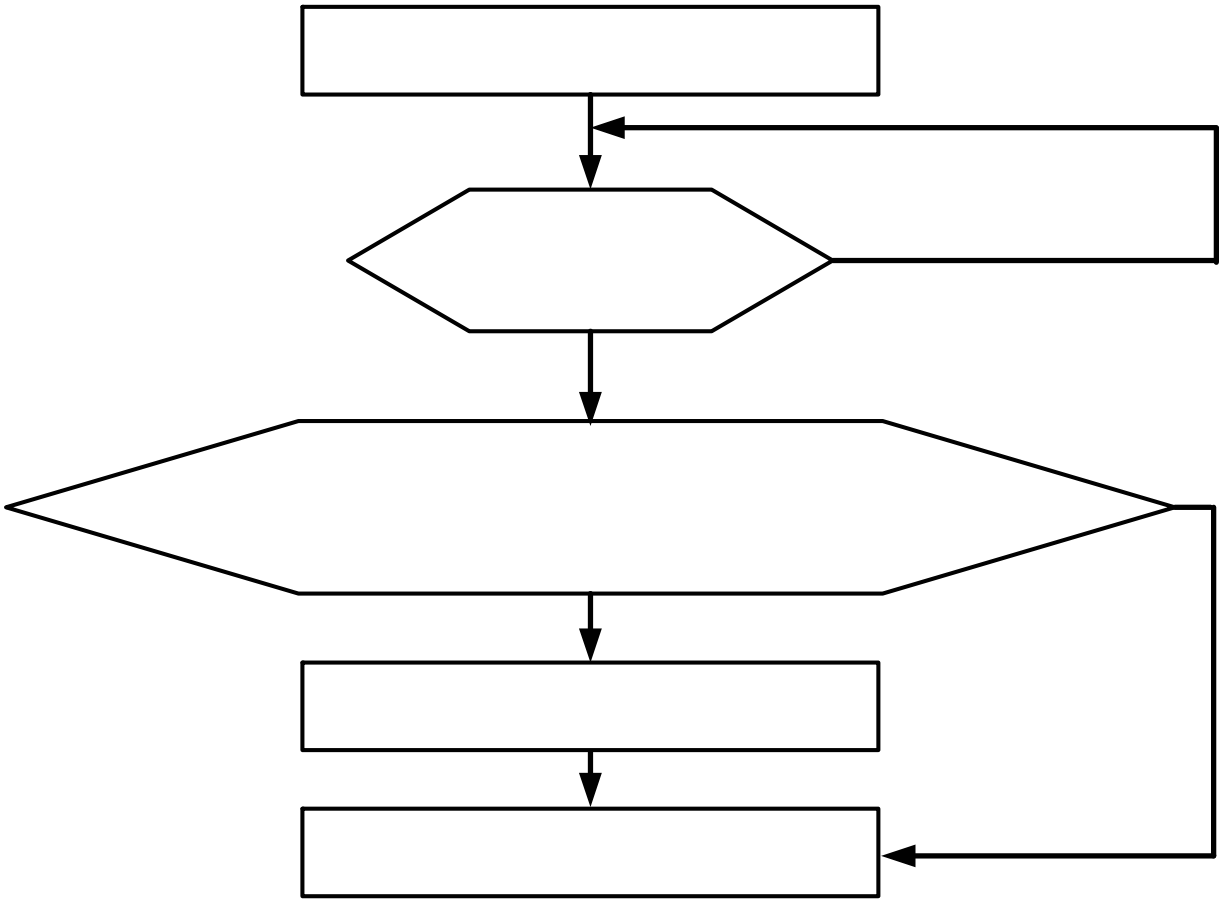

Figure 118: Flow chart camshaft monitoring, signal range

In-Use Monitoring Performance Ratio

Incrementing the Numerator:

The numerator is incremented when the engine is running, the camshaft control is activated, the catalyst heating phase is active, and the defined minimum waiting time of the diagnostic has elapsed.

Incrementing the Denominator:

The denominator is incremented when the conditions for incrementing the general denominator are fulfilled, and when, in accordance with CCR (d) (4.3.2.) (E) (ii), the commanded camshaft timing correction for catalyst heating has been active for a cumulative time greater than or equal to ten seconds.

Difference actual mi

14 COMPREHENSIVE COMPONENTS MONITORING

14.1 Injection valve

Check is performed while using 0
General Description

The gearbox is fitted with a oil temperature sensor, 2 rotation speed sensors (in/out), a shift lever sensor and 1 for reverse gear. Based on these sensors the diagnosis is checking if the gearbox is working correctly. For controlling the gearbox there are 7 pressure regulators and 2 magnetic valves necessary.
With the pressure regulators the clutches, the cooling, the system are controlled. The magnetic valves are need for the selection of the clutches. Also there's one valve for thermo management. BUS system is CAN.

1) Start Stop

For start stop function there is an Electrical oil pump needed. It is controlled via driver. The ATCU detects temperature and failure of EOP via CAN.

2) Plausibility Checks

2a) Shift lever diagnosis
Based on the driver action the movement of the shift lever were checked by the shift lever sensors with several plausibility checks. Also the sensors can detect manual shifting.

Output Stage Check

14.2 Ignition coil

Check is performed while using 0
General Description

The gearbox is fitted with a oil temperature sensor, 2 rotation speed sensors (in/out), a shift lever sensor and 1 for reverse gear. Output Stage Check

14.3 Idle Speed Control

14.3.1 Idle Speed Control (warm engine)

14.3.1.1 General Description

The idle speed should be as constant as possible under any operating condition. It should be set so as to allow a fast throttle response while also maintaining optimum exhaust gas emission levels and fuel consumption. The idle speed control regulates the air mass provided to the engine at idle speed.

14.3.1.2 Engine Speed Less Than Setpoint Value – P0506

Monitoring Strategy

The difference between the setpoint engine idle speed and the actual engine idle speed is compared against a calibrated threshold value.

Enable Conditions

- Vehicle speed = 0 km/h
- Engine running at idle speed (accelerator pedal angle = 0)
- Altitude < 2700 m above sea level
- Engine temperature > threshold value
- Intake air temperature > threshold value

Malfunction Criteria

If the engine speed remains below the threshold value for longer than a defined time period, a fault is detected. A "low engine speed" fault is present if the difference between the setpoint engine speed and the actual engine speed remains greater than a positive threshold value for longer than a defined time period and if the integrator of the idle speed control has reached its maximum.

Flowchart

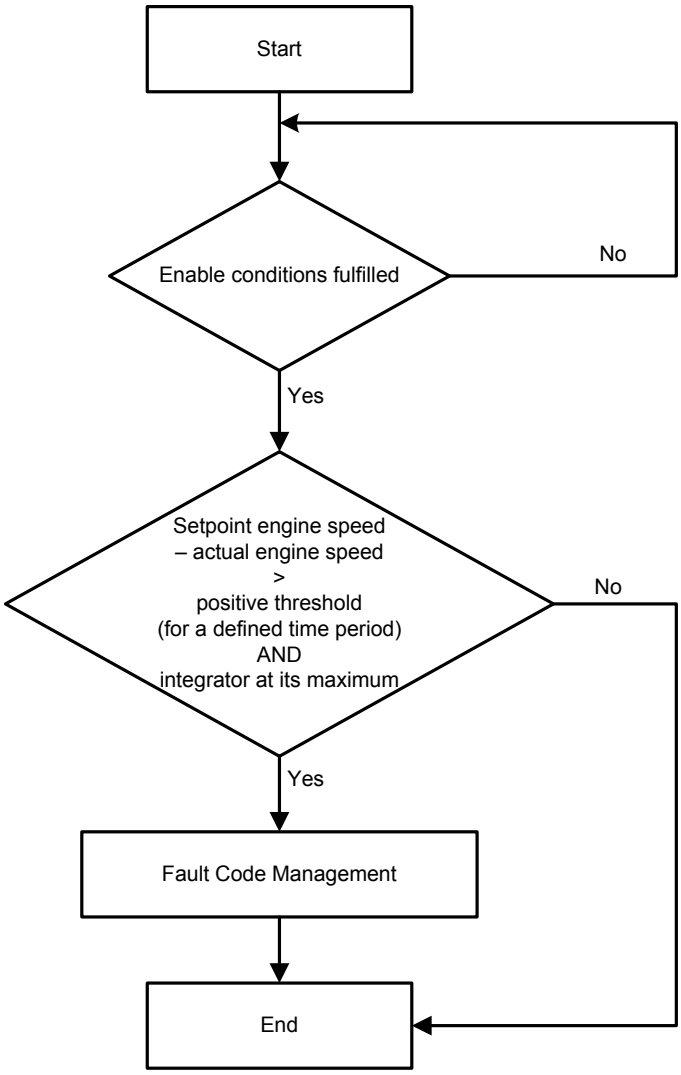

Figure 119: Engine speed below setpoint value – P0506

14.3.1.3 Engine Speed Greater Than Setpoint Value – P0507

Monitoring Strategy
The difference between the setpoint engine idle speed and the actual engine idle speed is compared against a calibrated threshold value.

Enable Conditions
- Vehicle speed = 0 km/h
- Engine running at idle speed (accelerator pedal angle = 0)
- Altitude < 2700 m above sea level
- Engine temperature > threshold value
- Intake air temperature > threshold value

Malfunction Criteria

If the engine speed remains greater than the threshold value for longer than a defined time period, a fault is detected. An "engine speed too high" fault is present if the difference between the setpoint engine speed and the actual engine speed remains below a negative threshold value for longer than a defined time period and if the integrator of the idle speed control has reached its minimum.

Flowchart

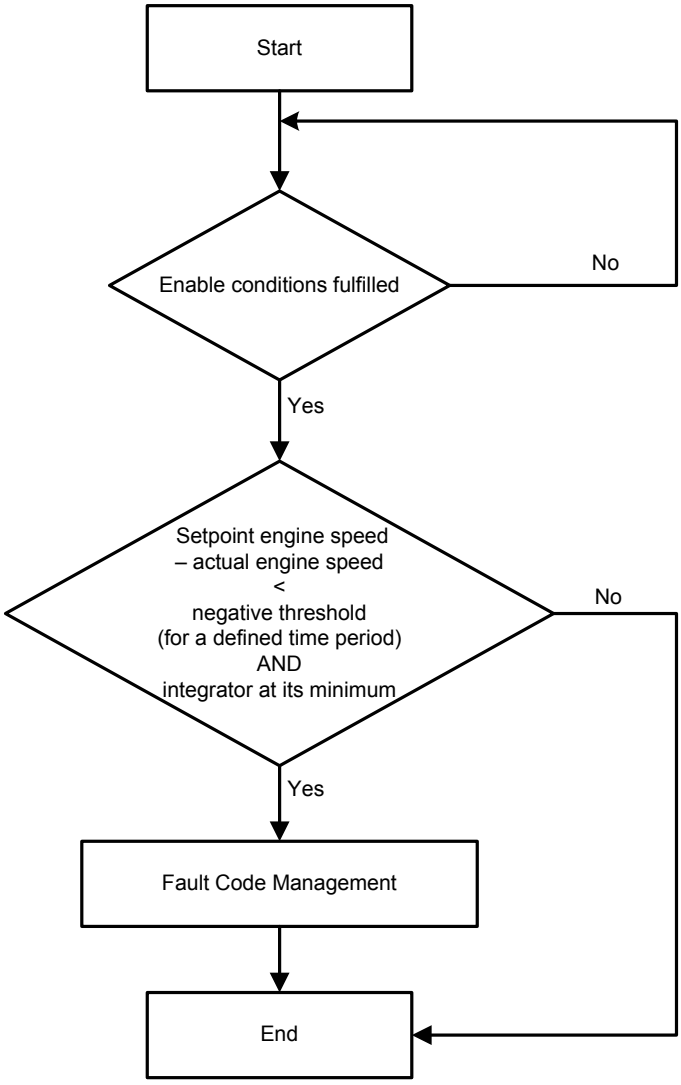

Figure 120: Engine speed greater than setpoint value – P0507

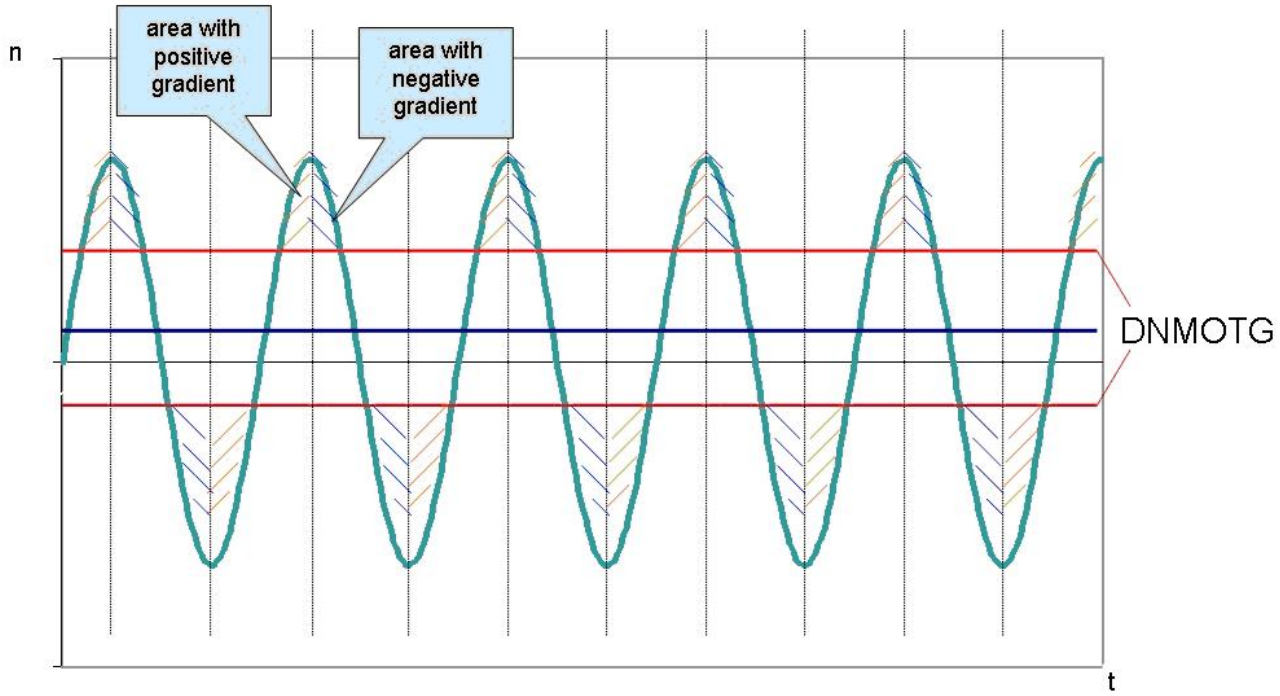
14.3.1.4 Rationality Fault – P0506

Monitoring Strategy
Monitoring for engine surges or impermissible engine speed oscillations

Enable Conditions
- Vehicle speed = 0 km/h
- Engine running at idle speed (accelerator pedal angle = 0)
- Altitude < 2700 m above sea level
- Engine temperature > threshold value
- Intake air temperature > threshold value

Malfunction Criteria
A rationality fault is detected when engine speed oscillations greater than the setpoint idle speed oscillation repeatedly occur and the total sum of the areas formed by these positive and negative engine speed gradients exceeds a calibrated threshold (see illustration below).



DNMOTG: Setpoint idle speed oscillation

Figure 121: Fault detection of engine surges or engine speed oscillations - rationality fault

Flowchart

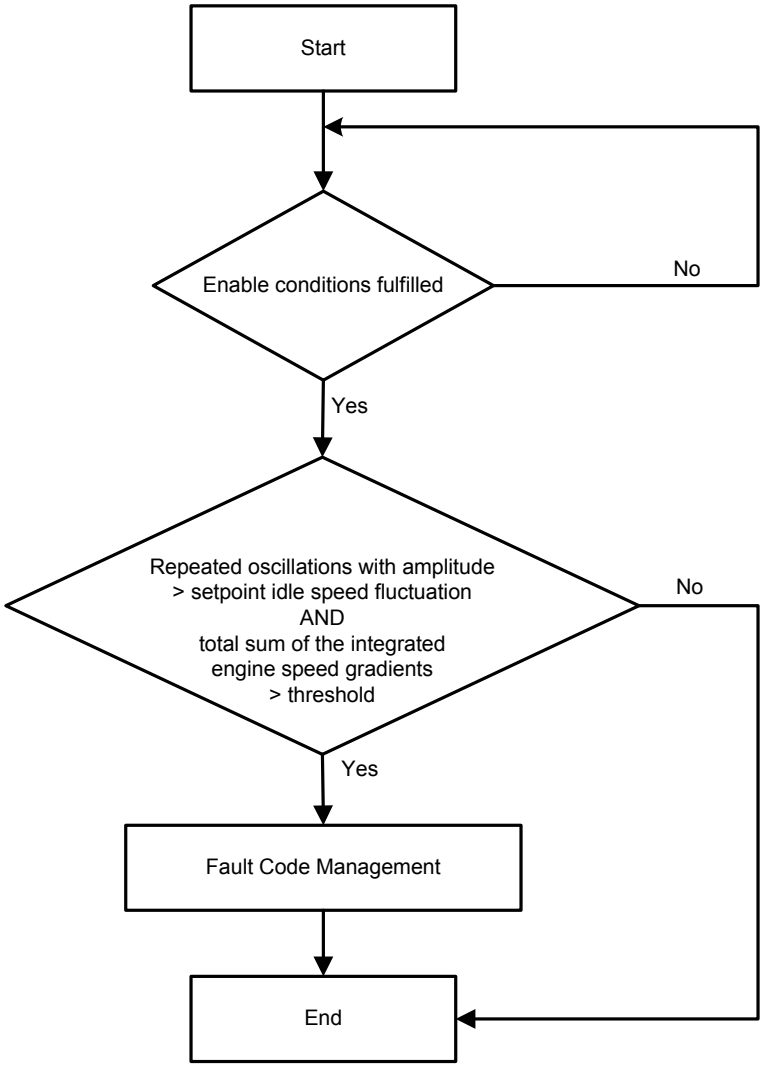


Figure 122: Rationality fault – P0506

In-Use Monitor Performance Ratio

Incrementing the numerator

The numerator is incremented when the dwell time at idle speed that would be necessary for the integration part of the idle controller to reach its maximum given an existing fault has elapsed and the additional waiting period of the diagnostic has elapsed.

Incrementing the denominator

The denominator is incremented when the conditions for incrementing the general denominator in accordance with CCR (d) (4.3.2.) (E) (ii)) are fulfilled.

14.3.2 Idle control check during cold start

The idle speed increase helps the catalyst reach its operating temperature faster by completing more combustion cycles per time unit than in normal idle speed and thus achieving higher mass air flow rates.

14.3.2.1 Signal Range Fault: P050A

Monitoring Strategy
The engine speed must not exceed the upper threshold value or fall below the lower threshold value for longer than a defined time period.

Enable Conditions
- Altitude less than 2700 meters above sea level
- Engine running in idle speed (accelerator pedal position = 0)
- Vehicle speed = 0
- catalyst heating active

Malfunction Criteria
A malfunction is detected when the engine speed exceeds the upper or falls below the lower threshold value for longer than the defined time period. An overspeed malfunction is detected when the difference between the actual engine speed and the setpoint engine speed exceeds the upper threshold value for longer than a defined time period.
An underspeed malfunction is detected when the difference between the actual engine speed and the setpoint engine speed falls below the lower threshold value for longer than a defined time period.

Flowchart

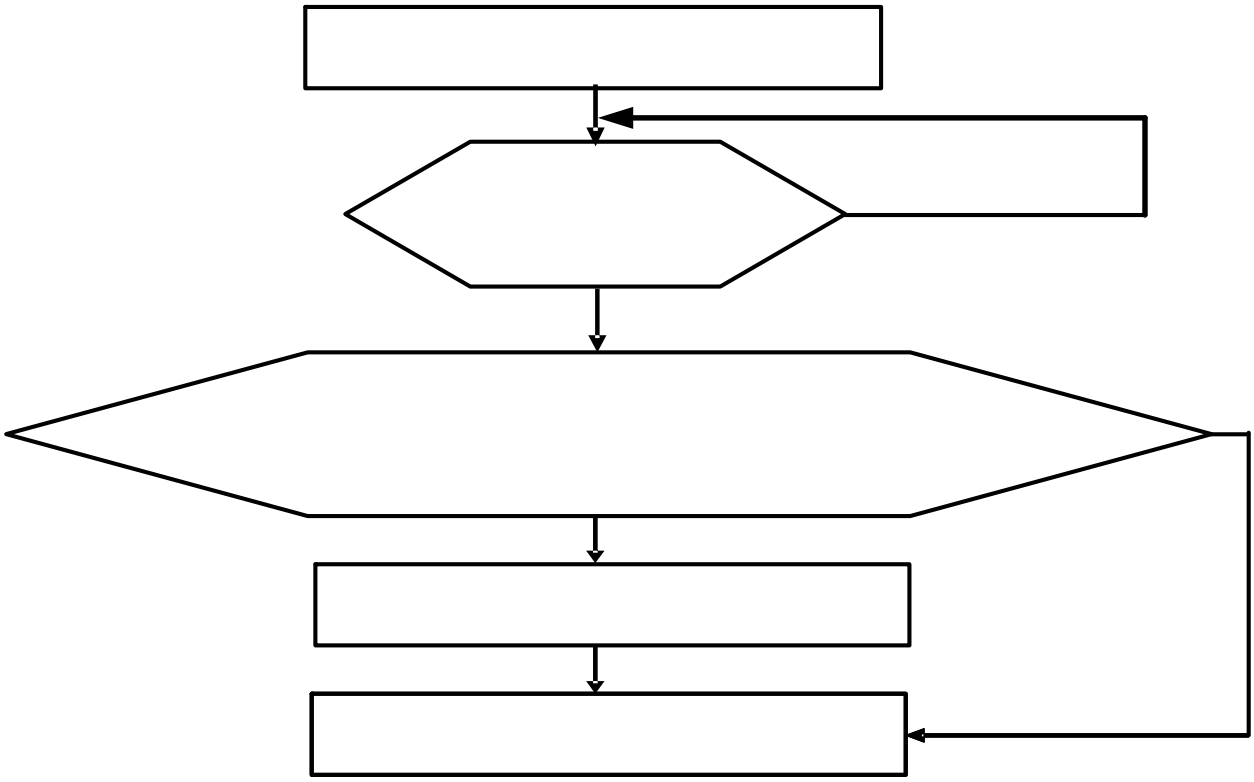

Figure 123: Flow chart catalyst-heating idle speed increase, signal range fault

In-use monitoring performance ratio

Incrementing the numerator

The numerator is incremented when the dwell time in idle speed that would be necessary for the integration part of the idle controller to reach its maximum in case of an existing fault, has elapsed, and the additional waiting period of the diagnostic has passed.

Incrementing the denominator

The denominator is incremented when the conditions for incrementing the general denominator are fulfilled, and when, in accordance with CCR (d) (4.3.2.) (E) (ii), the commanded idle speed increase for catalyst heating has been active for a cumulative time greater than or equal to ten seconds.

14.3.2.2 Rationality Fault: P050A

Monitoring Strategy

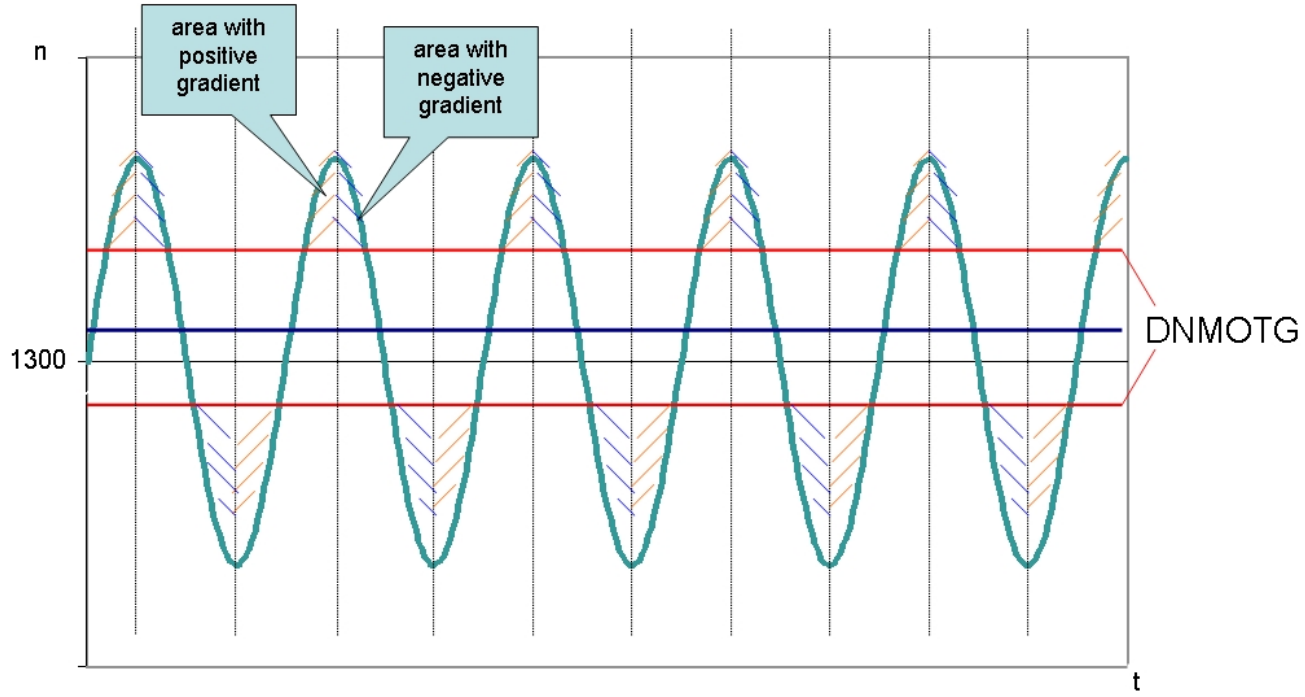
Monitoring for engine surge or impermissible engine speed oscillations

Enable Conditions

- Altitude less than 2700 meters above sea level
- Engine running in idle speed (accelerator pedal position = 0)
- Vehicle speed = 0
- Commanded idle speed increase for catalyst heating is active

Malfunction Criteria

A rationality fault is detected when engine speed oscillations greater than the setpoint idle speed fluctuation permanently occur and the total sum of the areas formed from these positive and negative engine speed gradients exceed a calibratable threshold (see illustration below).



DNMOTG: setpoint idle speed fluctuation

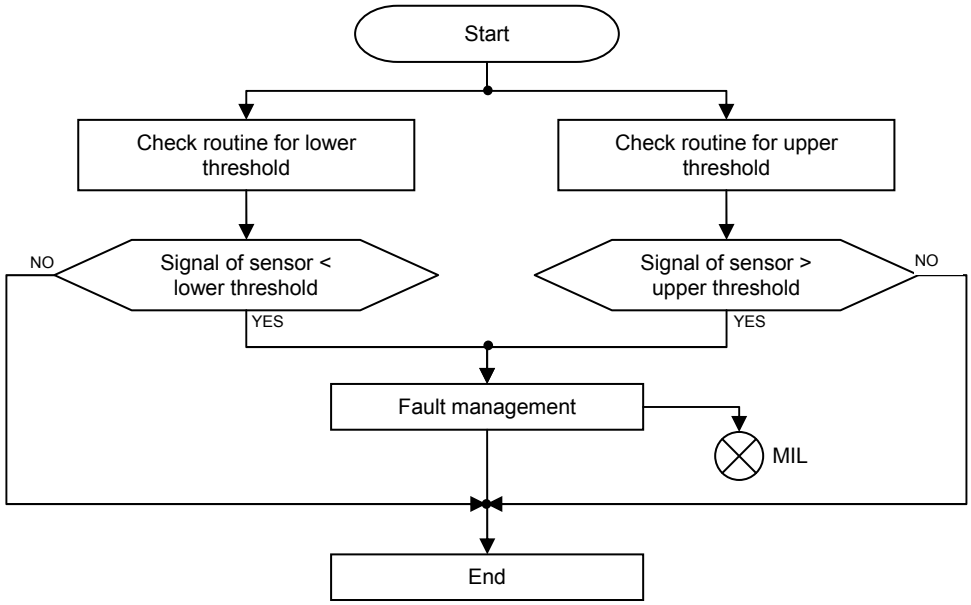

Figure 127: Flow chart signal range check for input sensor

14.6 Mass air flow sensor monitoring (MAF)

14.6.1 Single MAF Sensor System

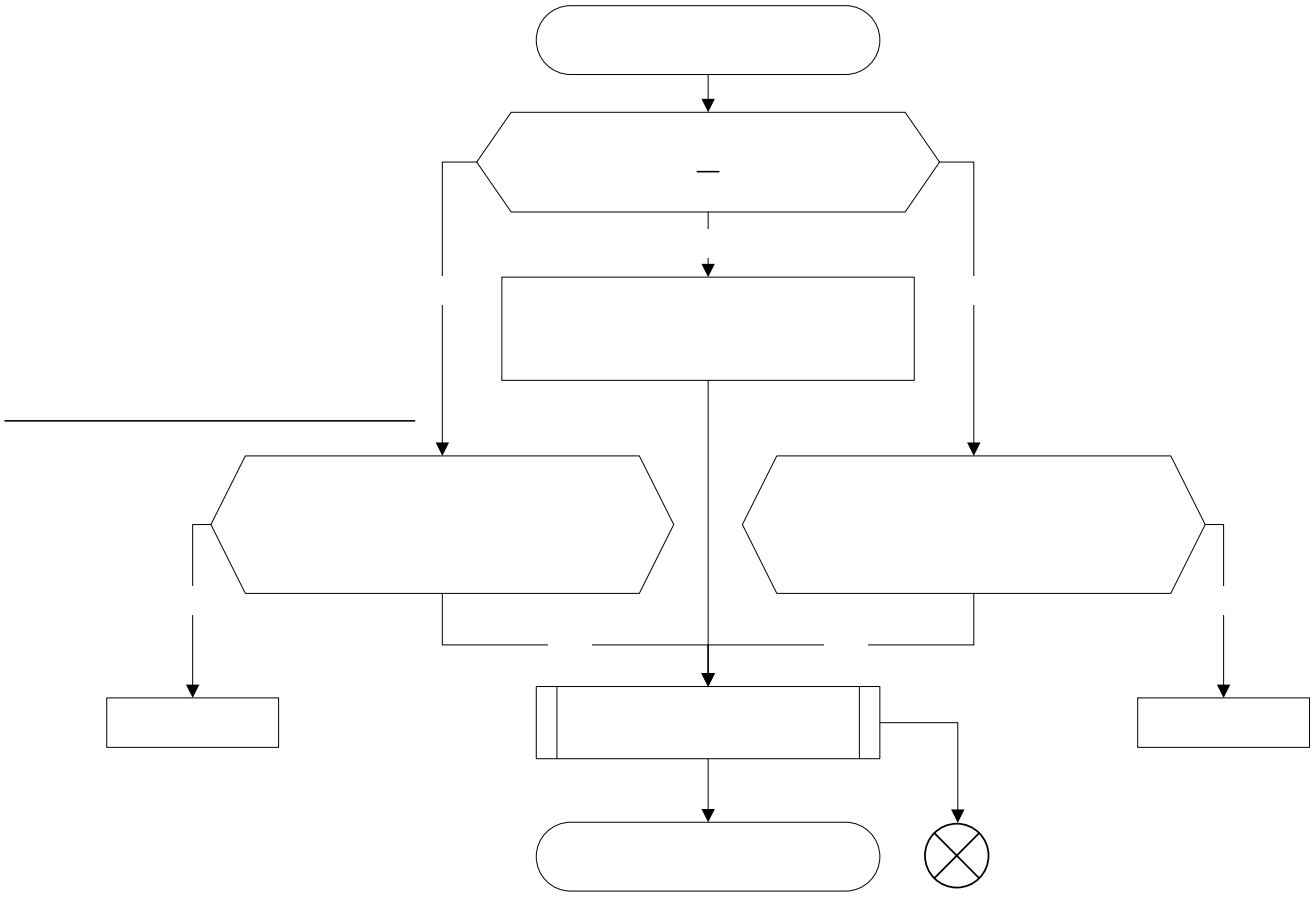

Figure 128: Flow chart rationality mass air flow sensor (one MAF system)

14.6.2 Correlation Air temperature intake manifold/ MAF intake air

General description

The main parts, that belong to the cross check, are shown in Figure 129.

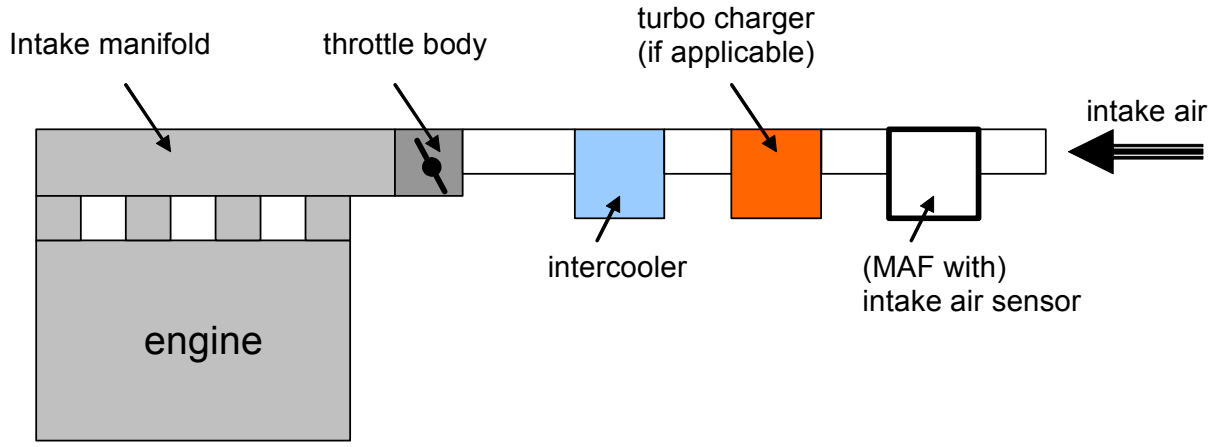

Figure 129: Overview - main parts for cross check

To run a cross check it is necessary to compare the two temperature signals during the cold start. In this case the MAF air temperature and intake manifold air temperature have to be in an sufficient range.

Monitor structure

In case that the difference between MAF air temperature and the intake manifold air temperature is to big during a cold-start, the monitoring system detects a “correlation fault” between these both sensor signals.

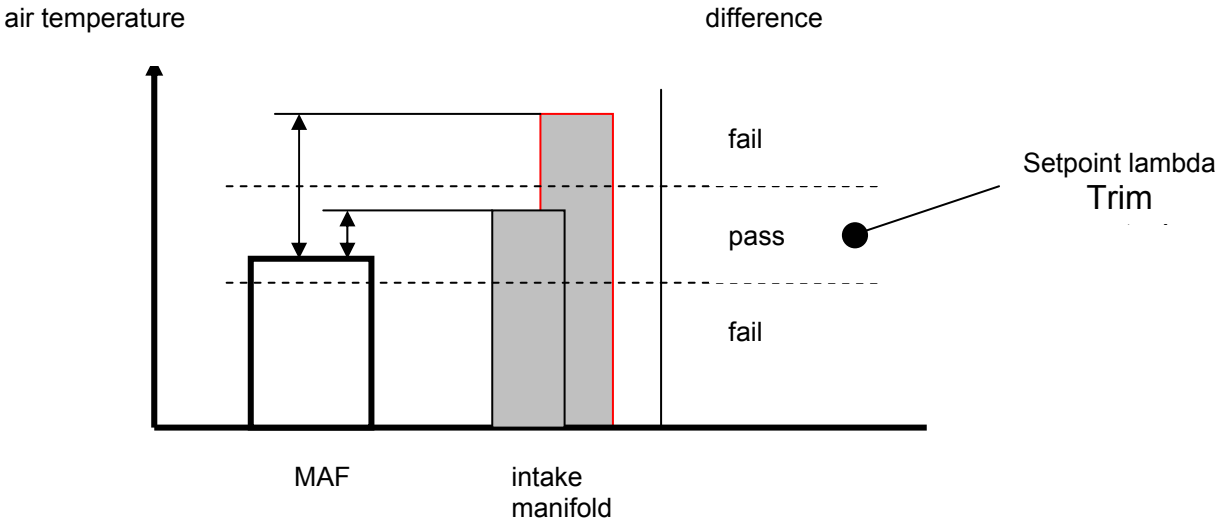

Figure 130: Correlation air temperature intake manifold / MAF intake air

Flowchart

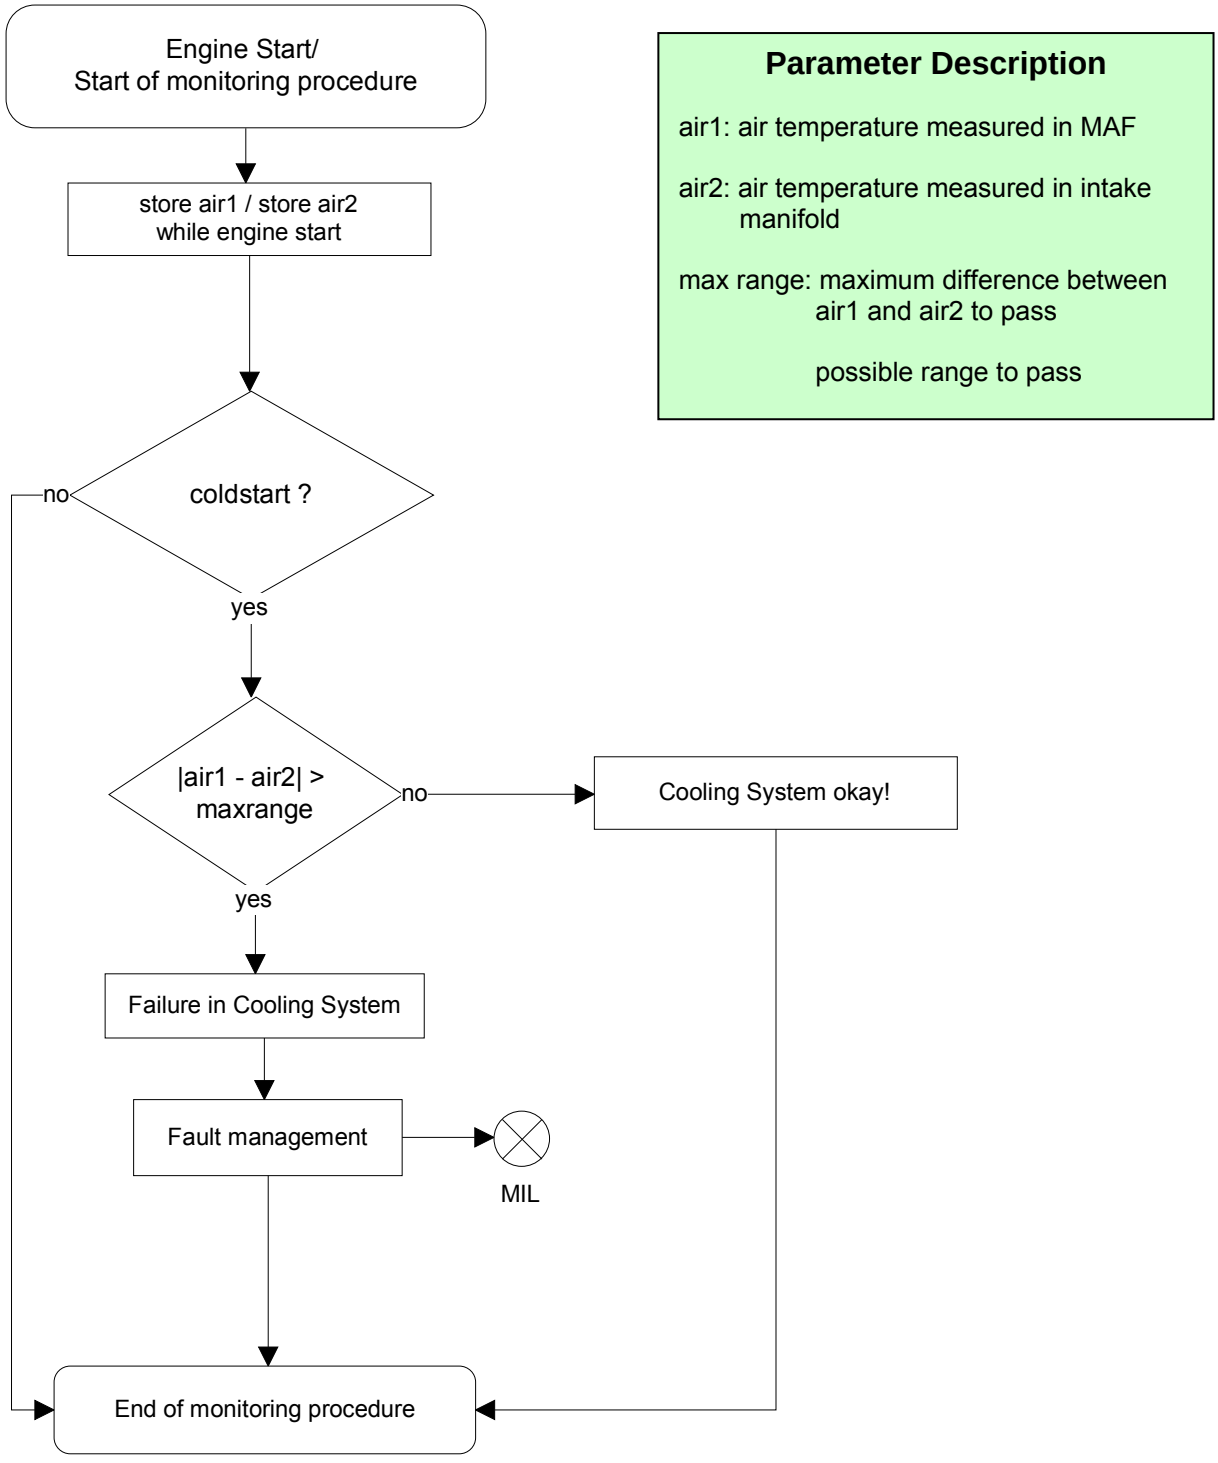

Figure 131: Flow chart - correlation air temperature intake manifold / MAF intake air

14.7 Vehicle speed sensor (VSS)

14.7.1 Vehicle Speed Signal Monitoring via ESP/ABS

14.7.1.1 General Description

The vehicle speed signal faults detected by the ESP/ABS control module are transmitted to the ECM via the FlexRay/CAN bus by means of an OBD error nibble (= half-byte = 4 bits) which contains the fault information of each wheel speed sensor. Obtaining the fault information, the ECM forwards it to its fault memory. A fault code is only registered in the ECM if none of the wheel speed sensors provides the ESP/ABS control module with a valid signal, and thus the MIL is commanded on if none of the wheel speed sensors is fault-free.

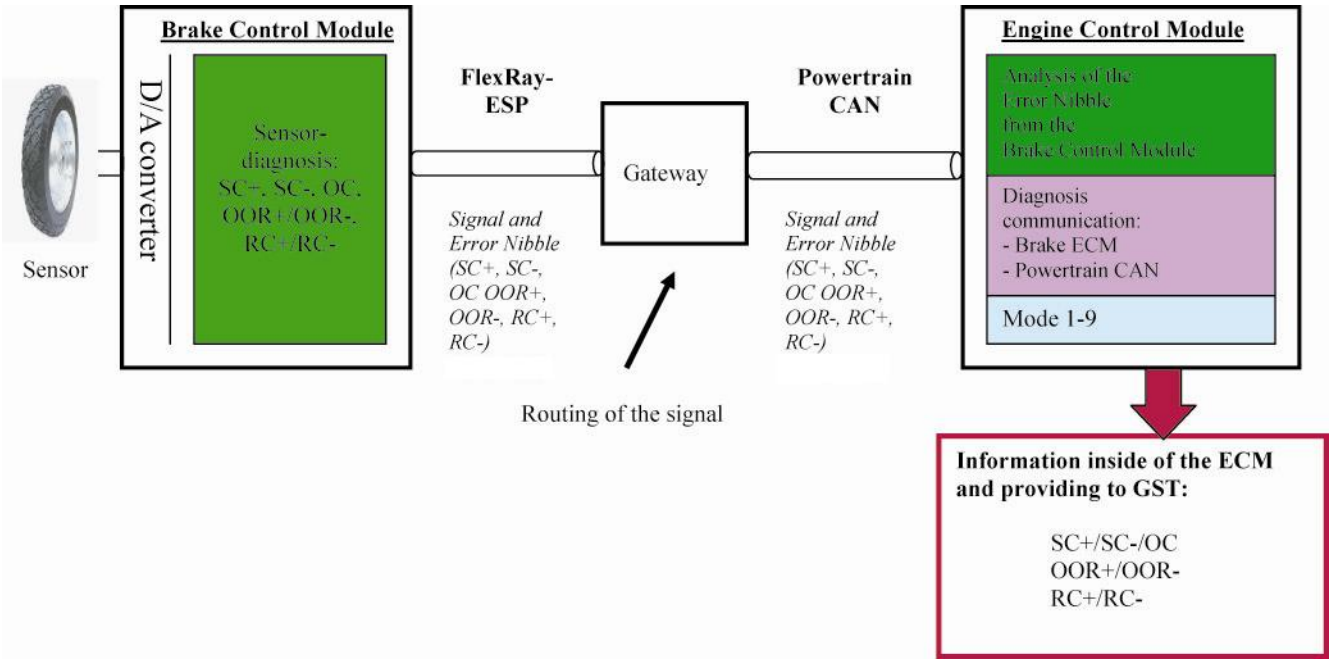

Figure 132: Schematic presentation of brake control module and engine control module

14.7.1.2 Vehicle Speed Signal faulty – P0501/P0502

Monitoring Strategy
The EPS/ASB fault memory is read out.

Enable Conditions
These diagnostics in the brake control module are run continuously; hence no enable conditions are defined.

Malfunction Criteria
In the ESP/ABS control module, the individual fault states of the wheel speed sensors are mapped to an error nibble, and in the ECM they are classified either as electrical faults or rationality faults and assigned to a P-Code, respectively. The MIL is commanded on if none of the individual signals from the wheel speed sensors is assessed as fault-free.

ESP/ABS control module	Error nibble	ECM		
Short to ground	$0001	Electrical faults	P0502	MIL ON, if no wheel speed sensor is available
Short to battery	$0010			
Open circuit	$0011			
Signal too high	$0100	Rationality faults	P0501	
Signal too low	$0101			
Rationality check, high	$0110			
Rationality check, low	$0111			

Figure 133: Fault states mapped to error nibble

14.7.2 Vehicle Speed Signal Monitoring via Deceleration Fuel Cut-Off Check

14.7.2.1 General Description
The ECM receives the vehicle speed signal via the FlexRay/CAN bus from the ESP/ABS control module. The ESP/ABS control module calculates the vehicle speed from the signals of the four wheel speed sensors and sends the information to the ECM.
The ECM monitors the incoming vehicle speed information regarding signal range validity and rationality.

14.7.2.2 Vehicle Speed Signal too high – U0415

Monitoring Strategy
The vehicle speed signal must not exceed an upper threshold.

Enable Conditions
No enable conditions defined.

Malfunction Criteria
The vehicle speed signal sent from the ESP/ABS control module to the ECM is monitored and must not exceed an upper threshold. When the upper vehicle speed threshold is exceeded, a failure is detected.

Flowchart

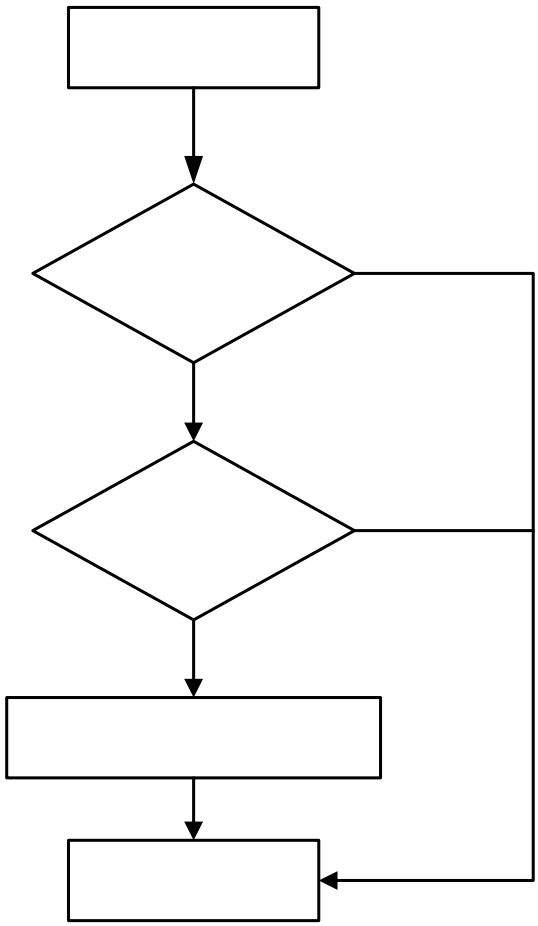

Figure 134: Vehicle speed signal too high

Flowchart

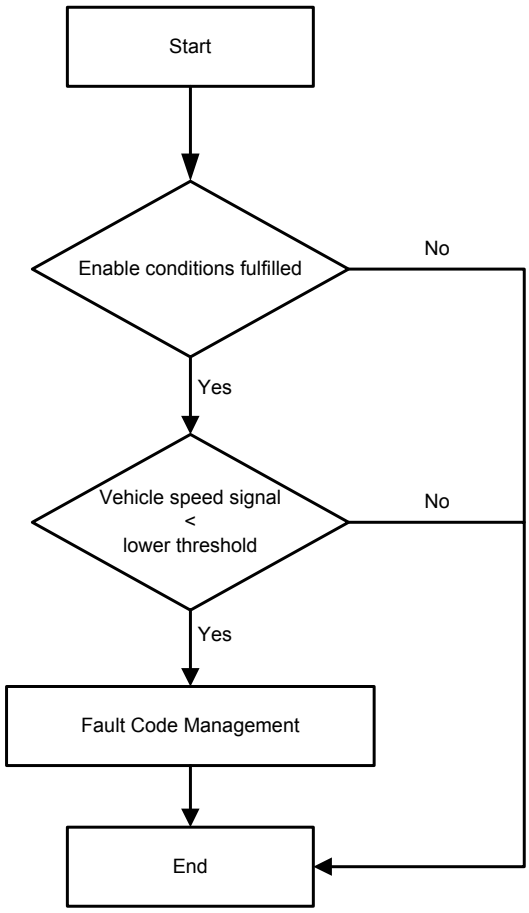

Figure 135: Rationality check of the vehicle speed signal during deceleration fuel cut-off

14.7.2.3 In-Use Monitor Performance Ratio

Incrementing the numerator
The numerator is incremented after the enable conditions (i.e. the deceleration fuel cut-off is active, the engine temperature is greater than a threshold, the engine speed is within a defined engine speed range) of the deceleration fuel cut-off rationality check have been fulfilled beyond the fault confirmation time.

Incrementing the denominator
The denominator is incremented when the conditions for incrementing the general denominator (according to CCR (d) (4.3.2) (E) (ii)) are fulfilled.

14.8 Throttle position sensor (throttle unit with E-gas actuator)

The throttle body consists of two potentiometers (reversed voltage logic). During the first start, the potentiometer characteristics are adapted and stored. The diagnosis monitors the corrected values of potentiometer 1 and 2. In case of a higher difference than a threshold value both signals are compared to the engine load to determine and disable the faulty one. A fault code will be stored and the MIL will be illuminated.

14.12 Boost pressure sensor

Not applicable.

14.13 Atmospheric Pressure Sensor

14.13.1 General description

The atmospheric pressure sensor monitor checks for circuit continuity, out of range signals and a rationality check.

14.13.2 Monitoring function description

Circuit Continuity
If the atmospheric pressure exceeds an upper limit for too long, a short circuit to battery is detected and a Atmospheric Pressure Circuit High fault is set.

If the atmospheric pressure stays below a lower limit for too long, a short circuit to ground is detected and a Atmospheric Pressure Circuit Low fault is set.

Range Check
If the atmospheric pressure exceeds an upper limit for too long, out of range high is detected, and a Atmospheric Pressure Circuit fault is set.

If the atmospheric pressure stays below a lower limit for too long, out of range low is detected, and a Atmospheric Pressure Circuit fault is set.

Key On, Engine Off (KOEO) Check
The KOEO check compares the atmospheric pressure at KOEO with the value stored at the last engine shut down. If this is not the same, and the atmospheric pressure is not similar to the upstream throttle pressure at KOEO, an Atmospheric Pressure Circuit Range/Performance fault is set.

14.13.3 Flow charts atmospheric sensor monitoring

14.14 Ambient Air Temperature (AAT) Monitor

14.14.1 Concepts receiving AAT over CAN

General Description
The AAT monitor checks that the measured AAT value is valid. It checks that the CAN message is received & uncorrupted; that the AAT value received is valid and that the AAT is plausible.

Monitoring Strategy
The monitor comprises four parts:

1. CAN message check – if the CAN message containing AAT is not received, or is incomplete or corrupted, a fault is detected
2. AAT is compared to upper and lower limits; if outside of these limits an out-of-range fault is detected
3. Rationality check at cold start – immediately after a cold start, AAT is compared to Intake Air Temperature; if the difference between the two is outside of limits, a fault is detected
4. Rationality check at normal engine temperature – AAT is compared to a modelled value; if the difference is outside of limits, a fault is detected.

14.15 Knock sensor monitoring (KS)

14.15.1 General description

The knock sensor signals are evaluated and processed in a custom integrated circuit (IC). This IC is controlled by the ECM microprocessor and the processed signals from the knock IC are sent to the microprocessor for knock control and diagnosis.

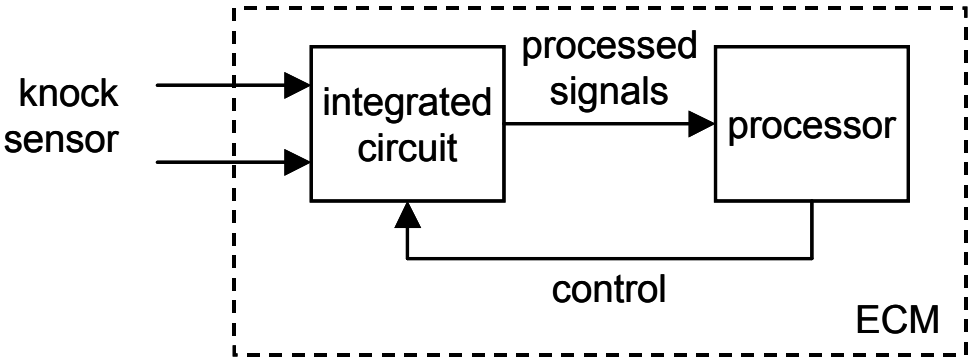

Figure 145: Overview knock sensor signal

The knock sensor monitor checks for electrical circuit faults and signal plausibility. In some cases, it can also detect excessive engine noise due to (for example) piston or valve gear problems.

14.15.2 Monitoring function description

Zero test
For monitoring purposes the knock sensor signals can be switched off and the integrated circuit is operated with a “zero signal“ as input. The zero signal is integrated in the circuit and the integrator output at the beginning (int_beg) and at the end (int_end) of a monitoring window is used for diagnostics.

Integrator check
The first part monitors the integrator value at the beginning of the measuring window, which is typically about 715 mV. If the absolute value of the difference between integrator and 715 mV exceeds a limit on a number of occasions, a Knock Control System Error fault is set.

Integrator gradient check
A second check is performed by monitoring the gradient of the integrator. The difference in the integrator output between the end and beginning of the measuring window is compared against a limit. If the absolute value of this difference exceeds the limit on a number of occasions, a Knock Control System Error fault is set.

Monitoring structure pulse test
For monitoring purposes the knock sensor signals can be switched off and the integrated circuit is operated with a “test pulse“ as input.

For an advanced diagnosis a test pulse can be generated at the input of the knock control circuit. In this mode, the test pulse signal is integrated instead of the signal from the knock sensors.

The integral of the test pulse is calculated in a monitoring window. The test pulse signal is integrated in the circuit and the integrator output at the beginning (int_beg) and at the end (int_end) of a monitoring window is used for diagnostics.

Therefore the content of the signal integrator at the beginning of the measuring window is subtracted from its content at the end of the window. If the difference is below a limit for a number of samples, a Knock Control System Error fault is set.

Monitoring structure knock sensor monitor

A reference signal (uref) is calculated based on the knock sensor signal. This reference value represents the basic noise of the current cylinder being monitored.

If uref exceeds the upper limit for a number of samples, a Knock Sensor Circuit High fault is set.

If uref stays below the lower limit for a number of samples, a Knock Sensor Circuit Low fault is set.

14.16 Diagnosis of Double Clutch Transmission

General Description

The gearbox is fitted with a oil temperature sensor, 2 rotation speed sensors (in/out), a shift lever sensor and 1 for reverse gear. Based on these sensors the diagnosis is checking if the gearbox is working correctly. For controlling the gearbox there are 7 pressure regulators and 2 magnetic valves necessary.
With the pressure regulators the clutches, the cooling, the system are controlled. The magnetic valves are need for the selection of the clutches. Also there's one valve for thermo management. BUS system is CAN.

1) Start Stop

For start stop function there is an Electrical oil pump needed. It is controlled via driver. The ATCU detects temperature and failure of EOP via CAN.

2) Plausibility Checks

2a) Shift lever diagnosis
Based on the driver action the movement of the shift lever were checked by the shift lever sensors with several plausibility checks. Also the sensors can detect manual shifting.

14.17 Output Stage Check

The output stages are integrated in manufacturer specific IC's:

The IC has a binary diagnostic line (e.g. SJ401).
If the control line of one stage has a different signal than the output line, the logic circuit inside the IC detects a malfunction. The logic circuit within the IC can separate the type of fault to a short circuit to minus, an open line, or a short circuit to plus. The check result will be sent to the ECM via diagnosis line.

U_{batt}=16V	normal working situations	short circuit to ground	Short circuit to battery	wiring defective

14.18 Engine off timer monitoring

14.18.1 General Description

Some monitoring functions require the information that a cold start situation is present on a motor vehicle with an internal combustion engine. A cold start situation is for example detected by temperature sensors fitted to the vehicle, however the temperature values provided by the sensors are not fully reliable. This is because the impact of varying ambient air temperatures and different mounting locations with their different thermal conditions may have a negative influence on the accuracy of the temperature values. As an alternative to the evaluation of the temperature values provided by the temperature sensors, a cold start situation can generally also be detected on the basis of an engine-off time provided by the engine control module.

14.18.2 Engine-Off Time Rationality Check in the case of an engine restart during ECM Keep Alive Time

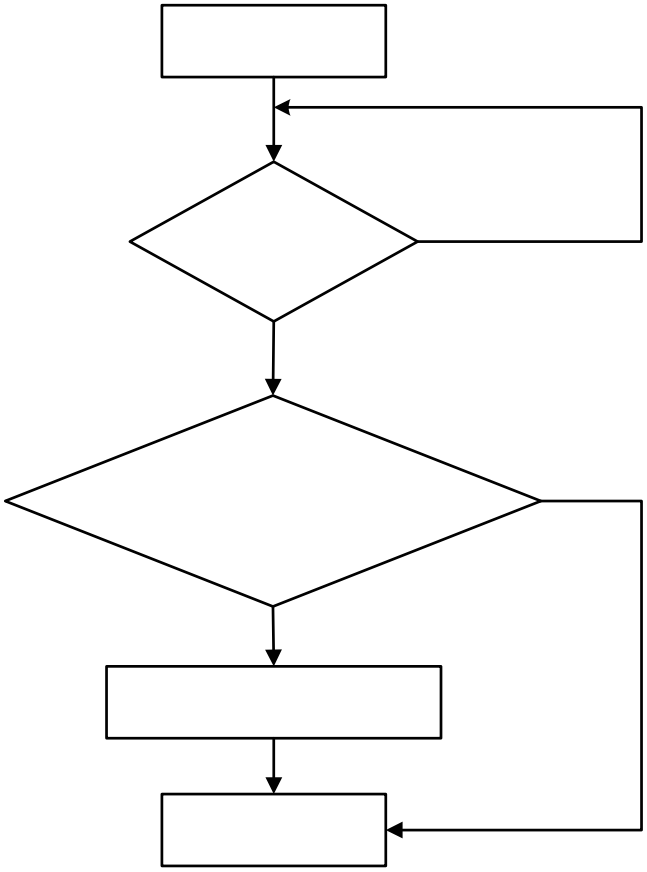
14.18.2.1 Engine-off time implausible – too long – P150A

Monitoring Strategy
The engine-off time provided by the instrument cluster is compared against the ECM keep alive time.

Enable Conditions
- Ignition on
- CAN communication active

Malfunction Criteria
If the difference between the engine-off time provided by the instrument cluster and the engine-off time obtained from the ECM keep alive time counter is greater than a positive upper threshold value, an implausibly long engine-off time is detected.

Flowchart



Start

Enable conditions fulfilled

Yes

Figure 150: Engine off-time implausible - too long – P150A

14.18.2.2 Engine-off time implausible – too short – P150A

Monitoring Strategy
The engine-off time provided by the instrument cluster is compared against the ECM keep alive time.

Enable Conditions
- Ignition on
- CAN communication active

Malfunction Criteria
If the difference between the engine-off time provided by the instrument cluster and the engine-off time obtained from the ECM keep alive time counter is less than a negative lower threshold value, an implausibly short engine-off time is detected.

Flowchart

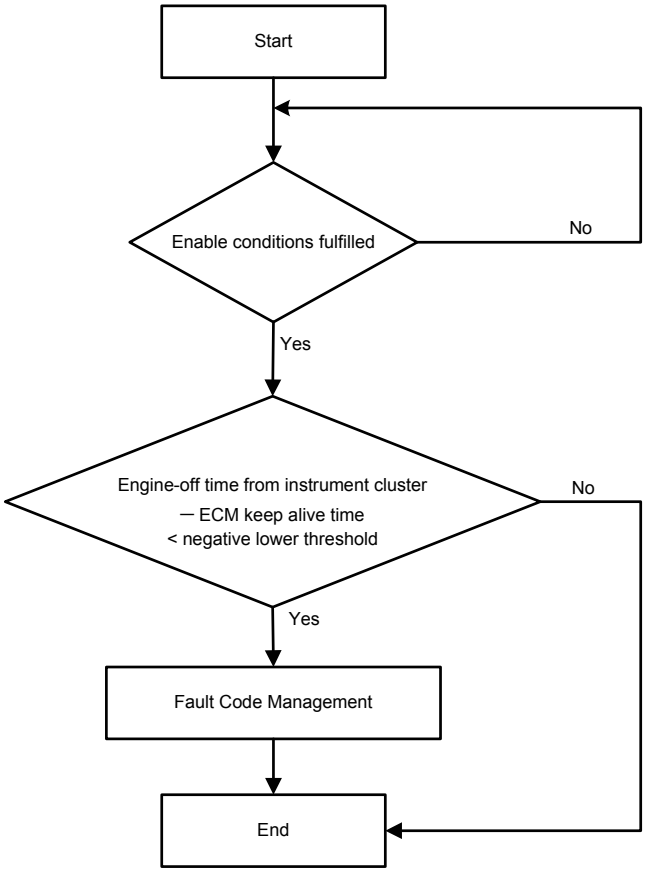


Figure 151: Engine-off time implausible - too short – P150A

14.18.3 Engine-Off Time Rationality Check in the case of an engine restart post to ECM Keep Alive Time

In this case, the engine-off time provided by the instrument cluster control module can only be assessed as “implausible – too short”, as the ECM keep alive time has a defined limit, after which the engine-off time cannot be assessed as “implausible – too long”, because after the ECM keep alive time, it will always be greater than the maximum keep alive time, and thus a comparison does not provide a result.

14.18.3.1 Engine-off time implausible - too short – P150A

Monitoring Strategy
The engine-off time provided by the instrument cluster is compared against the maximum ECM keep alive time.

Enable Conditions
- Ignition on
- CAN communication active

Malfunction Criteria
If the difference between the engine-off time provided by the instrument cluster and the maximum engine-off time obtained from the ECM keep alive time counter is less than a negative lower threshold value, an implausibly short engine-off time is detected.

Flowchart

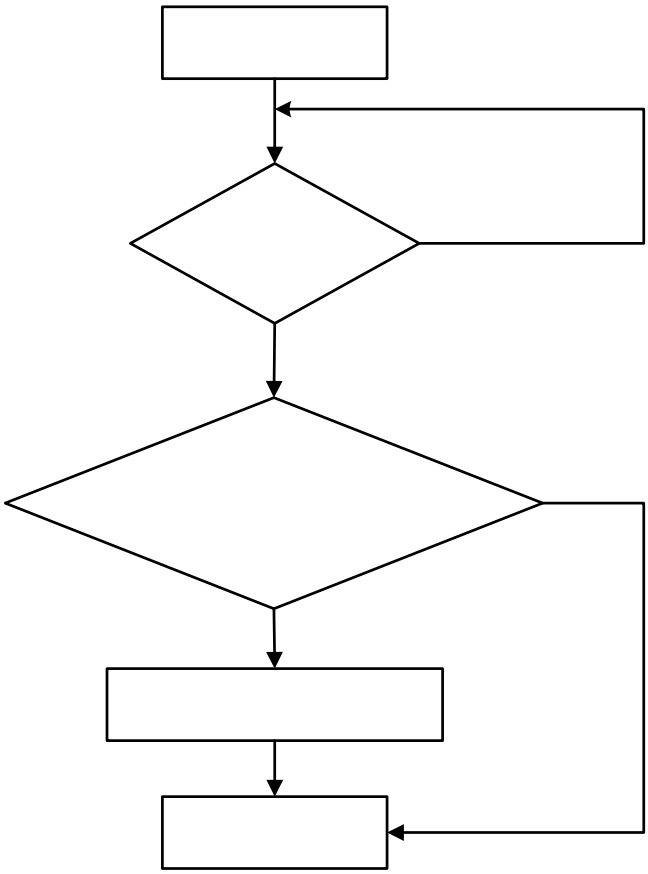

Figure 152: Engine-off time implausible - too short - post to ECM keep alive time – P150A

15 EXEMPTIONS TO MONITOR REQUIREMENTS

16 RESERVED

17 PARAMETERS AND CONDITIONS FOR CLOSED LOOP OPERATION

General

The highest conversion efficiency of the catalyst is given in a small window of air-fuel mixture close to the ratio of Lambda=1. Therefore a combination of two control loops are used to achieve the conditions for highest conversion capability of the catalyst. The first control loop uses the signal of the front Oxygen sensor (pre catalyst) to correct the air fuel ratio by adjusting the injection time. The second control loop uses the signals of the post catalyst Oxygen sensors. These control loops perform a fine tuning of the air / fuel ratio to optimize the catalytic conversion.
The first control loop has a quicker response time than the post control loops which are depending on the death time of the exhaust systems. Therefore the adjustment ranges for the post control loops are restricted and the response time is larger than the one of the first control loop.

Conditions for closed loop operation of the first control loop

The main condition for closed loop is a proper heated up Oxygen sensor and the dew point must be exceeded. To guaranty the Oxygen sensor readiness the heat-up strategy starts depending on engine temperature first on a low level of heater power. Upon the exhaust temperature reaches a level where no liquid water is expected to be in the exhaust system the heater power is controlled to achieve normal ceramic temperature of the Oxygen sensor. The ceramic temperature has to be >350 °C for binary and >685 °C linear sensors. Specific temperatures are mentioned in the individual summary tables of the concepts.
Additional heat-up of the Oxygen sensor is caused by the thermal energy of the exhaust gas. The engine management system evaluates permanently engine temperature and thermal energy introduced to calculate the exhaust temperature based on a model. The main value therefore is the integrated air mass after engine start. Upon the integrated air mass exceeds an applicable threshold, depending on engine start temperature, the due point is exceeded. In that case, the heater power will be increased until the sensor readiness is achieved and sensor is considered to be ready for closed loop control.

The criteria for sensor readiness of a binary sensor are:
- no fault from heater final stage check
- Sensor signal is out of a range 0,4V<sensor voltage<0,5V
- heater power > 50% within a certain time (typically 8-10 s)

The criteria for sensor readiness of the linear are:
- no fault from LSU-Heater, LSU-Signals and LSU-IC
- LSU is heated up to a ceramic-temperature of > 685°C or the internal sensor resistor Ri < 130Ω.

Parameters evaluated to begin closed loop (first control loop)
The target is to begin closed loop operation in a very early state after engine start. However closed loop is delayed if engine is operated according the catalyst heat-up strategy. In the table below the importance parameters are listed.

Parameter / System	Condition/Evaluation	Monitor
Oxygen Sensor	No fault detected in Oxygen sensor, wiring of the sensor or the sensor IC (linear sensors).	Oxygen sensor monitor for the front sensor(s)
Dew Point exceeded	Exhaust Temperature > threshold, calculated based on mass air flow integral.	Monitor of the mass air flow meter (out of range, rationality)
Oxygen Sensor Readiness	Sensor heated up, evaluated based on heater resistance.	Monitored by diagnostic of the heater control.
Mass Air Flow	Integrated air mass > threshold	Out of range / rationality
Oxygen Sensor Heater	OBD evaluation on sensor heater finished without fault	Oxygen sensor heater monitor.
Engine Load	Calculated value based on mass air flow and fuel injection.	Fuel system monitor, mass air flow meter monitor
Engine Temperature	Signal used to trigger the model calculation.	Monitor for engine coolant temperature sensor (out of range, rationality). Monitor of the cooling system (rationality).
Intake Air Temperature	Signal used to trigger the model calculation.	Monitor for the intake air temperature sensor (out of range)
Fuel injectors	OBD evaluation on injectors finished without fault	Monitor for the fuel injectors (out of range). Fuel system monitor
Ignition system	OBD evaluation on ignition system finished without fault. No misfire detected.	Monitor for the ignition system (out of range). Misfire monitor.

Figure 153: Parameters and conditions to begin closed loop operation

Continuity of closed loop operation (first control loop)
The closed loop operation is the most dominant operation mode for the fuel system. Despite that fact, there are operating conditions of the engine where closed loop control must be temporary disabled.

Parameter / System	Condition/Evaluation	Monitor
Target Lambda	Control range is within normal values of Lambda ($0.8<\lambda<1.5$)	Fuel system monitor, mass air flow meter monitor, oxygen sensor monitor
Engine load	Engine load is too low, to control the exhaust lambda value during SAI (typically relative engine load<15%)	Fuel system monitor, mass air flow meter monitor, oxygen sensor monitor
Fuel Injection	Injection time is not at minimum threshold. Injection is not disabled. Fuel cut is not commanded (e.g. coasting)	Monitor for the ignition/injection system (out of range). Misfire monitor. Fuel system monitor

Figure 154: Continuity of closed loop operation

Typical Values
Given a normal cold started FTP (around 20°C) most of the concepts reaches the closed loop condition for the first control loop within 20s to 60s. Additionally closed loop is forced depending on engine start temperature after a maximum time.

Engine Start Temperature	Time, when closed loop is forced
Temperature≥ 10 °C	120 s
Temperature ≥-6.7 °C and < 10°C	300 s

Figure 155: Engine start temperature and time to reach closed loop

18 PARAMETERS / CONDITIONS FOR 2ND CLOSED LOOP OPERATION

Conditions for closed loop operation of the second control loop
As already mentioned under “General” the 2nd control loop optimizes the adjustments of the first control loop over a longer time to achieve the maximum conversion of the catalyst in a very small window of air/fuel ratio close to Lambda=1. The second control loop uses a binary Oxygen sensor which is operated at a target value of sensor output voltage. Deviations from the target voltage are corrected by adjusting the air/fuel ratio until the target voltage is achieved again. The controller of the 2nd control loop is a combination of proportional and integral (PI-) controller. The proportional and the integral portion of the controller have individual enable criteria.

Parameters evaluated to begin closed loop (second control loop)

Enable criteria for P-portion of the controller
The proportional-portion of the controller corrects short term deviations and achieves the target sensor output voltage.

Parameter / System	Condition/Evaluation	Monitor
Closed loop condition for the first control loop. Minimum of integrated mass air flow passed.	No fault detected in wiring of the sensor or the sensor IC (linear sensors). Fuel control performs normal, no fault is detected and fuel control is not temporarily disabled.	Oxygen sensor monitor for the front sensor(s). Monitor of the mass air flow meter (out of range, rationality). Fuel system monitor
Oxygen Sensor for 2nd control loop readiness	Sensor heated up, a minimum power was delivered to the heater, sensor voltage has left the voltage range of a cold sensor	Monitored by diagnostic of the heater monitor and sensor wiring monitor.
Catalyst model temperature	Exhaust Temperature > threshold, calculated based on mass air flow integral, ignition timing, lambda value, vehicle speed.	Monitor of the mass air flow meter (out of range, rationality) Fuel system monitor, oxygen sensor monitor, vehicle speed sensor monitor
Variable Valve Timing System (if applicable)	No fault detected	VVT monitor
EVAP purge System	No fault detected	EVAP purge monitor
Mass Air Flow Meter	No fault detected	Mass Air Flow Meter monitor
Controller range for the first control loop is not at the threshold limit.	Controller for the first control loop not at minimum or maximum threshold	Oxygen sensor monitor

Figure 156: Enable criteria for P-portion of the controller

Enable criteria for adaptive I-portion of the controller (additionally)
The integral-portion of the controller corrects permanent deviations / shifts over a longer time by adjusting the adaptation.

Parameter / System	Condition/Evaluation	Monitor
Engine speed/load within a normal operating range	Engine Speed within 1500-4000 rpm Engine Load within 20-60% (Typical values; may differ on individual concepts)	Engine Speed Sensor monitor, Mass Air Flow Meter monitor, fuel system monitor.
Carbon Canister of the EVAP system	High load of carbon canister indicated during EVAP purge.	EVAP purge monitor.
Minimum of integrated mass air flow passed and P-portion of controller achieves target range for Oxygen sensor voltage already..	Oxygen sensor voltage of 2nd control loop, P-portion of controller for 2nd control loop	Oxygen sensor monitor for rear sensor. Fuel system monitor

Figure 157: Enable criteria for adaptive I-portion of the controller (additionally)

Typical Values (second control loop)
Given a normal cold started FTP (around 20°C) most of the concepts reaches the closed loop condition for the second control loop within 60s to 100s.

18.1 Fuel Trim Values

The description of ”Lambda-Control Strategies” within the ”Fuel System Monitoring” section of this document includes reference to fuel trim values.

	C0552	extended electrical monitoring	signal in upper or lower fault band	< 0.2 or > 4.8	[V]		continous		1.2 s	2 DCY
	C0552	longtime offset and calibration monitoring	calculated offset	> 1.9	[m/s²]				10 ms	2 DCY
	C0552	horizontal sensor mounting	comparison of measured value with the wheel speed signals	> 0.8 > 0.2 during constant driving	[g]	initialisation depending on acceleration signal	continous		0.7..1.07 s 2.7..8.6 s or 171 s	2 DCY
	C0552	vertical sensor mounting	comparison of measured value with the calculated value	> 0.35 < -0.35	[g]	90° turned 180° turned	< 8.7 mph < 43.51 mph		2.85 s 1.5 s	2 DCY
	C0552	mounting during ABS	comparison of measured value with the ABS reference speed	difference > 0.25 while measured deceleration > -0.1 difference > 0.4 while measured deceleration > - 0.1 during ABS difference > 0.7 and signal < calculated value	[g]				80 ms	2 DCY
	C0552	ECE handling monitoring	comparison fo emasured value with calculated acceleration	difference > 0.15 g for 500 ms & calculated acceleration > 0.15	[g]		once after power-up & speed > 3.11 mph & acceleration > 0.15 g		300 s	2 DCY

PORSCHE

ECU_OBD SUMMARY TABLE MY15 (ESP-part)

Component / System	Fault Code	Monitor Strategy Description	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Condition	Monitoring Time Length	MIL Illum.
ECU	U1017	PCU watchdog	comparison of MCU to PCU control word functionality of PCU watchdog circuit			continous once after power-on	10 ms	1 DCY
	U1017	redundancy check	comparison of the two CPU bus signals functionality of bus compare unit			continous every 2nd loop	10 ms	1 DCY
	U1017	ROM ECC check	read-write pattern functionality of ECC compare unit			every read access every 2nd loop	10 ms	1 DCY
	U1017	bus and ECC compare unit monitoring	defined toogling of one signal expected functionality of MCU compare unit			continous once after power-on	10 ms	1 DCY
	U1017	reset source monitoring	check of the reset source			once after each hardware reset	once at beginning of startup	1 DCY
	U1017	interrupt source monitoring	check of the interrupt source			continous	10 ms	1 DCY
	U1017	RAM self-test	read-write pattern			every 30.72 s	30.72 s	1 DCY
	U1017	ROM CRC check	difference			every 220 ms	220 ms	1 DCY
	U1017	non-volatile memory check	write access not possible			10 ms during write access	40 ms	1 DCY
	U1017	runtime monitoring	finish of former loop execution			continous	10 ms	1 DCY
	U1017	stack monitoring	read-write pattern			each call of OS stack dispatcher	1,25 ms from start of OS	1 DCY
	U1017	OSEK system check	corecction check of internal data			each call of OS API functions	10 ms	1 DCY
	U1017	HW failsafe module monitoring	check of voltage deviations			once after ignition on	80 ms	1 DCY

Component / System	Fault Code	Monitor Strategy	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Monitor Time Length	Frequency of Checks	MIL Illum.
Shift Solenoid									
S1	P0973	Conduction check in ON/OFF solenoid.	Comparison of the signal of solenoid monitor and solenoid driver output	Wrong output signal for more than 100 ms	--	--	100ms 5 times	continous	2 DCY
S1	P0974								
TV	P2754	Conduction check in ON/OFF solenoid.	Comparison of the signal of solenoid monitor and solenoid driver output	Wrong output signal for more than 100 ms	--	--			
TV	P2755								
Pressure Control Solenoid									
SLT	P0748	Linear solenoid feedback current check	Comparison of target current and Feedback current	Sum of difference of two current >20000	Input AD value Voltage Main Solenoid Switch	< 1333mA > 10.5 V ON	3 times	continous	2 DCY
SLB1	P0778								
SLC1	P0798								
SLC2	P2716								
SLC3	P2725								
SLC4	P2734								
SLU	P2759								
SLT	P0963	Input AD value check in every Linear solenoid.	Detection of wrong input AD value	Feedback current > 1333mA (AD value > 1000) for more than 100 ms			100ms 5 times		
SLB1	P0777								
SLC1	P0797								
SLC2	P2715								
SLC3	P2724								
SLC4	P2733								
SLU	P2758								

Component / System	Fault Code	Monitor Strategy	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Monitor Time Length	Frequency of Checks	MIL Illum.
SLT	P0962			Feedback current < 23mA (AD value < 15) for more than 100 ms			100ms 5 times		
SLB1	P0776								
SLC1	P0796								
SLC2	P2714								
SLC3	P2723								
SLC4	P2732								
SLU	P2757								

Component / System	Fault Code	Monitor Strategy	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Monitor Time Length	Frequency of Checks	MIL Illum.
Speed sensor									
Output speed sensor	P19AB	Electrical check	Detection of wrong input AD value	Voltage < 0.2 Volt (AD value < 45) for more than 100 ms	Output sensor	Not after failure decision for output sensor "no pulse check"	100ms 5 times	continous	2 DCY
Output speed sensor	P077D			(AD value > 545) Voltage > 2.72 Volt for more than 100 ms					
Output speed sensor	P0721	No pulse check	Comparison pulse of input revolution and output revolution	No pulse of input sensor more than 12 times	Engine speed No emergency mode Gear engagement condition Range Inhibitor switch Input sensor S1,SLC1,SLC2,SLC3,SLC4, SLB1,SLT (Input rev. / defined current gear ratio) Output sensor	> 400rpm Engage D,S No fault Active No fault >= 300 rpm Not during failure detection or after failure decision for output sensor electrical failure.	500ms		
Input speed sensor	P19AA	Electrical check	Detection of wrong input AD value	Voltage < 0.2 Volt (AD value < 45) for more than 100 ms	Input sensor	Not after failure decision for input sensor "no pulse check"	100ms 5 times		
Input speed sensor	P07C0			(AD value > 545) Voltage > 2.72 Volt for more than 100 ms					
Input speed sensor	P0716	No pulse check	Comparison pulse of input revolution and output revolution	No pulse of input sensor more than 30 times	Engine speed Output sensor Output speed	> 400rpm Active >= 300rpm	500ms		

Component / System	Fault Code	Monitor Strategy	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Monitor Time Length	Frequency of Checks	MIL Illum.
					Input sensor	Not during failure detection or after failure decision for input sensor electrical failure.			
Inhibitor switch									
Inhibitor switch	P0706	A, B, C and PA signal check in every shift lever position.	Detection of wrong combination of the A, B, C and PA signal	Wrong combination for more than 350 ms	--	--	350 ms		2 DCY
Inhibitor switch	P0709		Detection of no signal of the A, B, C and PA signal	All signals lost					

Component / System	Fault Code	Monitor Strategy	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Monitor Time Length	Frequency of Checks	MIL Illum.
Oil temperature sensor									
Oil temperature sensor Stuck	P0710	Electrical check **(Only for Start/Stop and Hybrid vehicle)**	Detection of wrong input AD value	Measurementblock shows Value between 30°C and 150°C and doesn't change this value by 5° during 10 min	--	--	100ms	continous	2 DCY
Oil temperature sensor GND short	P0712			Measurementblock shows Value 0V	--	--	5s		
Oil temperature sensor Battery short / open	P0713			Measurementblock shows Value of 4.9V	--	--	10s		
Microcontroller Hardware									
Flash ROM	P0700	ROM area check	Comparison of stored checksum value and calculated checksum	Two checksum values are not the same.	--	--	40 s	continous	2 DCY
Random Access Memory	P0700	RAM area check	Comparison of writing data and reading data.	Writing data is different from reading one.	--	--			
EEPROM	P0700	RAM area check	Comparison of stored checksum value and calculated checksum	Two checksum values are not the same.	--	--			
Safety processor	P2711	High breaking torque detection	Detect high braking torque condition by reading back of the solenoid feedback current in order to determine the pattern and ATCU compares it and the pattern of possible high braking torque conditions calculated with input torque	Breaking Torqe 1888Nm	--	--	700ms		
	P0613	Miscalculation detected	Wrong gear select detection	Single reset does not cover problem	--	--	150ms		
	P0613		CPU core check failed	Single reset does not cover problem	--	--	1 time		
	P0613		ROM check is failed	Single reset does not cover problem	--	--	1 time		
	P0613		RAM data protect is failed	Single reset does not cover problem	--	--	1 time		
	P0613		Communication data check is failed	Single reset does not cover problem	--	--	1 time		

Component / System	Fault Code	Monitor Strategy	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Monitor Time Length	Frequency of Checks	MIL Illum.
	P0613		Program flow check is failed	Single reset does not cover problem	--	--	1 time		
	P0613		Safe state shift check	Single reset does not cover problem	--	--	1 time		
CAN									
Bus off	U0001	CAN communication check	Detection of communication error	CAN BUS off condition for more than 250 ms	ignition on	> 500 ms	250 ms	continous	2 DCY
ECU no communication	U0100	CAN communication check	Detection of communication error	ECU no communication for more than 50 ms	CAN bus	Active	500ms		
					ignition on	> 500 ms			
ECU malfunction	U0401	CAN receive data check	ECU signal data freeze	Data counter not updated	CAN bus ECU communication	Active Active	5 messages continuously		
ECU malfunction	U0401			Chksum is wrong			3 messages continuously		
Accelerator pedal	U0401		Detection of error signal	0xFF	CAN bus ECU communication ECU data update	Active Active Active	250ms		
Engine speed	U0401		Detection of error signal	0xFFFF					
Engine torque	U0401		Detection of error signal	0x3FF					
ECU wrong level	U0301		Detection of error signal	Transmission coding is manual transmission code (0Fh) Or MO_Code is not same as one in ATCU or MO_Leistung is not same as one in ATCU					

Component / System	Fault Code	Monitor Strategy	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Monitor Time Length	Frequency of Checks	MIL Illum.
Driver Electrical Oil Pump									
EOP_Driver_Error **(Only Hybrid)**	P0C2A	Input AD value check of OPST PWM signal	OPST PWM sends signal "Motor system failure"				500ms	continous	2 DCY
EOP_Driver_Input_AD_Failure **(Only for Start/Stop)**	P0C2B		OPST PWM sends signal "A/D failure"		OPST PWM Signal sends not "Duty continuously low" or "Duty continuously high"				
EOP_Driver_OPST_Duty_High **(Only for Start/Stop and Hybrid vehicle)**	P0C2E		OPST PWM Signal sends "Duty continuously high"						
EOP_Driver_OPST_Duty_Low **(Only for Start/Stop and Hybrid vehicle)**	P0C2D		OPST PWM Signal sends "Duty continuously low"						
EOP_Driver_OPST_PWM_wrong **(Only for Start/Stop and Hybrid vehicle)**	P0C2C		OPST PWM Signal sends "PWM Wrong"						
EOP_Driver_SIG_PWM_wrong **(Only for Start/Stop)**	P0C29		OPST PWM sends signal "Motor system failure"						
EOP_Driver_Motor_lock **(Only for Start/Stop)**	P0C2A		OPST PWM Signal sends "Lock or over rev."				1000ms		
EOP_Driver_temperature_area_stuck *(Only Hybrid)*	P0C1D		OPST PWM Signal sends "Over heat (118~125°C)" or OPST PWM Signal sends "Over heat (>125°C)" and Target EOP revolution = 0[rpm]				900s		
Motor Electrical Oil Pump									
EOP_Motor_Functional_Failure_Hybrid	P0C26	Functional diagnosis **(Hybrid only)**	Comparison of target an actual EOP Motor revolution		EOP System normal		10s	continous	2DCY
EOP_Motor_Functional_Failure_IdleStop	P0C26	Functional diagnosis **(Start/Stopp only)**	Comparison of indicated slip and actual slip with stored values		EOP System normal		20s (OT Value < 0°C) 400ms (OT Value > 0°C)		
EOP_Motor_Temp_Sensor_SC-	P0C1E	Electrical check **(Hybrid only)**	Measurement block shows value of 208°C		EOP System normal		5x 1s		
EOP_Motor_temp_sensor_temperature_area_stuck	P0C1D	Electrical check **(Hybrid only)**	EOP Motor temperature > 130 [°C] and Target EOP motor revolution = 0[rpm]		EOP System normal		715s		

Component / System	Fault Code	Monitor Strategy	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Monitor Time Length	Frequency of Checks	MIL Illum.
Functional lock up control									
Lock up control	P0741	OFF stuck check.	Comparison of engine rpm and input rpm	Engine rpm – input rpm > -100 rpm for 2s (hybrid only) Engine rpm – input rpm > 100 rpm for 2s	Engine speed Shift Lever Estimated engine torque Revolution sensor SLU target current Model oil temp. Common parameter (see footnote)	> 400 rpm < 4000 rpm D or S >= 0 Nm No back up condition > 1000mA >= 20°C common condition (see footnote)	2 s 6 times	continous	2 DCY

Component / System	Fault Code	Monitor Strategy	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Monitor Time Length	Frequency of Checks	MIL Illum.
Gear ratio error									
1st gear	P0731	Input and output rpm signal check. Separate error memory for each gear.	Comparison of indicated slip and actual slip with stored values	**1.** abs(input rev. – output rev. x other gear ratio) < (0.04 x other gear ratio x output rev.) for more than 1s **2.** Slip differences > (0.20 x current gear ratio x output rev.) for more than 1 s	Engine speed	> 400rpm	**1.** 1000ms 12 times cumulative **2.** 450ms 5 times cumulative	continous	2 DCY
2nd gear	P0732				Output rev.	> 250rpm			
3rd gear	P0733				Shift Lever	D or S			
4th gear	P0734				Brake	off			
5th gear	P0735				slip difference of output speed(In case ABS valid)	difference < 10%			
6th gear	P0729				Revolution sensor	No back up condition			
7th gear	P076F				Model oil temp.	>= 20°C			
8th gear	P07D9				Common parameter (see footnote)	common condition (see footnote)			

Common parameter for enabling gear ratio or Lock up errors:

Main solenoid switch	ON
Gear condition	Engaged
S1 solenoid	No fault
Linear solenoid	No fault
Inhibitor switch	No fault
CAN communication	No fault
ECU data update	No fault
Estimated engine trq	No fault
Engine speed	No fault
Accelerator pedal	No fault
ROM	No fault
RAM	No fault
Safety processor	No fault

	P0613		Safe state shift check	Single reset does not cover problem	--	--	1 time		
CAN									
Bus off	U0001	CAN communication check	Detection of communication error	CAN BUS off condition for more than 250 ms	ignition on	> 500 ms	250 ms	continous	2 DCY
ECU no communication	U0100	CAN communication check	Detection of communication error	ECU no communication for more than 50 ms	CAN bus	Active	500ms		
					ignition on	> 500 ms			
ECU malfunction	U0401	CAN receive data check	ECU signal data freeze	Data counter not updated	CAN bus ECU communication	Active Active	5 messages continuously		
ECU malfunction	U0401			Chksum is wrong			3 messages continuously		
Accelerator pedal	U0401		Detection of error signal	0xFF	CAN bus ECU communication ECU data update	Active Active Active	250ms		
Engine speed	U0401		Detection of error signal	0xFFFF					
Engine torque	U0401		Detection of error signal	0x3FF					
ECU wrong level	U0301		Detection of error signal	Transmission coding is manual transmission code (0Fh) Or MO_Code is not same as one in ATCU or MO_Leistung is not same as one in ATCU					

Component / System	Fault Code	Monitor Strategy	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Monitor Time Length	Frequency of Checks	MIL Illum.
Driver Electrical Oil Pump									
EOP_Driver_Error **(Only Hybrid)**	P0C2A	Input AD value check of OPST PWM signal	OPST PWM sends signal "Motor system failure"				500ms	continous	2 DCY
EOP_Driver_Input_AD_Failure **(Only for Start/Stop)**	P0C2B		OPST PWM sends signal "A/D failure"		OPST PWM Signal sends not "Duty continuously low" or "Duty continuously high"				
EOP_Driver_OPST_Duty_High **(Only for Start/Stop and Hybrid vehicle)**	P0C2E		OPST PWM Signal sends "Duty continuously high"						
EOP_Driver_OPST_Duty_Low **(Only for Start/Stop and Hybrid vehicle)**	P0C2D		OPST PWM Signal sends "Duty continuously low"						
EOP_Driver_OPST_PWM_wrong **(Only for Start/Stop and Hybrid vehicle)**	P0C2C		OPST PWM Signal sends "PWM Wrong"						
EOP_Driver_SIG_PWM_wrong **(Only for Start/Stop)**	P0C29		OPST PWM sends signal "Motor system failure"						
EOP_Driver_Motor_lock **(Only for Start/Stop)**	P0C2A		OPST PWM Signal sends "Lock or over rev."				1000ms		
EOP_Driver_temperature_area_stuck *(Only Hybrid)*	P0C1D		OPST PWM Signal sends "Over heat (118~125°C)" or OPST PWM Signal sends "Over heat (>125°C)" and Target EOP revolution = 0[rpm]				900s		
Motor Electrical Oil Pump									
EOP_Motor_Functional_Failure_Hybrid	P0C26	Functional diagnosis **(Hybrid only)**	Comparison of target an actual EOP Motor revolution		EOP System normal		10s	continous	2DCY
EOP_Motor_Functional_Failure_IdleStop	P0C26	Functional diagnosis **(Start/Stopp only)**	Comparison of indicated slip and actual slip with stored values		EOP System normal		20s (OT Value < 0°C) 400ms (OT Value > 0°C)		
EOP_Motor_Temp_Sensor_SC-	P0C1E	Electrical check **(Hybrid only)**	Measurement block shows value of 208°C		EOP System normal		5x 1s		
EOP_Motor_temp_sensor_temperature_area_stuck	P0C1D	Electrical check **(Hybrid only)**	EOP Motor temperature > 130 [°C] and Target EOP motor revolution = 0[rpm]		EOP System normal		715s		

Component / System	Fault Code	Monitor Strategy	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Monitor Time Length	Frequency of Checks	MIL Illum.
Functional lock up control									
Lock up control	P0741	OFF stuck check.	Comparison of engine rpm and input rpm	Engine rpm – input rpm > -100 rpm for 2s (hybrid only) Engine rpm – input rpm > 100 rpm for 2s	Engine speed Shift Lever Estimated engine torque Revolution sensor SLU target current Model oil temp. Common parameter (see footnote)	> 400 rpm < 4000 rpm D or S >= 0 Nm No back up condition > 1000mA >= 20°C common condition (see footnote)	2 s 6 times	continous	2 DCY

Component / System	Fault Code	Monitor Strategy	Malfunction Criteria	Threshold Value	Secondary Parameters	Enable Conditions	Monitor Time Length	Frequency of Checks	MIL Illum.
Gear ratio error									
1st gear	P0731	Input and output rpm signal check. Separate error memory for each gear.	Comparison of indicated slip and actual slip with stored values	**1.** abs(input rev. – output rev. x other gear ratio) < (0.04 x other gear ratio x output rev.) for more than 1s **2.** Slip differences > (0.20 x current gear ratio x output rev.) for more than 1 s	Engine speed	> 400rpm	**1.** 1000ms 12 times cumulative **2.** 450ms 5 times cumulative	continous	2 DCY
2nd gear	P0732				Output rev.	> 250rpm			
3rd gear	P0733				Shift Lever	D or S			
4th gear	P0734				Brake	off			
5th gear	P0735				slip difference of output speed(In case ABS valid)	difference < 10%			
6th gear	P0729				Revolution sensor	No back up condition			
7th gear	P076F				Model oil temp.	>= 20°C			
8th gear	P07D9				Common parameter (see footnote)	common condition (see footnote)			

Common parameter for enabling gear ratio or Lock up errors:

Main solenoid switch	ON
Gear condition	Engaged
S1 solenoid	No fault
Linear solenoid	No fault
Inhibitor switch	No fault
CAN communication	No fault
ECU data update	No fault
Estimated engine trq	No fault
Engine speed	No fault
Accelerator pedal	No fault
ROM	No fault
RAM	No fault
Safety processor	No fault

Cayenne, MY 2011-

P000A00

Diagnostic information - DME control unit

P000A00 Bank 1 intake camshaft adjustment too slow

Diagnostic conditions

- No camshaft adjuster output stage fault
- No rpm or phase sensor fault
- Engine running

Fault setting condition(s)

- The fault is set if the camshaft adjuster cannot follow the specified setpoint quickly enough.

Monitored component or system

♦ Bank 1 intake camshaft adjuster

Possible fault causes

♦ **Engine oil pressure** too low
⇒ (e.g. oil thickening, wrong oil quality, oil pressure control or **oil pump** sluggish/stuck)
♦ Loose contact on solenoid valve plug connection
♦ **Solenoid valve** dirty/blocked
♦ **Solenoid valve** sluggish/stuck
♦ **Camshaft adjustment** sluggish/stuck
♦ Wiring for camshaft adjusters interchanged
♦ **Intake camshaft** sluggish/stuck
♦ Camshaft position sender/sender wheel loose

Fault effects

♦ The camshaft is moved to the reference position if possible.
♦ Engine speed limited
♦ Message >>Reduced engine power<< in instrument cluster

P000C00

Diagnostic information - DME control unit

P000C00 Bank 2 intake camshaft adjustment too slow

Diagnostic conditions

- No camshaft adjuster output stage fault
- No rpm or phase sensor fault
- Engine running

Fault setting condition(s)

- The fault is set if the camshaft adjuster cannot follow the specified setpoint quickly enough.

Monitored component or system

♦ Bank 2 intake camshaft adjuster

Possible fault causes

♦ **Engine oil pressure** too low
⇒ (e.g. oil thickening, wrong oil quality, oil pressure control or **oil pump** sluggish/stuck)
♦ Loose contact on solenoid valve plug connection
♦ **Solenoid valve** dirty/blocked
♦ **Solenoid valve** sluggish/stuck
♦ **Camshaft adjustment** sluggish/stuck
♦ Wiring for camshaft adjusters interchanged
♦ **Intake camshaft** sluggish/stuck
♦ Camshaft position sender/sender wheel loose

Fault effects

♦ The camshaft is moved to the reference position if possible.
♦ Engine speed limited
♦ Message >>Reduced engine power<< in instrument cluster

Diagnosis information DME control module

P001000 Bank 1 intake camshaft adjustment - open circuit

► Check in the **>PIWIS information system<** whether the vehicle is designated for the following workshop campaign: **WC54**
► Carry out the campaign if necessary

Diagnostic conditions

- With running engine

Fault setting condition(s)

- Activation voltage higher than diagnostic threshold 4.4...5.6 V
- Output stage diagnostics, line open circuit

Monitored component or system

♦ Bank 1 intake camshaft adjuster output stage

Diagnostic information - DME control unit

P001100 Bank 1 camshaft retardation - setpoint not reached

Diagnostic conditions

- No camshaft adjuster output stage fault
- No rpm or phase sensor fault
- Engine running

Fault setting condition(s)

- The fault is set if the camshaft adjuster cannot follow the specified setpoint quickly enough.

Monitored component or system

♦ Bank 1 intake camshaft adjuster

Possible fault causes

♦ **Engine oil pressure** too low
⇒ (e.g. oil thickening, wrong oil quality, oil pressure control or **oil pump** sluggish/stuck)
♦ Loose contact on solenoid valve plug connection
♦ **Solenoid valve** dirty/blocked
♦ **Solenoid valve** sluggish/stuck
♦ **Camshaft adjustment** sluggish/stuck
♦ Wiring for camshaft adjusters interchanged
♦ **Intake camshaft** sluggish/stuck
♦ Camshaft position sender/sender wheel loose

Fault effects

♦ The camshaft is moved to the reference position if possible.
♦ Engine speed limited
♦ Message >>Reduced engine power<< in instrument cluster

Diagnosis information DME control module

P001600 Bank 1 camshaft position/crankshaft position sensor - incorrect allocation

Diagnostic conditions

- No fault of the crankshaft sensor
- No camshaft adjuster fault
- No other faults of the camshaft sensor
- No sensor supply voltage fault present
- Engine start
- Ignition off, ignition on
- With engine running

Fault setting condition(s)

- Edges of the camshaft sensor signal when the camshaft is in reference position (stop) do not match the crankshaft signal (camshaft impermissibly turned out of position)
- If the camshaft is moved to the reference position (stop) during the driving cycle, a camshaft-to-crankshaft allocation test is performed

Monitored component or system

♦ Bank 1 intake camshaft sensor

Fault finding notes

♦ Check camshaft timing (camshaft position) via the Tester
♦ Check chain drive to determine whether the chain is out of place
♦ Check the camshaft adjuster function (check timing valves, shaft adjuster, oil pressure)
♦ Check wiring of the camshaft adjusters
♦ Check sensor wiring
♦ Check camshaft sensor wheel

Function restrictions

♦ Camshaft adjustment not possible
♦ Loss of power possible
♦ Engine rough running and even "engine stall" possible if the chain is out of position by several teeth

Diagnosis information DME control module

P001800 Bank 2 camshaft position/crankshaft position sensor - incorrect allocation

Diagnostic conditions

- No fault of the crankshaft sensor
- No camshaft adjuster fault
- No other faults of the camshaft sensor
- With engine running

Fault setting condition(s)

- Edges of the camshaft sensor signal when the camshaft is in reference position (stop) do not match the crankshaft signal (camshaft impermissibly turned out of position)

Monitored component or system

♦ Bank 2 intake camshaft sensor

Diagnosis information DME control module

P002000 Bank 2 camshaft adjustment malfunction

► Check in the **>PIWIS information system<** whether the vehicle is designated for the following workshop campaign: **WC54**
► Carry out the campaign if necessary

Diagnostic conditions

- With running engine

Fault setting condition(s)

- Output stage diagnostics, line open circuit
- Activation voltage higher than diagnostic threshold 4.4...5.6 V

Monitored component or system

♦ Bank 2 intake camshaft adjuster output stage

Diagnostic information - DME control unit

P002100 Bank 2 camshaft retardation - setpoint not reached

Diagnostic conditions

- No camshaft adjuster output stage fault
- No rpm or phase sensor fault
- Engine running

Fault setting condition(s)

- The fault is set if the camshaft adjuster cannot follow the specified setpoint quickly enough.

Monitored component or system

♦ Bank 2 intake camshaft adjuster

Possible fault causes

♦ **Engine oil pressure** too low
⇒ (e.g. oil thickening, wrong oil quality, oil pressure control or **oil pump** sluggish/stuck)
♦ Loose contact on solenoid valve plug connection
♦ **Solenoid valve** dirty/blocked
♦ **Solenoid valve** sluggish/stuck
♦ **Camshaft adjustment** sluggish/stuck
♦ Wiring for camshaft adjusters interchanged
♦ **Intake camshaft** sluggish/stuck
♦ Camshaft position sender/sender wheel loose

Fault effects

♦ The camshaft is moved to the reference position if possible.
♦ Engine speed limited
♦ Message >>Reduced engine power<< in instrument cluster

Diagnosis information DME control module

P003000 Bank 1 sensor 1 - heating circuit open circuit

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater voltage > 4.4...5.6 V

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor heater ahead of cat. conv., bank 1 sensor 1 faulty

Function restrictions

♦ Output stage inactive, failure of the sensor heater

Diagnosis information DME control module

P003100 Bank 1 sensor 1 - heating circuit short circuit to ground

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater voltage > 2.15...3.25 V

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor heater ahead of cat. conv., bank 1 sensor 1 faulty

Function restrictions

♦ Output stage inactive, failure of the sensor heater

P003200

Diagnosis information DME control module

P003200 Bank 1 sensor 1 - heating circuit short circuit to B+

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater current > 3 A

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor heater ahead of cat. conv., bank 1 sensor 1 faulty

Function restrictions

♦ Output stage inactive, failure of the sensor heater

Diagnosis information DME control module

P003600 Bank 1 sensor 2 - heating circuit open circuit

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater voltage > 4.4...5.6 V

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor behind cat. conv., bank 1 sensor 2 faulty

Function restrictions

♦ Output stage inactive, failure of the sensor heater

Diagnosis information DME control module

P003700 Bank 1 sensor 2 - heating circuit short circuit to ground

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater voltage > 2.15...3.25 V

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor behind cat. conv., bank 1 sensor 2 faulty

Function restrictions

♦ Output stage inactive, failure of the sensor heater

P003800

Diagnosis information DME control module

P003800 Bank 1 sensor 2 - heating circuit short circuit to B+

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater current > 3 A

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor behind cat. conv., bank 1 sensor 2 faulty

Function restrictions

♦ Output stage inactive, failure of the sensor heater

Diagnosis information DME control module

P004000 Bank 1 sensor 1/bank 2 sensor 1 interchanged

Diagnostic conditions

- Oxygen sensor heating completed
- Diagnostics runs continuously

Fault setting condition(s)

- Observation of the controller outputs of the pre-catalytic converters of the two banks
- The lambda controllers of the two banks run in the opposite direction: bank 1 at rich limit (FRMAX) and bank 2 at lean limit (FRMIN) or bank 1 at lean limit (FRMIN) and bank 2 at rich limit (FRMAX)

Monitored component or system

♦ Oxygen sensors ahead of the catalytic converter

Fault finding notes

♦ Oxygen sensors ahead of catalytic converter interchanged

Function restrictions

♦ Rough-running engine

Diagnosis information DME control module

P005000 Bank 2 sensor 1 - heating circuit electrical fault

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater voltage > 4.4...5.6 V

Monitored component or system

♦ Oxygen sensors 2 ahead of the catalytic converter

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor heater ahead of cat. conv., bank 2 sensor 1 faulty

Function restrictions

♦ Output stage inactive, failure of the sensor heater

Diagnosis information DME control module

P005100 Bank 2 sensor 1 - heating circuit short circuit to ground

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater voltage > 2.15...3.25 V

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor heater ahead of cat. conv., bank 2 sensor 1 faulty

Function restrictions

♦ Output stage inactive, failure of the sensor heater

P005200

Diagnosis information DME control module

P005200 Bank 2 sensor 1 - heating circuit short circuit to B+

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater current > 3 A

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor heater ahead of cat. conv., bank 2 sensor 1 faulty

Function restrictions

♦ Output stage inactive, failure of the sensor heater

Diagnosis information DME control module

P005600 Bank 2 sensor 2 - heating circuit electrical fault

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater voltage > 4.4...5.6 V

Monitored component or system

♦ Oxygen sensors 2 ahead of the catalytic converter

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor heater behind cat. conv., bank 2 sensor 2 faulty

Function restrictions

♦ Output stage inactive, failure of the sensor heater

Diagnosis information DME control module

P005700 Bank 2 sensor 2 - heating circuit short circuit to ground

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater voltage > 2.15...3.25 V

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor heater behind cat. conv., bank 2 sensor 2 faulty

Function restrictions

♦ Output stage inactive, failure of the sensor heater

P005800

Diagnosis information DME control module

P005800 Bank 2 sensor 2 - heating circuit short circuit to B+

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater current > 3 A

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor heater behind cat. conv., bank 2 sensor 2 faulty

Function restrictions

♦ Output stage inactive, failure of the sensor heater

P007000

Diagnosis information DME control module

P007000 Outside-temperature sensor - electrical fault
P007200 Outside-temperature sensor - signal too low
P007400 Outside-temperature sensor - loose contact

Monitored component or system

♦ Ambient temperature sensor

Fault finding notes

♦ see Air conditioning system fault memory

Function restrictions

P007400
♦ Possible radiator fan emergency operation

P007100

Diagnosis information DME control module

P007100 Outside-temperature sensor - implausible signal

Diagnostic conditions

- Cold start detected
- No block heater operation detected
- No solar irradiation detected

Fault setting condition(s)

- Temperature cross-check after engine start in the conditioned vehicle state
- Comparison of intake-air temperature, engine temperature and ambient temperature

Monitored component or system

♦ Ambient-temperature sensor

Diagnosis information DME control module

P007000 Outside-temperature sensor - electrical fault
P007200 Outside-temperature sensor - signal too low
P007400 Outside-temperature sensor - loose contact

Monitored component or system

♦ Ambient temperature sensor

Fault finding notes

♦ see Air conditioning system fault memory

Function restrictions

P007400
♦ Possible radiator fan emergency operation

P007400

Diagnosis information DME control module

P007000 Outside-temperature sensor - electrical fault
P007200 Outside-temperature sensor - signal too low
P007400 Outside-temperature sensor - loose contact

Monitored component or system

♦ Ambient temperature sensor

Fault finding notes

♦ see Air conditioning system fault memory

Function restrictions

P007400
♦ Possible radiator fan emergency operation

P008700

Diagnosis information DME control module

P008700 Fuel rail/system pressure too low

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Monitored component or system

♦ Fuel metering valve

Fault finding notes

♦ Pressure limiting valve faulty
♦ Metering valve faulty
♦ Leaks in the rail
♦ Low pressure system faulty

Function restrictions

♦ Misfiring is detected, and the power is correspondingly less
♦ Engine off

P008800

Diagnosis information DME control module

P008800 Fuel rail/system pressure too high

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Monitored component or system

♦ Fuel metering valve
♦ Fuel rail/system pressure

Fault finding notes

♦ Metering valve faulty
♦ High pressure sensor faulty

Function restrictions

♦ Misfiring is detected, and the power is correspondingly less
♦ Engine off

P008A00

Diagnosis information DME control module

P008A00 Fuel low pressure system pressure too low

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- The measured fuel low pressure deviates significantly from the setpoint pressure.

Monitored component or system

♦ Fuel low pressure system

Fault finding notes

♦ Check fuel lines (tightness)
♦ Check fuel filter (soiled/clogged)
♦ Check pressure retaining valve
♦ Check pressure limiting valve
♦ Check activation of electric fuel pump (low pressure)
♦ Check low pressure sensor (in the high pressure pump)
♦ Check electric fuel pump (low pressure) (pressure, delivery quantity)

P008B00

Diagnosis information DME control module

P008B00 Fuel low pressure system pressure too high

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- The measured fuel low pressure deviates significantly from the setpoint pressure.

Monitored component or system

♦ Fuel low pressure system

Fault finding notes

♦ Check fuel lines (tightness)
♦ Check fuel filter (soiled/clogged)
♦ Check pressure retaining valve
♦ Check pressure limiting valve
♦ Check activation of electric fuel pump (low pressure)
♦ Check low pressure sensor (in the high pressure pump)
♦ Check electric fuel pump (low pressure) (pressure, delivery quantity)

Diagnosis information DME control module

P009600 Bank 2 intake-manifold temperature exceeded

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- A maximum intake-manifold temperature is specified to protect the component
- The maximum value depends on the compressor pressure ratio

Monitored component or system

♦ Bank 2 intake manifold temperature sensor

Fault finding notes

♦ Check wiring
♦ Check measured values
♦ Bank 1/2 intake-manifold temperature sensor fault
♦ Faulty bank 2 charge air cooler

Function restrictions

♦ Power loss - MIL on

Diagnosis information DME control module

P00AB00 Bank 2 intake-manifold temperature sensor - implausible signal

Diagnostic conditions

- Enabling of master cross-check
- Diagnostics runs once per driving cycle with conditioned vehicle

Fault setting condition(s)

- Temperature cross-check after engine start in the conditioned vehicle state
- Comparison of sensors for intake-manifold temperature

Monitored component or system

♦ Bank 2 intake manifold temperature sensor

Fault finding notes

♦ Check of the temperature sensor compared to the other temperature sensors, ideally after engine cooling phase
♦ If plug and wiring are OK, replace
sensor

Diagnosis information DME control module

P00AC00 Bank 2 intake-air temperature sender 1 - short circuit to ground

Diagnostic conditions

- Ignition on
- Continuously

Fault setting condition(s)

- Monitoring of the electrical components for short circuit to ground

Monitored component or system

♦ Intake-air temperature sensor in intake pipe

Fault finding notes

♦ Perform line check
♦ Check sender internal resistance
♦ Spray sensor with cooling spray, observe measured value

Diagnosis information DME control module

P00AD00 Bank 2 intake-air temperature sender 1 - short circuit to B+

Diagnostic conditions

- Ignition on
- Continuously

Fault setting condition(s)

- Monitoring of the electrical components for short circuit to B+ or open circuit

Monitored component or system

♦ Intake-air temperature sensor in intake pipe

Fault finding notes

♦ Perform line check
♦ Check sender internal resistance
♦ Spray sensor with cooling spray, observe measured value

Diagnostic information - DME control unit

P00AE00 Bank 2, intake-air temperature sensor (intake manifold), loose contact

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Monitored component or system

♦ Bank 2 intake-manifold temperature sender

Fault finding notes

♦ Loose contact or corrosion on connectors or lines
♦ Short circuit to B+/ground/between lines or open circuit in the signal line

Diagnosis information DME control module

P00C700 Sender 1/2 for boost pressure correlation

Diagnostic conditions

● Diagnostics runs continuously

Fault setting condition(s)

● Absolute value (measured intake-pipe pressure in bank 1 - measured intake-pipe pressure in bank 2) < 102.031 hPa

Monitored component or system

♦ Boost pressure sensor

Fault finding notes

♦ Perform line check
♦ Check measured values
♦ Check charge air cooler for clogging or leaks

Function restrictions

♦ Power loss - MIL on

Diagnosis information DME control module

P011100 Bank 1 intake-manifold temperature sensor - implausible signal

Diagnostic conditions

- Cold start detected
- No block heater operation detected
- No solar irradiation detected

Fault setting condition(s)

- Temperature cross-check after engine start in the conditioned vehicle state
- Comparison of sensors for intake-manifold temperature

Monitored component or system

♦ Bank 1 intake manifold temperature sensor

Fault finding notes

♦ Check of the temperature sensor compared to the other temperature sensors, ideally after engine cooling phase
♦ If plug and wiring are OK, replace
sensor

Function restrictions

♦ None

Diagnosis information DME control module

P011200 Bank 1 intake-manifold temperature sensor - short circuit to ground

Diagnostic conditions

- Ignition on

Fault setting condition(s)

- Monitoring of electrical components for short circuit to ground

Monitored component or system

♦ Bank 1 intake manifold temperature sensor

Fault finding notes

♦ Perform line test
♦ Spray sensor with cooling spray, observe measured value

Diagnosis information DME control module

P011300 Bank 1 intake-manifold temperature sensor - short circuit to B+/open circuit

Diagnostic conditions

- Engine idling
- Diagnostics runs continuously

Fault setting condition(s)

- Monitoring of electrical components for short circuit to B+ or open circuit

Monitored component or system

♦ Bank 1 intake manifold temperature sensor

Fault finding notes

♦ Perform line test
♦ Spray sensor with cooling spray, observe measured value

Diagnostic information - DME control unit

P011400 Bank 1, intake-air temperature sensor (intake manifold), loose contact

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Monitored component or system

♦ Bank 1 intake-manifold temperature sender

Fault finding notes

♦ Loose contact or corrosion on connectors or lines
♦ Short circuit to B+/ground/between lines or open circuit in the signal line

Diagnostic information - DME control unit

P011600 Coolant temperature sender - implausible signal

Diagnostic conditions

- Time after engine starts > 3 sec.
- Diagnostics runs once per driving cycle
- Cold start detected
- No block heater operation detected
- No solar irradiation detected

Fault setting condition(s)

- If no perceptible temperature change is recorded after driving states with low and high cooling power, it is assumed that the sensor is stuck.
- Temperature cross-check after engine start in the conditioned vehicle state
- Comparison of intake-air temperature, engine temperature and ambient temperature

Monitored component or system

♦ Engine cooling system temperature sensor

Fault finding notes

♦ Engine temperature sensor faulty

Functional restrictions

♦ Engine temperature too low or too high

Diagnosis information DME control module

P011700 Coolant temperature sender - signal too low

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Measured engine temperature > 137.3 °C (279.1 °F)
- Voltage drop at the NTC sensor is assigned to a corresponding temperature
- Fault detection when a maximum temperature threshold is exceeded

Monitored component or system

♦ Engine cooling system temperature sensor

Fault finding notes

♦ Measure voltage via sensor
♦ Fault case: if the voltage is near 0 V, the sensor or wiring is faulty

Function restrictions

♦ Engine temperature too high

Diagnosis information DME control module

P011800 Coolant temperature sender - signal too high

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Measured engine temperature < -44.3 °C (-47.7 °F)
- Voltage drop at the NTC sensor is assigned to a corresponding temperature
- Fault detection when a minimum temperature threshold is exceeded

Monitored component or system

♦ Engine cooling system temperature sensor

Fault finding notes

♦ Measure voltage via sensor
♦ Fault case: if the voltage is near 5 V, the sensor or wiring is faulty

Function restrictions

♦ Engine temperature too low

P011900

Diagnosis information DME control module

P011900 Coolant temperature sender - loose contact

Diagnostic conditions

- Continuously

Fault setting condition(s)

- Difference between raw value and filtered value > 1 V

Monitored component or system

♦ Coolant temperature sender

Fault finding notes

♦ Loose contact or corrosion on connectors or lines
♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Coolant temperature sender faulty

Diagnosis information DME control module

P012100 Throttle valve potentiometer - implausible signal

Diagnostic conditions

- Engine speed > 480 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- The angles of throttle valve potentiometers 1 and 2 deviate by more than 6.3 % from each other
- The angle of throttle valve potentiometer 1 and the calculated throttle valve angle deviate by more than 9.0% from each other

Monitored component or system

♦ Throttle valve sensor 1

Fault finding notes

♦ Electrical test of the sensor line, power supply, ground, plug
♦ A power supply of 5 V with respect to sensor ground (in the plug) must be measured on the wiring harness of the throttle valve plug when the ignition is on (throttle valve unplugged)

Diagnosis information DME control module

P012200 Throttle valve potentiometer - signal too low

Diagnostic conditions

- Ignition on
- Run-on
- Diagnostics runs continuously

Fault setting condition(s)

- Throttle valve potentiometer voltage of sensor 1 < 0.195 V

Monitored component or system

♦ Throttle valve sensor 1

Fault finding notes

♦ Electrical test of the sensor line, power supply, ground, plug
♦ A power supply of 5 V with respect to sensor ground (in the plug) must be measured on the wiring harness of the throttle valve plug when the ignition is on (throttle valve unplugged)

Diagnosis information DME control module

P012300 Throttle valve potentiometer - signal too high

Diagnostic conditions

- Ignition on
- Run-on
- Diagnostics runs continuously

Fault setting condition(s)

- Throttle valve potentiometer voltage of sensor 1 > 4.80 V

Monitored component or system

♦ Throttle valve sensor 1

Fault finding notes

♦ Electrical test of the sensor line, power supply, ground, plug
♦ A power supply of 5 V with respect to sensor ground (in the plug) must be measured on the wiring harness of the throttle valve plug when the ignition is on (throttle valve unplugged)

P012700

Diagnosis information DME control module

P012700 Bank 1 intake-manifold temperature exceeded

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Measured intake-manifold temperature in bank 1 > 100 °C (212 °F)

Monitored component or system

♦ Bank 1 intake manifold temperature sensor

Fault finding notes

♦ Perform line test
♦ Check measured values
♦ Check charge air cooler for clogging or leaks

Function restrictions

♦ Power loss - MIL on

Diagnosis information DME control module

P012B00 Sensor for intake-manifold pressure behind throttle valve - signal implausible

Diagnostic conditions

- Diagnostics runs continuously from engine start
- Part-load operation (engine speed < 1,800 rpm)

Fault setting condition(s)

- Comparison of several pressure sensors at start
- Diagnostics runs only if engine was stopped for at least 10 seconds before starting
- Measured pressure behind throttle valve implausible compared to model value
- Comparison of several pressure sensors at partial load
- Compressor control flap open

Monitored component or system

♦ Pressure sensor behind throttle valve

Fault finding notes

♦ Compare pressure signal with stationary engine with values from other vehicles
♦ Compare measured values
♦ Check plug connections and lines
♦ Check intake-manifold pressure sensor ground line
♦ Check intake tract for tightness
♦ Check compressor control flap (short test)
♦ Check throttle valve for deformation/soiling
♦ Visual inspection of air cleaner
♦ Visual inspection of charge air cooler
♦ Replace sensor

Diagnosis information DME control module

P012C00 Sensor for intake-manifold pressure behind throttle valve - short circuit to ground

Diagnostic conditions

- Engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Monitoring of electrical components for short circuit to ground
- Voltage of pressure sensor behind throttle valve < 0.25 V

Monitored component or system

♦ Pressure sensor behind throttle valve

Fault finding notes

♦ Check plug connections and lines
♦ Replace sensor

P012D00

Diagnosis information DME control module

P012D00 Sensor for intake-manifold pressure behind throttle valve - short circuit to B+/open circuit

Diagnostic conditions

- Engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Monitoring of electrical components for short circuit to B+ or open circuit
- Voltage of pressure sensor behind throttle valve > 4.850 V

Monitored component or system

♦ Pressure sensor behind throttle valve

Fault finding notes

♦ Line test
♦ Replace sensor

Function restrictions

♦ None

Diagnosis information DME control module

P013000 Bank 1 sensor 1 - electrical fault in circuit

Diagnostic conditions

- Oxygen sensor 4.9/4.2
- Exhaust temperature > 249.998 °C (481.996 °F)
- Heater control active
- Dew point end reached
- Diagnostics runs continuously

Fault setting condition(s)

- Ceramic element temperature < 640.022 °C (1,184.040 °F)
- Internal resistance > 950 Ohm
- Heater fault
- Line open circuit
- A fault entry is made as soon as the ceramic element temperature is implausibly low, the internal resistance of the Nernst cell is implausibly high or a heater fault or a line open circuit is present
- This diagnostic test represents a quick test in order to deactivate lambda control as quickly as possible in the event of a fault. The exact fault cause is stored as the second fault memory entry

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor ahead of catalytic converter, bank 1 sensor 1 faulty

Diagnosis information DME control module

P013100 Bank 1 sensor 1 - voltage too low

Diagnostic conditions

- Oxygen sensor 4.9/4.2
- Heater control active
- Diagnostics runs continuously

Fault setting condition(s)

- Virtual ground < 2 V
- Nernst voltage < 1.75 V
- Comparison line < 0.9 V
- Collective fault: Short circuit of the virtual ground to ground, short circuit of the Nernst voltage to ground or short circuit of the comparison line to ground

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor ahead of catalytic converter, bank 1 sensor 1 faulty

Diagnosis information DME control module

P013200 Bank 1 sensor 1 - voltage too high

Diagnostic conditions

- Oxygen sensor 4.9/4.2
- Heater control active
- Diagnostics runs continuously

Fault setting condition(s)

- Virtual ground > 3 V
- Nernst voltage > 4 V
- Comparison line > 6 V
- Collective fault: Short circuit of the virtual ground to B+, short circuit of the Nernst voltage to B+ or short circuit of the comparison line to B+

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor ahead of catalytic converter, bank 1 sensor 1 faulty

Diagnosis information DME control module

P013300 Bank 1 sensor 1 - signal too slow

Monitored component or system

- Oxygen sensor ahead of catalytic converter
- Dynamic response

Fault finding notes

- Open circuit
- Short circuit to B+
- Short circuit to ground
- Loose contact or corrosion on connectors or lines
- Oxygen sensor ahead of catalytic converter, bank 1 sensor 1 faulty

Diagnosis information DME control module

P013500 Bank 1 sensor 1 heating circuit - electrical fault
P015500 Bank 2 sensor 1 heating circuit - electrical fault

Diagnostic conditions

General:
- Battery positive voltage between 10.7 V and 16.1 V
- No electrical fault of the sensor
- No overrun mode > 3 seconds

Start diagnostics:
- Engine temperature at engine start > -9.8 °C (+14.4 °F)
- Modeled pipe wall temperature at sensor position < 720 °C (1,328 °F)

Permanent diagnostics:
- Modeled exhaust gas temperature at sensor installation position > 350 °C (662 °F)
- Sensor heating active > 50 seconds

Low-temperature diagnostics:
- Modeled exhaust gas temperature at sensor installation position > 250 °C (482 °F)

Fault setting condition(s)

- Start diagnostics: One-time test of heating time after engine start
⇒ Heating time to operating temperature of 720 °C (1,328 °F) > 40 seconds

- Permanent diagnostics: Continuous testing during driving
⇒ Temperature < 720 °C (1,328 °F) and heating control > 90%

- Low-temperature diagnostics:
⇒ Sensor temperature < 640 °C (1,184 °F)

ⓘ Information
The engine control unit converts the internal resistance of the sensor Nernst cell to a ceramic element temperature, which is compared with the respective setpoint.

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter

Function restrictions

♦ Lambda control deactivated
♦ Higher emissions
♦ Poor engine running

Fault finding notes

♦ Check supply voltage
♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor heater ahead of cat. conv., bank 1 sensor 1 faulty

P013700

Diagnosis information DME control module

P013700 Bank 1 sensor 2 - voltage too low

Diagnostic conditions

● Diagnostics runs continuously

Fault setting condition(s)

● At start with cold sensor: The sensor voltage is below the minimum voltage (0.04 V)
● In warm operation: The sensor voltage is below a minimum voltage (0.04 V) and no reaction to closed-loop enrichment

Monitored component or system

♦ Bank 1 oxygen sensor 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor behind cat. conv., bank 1 sensor 2 faulty

Diagnosis information DME control module

P013800 Bank 1 sensor 2 - voltage too high

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- The sensor voltage is above the maximum voltage (1.08 V)

Monitored component or system

♦ Bank 1 oxygen sensor 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor behind cat. conv., bank 1 sensor 2 faulty

Diagnosis information DME control module

P013A00 Bank 1 sensor 2 - signal too slow from rich to lean

Diagnostic conditions

- Sensor ready for operation
- Diagnostics runs once per driving cycle

Fault setting condition(s)

- During the change from rich signal to lean signal, several differential gradients of the oxygen-sensor signal are evaluated in a 10-mV grid
- If the largest slope (delta voltage over delta time) is above the limit value, the test is OK

Monitored component or system

♦ Oxygen sensors behind catalytic converter

Fault finding notes

♦ Plug test, electrical fault finding
♦ Check oxygen sensor for soiling
♦ Check tightness of the exhaust system. If it is OK, test the oxygen sensor in a short trip

Diagnosis information DME control module

P013B00 Bank 1 sensor 2 - signal too slow from lean to rich
P013D00 Bank 2 sensor 2 - signal too slow from lean to rich

Diagnostic conditions

- Sensor ready for operation
- Diagnostics runs once per driving cycle

Information
The sensor reaction time (rise time) is measured during defined fuel jumps (change in the supplied fuel quantity).

Fault setting condition(s)

- Rise time from lean to rich > 1 second

Monitored component or system

♦ Oxygen sensors behind catalytic converter

Fault finding notes

♦ Connector test
♦ Electrical fault finding
♦ Check oxygen sensor for soiling
♦ Check tightness of the exhaust system
♦ Test oxygen sensor with a short trip

Fault effects

♦ The driver cannot perceive the reduction in the dynamic response of the sensor
♦ Accuracy loss of lambda control

Diagnosis information DME control module

P013C00 Bank 2 sensor 2 - signal too slow from rich to lean

Diagnostic conditions

- Sensor ready for operation
- Diagnostics runs once per driving cycle

Fault setting condition(s)

- During the change from rich signal to lean signal, several differential gradients of the oxygen-sensor signal are evaluated in a 10-mV grid
- If the largest slope (delta voltage over delta time) is above the limit value, the test is OK

Monitored component or system

♦ Oxygen sensors behind catalytic converter

Fault finding notes

♦ Plug test, electrical fault finding
♦ Check oxygen sensor for soiling
♦ Check tightness of the exhaust system. If it is OK, test the oxygen sensor in a short trip

Diagnosis information DME control module

P013B00 Bank 1 sensor 2 - signal too slow from lean to rich
P013D00 Bank 2 sensor 2 - signal too slow from lean to rich

Diagnostic conditions

- Sensor ready for operation
- Diagnostics runs once per driving cycle

Information
The sensor reaction time (rise time) is measured during defined fuel jumps (change in the supplied fuel quantity).

Fault setting condition(s)

- Rise time from lean to rich > 1 second

Monitored component or system

♦ Oxygen sensors behind catalytic converter

Fault finding notes

♦ Connector test
♦ Electrical fault finding
♦ Check oxygen sensor for soiling
♦ Check tightness of the exhaust system
♦ Test oxygen sensor with a short trip

Fault effects

♦ The driver cannot perceive the reduction in the dynamic response of the sensor
♦ Accuracy loss of lambda control

Diagnosis information DME control module

P013E00 Bank 1 sensor 2 - signal delayed from rich to lean
P013F00 Bank 1 sensor 2 - signal delayed from lean to rich
P014A00 Bank 2 sensor 2 - signal delayed from rich to lean
P014B00 Bank 2 sensor 2 - signal delayed from lean to rich

Diagnostic conditions

- Sensor ready for operation
- Diagnostics runs once per driving cycle

Information
The sensor reaction time (rise time) is measured during defined fuel jumps (change in the supplied fuel quantity).

Fault setting condition(s)

- For lean-out: delay time from rich to lean
- For enrichment: delay time from lean to rich
- Delay time > 0.8 second

Monitored component or system

♦ Oxygen sensors behind catalytic converter

Fault finding notes

♦ Connector test
♦ Electrical fault finding
♦ Check oxygen sensor for soiling
♦ Check tightness of the exhaust system
♦ Test oxygen sensor with a short trip

Fault effects

♦ The driver cannot perceive the reduction in the dynamic response of the sensor
♦ Accuracy loss of lambda control

Diagnosis information DME control module

P013E00 Bank 1 sensor 2 - signal delayed from rich to lean
P013F00 Bank 1 sensor 2 - signal delayed from lean to rich
P014A00 Bank 2 sensor 2 - signal delayed from rich to lean
P014B00 Bank 2 sensor 2 - signal delayed from lean to rich

Diagnostic conditions

- Sensor ready for operation
- Diagnostics runs once per driving cycle

Information
The sensor reaction time (rise time) is measured during defined fuel jumps (change in the supplied fuel quantity).

Fault setting condition(s)

- For lean-out: delay time from rich to lean
- For enrichment: delay time from lean to rich
- Delay time > 0.8 second

Monitored component or system

♦ Oxygen sensors behind catalytic converter

Fault finding notes

♦ Connector test
♦ Electrical fault finding
♦ Check oxygen sensor for soiling
♦ Check tightness of the exhaust system
♦ Test oxygen sensor with a short trip

Fault effects

♦ The driver cannot perceive the reduction in the dynamic response of the sensor
♦ Accuracy loss of lambda control

Diagnosis information DME control module

P014000 Bank 1 sensor 2 - no activity

Diagnostic conditions

● Diagnostics runs continuously

Fault setting condition(s)

● The sensor voltage is in the voltage range or the exhaust gas temperature is higher than the temperature threshold and the internal resistance is higher than the internal-resistance threshold

Monitored component or system

♦ Bank 1 oxygen sensor 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor behind cat. conv., bank 1 sensor 2 faulty

Diagnosis information DME control module

P013E00 Bank 1 sensor 2 - signal delayed from rich to lean
P013F00 Bank 1 sensor 2 - signal delayed from lean to rich
P014A00 Bank 2 sensor 2 - signal delayed from rich to lean
P014B00 Bank 2 sensor 2 - signal delayed from lean to rich

Diagnostic conditions

- Sensor ready for operation
- Diagnostics runs once per driving cycle

Information
The sensor reaction time (rise time) is measured during defined fuel jumps (change in the supplied fuel quantity).

Fault setting condition(s)

- For lean-out: delay time from rich to lean
- For enrichment: delay time from lean to rich
- Delay time > 0.8 second

Monitored component or system

♦ Oxygen sensors behind catalytic converter

Fault finding notes

♦ Connector test
♦ Electrical fault finding
♦ Check oxygen sensor for soiling
♦ Check tightness of the exhaust system
♦ Test oxygen sensor with a short trip

Fault effects

♦ The driver cannot perceive the reduction in the dynamic response of the sensor
♦ Accuracy loss of lambda control

Diagnosis information DME control module

P013E00 Bank 1 sensor 2 - signal delayed from rich to lean
P013F00 Bank 1 sensor 2 - signal delayed from lean to rich
P014A00 Bank 2 sensor 2 - signal delayed from rich to lean
P014B00 Bank 2 sensor 2 - signal delayed from lean to rich

Diagnostic conditions

- Sensor ready for operation
- Diagnostics runs once per driving cycle

Information
The sensor reaction time (rise time) is measured during defined fuel jumps (change in the supplied fuel quantity).

Fault setting condition(s)

- For lean-out: delay time from rich to lean
- For enrichment: delay time from lean to rich
- Delay time > 0.8 second

Monitored component or system

♦ Oxygen sensors behind catalytic converter

Fault finding notes

♦ Connector test
♦ Electrical fault finding
♦ Check oxygen sensor for soiling
♦ Check tightness of the exhaust system
♦ Test oxygen sensor with a short trip

Fault effects

♦ The driver cannot perceive the reduction in the dynamic response of the sensor
♦ Accuracy loss of lambda control

Diagnosis information DME control module

P015000 Bank 2 sensor 1 - electrical fault in circuit

Diagnostic conditions

- Oxygen sensor 4.9/4.2
- Exhaust temperature > 249.998 °C (481.996 °F)
- Heater control active
- Dew point end reached
- Diagnostics runs continuously

Fault setting condition(s)

- Ceramic element temperature < 640.022 °C (1,184.040 °F)
- Internal resistance > 950 Ohm
- Heater fault
- Line open circuit
- A fault entry is made as soon as the ceramic element temperature is implausibly low, the internal resistance of the Nernst cell is implausibly high or a heater fault or a line open circuit is present
- This diagnostic test represents a quick test in order to deactivate lambda control as quickly as possible in the event of a fault. The exact fault cause is stored as the second fault memory entry

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter, bank 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor ahead of catalytic converter, bank 2 sensor 1 faulty

Diagnosis information DME control module

P015100 Bank 2 sensor 1 - voltage too low

Diagnostic conditions

- Oxygen sensor 4.9/4.2
- Heater control active
- Diagnostics runs continuously

Fault setting condition(s)

- Virtual ground < 2 V
- Nernst voltage < 1.75 V
- Comparison line < 0.9 V
- Collective fault: Short circuit of the virtual ground to ground, short circuit of the Nernst voltage to ground or short circuit of the comparison line to ground

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter, bank 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor ahead of catalytic converter, bank 2 sensor 1 faulty

Diagnosis information DME control module

P015200 Bank 2 sensor 1 - voltage too high

Diagnostic conditions

- Oxygen sensor 4.9/4.2
- Heater control active
- Diagnostics runs continuously

Fault setting condition(s)

- Virtual ground > 3 V
- Nernst voltage > 4 V
- Comparison line > 6 V
- Collective fault: Short circuit of the virtual ground to B+, short circuit of the Nernst voltage to B+ or short circuit of the comparison line to B+

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter, bank 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor ahead of catalytic converter, bank 2 sensor 1 faulty

P015300

Diagnosis information DME control module

P015300 Bank 2 sensor 1 - signal too slow

Monitored component or system

♦ Bank 2 oxygen sensor 1

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor ahead of catalytic converter, bank 2 sensor 1 faulty

Diagnosis information DME control module

P013500 Bank 1 sensor 1 heating circuit - electrical fault
P015500 Bank 2 sensor 1 heating circuit - electrical fault

Diagnostic conditions

General:
- Battery positive voltage between 10.7 V and 16.1 V
- No electrical fault of the sensor
- No overrun mode > 3 seconds

Start diagnostics:
- Engine temperature at engine start > -9.8 °C (+14.4 °F)
- Modeled pipe wall temperature at sensor position < 720 °C (1,328 °F)

Permanent diagnostics:
- Modeled exhaust gas temperature at sensor installation position > 350 °C (662 °F)
- Sensor heating active > 50 seconds

Low-temperature diagnostics:
- Modeled exhaust gas temperature at sensor installation position > 250 °C (482 °F)

Fault setting condition(s)

- Start diagnostics: One-time test of heating time after engine start
⇒ Heating time to operating temperature of 720 °C (1,328 °F) > 40 seconds

- Permanent diagnostics: Continuous testing during driving
⇒ Temperature < 720 °C (1,328 °F) and heating control > 90%

- Low-temperature diagnostics:
⇒ Sensor temperature < 640 °C (1,184 °F)

ⓘ Information
The engine control unit converts the internal resistance of the sensor Nernst cell to a ceramic element temperature, which is compared with the respective setpoint.

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter

Function restrictions

♦ Lambda control deactivated
♦ Higher emissions
♦ Poor engine running

Fault finding notes

♦ Check supply voltage
♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor heater ahead of cat. conv., bank 1 sensor 1 faulty

Diagnosis information DME control module

P015700 Bank 2 sensor 2 - voltage too low

Diagnostic conditions

● Diagnostics runs continuously

Fault setting condition(s)

● At start with cold sensor: The sensor voltage is below the minimum voltage (0.04 V)
● In warm operation: The sensor voltage is below a minimum voltage (0.04 V) and no reaction to closed-loop enrichment

Monitored component or system

♦ Bank 2 oxygen sensor 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor behind cat. conv., bank 2 sensor 2 faulty

Diagnosis information DME control module

P015800 Bank 2 sensor 2 - voltage too high

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- The sensor voltage is above the maximum voltage (1.08 V)

Monitored component or system

♦ Bank 2 oxygen sensor 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor behind cat. conv., bank 2 sensor 2 faulty

Diagnosis information DME control module

P016000 Bank 2 sensor 2 - no activity

Diagnostic conditions

● Diagnostics runs continuously

Fault setting condition(s)

● The sensor voltage is in the voltage range or the exhaust gas temperature is higher than the temperature threshold and the internal resistance is higher than the internal-resistance threshold

Monitored component or system

♦ Bank 2 oxygen sensor 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor behind cat. conv., bank 2 sensor 2 faulty

Diagnosis information DME control module

P016100 Bank 2 sensor 2 heating circuit - electrical fault

Diagnostic conditions

- Intake-air temperature > -48 °C (-54 °F)
- Battery positive voltage 10.7...16.1 V
- Time after engine starts > 30 seconds
- Engine running
- Modeled exhaust-gas temperature at the sensor 300...820 °C (572 ... 1,508 °F)
- Sensor ready for operation
- Valid, current internal resistance of the sensor measured

Information
The internal resistance of the Nernst cell is measured. The resistance is inversely proportional to the ceramic-element temperature. The output capability of the heater is deduced via the resistance.

Fault setting condition(s)

- The measured internal resistance exceeds the threshold (map), which depends on the engine operating point (exhaust gas temperature and exhaust gas mass flow) and the heating output.

Monitored component or system

♦ Oxygen sensor heater behind catalytic converter 2

Fault finding notes

♦ Check power supply of the heater
♦ Check component for continuity (heater)
♦ Check wiring between the control unit and component for open circuit and contact resistance (heater circuit and sensor signal line)

Fault effects

♦ Accuracy loss of lambda control

P017000

Diagnosis information DME control module

P017000 Bank 1 fuel metering system - malfunction

Fault setting condition(s)

- **Lambda controller amplitude > 3%**

Monitored component or system

♦ Mixture adaptation (short trip)

Possible fault causes

♦ **Exhaust system** leaks (Engine ⇒ **Oxygen sensor in front of catalytic converter**)
♦ **Exhaust system** Narrowed / Blocked

♦ **Injection valve** Faulty (Mechanical fault)
♦ Timing incorrectly set
♦ Fault in area Fuel high-pressure, Intake manifold pressure sensor, **Throttle adjusting unit**, **Ambient pressure sensor**, **Intake air temperature sensor**, **Speed sensor**, **Valve lift control**, **Camshaft adjustment**
♦ High fuel content in engine oil

Diagnosis information DME control module

P017100 Bank 1 fuel metering system - system too lean

Fault setting condition(s)

- System too lean
- Adaptive value > 21%

Monitored component or system

♦ Mixture adaptation (short trip)

Possible fault causes

♦ **Exhaust system** leaks (Engine ⇒ **Oxygen sensor in front of catalytic converter**)
♦ **Exhaust system** Narrowed / Blocked

♦ **Injection valve** Faulty (Mechanical fault)
♦ Timing incorrectly set
♦ Fault in area Fuel high-pressure, Intake manifold pressure sensor, **Throttle adjusting unit**, **Ambient pressure sensor**, **Intake air temperature sensor**, **Speed sensor**, **Valve lift control**, **Camshaft adjustment**

P017200

Diagnosis information DME control module

P017200 Bank 1 fuel metering system - system too rich

Fault setting condition(s)

- System too rich
- Adaptive value < 21%

Monitored component or system

♦ Mixture adaptation (short trip)

Possible fault causes

♦ High fuel content in engine oil
♦ **Exhaust system** leaks (Engine ⇒ **Oxygen sensor in front of catalytic converter**)
♦ **Injection valve** Faulty (Mechanical fault)
♦ Timing incorrectly set
♦ Fault in area Fuel high-pressure, Intake manifold pressure sensor, **Throttle adjusting unit**, **Ambient pressure sensor**, **Intake air temperature sensor**, **Speed sensor**, **Valve lift control**, **Camshaft adjustment**

P017300

Diagnosis information DME control module

P017300 Bank 2 fuel metering system - malfunction

Fault setting condition(s)

- **Lambda controller amplitude > 3%**

Monitored component or system

♦ Mixture adaptation (short trip)

Possible fault causes

♦ **Exhaust system** leaks (Engine ⇒ **Oxygen sensor in front of catalytic converter**)
♦ **Exhaust system** Narrowed / Blocked

♦ **Injection valve** Faulty (Mechanical fault)
♦ Timing incorrectly set
♦ Fault in area Fuel high-pressure, Intake manifold pressure sensor, **Throttle adjusting unit**, **Ambient pressure sensor**, **Intake air temperature sensor**, **Speed sensor**, **Valve lift control**, **Camshaft adjustment**
♦ High fuel content in engine oil

P017400

Diagnosis information DME control module

P017400 Bank 2 fuel metering system - system too lean

Fault setting condition(s)

- System too rich
- Adaptive value > 21%

Monitored component or system

♦ Mixture adaptation (short trip)

Possible fault causes

♦ **Exhaust system** leaks (Engine ⇒ **Oxygen sensor in front of catalytic converter**)
♦ **Exhaust system** Narrowed / Blocked

♦ **Injection valve** Faulty (Mechanical fault)
♦ Timing incorrectly set
♦ Fault in area Fuel high-pressure, Intake manifold pressure sensor, **Throttle adjusting unit**, **Ambient pressure sensor**, **Intake air temperature sensor**, **Speed sensor**, **Valve lift control**, **Camshaft adjustment**

P017500

Diagnosis information DME control module

P017500 Bank 2 fuel metering system - system too rich

Fault setting condition(s)

- System too rich
- Adaptive value < 21%

Monitored component or system

♦ Mixture adaptation (short trip)

Possible fault causes

♦ High fuel content in engine oil
♦ **Exhaust system** leaks (Engine ⇒ **Oxygen sensor in front of catalytic converter**)
♦ **Injection valve** Faulty (Mechanical fault)
♦ Timing incorrectly set
♦ Fault in area Fuel high-pressure, Intake manifold pressure sensor, **Throttle adjusting unit**, **Ambient pressure sensor**, **Intake air temperature sensor**, **Speed sensor**, **Valve lift control**, **Camshaft adjustment**

Diagnostic information - DME control unit

P017B00 Cylinder head temperature sender - implausible signal

Diagnostic conditions

● Cold start detected (switch-off time > 8 h)
● Engine was shut off while hot
● Vehicle start with conditioned vehicle
● Diagnostics runs once per driving cycle with conditioned vehicle
● Enabling of "master cross-check" via ambient air temperature signal
● No electrical faults in the engine temperature sensor, no component faults justifying blockage, engine running and no block heater operation

Fault setting condition(s)

● The purpose of the high-stuck check is to detect a stuck sensor in the control range
● Each check is performed once after a correspondingly long engine-off time
● Subsequent temperature cross-check after engine start in the conditioned vehicle state (long off time)
● Comparison of the cylinder head temperature with the engine temperature that has already undergone a plausibility check (checked against intake air temperature and ambient air temperature)
● The measured cylinder head temperature undergoes a plausibility check compared to a modelled cylinder head reference temperature
● If no perceptible temperature change is recorded after driving states with low and high cooling power, it is safe to assume that the sensor is stuck

Monitored component or system

♦ Coolant temperature sensor

Fault finding notes

♦ Test of the temperature sensor with cold engine
♦ Check of the cylinder head temperature compared to the coolant temperature. Ideally, compare the measured values after the engine cooling phase (e.g. 8 hours)
♦ A fault exists if the cylinder head temperature value is 30 °C (86 °F) less than the coolant temperature
♦ If the connectors and wiring are OK, replace the sensor
♦ At low ambient temperatures (Extended fault memory - ambient temperature < 15 °C (59 °F) or driving at low revs) ⇒ Thermostat stuck open

Functional restrictions

- ♦ Engine temperature too high
- ♦ Measured cylinder head temperature too high
- ♦ Measured cylinder head temperature too low
- ♦ In combination with P308100 ⇒ Fan activation

Diagnosis information DME control module

P017C00 Cylinder head temperature sender - short circuit to ground

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- The temperature sensor for thermal management input signal falls below the minimum value

Fault finding notes

- ♦ Check for short circuit to ground
- ♦ Check sensor, electrical wiring and the plug
- ♦ If the fault is a sensor fault, a fault will be entered when the sensor is unplugged

Diagnosis information DME control module

P017D00 Cylinder head temperature sender - short circuit to B+

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- The temperature sensor for thermal management input signal exceeds the maximum value

Fault finding notes

♦ Check for short circuit to B+/open line
♦ Check sensor, electrical wiring and the plug

Diagnosis information DME control module

P019000 Fuel pressure sender - electrical fault in circuit

Diagnostic conditions

● Diagnostics runs continuously

Fault setting condition(s)

● Sensor voltage > 4.8 V
● Monitoring of the electric signal from the pressure sensor for the high pressure/rail pressure fuel system
● The sensor voltage is read into the engine control unit via an AD channel; the voltage value is monitored for minimum and maximum limits

Monitored component or system

♦ Fuel high pressure sensor

Fault finding notes

♦ Check wiring, sensor and the engine control unit

Function restrictions

♦ Possibly power reduction/limp-home mode (with low pressure)

Diagnosis information DME control module

P019100 Fuel pressure sensor - implausible signal

Diagnostic conditions

- Diagnostics runs continuously
- With engine running

Fault setting condition(s)

- By means of an upper and a lower pressure limit, it is possible to define a signal range in which the sensor provides plausible, variable values, but they cannot be identified as plausible because they lie outside the working range
- Voltage difference of the high pressure sensor < 0.0049 V (difference is formed over 4 injections)

Monitored component or system

♦ Fuel high-pressure sensor

Fault finding notes

♦ High pressure sensor faulty (no electrical fault)
♦ Possibly faulty plug on sensor

Function restrictions

♦ Engine shudders, possibly until it stalls at idle
♦ Acute lack of power
♦ Possibly breakdown

Diagnosis information DME control module

P019200 Fuel pressure sender - short circuit to ground

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Sensor voltage < 0.2 V
- Monitoring of the electric signal from the pressure sensor for the high pressure/rail pressure fuel system
- The sensor voltage is read into the engine control unit via an AD channel
- The voltage value is monitored for minimum and maximum limits

Monitored component or system

♦ Fuel high pressure sensor

Fault finding notes

♦ Check wiring, sensor and the engine control unit

Function restrictions

♦ Possibly power reduction/limp-home mode (with low pressure)

Diagnosis information DME control module

P019600 Oil temperature sender - implausible signal

Diagnostic conditions

- Ignition on
- Diagnostics runs once per driving cycle with conditioned vehicle
- Enabling of "master cross-check" via ambient air temperature signal

Fault setting condition(s)

- Temperature cross-check after engine start in the conditioned vehicle state.
- Comparison of engine oil temperature in the sump with engine temperature or intake-air temperature in the intake pipe

Monitored component or system

♦ Oil temperature signal from oil level/oil temperature sender

Fault finding notes

♦ Check of the temperature sensor compared to the other temperature sensors, ideally after an engine cooling phase
♦ If plug and wiring are OK, replace sensor
♦ The sensor stabilization duration must be observed

Function restrictions

♦ Hybrid driving possibly not possible

P019700

Diagnosis information DME control module

P019700 Oil temperature sender - signal too low

Diagnostic conditions

- Ignition on

Fault setting condition(s)

- Short circuit to B+

Monitored component or system

♦ Oil level/oil temperature sender

Fault finding notes

♦ Sensor or wiring faulty

P019800

Diagnosis information DME control module

P019800 Oil temperature sender - signal too high

Diagnostic conditions

- Ignition on

Fault setting condition(s)

- Short circuit to ground

Monitored component or system

♦ Oil level/oil temperature sender

Fault finding notes

♦ Sensor or wiring faulty

Diagnosis information DME control module

P01E300 Coolant temperature sender 3 - electrical fault
P01E700 Coolant temperature sender 3 - loose contact

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

P01E300
- Short circuit to ground: sensor voltage > 4.90 V
- Short circuit to B+: sensor voltage < 0.26 V

P01E700
- Difference between raw value and filtered value > 1 V

Monitored component or system

♦ Coolant temperature sensor at radiator outlet

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Coolant temperature sender 3 faulty

Fault effects

♦ Loss of performance capability of the electric machine

P01E400

Diagnosis information DME control module

P01E400 Coolant temperature sender 3 - signal implausible

Diagnostic conditions

DFCC 24184
● Once per driving cycle
● No electrical fault present
● Switch-off time > 7 hours and 47 minutes
● Switch-off time valid
● End of starting completed or E-driving readiness set
● Vehicle speed > 25 km/h (16 mph) for 30 seconds
● No temperature difference between the individual cross-check sensors

DFCC 24186
● Once per driving cycle
● Engine temperature -20.3...39.8 °C (-4.5 ... 103.6 °F)

Fault setting condition(s)

DFCC 24184
● Confirmed cross-check error for the cooling-circuit temperature sensor ● Threshold exceeded (map depending on engine switch-off time)
● No cross-check error of the other temperature sensors

DFCC 24186
● Temperature signal of the hybrid cooling circuit temperature changed by less than 3 °C (5.4 ° F)

Monitored component or system

♦ Coolant temperature sensor at radiator outlet

Fault finding notes

♦ Check of the temperature sensor compared to the other temperature sensors, ideally after engine cooling phase
♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Coolant temperature sender 3 faulty

Fault effects

DFCC 24184
♦ Switchover of the sensor temperature to substitute value or substitute model
♦ Possibly restrictions in functions that use the sensor value

DFCC 24186
♦ No temperature specification of the coolant circuit from the radiator outlet to the electric machine
⇒ Switchover to model value
♦ Possibly earlier power reduction
♦ Possibly more frequent operation of the combustion engine

Diagnosis information DME control module

P01E300 Coolant temperature sender 3 - electrical fault
P01E700 Coolant temperature sender 3 - loose contact

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

P01E300
- Short circuit to ground: sensor voltage > 4.90 V
- Short circuit to B+: sensor voltage < 0.26 V

P01E700
- Difference between raw value and filtered value > 1 V

Monitored component or system

♦ Coolant temperature sensor at radiator outlet

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Coolant temperature sender 3 faulty

Fault effects

♦ Loss of performance capability of the electric machine

Diagnosis information DME control module

P020100 Cylinder 1 fuel injector - electrical fault in circuit

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side-sensing) > 0.45 A...0.85 A and < 2.05 A...2.55 A
- Current (high-side-sensing) < 2.4 A...3.4 A
- The fault is set in case of a booster timeout or open load of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 1

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P020200 Cylinder 2 fuel injector - electrical fault in circuit

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side-sensing) > 0.45 A...0.85 A and < 2.05 A...2.55 A
- Current (high-side-sensing) < 2.4 A...3.4 A
- The fault is set in case of a booster timeout or open load of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 2

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P020300 Cylinder 3 fuel injector - electrical fault in circuit

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side-sensing) > 0.45 A...0.85 A and < 2.05 A...2.55 A
- Current (high-side-sensing) < 2.4 A...3.4 A
- The fault is set in case of a booster timeout or open load of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 3

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P020400 Cylinder 4 fuel injector - electrical fault in circuit

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side-sensing) > 0.45 A...0.85 A and < 2.05 A...2.55 A
- Current (high-side-sensing) < 2.4 A...3.4 A
- The fault is set in case of a booster timeout or open load of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 4

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

P020500

Diagnosis information DME control module

P020500 Cylinder 5 fuel injector - electrical fault in circuit

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side-sensing) > 0.45 A...0.85 A and < 2.05 A...2.55 A
- Current (high-side-sensing) < 2.4 A...3.4 A
- The fault is set in case of a booster timeout or open load of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 5

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

P020600

Diagnosis information DME control module

P020600 Cylinder 6 fuel injector - electrical fault in circuit

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side-sensing) > 0.45 A...0.85 A and < 2.05 A...2.55 A
- Current (high-side-sensing) < 2.4 A...3.4 A
- The fault is set in case of a booster timeout or open load of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 6

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P021900 Maximum engine speed exceeded

Fault setting condition(s)

- Engine ran at a speed exceeding the governed speed (6,900 rpm)
- Presumably due to incorrect shifting of manual transmission
- Impossible for automatic transmissions in the field

Monitored component or system

♦ The engine is monitored for overspeed

Fault finding notes

♦ Possible cause in case of mechanical damage

Diagnosis information DME control module

P022100 Angle sender 2 for throttle valve drive - implausible signal

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- The angles of throttle valve potentiometers 1 and 2 deviate by more than 6.3% from each other
- The angle of throttle valve potentiometer 2 and the calculated throttle valve angle deviate by more than 9.0% from each other

Monitored component or system

♦ Throttle valve sensor 2

Fault finding notes

♦ Electrical test of the sensor line, power supply, ground, plug
♦ A power supply of 5 V with respect to sensor ground (in the plug) must be measured on the wiring harness of the throttle valve plug when the ignition is on (throttle valve unplugged)

Function restrictions

♦ Limp-home mode (engine speed and torque limitation) maximum 110 km/h (68 mph)

Diagnosis information DME control module

P022200 Angle sender 2 for throttle valve drive - signal too low

Diagnostic conditions

- Ignition on, run-on
- Diagnostics runs continuously

Fault setting condition(s)

- Throttle valve potentiometer voltage of throttle valve 1 sensor 2 < 0.195V

Monitored component or system

♦ Throttle valve sensor 2

Fault finding notes

♦ Electrical test of the sensor line, power supply, ground, plug
♦ A power supply of 5 V with respect to sensor ground (in the plug) must be measured on the wiring harness of the throttle valve plug when the ignition is on (throttle valve unplugged)

Function restrictions

♦ Limp-home mode (engine speed and torque limitation) maximum 110 km/h (68 mph)

P022300

Diagnosis information DME control module

P022300 Angle sender 2 for throttle valve drive - signal too high

Diagnostic conditions

- Ignition on, run-on
- Diagnostics runs continuously

Fault setting condition(s)

- Throttle valve potentiometer voltage of throttle valve 1 sensor 2 > 4.805 V

Monitored component or system

♦ Throttle valve sensor 2

Fault finding notes

♦ Electrical test of the sensor line, power supply, ground, plug
♦ A power supply of 5 V with respect to sensor ground (in the plug) must be measured on the wiring harness of the throttle valve plug when the ignition is on (throttle valve unplugged)

Function restrictions

♦ Limp-home mode (engine speed and torque limitation) maximum 110 km/h (68 mph)

Diagnosis information DME control module

P023600 Boost pressure sender - implausible signal

Diagnostic conditions

● At engine start
● Continuously from engine start
● In partial-load range
● Partial-load operation (engine speed < 1,800 rpm)
and
● Compressor control flap open for 1 second

Fault setting condition(s)

● Diagnostics runs only if engine was stopped for at least 3 seconds before starting
At engine start
● Comparison of several pressure sensors at engine start
● Intake-pipe pressure < mean value from all valid pressures
In partial-load mode
● Comparison of several pressures in partial-load mode
● The intake-pipe sensor 1 value is more than 110 hPa less than or greater than the intake-pipe 2 sensor value and the pressure sensor behind the throttle valve
Continuously from engine start
● Comparison of measured bank 1 intake-pipe pressure implausible compared to model value

Monitored component or system

♦ Intake manifold sensor

Fault finding notes

♦ Compare measured values
♦ Check intake tract for tightness
♦ Check plug connections and lines
♦ Check compressor control flap (short test)
♦ Visual inspection for deformation/soiling of the throttle valve
♦ Visual inspection of charge air cooler
♦ Replace sensor

Function restrictions

♦ None other than bank 2 intake-pipe sensor also faulty, then ban on boost-pressure buildup

P023700

Diagnosis information DME control module

P023700 Boost pressure sender - signal too low

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Monitoring of the electrical components for short circuit to ground
- Intake-pipe pressure sensor voltage < 0.25 V

Monitored component or system

♦ Intake manifold sensor

Fault finding notes

♦ Check plug connections and lines
♦ Replace sensor

Function restrictions

♦ None other than bank 2 intake-pipe sensor also faulty, then ban on boost-pressure buildup

Diagnosis information DME control module

P023700 Boost pressure sender - signal too high

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Monitoring of the electrical components for short circuit to B+ or open circuit
- Intake-pipe pressure sensor voltage > 4.75 V

Monitored component or system

♦ Intake manifold sensor

Fault finding notes

♦ Check plug connections and lines
♦ Replace sensor

Function restrictions

♦ None other than bank 2 intake-pipe sensor also faulty, then ban on boost-pressure buildup

Diagnosis information DME control module

P023A00 Coolant pump for charge air cooler - open circuit

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Monitoring of the electrical components for line open circuit
- The output stage hardware reports the load decrease fault

Monitored component or system

♦ Auxiliary water pump 2

Fault finding notes

♦ Check plug connections and lines

P023B00

Diagnosis information DME control module

P023B00 Coolant pump for charge air cooler - short circuit to ground

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Monitoring of the electrical components for short circuit to ground
- The output stage hardware reports the short circuit to ground fault

Monitored component or system

♦ Auxiliary water pump 2

Fault finding notes

♦ Check plug connections and lines

Function restrictions

♦ Power limit of the combustion engine
♦ No boost possible
♦ Lower recuperation
♦ Start/stop ban
♦ Electric driving not possible
♦ Shutoff of accessories
♦ Breakdown possible

Diagnosis information DME control module

P023C00 Coolant pump for charge air cooler - short circuit to B+

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Monitoring of the electrical components for short circuit to B+
- The output stage hardware reports the short circuit to B+ fault

Monitored component or system

♦ Auxiliary water pump 2

Fault finding notes

♦ Check plug connections and lines

Diagnosis information DME control module

P024000 Bank 2 intake-manifold pressure sensor - implausible signal

Diagnostic conditions

- At engine start
- Continuously from engine start
- In partial-load range
- Partial-load operation at engine speed < 1,800 rpm

and

- Compressor control flap open for 1 second

Fault setting condition(s)

- Diagnostics runs only if engine was stopped for at least 3 seconds before starting

At engine start

- Comparison of several pressure sensors at engine start
- Intake-manifold pressure 2 < mean value from all valid pressures

In partial-load mode

- Comparison of several pressures in partial-load mode
- The intake-manifold sensor 2 value is more than 110 hPa less than or greater than the intake-manifold 1 sensor value and the pressure sensor behind the throttle valve

Continuously from engine start

- Comparison of measured bank 2 intake-manifold pressure implausible compared to model value

Monitored component or system

♦ Bank 2 intake manifold pressure sensor

Fault finding notes

♦ Compare measured values
♦ Check intake tract for tightness
♦ Check plug connections and lines
♦ Check compressor control flap (short test)
♦ Visual inspection for deformation/soiling of the throttle valve
♦ Visual inspection of charge air cooler
♦ Replace sensor

Function restrictions

♦ None other than bank 1 intake-manifold sensor also faulty, then ban on boost-pressure buildup

Diagnosis information DME control module

P024100 Boost pressure sender 2 - signal too low

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Monitoring of the electrical components for short circuit to ground
- Intake-pipe pressure sensor voltage < 0.25 V

Monitored component or system

♦ Intake-manifold pressure sensor 2

Fault finding notes

♦ Check plug connections and lines
♦ Replace sensor

Function restrictions

♦ None other than bank 1 intake-pipe sensor also faulty, then ban on boost-pressure buildup

Diagnosis information DME control module

P024200 Boost pressure sender 2 - signal too high

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Monitoring of the electrical components for short circuit to B+ or open circuit
- Intake-pipe pressure sensor voltage > 4.75 V

Monitored component or system

♦ Intake-manifold pressure sensor 2

Fault finding notes

♦ Check plug connections and lines
♦ Replace sensor

Function restrictions

♦ None other than bank 1 intake-pipe sensor also faulty, then ban on boost-pressure buildup

P025A00

Diagnosis information DME control module

P025A00 Fuel pump module activation - electrical fault/open circuit

Diagnostic conditions

- Ignition on
- If the low-side transistor is not conducting
- Diagnostics runs continuously

Fault setting condition(s)

- Voltage between 1.5 V and 2.5 V
- Direct current measurement in the output-stage driver (engine control unit); the output stage is switched off and a status is sent when the threshold is reached

Monitored component or system

♦ Control unit: fuel supply

Fault finding notes

♦ Check electrical connection to the fuel pump unit for open circuit.
♦ Unplug the fuel pump unit and connect signal line to ground
♦ If a short circuit to ground is detected, the fuel pump unit is faulty. Otherwise, the engine control unit is faulty

Function restrictions

♦ Engine failure

Diagnosis information DME control module

P025C00 Fuel pump module activation - short circuit to ground

Diagnostic conditions

- Ignition on
- If the low-side transistor is not conducting
- Diagnostics runs continuously

Fault setting condition(s)

- Voltage < 1.5 V
- Direct current measurement in the output-stage driver (engine control unit); the output stage is switched off and a status is sent when the threshold is reached

Monitored component or system

♦ Control unit: fuel supply

Fault finding notes

♦ Check electrical connection to the fuel pump unit for short circuit to ground
♦ Unplug the fuel pump unit
♦ If an open line is detected, the fuel pump unit is faulty. Otherwise, the engine control unit is faulty

Function restrictions

♦ Engine failure

P025D00

Diagnosis information DME control module

P025D00 Fuel pump module activation - short circuit to B+

Diagnostic conditions

- Ignition on
- If the low-side transistor is conducting
- Diagnostics runs continuously

Fault setting condition(s)

- Current > 1.5 A
- Direct current measurement in the output-stage driver (engine control unit); the output stage is switched off and a status is sent when the threshold is reached

Monitored component or system

♦ Control unit: fuel supply

Fault finding notes

♦ Check electrical connection to the fuel pump unit for short circuit to B+
♦ Unplug the fuel pump unit
♦ If an open line is detected, the fuel pump unit is faulty. Otherwise, the engine control unit is faulty

Function restrictions

♦ Engine failure

Diagnosis information DME control module

P026100 Cylinder 1 fuel injector - short circuit to ground

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) < 2.05 A...2.55 A
- Current (high-side sensing) > 2.4 A...3.4 A
- The fault is set in case of short circuit to ground of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 1

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P026200 Cylinder 1 fuel injector - short circuit to B+

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) > 14.3 A...19.3 A
- The fault is set in case of short circuit to B+ of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 1

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P026400 Cylinder 2 fuel injector - short circuit to ground

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) < 2.05 A...2.55 A
- Current (high-side sensing) > 2.4 A...3.4 A
- The fault is set in case of short circuit to ground of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 2

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P026500 Cylinder 2 fuel injector - short circuit to B+

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) > 14.3 A...19.3 A
- The fault is set in case of short circuit to B+ of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 2

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P026700 Cylinder 3 fuel injector - short circuit to ground

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) < 2.05 A...2.55 A
- Current (high-side sensing) > 2.4 A...3.4 A
- The fault is set in case of short circuit to ground of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 3

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P026800 Cylinder 3 fuel injector - short circuit to B+

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) > 14.3 A...19.3 A
- The fault is set in case of short circuit to B+ of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 3

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnostic information - DME control unit

P026A00 Charge-air cooler efficiency too low

Diagnostic conditions

- Diagnostics runs several times per driving cycle

Fault setting condition(s)

- Cooling power in low-temperature circuit too low
- The mean intake-air temperature is higher than the calculated intake air temperature

Monitored component or system

♦ Low-temperature cooling circuit

Fault finding notes

♦ Check auxiliary coolant pump for low-temperature circuit and hoses
♦ Auxiliary coolant pump frozen/blocked
⇒ Activation possible via drive link
♦ Charge-air cooler covered (e.g. by snow, leaves)
♦ Cooling system blocked
♦ Check compressor temperature sensors
♦ No supply from auxiliary coolant pump (e.g. pump wheel broken)
♦ Air in cooling system

Fault effects

♦ Message >>Hybrid system fault<< in instrument cluster
♦ Radiator fan emergency operation

P027000

Diagnosis information DME control module

P027000 Cylinder 4 fuel injector - short circuit to ground

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) < 2.05 A...2.55 A
- Current (high-side sensing) > 2.4 A...3.4 A
- The fault is set in case of short circuit to ground of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 4

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P027100 Cylinder 4 fuel injector - short circuit to B+

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) > 14.3 A...19.3 A
- The fault is set in case of short circuit to B+ of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 4

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

P027300

Diagnosis information DME control module

P027300 Cylinder 5 fuel injector - short circuit to ground

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) < 2.05 A...2.55 A
- Current (high-side sensing) > 2.4 A...3.4 A
- The fault is set in case of short circuit to ground of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 5

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P027400 Cylinder 5 fuel injector - short circuit to B+

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) > 14.3 A...19.3 A
- The fault is set in case of short circuit to B+ of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 5

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P027600 Cylinder 6 fuel injector - short circuit to ground

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) < 2.05 A...2.55 A
- Current (high-side sensing) > 2.4 A...3.4 A
- The fault is set in case of short circuit to ground of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 6

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P027700 Cylinder 6 fuel injector - short circuit to B+

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) > 14.3 A...19.3 A
- The fault is set in case of short circuit to B+ of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 6

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

P030000

Diagnosis information DME control module

P030000 Misfiring detected

Fault setting condition(s)

- Catalytic converter faulty
- Misfiring rate > 2.5%...25%

Monitored component or system

♦ Misfire detection, misfiring detected

Fault finding notes

♦ Regularly only together with a single fault
♦ If this fault occurs without an individual-cylinder fault, perform the test procedure (e.g. test drive)

Function restrictions

♦ Loss of power
♦ MIL on

P030100

Diagnosis information DME control module

Misfiring detected
P030100 Cylinder 1
P030200 Cylinder 2
P030300 Cylinder 3
P030400 Cylinder 4
P030500 Cylinder 5
P030600 Cylinder 6

ⓘ Guided Fault Finding available.

Diagnostic conditions

- With engine running
- Engine speed between 400 and 6,500 rpm
- Engine torque >= 0 Nm
- Intake-air temperature > -48°C (-54 °F)
- Engine start temperature > -30 °C (-22 °F)
- Fuel shutoff not active
- Bad-road detection not active
- Internal CAN without fault
- Diagnostics runs continuously

Fault setting condition(s)

- Misfiring rate > 2% per 1,000 revolutions

Monitored component or system

♦ Misfire detection, cylinder 1 misfiring detected

Fault finding notes

♦ Loose contact or corrosion on connectors or lines
♦ Power or ground supply faulty

♦ Spark plug(s) Oily due to oil entrainment in the cylinder
♦ Spark plug(s) incorrect
♦ Spark plug(s) Mechanical fault or Electrical fault
♦ **Ignition coil** Faulty
♦ Power or ground supply faulty

♦ Fuel quality incorrect
♦ Fuel tank empty
♦ Water in the Fuel tank
♦ Fuel line soiled / Blocked

♦ **Electric fuel pump** Mechanical fault
♦ **Fuel high-pressure pump** Mechanical fault

♦ **Injection valve** Faulty or Borderline
(opens too late / not long enough / not enough or leaks)
♦ **Oxygen sensor(s)** Faulty

♦ **Exhaust system** Narrowed / Blocked

♦ **Catalytic converter** Faulty

♦ **Intake distributor** leaks
♦ Foreign bodies in the **Intake distributor**
♦ Fault **Camshaft adjustment**
♦ Timing incorrect - **Exhaust camshaft**
♦ Valve lifter Faulty
(Intake valve has not switched to the other lift or has not switched quickly enough)
♦ Mechanical fault Valve drive
♦ Compression too low
(e.g. Cylinder lining damaged, Valve-seat ring Faulty ...)

Function restrictions

♦ Loss of power
♦ MIL on

Misfiring detected
P030100 Cylinder 1
P030200 Cylinder 2
P030300 Cylinder 3
P030400 Cylinder 4
P030500 Cylinder 5
P030600 Cylinder 6

ⓘ Guided Fault Finding available.

Diagnostic conditions

- With engine running
- Engine speed between 400 and 6,500 rpm
- Engine torque >= 0 Nm
- Intake-air temperature > -48°C (-54 °F)
- Engine start temperature > -30 °C (-22 °F)
- Fuel shutoff not active
- Bad-road detection not active
- Internal CAN without fault
- Diagnostics runs continuously

Fault setting condition(s)

- Misfiring rate > 2% per 1,000 revolutions

Monitored component or system

♦ Misfire detection, cylinder 1 misfiring detected

Fault finding notes

♦ Loose contact or corrosion on connectors or lines
♦ Power or ground supply faulty

♦ Spark plug(s) Oily due to oil entrainment in the cylinder
♦ Spark plug(s) incorrect
♦ Spark plug(s) Mechanical fault or Electrical fault
♦ **Ignition coil** Faulty
♦ Power or ground supply faulty

♦ Fuel quality incorrect
♦ Fuel tank empty
♦ Water in the Fuel tank
♦ Fuel line soiled / Blocked

♦ **Electric fuel pump** Mechanical fault
♦ **Fuel high-pressure pump** Mechanical fault

♦ **Injection valve** Faulty or Borderline
(opens too late / not long enough / not enough or leaks)
♦ **Oxygen sensor(s)** Faulty

♦ **Exhaust system** Narrowed / Blocked

♦ **Catalytic converter** Faulty

♦ **Intake distributor** leaks
♦ Foreign bodies in the **Intake distributor**
♦ Fault **Camshaft adjustment**
♦ Timing incorrect - **Exhaust camshaft**
♦ Valve lifter Faulty
(Intake valve has not switched to the other lift or has not switched quickly enough)
♦ Mechanical fault Valve drive
♦ Compression too low
(e.g. Cylinder lining damaged, Valve-seat ring Faulty ...)

Function restrictions

Diagnosis information DME control module

P032100 Engine speed sender - implausible signal

Diagnostic conditions

● The intelligent speed sender is permanently supplied with power
● After synchronization via a safe run-out position and reaching the first reference mark (gap on sender wheel)
● No camshaft sender fault present
● No fault in the sensor supply voltage
● Engine stalling detection not active
● Engine start
● Switch ignition off and then on again
● Diagnostics runs continuously
● With engine running

Fault setting condition(s)

● After synchronization via a safe run-out position, a correction of the angle basis is made at the first reference mark (gap on sender wheel). If a certain amount is exceeded in this process, the fault is set
● Disturbed signal from intelligent speed sender detected
● Incorrect shut-off position of the intelligent speed sender detected
● Several edges implausible with respect to each other in time
● Incorrect number of crankshaft gaps and/or crankshaft teeth detected

Monitored component or system

♦ Crankshaft sensor

Fault finding notes

♦ Check of the sensor for correct installation (distance from sensor to sender wheel, fit)
♦ Check sensor power supply (only with active sensor)
♦ Check sensor signal with engine running (oscilloscope)
♦ Check the wiring for short circuit to B+, short circuit to ground and line open circuit
♦ Check sender wheel
♦ Replace sensor

Function restrictions

♦ Possibly torque limitation through switch-off of the high-pressure pump
♦ Delayed starting process possible

Diagnosis information DME control module

P032200 Engine speed sender - no signal

Diagnostic conditions

- No camshaft sender fault present
- No fault in the sensor supply voltage
- Engine stalling detection not active
- Engine start
- Switch ignition off and then on again
- Diagnostics runs continuously
- With engine running

Fault setting condition(s)

- No edge change of the crankshaft signal detected with camshaft signal present and engine turning

Monitored component or system

♦ Crankshaft sensor

Fault finding notes

♦ Check of the sensor for correct installation (distance from sensor to sender wheel, fit)
♦ Check sensor power supply (only with active sensor)
♦ Check sensor signal with engine running (oscilloscope)
♦ Check of the wiring
♦ Check sender wheel

Function restrictions

♦ Possibly torque limitation through switch-off of the high-pressure pump

Diagnosis information DME control module

P032700 Knock sensor 1 - signal too low

Diagnostic conditions

- Engine speed > 1,000 rpm
- Cyclical, except if fault or fault healing is suspected, in which case only this line is tested until the suspicion is no longer present
- Performed once per 100-ms grid

Fault setting condition(s)

- Knocking signal < -0.7 V
- Short circuit to ground
- Voltage too low

Monitored component or system

♦ Knock sensor 1

Fault finding notes

♦ Check of the sensor, the line, the connections for correct seating of the sensor

Diagnosis information DME control module

P032800 Knock sensor 1 - signal too high

Diagnostic conditions

● Engine speed > 1,000 rpm
● Cyclical, except if fault or fault healing is suspected, in which case only this line is tested until the suspicion is no longer present
● Performed once per 100-ms grid

Fault setting condition(s)

● Knocking signal > 1.0 V
● Short circuit to B+
● Voltage too high

Monitored component or system

♦ Knock sensor 1

Fault finding notes

♦ Check of the sensor, the line, the connections for correct seating of the sensor

Diagnosis information DME control module

P033200 Knock sensor 2 - signal too low

Diagnostic conditions

● Engine speed > 1,000 rpm
● Cyclical, except if fault or fault healing is suspected, in which case only this line is tested until the suspicion is no longer present
● Performed once per 100-ms grid

Fault setting condition(s)

● Knocking signal < -0.7 V
● Short circuit to ground
● Voltage too low

Monitored component or system

♦ Knock sensor 2

Fault finding notes

♦ Check of the sensor, the line, the connections for correct seating of the sensor

Diagnosis information DME control module

P033300 Knock sensor 2, signal too high

Diagnostic conditions

● Engine speed > 1,000 rpm
● Cyclical, except if fault or fault healing is suspected, in which case only this line is tested until the suspicion is no longer present
● Performed once per 100-ms grid

Fault setting condition(s)

● Knocking signal > 1.0 V
● Short circuit to B+
● Voltage too high

Monitored component or system

♦ Knock sensor 2

Fault finding notes

♦ Check of the sensor, the line, the connections for correct seating of the sensor

Diagnosis information DME control module

P034100 Camshaft position sensor - implausible signal

Diagnostic conditions

- No crankshaft sensor fault present
- No fault in the sensor supply voltage
- Switch ignition off and then on again
- Diagnostics at each start
- With engine running

Fault setting condition(s)

- The number of newly detected camshaft edges is evaluated once per camshaft revolution
- The camshaft signal is monitored for the number of edges actually present, their spacing and the signal level between the edges
- Number of edge changes, the signal level between the edges and the angular spacing of the camshaft sender edges deviate too far from the setpoints

Monitored component or system

♦ Bank 1 intake camshaft sensor

Fault finding notes

♦ Check of the sensor for correct installation (distance from sensor to sender wheel, fit)
♦ Check sensor power supply
♦ Check sensor signal with engine running (oscilloscope)
♦ Check of the wiring
♦ Check sender wheel

Function restrictions

♦ Camshaft adjustment is no longer permissible; camshaft moves to reference position

Diagnosis information DME control module

P034200 Camshaft position sensor - signal too low

Diagnostic conditions

- No crankshaft sensor fault present
- With engine running

Fault setting condition(s)

- No sensor edge change detected while engine is running
- Sensor signal is continuously at Low level

Monitored component or system

♦ Bank 1 intake camshaft sensor

Fault finding notes

♦ Check of the sensor for correct installation (distance from sensor to sender wheel, fit)
♦ Check sensor power supply
♦ Check sensor signal with engine running (oscilloscope)
♦ Check of the wiring
♦ Check sender wheel

Function restrictions

♦ Camshaft adjustment is no longer permissible; camshaft moves to reference position

Diagnosis information DME control module

P034300 Camshaft position sensor - signal too high

Diagnostic conditions

- No crankshaft sensor fault present
- With engine running

Fault setting condition(s)

- No sensor edge change detected while engine is running
- Sensor signal continuously at High level

Monitored component or system

♦ Bank 1 intake camshaft sensor

Fault finding notes

♦ Check of the sensor for correct installation (distance from sensor to sender wheel, fit)
♦ Check sensor power supply
♦ Check sensor signal with engine running (oscilloscope)
♦ Check of the wiring
♦ Check sender wheel

Function restrictions

♦ Camshaft adjustment is no longer permissible; camshaft moves to reference position

Diagnosis information DME control module

P034600 Bank 2 intake camshaft position sensor - implausible signal

Diagnostic conditions

- No crankshaft sensor fault present
- With engine running

Fault setting condition(s)

- Not enough camshaft sender edge changes matching the crankshaft signal detected

Monitored component or system

♦ Bank 2 intake camshaft sensor

Diagnosis information DME control module

P034700 Bank 2 camshaft position sensor - short circuit to ground

Diagnostic conditions

- No crankshaft sensor fault present
- With engine running

Fault setting condition(s)

- No sensor edge change detected while engine is running Sensor signal is continuously at Low level

Monitored component or system

♦ Bank 2 intake camshaft sensor

P034800

Diagnosis information DME control module

P034800 Bank 2 camshaft position sensor - short circuit to B+

Diagnostic conditions

- No crankshaft sensor fault present
- With engine running

Fault setting condition(s)

- No sensor edge change detected while engine is running Sensor signal continuously at High level

Monitored component or system

♦ Bank 2 intake camshaft sensor

Diagnosis information DME control module

P035100 Cylinder 1 ignition control - malfunction

Diagnostic conditions

- Engine speed > 80 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage > 5.2 V...6.0 V
- In case of idling, an internal register is set after a filtering time
- A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

P035200

Diagnosis information DME control module

P035200 Cylinder 2 ignition control - malfunction

Diagnostic conditions

- Engine speed > 80 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage > 5.2 V...6.0 V
- In case of idling, an internal register is set after a filtering time
- A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

P035300

Diagnosis information DME control module

P035300 Cylinder 3 ignition control - malfunction

Diagnostic conditions

- Engine speed > 80 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage > 5.2 V...6.0 V
- In case of idling, an internal register is set after a filtering time
- A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

Diagnosis information DME control module

P035400 Cylinder 4 ignition control - malfunction

Diagnostic conditions

- Engine speed > 80 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage > 5.2 V...6.0 V
- In case of idling, an internal register is set after a filtering time
- A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

P035500

Diagnosis information DME control module

P035500 Cylinder 5 ignition control - malfunction

Diagnostic conditions

- Engine speed > 680 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage > 5.2 V...6.0 V
- Monitoring of ignition coil activation for line open circuit

Monitored component or system

♦ Ignition coils

Fault finding notes

♦ Perform line check
♦ Check resistance of the ignition coil

Function restrictions

♦ Breakdown possible

P035600

Diagnosis information DME control module

P035600 Cylinder 6 ignition control - malfunction

Diagnostic conditions

- Engine speed > 680 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage > 5.2 V...6.0 V
- Monitoring of ignition coil activation for line open circuit

Monitored component or system

♦ Ignition coils

Fault finding notes

♦ Perform line check
♦ Check resistance of the ignition coil

Function restrictions

♦ Breakdown possible

Diagnosis information DME control module

P041000 Secondary-air system - malfunction

Diagnostic conditions

● Diagnostics runs once per driving cycle

Fault setting condition(s)

● Difference of measured pressure between secondary-air pump and secondary-air valve after secondary-air injection in the offset phase before secondary-air injection

Monitored component or system

♦ Secondary-air system

Fault finding notes

♦ Perform a short test if necessary

Function restrictions

♦ MIL on

Diagnosis information DME control module

P041600 Secondary-air injection valve 2 - open circuit

Diagnostic conditions

- Diagnostics runs continuously
- Secondary-air valve 2 activated
- Engine running

Fault setting condition(s)

- Secondary-air valve output stage line open circuit (low side switch)
- The output stage of the secondary-air valve detects a load drop-off
- Internal voltage is measured at the output 4.8...5.3 V

Monitored component or system

♦ Secondary-air valve

Fault finding notes

♦ Check wiring between engine control unit and component for open circuit
♦ The internal diagnostic voltage (between 3 V and 6 V) per output stage is measured
♦ Check power supply

Function restrictions

♦ Output stage inactive; failure of the secondary-air valve

Diagnosis information DME control module

P041700 Secondary-air injection valve 2 - short circuit

Diagnostic conditions

- Diagnostics runs continuously
- Secondary-air valve 2 activated
- Engine running

Fault setting condition(s)

Short circuit to B+
- Secondary-air valve output stage - short circuit to B+ (low side switch)
- The output stage of the secondary-air valve detects a short circuit to B+
- Signal current 2.2...4.0 A

Short circuit to ground
- Secondary-air valve output stage - short circuit to ground (low side switch)
- The output stage of the secondary-air valve detects a short circuit to ground
- Diagnostic voltage 0...3.25 V is measured at the output

Monitored component or system

♦ Secondary-air valve

Fault finding notes

♦ Check wiring between engine control unit and component for short circuit to B+
♦ If OK, disconnect the component plug and erase the fault memory
♦ If the engine control unit detects an open circuit, the
fault lies in the component

Function restrictions

♦ Output stage inactive; failure of the secondary-air valve

Diagnosis information DME control module

P042000 Bank 1 catalytic converter system - inadequate effect

Diagnostic conditions

- Exhaust gas mass flow < 25 kg/h...140 kg/h
- Modeled catalytic converter temperature in the range 549.998 °C...950 °C (1,021.996 °F... 1,742 °F)
- Mass air flow in the range 15%...68.3%
- Engine speed in the range 1,000 rpm...3,000 rpm
- Number of tests: 4
- Rapid adaptation stabilized
- Oxygen sensor ahead of catalytic converter ready; no fault
- Oxygen sensor behind catalytic converter ready; no fault
- Secondary-air system not active
- No misfiring
- Diagnostics runs once per driving cycle

Fault setting condition(s)

- Catalytic converter diagnostics through determination of the oxygen storage capacity

Monitored component or system

♦ Bank 1 catalytic converter

Fault finding notes

♦ The fault of the conversion loss in the catalytic converter cannot be checked in the workshop
♦ Poor fuel quality or misfiring could have caused the fault

Function restrictions

♦ The driver cannot perceive the reduction in the catalytic converter effect

Diagnosis information DME control module

P043000 Bank 2 catalytic converter system - inadequate effect

Diagnostic conditions

- Exhaust gas mass flow < 25 kg/h...140 kg/h
- Modeled catalytic converter temperature in the range 549.998 °C...950 °C (1,021.996 °F... 1,742 °F)
- Mass air flow in the range 15.0%...68.3%
- Engine speed in the range 1,000 rpm...3,000 rpm
- Number of tests: 4
- Rapid adaptation stabilized
- Oxygen sensor ahead of catalytic converter ready; no fault
- Oxygen sensor behind catalytic converter ready; no fault
- Secondary-air system not active
- No misfiring
- Diagnostics runs once per driving cycle

Fault setting condition(s)

- Catalytic converter diagnostics through determination of the oxygen storage capacity

Monitored component or system

♦ Bank 2 catalytic converter

Fault finding notes

♦ The fault of the conversion loss in the catalytic converter cannot be checked in the workshop
♦ Poor fuel quality or misfiring could have caused the fault

Function restrictions

♦ The driver cannot perceive the reduction in the catalytic converter effect

P043E00

Diagnostic information - DME control unit

P043E00 Tank vent system leakage diagnostics for reference leak - inadequate flow

Diagnostic conditions

- Tank leakage short test

Then:

- Tank vent valve short test

or

- Engine start with the following conditions:
  - Engine temperature > 4 °C (39 °F)
  - Difference between engine temperature and intake-air temperature < 15 °C (27 °F)
- Drive for longer than 10 minutes
- Tank vent adaptation value < 5.00

then:

- Engine and ignition off for longer than 15 minutes

at:

- Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
- Ambient temperature 4 ... 35 °C (39 ... 95 °F)
- Vehicle standstill
- Constant supply voltage (change < 1 V)
- Constant current draw of the tank leak diagnostic module - DMTL (fluctuation < 1 mA)

ⓘ The previous sequence is used to perform the tank leak test as a prerequisite for the actual diagnosis during the next trip.

then:

- Drive under the following conditions:
  - Engine start temperature < 60 °C (140 °F)
  - Vehicle speed 20..125 km/h (13...77 mph)
  - Change in vehicle speed < 30 km/h (18 mph)
  - No gear changes
  - No overrun fuel cut-off
  - Engine in partial-load mode
  - Intake manifold pressure at least 40 hPa less than ambient pressure
  - Current fuel consumption < 5 ml/s
  - Total tank ventilation quantity since engine start > 2.0 g
  - DMTL pump activated

Diagnostics run if the tank vent valve is open for

- > 15 seconds and is closed for > 5 seconds under these conditions.

Fault setting condition(s)

- The pump current during the reference-leak measurement is too high

● Pump current in the reference phase > 40.0 mA

Monitored component or system

♦ Leakage diagnostic pump

Fault finding notes

♦ Vent line from DMTL clogged
♦ Vent line to DMTL clogged
♦ Short circuit to B+/ground or open circuit in the line ▶ Activation line to DMTL
♦ DMTL power supply faulty
♦ **Tank leak diagnostic module** - DMTL faulty

Functional restrictions

♦ MIL comes on

P043F00

Diagnosis information DME control module

P043F00 Tank vent system - leakage diagnostics for reference leak - excessive flow

Diagnostic conditions

● Tank leakage short test
then:
● Tank vent valve short test

or

● Drive for longer than 10 minutes
● Tank vent adaptation value < 5.00
then:
● Engine and ignition off for longer than 15 minutes
at:
● Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
● **Ambient temperature** 4 ... 35 °C (39 ... 95 °F)
● Vehicle standstill
● Constant supply voltage (change < 1 V)
● Constant current draw of the tank leak diagnostic module - DMTL (fluctuation < 1 mA)
then:
● Engine start with the following conditions:
● **Engine temperature** > 4 °C (39 °F)
● Difference between engine compartment temperature and intake-air temperature < 15 °C (27 °F)

Fault setting condition(s)

● The pump current during the reference-leak measurement is too low
● Pump current in the reference phase < 15.0 mA

Monitored component or system

♦ Leakage diagnostic pump

Fault finding notes

♦ Vent line from DMTL clogged
♦ Vent line to DMTL clogged
♦ Short circuit to B+/ground or open circuit in the line ▶ Activation line to DMTL
♦ DMTL power supply faulty
♦ **Tank leakage diagnostic module** - DMTL faulty

Function restrictions

♦ MIL lights up
♦ Tank implodes

Diagnosis information DME control module

P044100 Tank vent system - incorrect throughput

Diagnostic conditions

● Tank leakage short test
then:
● Tank vent valve short test

or

● Engine start under the following conditions:
● Tank leak test performed after most recent engine run
● Engine compartment temperature < 60 °C (140 °F)
then:
● Drive under the following conditions:
● Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
● **Ambient temperature** 4 ... 35 °C (39 ... 95 °F)
● **Time since engine start** > 10 minute(s)
● Lambda control ahead of catalytic converter ready
● Engine running > idle speed
● Vehicle speed 20 ... 125 **km/h** (12 ... 78 mph); with speed change < 30 **km/h** (19 mph)
● No overrun fuel cut-off
● No gear changes
● Fuel flow rate from tank < 5.00 ml/sec.
here:
● Tank vent valve NOT activated > 5 seconds
and
● Tank vent valve activated > 5 seconds

Fault setting condition(s)

ⓘ The **tank leak diagnostic module - DMTL -** is activated during the drive. The **tank vent valve** is opened or closed at the same time.
♦ **Tank vent valve** does not close (completely):
● Current-draw difference of the **DMTL** is significantly higher than in the last tank leak test.
♦ **Tank vent valve** does not open:
● Constant current draw of the **DMTL** when the tank vent valve is opened .
● If tank leakage diagnostics via leakage diagnostic pump (el. pump connected to the fresh-air side of the carbon canister, which applies approx. 30 hPa overpressure to the tank in control unit run-on) is installed, diagnostics of the tank vent valve is also performed via the DMTL. The pump current draw serves as a measure of the pressure increase in the tank. For this purpose, diagnostics initially determines a reference current by the pump pumping against a reference leak measuring 0.5 mm in diameter. After switchover of an internal solenoid valve, pumping

takes place into the tank with the tank vent valve closed. In this process, the idle current is measured first, and the reference current change compared to the idle current is compared with the current change from the last leakage diagnostics in control unit run-on. If the current change is too high, the tank vent valve is stuck open and evacuates the tank. If the current change is OK, the tank will continue to be pumped up. If the relative current increase exceeds a threshold in the further process, the tank vent valve will be opened. The pump current must now have decreased by an applicable value within a specified time, otherwise the tank vent valve is stuck closed.

Monitored component or system

♦ Tank vent valve

Fault finding notes

♦ If the tank vent valve drive link test is not OK, then replace the tank vent valve
♦ If the tank vent valve drive link test is OK, then perform short trip tank vent valve test
♦ Check lines from the carbon canister to the tank vent valve and from the tank vent valve to the intake manifold for leaks, kinks, joined connections and clogging
♦ Replace tank vent valve
ⓘ For information about the DMTL function, refer to the document **Function description**.

Function restrictions

♦ The tank vent valve does not open
♦ The carbon canister is not flushed
♦ Fuel vapors can emerge at the fresh air filter in the rear left wheel housing
♦ MIL on

P044200

Diagnostic information - DME control unit

P044200 Tank vent system, fine leak detected

Diagnostic conditions

● Tank leakage diagnosis short test
then:
  ● Tank vent valve short test

or

● Engine start with the following conditions:
  ● Engine temperature > 4 °C (39 °F)
  ● Difference between engine temperature and intake-air temperature < 15 °C (59 °F)
● Drive for longer than 10 minutes
● Tank vent adaptation value < 5.00
then:
  ● Engine and ignition off for longer than 15 minutes
  at:
    ● Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
    ● Ambient temperature 4 ... 35 °C (39 … 95 °F)
    ● Vehicle standstill
    ● Constant supply voltage (change < 1 V)
    ● Constant current draw of the tank leakage diagnosis module - DMTL (fluctuation < 1 mA)

Fault setting condition(s)

● Test of the tank system for leaks with an equivalent diameter > 1.0 mm (0.04 in.)
ⓘ There may be several small leaks, which correspond in total to the leak determined here.

Monitored component or system

♦ Tank system minor leak

Fault finding notes

♦ Check the tank cap for correct closing and intact seals
♦ Check tank vent valve
♦ Check plug on the leakage diagnostic pump for correct seating
♦ Check tank system (with hoses) for tightness
♦ **Check tank leakage diagnosis module** - DMTL (leaks/faulty)
ⓘ For information about the DMTL function, see also the document **Function description**.

Functional restrictions

- ♦ Stronger smell of fuel
- ♦ Tank cap warning light comes on
- ♦ MIL on

Diagnosis information DME control module

P044400 Tank vent valve - open circuit

Diagnostic conditions

● Perform tank vent valve short test

or:

● **Time since engine start** > 10 second(s)
● Tank vent valve activated

Fault setting condition(s)

● The output stage of the tank vent valve detects a load decrease; the internal voltage is measured at the output > 4.8 V...5.3 V
● Tank vent valve output stage line open circuit (low side switch)

Monitored component or system

♦ Tank vent valve

Fault finding notes

♦ Check wiring between the DME control unit and component for open circuit. Depending on the output stage, the internal diagnostic voltage (between 3 V and 6 V) is measured
♦ Check power supply

Function restrictions

♦ Output stage inactive, failure of the tank vent valve

P044700

Diagnosis information DME control module

P044700 Tank vent system venting activation - open circuit

Diagnostic conditions

- Tank leakage short test

or

- **Power supply voltage** 9 V ... 16 V
- For detection of open circuit or short circuit to ground:
  - Ignition on
- For detection of short circuit to B+:
  - Tank leak test

Fault setting condition(s)

♦ Short circuit to open circuit in the line ▶ Activation line to DMTL solenoid valve
♦ DMTL power supply faulty
♦ **Tank leakage diagnostic module** - DMTL faulty

Monitored component or system

♦ DMTL solenoid valve output stage

Fault finding notes

♦ Line test
♦ Replace module

Function restrictions

♦ MIL lights up

Diagnosis information DME control module

P044800 Tank vent system venting activation - short circuit

Diagnostic conditions

- Tank leakage short test

or

- **Power supply voltage** 9 V ... 16 V
- For detection of open circuit or short circuit to ground:
  - Ignition on
- For detection of short circuit to B+:
  - Tank leak test

Fault setting condition(s)

- DMTL solenoid switchover valve output stage short circuit to B+
- DMTL solenoid switchover valve output stage short circuit to ground

Monitored component or system

♦ DMTL solenoid valve output stage

Fault finding notes

♦ Short circuit to B+/ground or open circuit in the line ▶ Activation line to DMTL solenoid valve
♦ DMTL power supply faulty
♦ **Tank leakage diagnostic module** - DMTL faulty

Function restrictions

♦ Tank implodes
♦ MIL lights up

P044900

Diagnostic information - DME control unit

P044900 Pressure tank, fuel tank isolation valve, electrical fault

Diagnostic conditions

- Fuel tank isolation valve (FTIV) activated

Monitored component or system

♦ Tank vent system

Fault finding notes

♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Loose contact or corrosion on connectors or lines

Functional restrictions

♦ No pressure control in fuel tank
♦ MIL on
♦ Longer waiting time before opening of filler flap
♦ Tank pressurized when tank cap is opened
♦ Refueling not possible
♦ Fuel odor from carbon canister

1. Short circuit to B+ or open circuit in line
⇒ No tank pressurization
2. Short circuit to ground
⇒ No tank pressure reduction

Diagnostic information - DME control unit

P045000 Pressure tank, pressure sensor, signal implausible

Diagnostic conditions

- Once per driving cycle after cold start, max. 10 attempts for a successful test.
- Change in ambient pressure < 3 hPa
- Ambient pressure > 680 hPa
- Ambient temperature 3.75...35.25 °C (38.75...95.45 °F)
- No refueling requested
- Fuel level < 80 l (21.1 gallons)

Fault setting condition(s)

- Tank pressure sensor offset: Differential pressure > 20 hPa

Monitored component or system

♦ Tank vent system

Fault finding notes

♦ Check function of fuel tank isolation valve (FTIV) ⇒ Tank leak test: This activates the FTIV. (Provided the tank leakage diagnostic module (DMTL) is available)
♦ Pressure sensor faulty
♦ Tank vent line trapped/clogged

Functional restrictions

♦ MIL on
♦ Extended waiting time before filler flap opens
♦ Smell of fuel from carbon canister

Diagnostic information - DME control unit

P045100 Pressure tank, pressure sensor, signal implausible

Diagnostic conditions

- Several times per driving cycle if conditions are met
- Vehicle speed 5 ... 80 km/h (3 ... 50 mph)
- Ambient pressure >= 746 hPa
- Ambient temperature >= 0 °C (32 °F)

Fault setting condition(s)

DFCC 14522
- Filtered tank pressure for diagnostics > 400 hPa (signal too high)

DFCC 14523
- Filtered tank pressure for diagnostics < -200 hPa (signal too low)

DFCC 14524
- Change in the tank pressure signal < 0.2 hPa (depending on the vehicle speed)

Monitored component or system

♦ Tank vent system

Fault finding notes

♦ Tank cap open
♦ Loose contact or corrosion on connectors or lines
♦ Pressure sensor faulty

Functional restrictions

♦ Pressure signal shows no changes
♦ No pressure control in tank
♦ Extended waiting time before filler flap opens
♦ Smell of fuel from carbon canister

Diagnostic information - DME control unit

P045600 Tank vent system, micro leak detected

Diagnostic conditions

● Tank leakage short test
Then:
  ● Tank vent valve short test

or

● Engine start with the following conditions:
  ● Engine temperature > 4 °C (39 °F)
  ● Difference between engine temperature and intake-air temperature < 15 °C (27 °F)
● Drive for longer than 10 minutes
● Tank vent adaptation value < 5.00
then:
  ● Engine and ignition off for longer than 15 minutes
  at:
    ● Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
    ● Ambient temperature 4 ... 35 °C (39 ... 95 °C)
    ● Vehicle standstill
    ● Constant supply voltage (change < 1 V)
    ● Constant current draw of the tank leak diagnostic module - DMTL (fluctuation < 1 mA)

Fault setting condition(s)

● Test of the tank system for leaks with an equivalent diameter of 0.5 ... 1.0 mm (0.02 ... 0.04 in.)
ⓘ There may be several small leaks which correspond in total to the leak determined here.

Monitored component or system

♦ Tank system micro leak

Fault finding notes

♦ Check the tank cap for correct closing and intact seals
♦ Check tank vent valve
♦ Check plug on the leakage diagnostic pump for correct seating
♦ Check tank system (with hoses) for tightness
♦ Check **tank leakage diagnostic module** - DMTL (leaks/faulty)

ⓘ For information about the DMTL function, refer to the document **Function description**.

Functional restrictions

- More pronounced fuel odor
- MIL on

P045700

Diagnosis information DME control module

P045700 Tank vent system - major leak

Diagnostic conditions

- Engine control unit run-on longer than 3 s
- MIL not on
- Elevation above sea level < 2,700 m (8,858 ft.)
- Engine start temperature 3.8 °C...35.3 °C (38.8 °F....95.5 °F)
- Diagnostics runs once per start cycle in control unit run-on

Fault setting condition(s)

- Test of the tank system for missing tank cap with purely informative diagnostics (no OBD II output); diagnostics controls a separate tank cap warning lamp

Monitored component or system

♦ Tank system major leak (tank cap open test during driving)

Fault finding notes

♦ A major leak was detected after a refueling operation; the customer may have forgotten to close the tank cap
♦ Check tank cap

Function restrictions

♦ Tank cap warning light illuminates
♦ More pronounced fuel odor

Diagnosis information DME control module

P045800 Tank vent valve - short circuit to ground

Diagnostic conditions

● Perform tank vent valve short test

or:

● **Time since engine start** > 10 second(s)
● **Leakage diagnostic pump not** activated

Fault setting condition(s)

● The output stage of the tank vent valve detects a short circuit to ground; the diagnostic voltage is measured at the output < 0 V...3.25 V
● Tank vent valve output stage short circuit to ground (low side switch)

Monitored component or system

♦ Tank vent valve

Fault finding notes

♦ Check wiring between the DME control unit and component for short circuit to ground. If this is OK, then pull the component off and clear the fault memory
♦ If the DME control unit detects an open circuit, the fault is in the component
♦ Check power supply on the component

Function restrictions

♦ Output stage inactive, failure of the tank vent valve

P045900

Diagnosis information DME control module

P045900 Tank vent valve - short circuit to B+

Diagnostic conditions

- Perform tank vent valve short test

or:

- **Time since engine start** > 10 second(s)
- Tank vent valve activated

Fault setting condition(s)

- The output stage of the tank vent valve detects a short circuit to B+
- Signal current > 2.2 A...4.0 A
- Tank vent valve output stage short circuit to ground (low side switch)

Monitored component or system

♦ Tank vent valve

Fault finding notes

♦ Check wiring between the DME control unit and component for short circuit to B+. If this is OK, then pull the component off and clear the fault memory
♦ If the DME control unit detects an open circuit, the fault is in the component

Function restrictions

♦ Output stage inactive, failure of the tank vent valve

P046100

Diagnosis information DME control module

P046100 Fuel level sender - signal implausible
P206600 Fuel level sender 2 - physical value range exceeded
P25D800 Fuel level sender 3 - physical value range exceeded

Diagnostic conditions

- Ignition on
- Continuously

Fault setting condition(s)

P046100
- Fuel level sender, signal > 110 l (liters)
- Resistance of sensor 1 > 1,100 Ohm

P206600
- Resistance of sensor 2 > 1,100 Ohm

P25D800
- Resistance of sensor 3 > 550 Ohm

Monitored component or system

♦ Fuel level sender

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Fuel level sender stuck
♦ Fault finding via instrument cluster

P046200

Diagnosis information DME control module

P046200 Fuel level sender, signal too low
P046300 Fuel level sender, signal too high
P206700 Fuel level indicator sender 2 - short circuit to ground
P206800 Fuel level indicator sender 2 - short circuit to B+

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- The fault is detected by the instrument cluster and transferred to the DME control unit, where the fault memory entry is made

Monitored component or system

♦ Fuel level sender

Fault finding notes

♦ Check instrument cluster fault memory content

Fault effects

♦ MIL on

P046300

Diagnosis information DME control module

P046200 Fuel level sender, signal too low
P046300 Fuel level sender, signal too high
P206700 Fuel level indicator sender 2 - short circuit to ground
P206800 Fuel level indicator sender 2 - short circuit to B+

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- The fault is detected by the instrument cluster and transferred to the DME control unit, where the fault memory entry is made

Monitored component or system

♦ Fuel level sender

Fault finding notes

♦ Check instrument cluster fault memory content

Fault effects

♦ MIL on

Diagnosis information DME control module

P048000 Radiator fan activation 1 - electrical fault

Diagnostic conditions

- Switch ignition on; fault is entered immediately
- Effect: Last revs are maintained; limp-home mode occurs after 10 s

Fault setting condition(s)

- Open circuit in signal line to fan control unit 1

Monitored component or system

♦ Activation line to the first fan output stage

Fault finding notes

♦ Line from DME control unit to fan control unit 1 is interrupted
♦ Continuity test from DME control unit to the radiator fan output stage
♦ In case of open circuit, it is possible to measure battery positive voltage at the fan control unit and ground at the DME control unit

Function restrictions

♦ Emergency operation of the fan means that the requirements for charging balance, acoustics and closed-circuit current are not met
♦ An empty battery is the possible result

Diagnostic information - DME control unit

P049100 Bank 1 secondary-air system - inadequate flow

Diagnostic conditions

● Diagnostics runs once during cold start

Fault setting condition(s)

● Leak or blockage detected in secondary-air line

Monitored component or system

♦ Secondary-air system

Fault finding notes

If the fault occurs in connection with the fault symptom (P code P049200), the fault in question is a fault in the overall system:
♦ Blockage between secondary-air pump and junction at which the secondary-air system separates into the two banks
♦ Leak between secondary-air pump and a secondary-air valve
♦ Inadequate secondary-air pump delivery quantity

If the fault occurs by itself:
♦ Blockage on bank 1
♦ Leak behind the valve

Generally:
♦ Check the secondary-air hoses
♦ Check that the secondary-air valves are activated (drive link)
♦ Visual inspection of the air admission into the cylinder head (contamination)
► See cleaning instructions in the PIWIS information system (Workshop Manual 266029)

♦ Check secondary-air system, bank 1 short test
♦ Check secondary-air system, bank 2 short test
The short tests can only be carried out once per driving cycle.

Functional restrictions

♦ No secondary-air supply in catalytic converter hot start
♦ Catalytic converter heats too slowly

♦ MIL on

P049200

Diagnostic information - DME control unit

P049200 Bank 2 secondary-air system - malfunction

Diagnostic conditions

● Diagnostics runs once during cold start

Fault setting condition(s)

● Leak or blockage detected in secondary-air line

Monitored component or system

♦ Secondary-air system

Fault finding notes

If the fault occurs in connection with the fault symptom (P code P049100), the fault in question is a fault in the overall system:
♦ Blockage between secondary-air pump and junction at which the secondary-air system separates into the two banks
♦ Leak between secondary-air pump and a secondary-air valve
♦ Inadequate secondary-air pump delivery quantity

If the fault occurs by itself:
♦ Blockage on bank 2
♦ Leak behind the valve

Generally:
♦ Check the secondary-air hoses
♦ Check that the secondary-air valves are activated (drive link)
♦ Visual inspection of the air admission into the cylinder head (contamination)
► See cleaning instructions in the PIWIS information system (Workshop Manual 266029)

♦ Check secondary-air system, bank 1 short test
♦ Check secondary-air system, bank 2 short test
The short tests can only be carried out once per driving cycle.

Functional restrictions

♦ No secondary-air supply in catalytic converter hot start
♦ Catalytic converter heats too slowly

♦ MIL on

P049600

Diagnostic information - DME control unit

P049600 Tank vent valve open

ⓘ Information
If tank leakage diagnostics via tank leakage diagnosis module (an electric pump connected to the fresh-air side of the carbon canister, which applies approx. 30 hPa overpressure to the tank in control unit run-on mode) is installed, diagnostics of the tank vent valve is also performed via the tank leakage diagnosis module. The pump's current draw serves as a measure of the pressure increase in the tank.

Diagnostic conditions

- Once per driving cycle
- Valid reference-current measurement from leakage diagnostics available
- Lambda control active/sensor operational readiness upstream of catalytic converter
- Tank ventilation enabled (e.g. no overrun switch-on)
- Battery voltage 11.0...16.1 V
- Ambient temperature 3.8 ... 35.3 °C (39 … 95.5 °F)
- Engine start temperature < 60 °C (140 °F)
- Vehicle speed 20 ... 125 km/h (13 … 77 mph)
- Difference between intake manifold pressure and ambient pressure > 40 hPa

Fault setting condition(s)

- Diagnostics initially determines a reference current by getting the pump to pump against a reference leak measuring 0.5 mm in diameter. After switchover of an internal solenoid valve, pumping takes place into the tank with the tank vent valve closed. In this process, the idle current is measured first, and the reference current change compared to the idle current is compared with the current change from the last leakage diagnostics in control unit run-on. If the current change is too high, the tank vent valve is stuck open, thereby evacuating the tank, and the fault is set.

Monitored component or system

♦ Tank vent system

Fault finding notes

♦ If tank leakage diagnosis module is available ⇒ Maintenance/repairs ⇒ Tank leakage diagnostics
⇒ Leaks can be caused by a tank vent valve that is stuck open
♦ Drive link/Tank vent valve short test
♦ Check lines from the carbon canister to the tank vent valve and from the tank vent valve to the

intake manifold for leaks, kinks, joined connections and clogging
♦ Tank vent valve faulty

Fault effects

♦ No mixture adaptation or charge comparison can be performed
♦ Combustion engine no longer stops
♦ No ignition misfire adaptation can be performed
♦ The tank vent valve is permanently stuck open, and the carbon canister is continuously flushed. An excessive load of the carbon canister can lead to rough idling and to ignition misfiring, because an excessively rich mixture is fed into the combustion chamber.
♦ MIL comes on

Diagnostic information - DME control unit

P04ED00 Tank vent system, fresh-air side, major leak detected

Diagnostic conditions

- Once per driving cycle in control unit run-on
- Vehicle electrical system voltage 11...16 V
- Elevation <= 2,700 m (8,858 ft.)
- Engine start temperature => 3.75 °C (38.75 °F)
- Ambient temperature 3.75...35.25 °C (38.75...95.45 °F)
- DME control unit run-on longer than 3 s
- No tank leakage faults

Fault setting condition(s)

- Calculated tank overpressure < 11 hPa
- Pressure change < 0.05 hPa within 15 s after a minimum diagnostic time of 180 s
- Diagnostic time > 249 s

Monitored component or system

♦ Tank vent system

Fault finding notes

♦ The fault is entered together with P044200 or P045600 and provides an indication of the leak location
♦ The tank up to the pressure tank isolation valve and tank cap is tight.
♦ Check low-pressure area

Functional restrictions

♦ MIL on
♦ More pronounced fuel odor

P04EE00

Diagnostic information - DME control unit

P04EE00 Tank vent system, fuel supply side, very fine leak detected

Diagnostic conditions

● Tank leakage diagnostic module (DMTL), major-leak test completed

Fault setting condition(s)

● 10 tank leakage diagnostic tests in sequence (approx. 30 cold starts) with open fuel tank isolation valve (FTIV)

Monitored component or system

♦ Tank vent system

Fault finding notes

♦ This fault is for information purposes; it is not a repair measure
♦ Lack of vehicle ambient conditions for a natural vacuum in the pressure tank.
♦ The fault can be entered due to a very small leak in the tank.

Diagnostic information - DME control unit

P04EF00 Tank vent system, fresh-air side, very fine leak detected

Diagnostic conditions

- Once per driving cycle in control unit run-on
- Vehicle electrical system voltage 11...16 V
- Elevation <= 2,700 m (8,858 ft.)
- Engine start temperature => 3.75 °C (38.75 °F)
- Ambient temperature 3.75...35.25 °C (38.75...95.45 °F)
- DME control unit run-on longer than 3 s
- No tank leakage faults

Fault setting condition(s)

- Estimated leak surface area > 0.14 mm² (0.00022 sq. in.)

Monitored component or system

♦ Tank vent system

Fault finding notes

♦ The fault is entered together with P044200 or P045600 and provides an indication of the leak location
♦ The tank up to the pressure tank isolation valve and tank cap is tight.
♦ Check low-pressure area

Functional restrictions

♦ MIL on
♦ More pronounced fuel odor

P050600

Diagnostic information - DME control unit

P050600 Idle control - speed below setpoint

Diagnostic conditions

- Vehicle speed = 0 km/h (0 mph)
- Vehicle speed signal OK
- Engine temperature > 20.3 °C (68.5 °F)
- Intake air temperature > -48.0 °C (-54 °F)
- No throttle potentiometer fault (banks 1+2)
- No safety fuel shutoff
- Emergency air driving not active
- No rpm sender limp-home mode
- Diagnostics runs continuously

Fault setting condition(s)

- Idle speed deviation > 100.0 rpm

Monitored component or system

♦ Idle speed control

Possible fault causes

♦ Fuel quality insufficient
♦ Air cleaner blocked/frozen
♦ Air guide ahead of **throttle valve** blocked
♦ Ancillary units sluggish
♦ Exhaust system blocked
♦ **Throttle valve adjusting unit** faulty

P050700

Diagnosis information DME control module

P050700 Idle control - speed above setpoint

Diagnostic conditions

- Vehicle speed = 0 km/h / mph
- Vehicle speed signal OK
- Engine temperature > 20.3 °C (68.5 °F)
- Intake-air temperature > -48.0°C (-54 °F)
- No throttle potentiometer fault (banks 1+2)
- No safety fuel shutoff
- Emergency air driving not active
- No rpm sensor limp-home mode
- Diagnostics runs continuously

Fault setting condition(s)

- Idle speed deviation < -100.0 rpm

Monitored component or system

♦ Idle control

Possible fault causes

♦ **Intake pipe** leaks
♦ **Positive crankcase ventilation** leaks
♦ **Throttle adjusting unit** Faulty

P050A00

Diagnostic information - DME control unit

P050A00 Idle control, malfunction during cold start

Diagnostic conditions

- Vehicle speed = 0 km/h (0 mph)
- No throttle potentiometer fault (banks 1+2)
- Catalytic converter heating active
- Diagnostics runs continuously (during catalytic converter heating for cold start)

Fault setting condition(s)

- Engine speed deviation with respect to stationary setpoint engine speed < -100.0 rpm or > 200.0 rpm
- Idle speed monitoring; maximum threshold or minimum threshold exceeded

Monitored component or system

♦ Idle speed control (overspeed or underspeed)

Fault finding notes

♦ Fuel quality insufficient
♦ Air cleaner blocked/frozen
♦ Air guide ahead of **throttle valve** blocked
♦ Ancillary units sluggish
♦ Exhaust system blocked

Functional restrictions

♦ Higher revs in the instrument cluster
♦ Noise due to higher engine speed
♦ Rough-running engine

P050B00

Diagnosis information DME control module

P050B00 Ignition timing adjustment - malfunction during cold start

Diagnostic conditions

- Diagnostics runs only during catalytic converter heating

Fault setting condition(s)

- Monitoring of ignition angle for advancing (via engine efficiency) during idling

Monitored component or system

♦ Ignition angle

Fault finding notes

♦ Inform the product support department (possibly fuel quality)

P052A00

Diagnostic information - DME control unit

P052A00 Bank 1 intake camshaft adjustment - setpoint not reached during cold start

Diagnostic conditions

- Camshaft adjustment enable issued
- Catalytic converter heating active (cold start)
- Diagnostics runs once per driving cycle (cold start)

Fault setting condition(s)

- The fault is set if the camshaft adjuster cannot follow the specified setpoint quickly enough.

Monitored component or system

♦ Intake camshaft, bank 1

Possible fault causes

♦ **Engine oil pressure** too low
⇒ (e.g. oil thickening, wrong oil quality, oil pressure control or **oil pump** sluggish/stuck)
♦ Loose contact on solenoid valve plug connection
♦ **Solenoid valve** dirty/blocked
♦ **Solenoid valve** sluggish/stuck
♦ **Camshaft adjustment** sluggish/stuck
♦ Wiring for camshaft adjusters interchanged
♦ **Intake camshaft** sluggish/stuck
♦ Camshaft position sender/sender wheel loose

Fault effects

♦ The camshaft is moved to the reference position if possible.
♦ Engine speed limited
♦ Message >>Reduced engine power<< in instrument cluster

P052C00

Diagnostic information - DME control unit

P052C00 Bank 2 intake camshaft adjustment - setpoint not reached during cold start

Diagnostic conditions

- Camshaft adjustment enable issued
- Catalytic converter heating active (cold start)
- Diagnostics runs once per driving cycle (cold start)

Fault setting condition(s)

- The fault is set if the camshaft adjuster cannot follow the specified setpoint quickly enough.

Monitored component or system

♦ Intake camshaft, bank 2

Possible fault causes

♦ **Engine oil pressure** too low
⇒ (e.g. oil thickening, wrong oil quality, oil pressure control or **oil pump** sluggish/stuck)
♦ Loose contact on solenoid valve plug connection
♦ **Solenoid valve** dirty/blocked
♦ **Solenoid valve** sluggish/stuck
♦ **Camshaft adjustment** sluggish/stuck
♦ Wiring for camshaft adjusters interchanged
♦ **Intake camshaft** sluggish/stuck
♦ Camshaft position sender/sender wheel loose

Fault effects

♦ The camshaft is moved to the reference position if possible.
♦ Engine speed limited
♦ Message >>Reduced engine power<< in instrument cluster

P053F00

Diagnosis information DME control module

P053F00 Fuel pressure during cold start - pressure too low

Diagnostic conditions

- Engine start longer than debouncing time (5 sec)
- Catalytic converter heating active
- Diagnostics running only during catalytic converter heating

Fault setting condition(s)

- The control-difference signal is smoothed via a low-pass filter with a time constant and compared with two threshold values

Monitored component or system

♦ Fuel rail/system pressure during catalytic converter heating

Fault finding notes

♦ High-pressure sensor faulty
♦ Metering valve faulty
♦ Low-pressure system faulty
♦ Leaks in the rail
♦ Pressure limiting valve faulty

Function restrictions

♦ Misfiring detected (less power)
♦ Engine stalls

Diagnosis information DME control module

P055500 Brake booster pressure sender - electrical fault

Diagnostic conditions

- Diagnostics running continuously from ignition on

Fault setting condition(s)

- Brake booster vacuum sensor overvoltage or an open signal line detected

Monitored component or system

♦ Pressure sensor for brake booster

Fault finding notes

♦ Unplug pressure sensor and jumper signal line to ground
♦ If the raw sensor voltage in the measured-value block is approx. 0 V, the sensor is faulty. If the raw sensor voltage in the measured value block > 0 V, check the line to the DME control unit
♦ If the line to the DME control unit is OK, the DME control unit is faulty

Function restrictions

♦ Start/stop may not be available
♦ Electric mode might not be available
♦ On vehicles with electrical vacuum pump, it is activated as long as the fault as present. The electrical vacuum pump could be damaged as a result

P055600

Diagnosis information DME control module

P055600 Brake booster pressure sensor - vacuum

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- This detects a faulty electric brake booster vacuum pump
- This detects a brake booster vacuum that is too high, too low or implausible

Monitored component or system

♦ Electric brake booster vacuum pump
♦ Pressure sensor for brake booster

Fault finding notes

♦ Check brake pedal sensor adjustment
♦ Check whether vacuum is physically OK (leakage, etc.)
♦ Check wiring harness
♦ Check relay for vacuum pump
♦ Replace vacuum sensor
♦ Check DME control unit for correct program/data version
♦ Replace DME control unit

Function restrictions

♦ Start/stop may not be available
♦ Electric mode might not be available
♦ On vehicles with electrical vacuum pump, it is activated as long as the fault as present. The electrical vacuum pump could be damaged as a result

P055700

Diagnosis information DME control module

P055700 Brake booster pressure sender - short circuit to ground
P191300 Brake booster pressure sender - short circuit to ground

Diagnostic conditions

- Diagnostics always running continuously from ignition on

Fault setting condition(s)

- This detects insufficient voltage of the brake booster vacuum sensor

Monitored component or system

♦ Pressure sensor for brake booster

Fault finding notes

♦ Unplug pressure sensor
♦ If the raw sensor voltage in the measured value block is the reference voltage (5 V), the sensor is faulty. If not, check the line to the DME control unit
♦ If the line to the DME control unit is OK, the DME control unit is faulty

Function restrictions

♦ Start/stop might not be available
♦ Electric mode might not be available
♦ On vehicles with electric vacuum pump, it is activated as long as the fault as present. The electric vacuum pump could be damaged as a result

P056000

Diagnosis information DME control module

P056000 Power supply - implausible signal

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Battery positive voltage signal implausible

Monitored component or system

♦ Battery positive voltage

Fault finding notes

♦ Check terminal 87 behind main relay for battery positive voltage
♦ Check of the line, fuse and main relay

Function restrictions

♦ Engine off

P056200

Diagnosis information DME control module

P056200 Power supply - voltage too low

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Battery positive voltage below minimum value (vehicle electrical system)
- If the battery positive voltage < 9.04 V (but not below the absolute minimum limit below which fault memory entries are no longer possible)

Monitored component or system

♦ Battery positive voltage

Fault finding notes

♦ Check terminal 87 behind main relay for battery positive voltage
♦ Check of the line, fuse and main relay

Function restrictions

♦ Engine off

P056300

Diagnosis information DME control module

P056300 Power supply - voltage too high

Diagnostic conditions

- Time after engine starts > 180 s
- Main relay activated
- Diagnostics runs continuously

Fault setting condition(s)

- Battery positive voltage above maximum value (vehicle electrical system)
- If the battery positive voltage > 16.01 V

Monitored component or system

♦ Battery positive voltage

Fault finding notes

♦ Check terminal 87 behind main relay for battery positive voltage
♦ Check of the line, fuse and main relay (main relay possibly stuck)

Diagnosis information DME control module

P056800 Cruise control switch - implausible signal

Diagnostic conditions

- DME control unit coded for cruise control/adaptive cruise control (ACC)
- Corresponding operating lever installed
- Cruise control selected
- Release of diagnostic function from ignition on
- Diagnostics running continuously from ignition on

Fault setting condition(s)

- CAN signal of the cruise control/adaptive cruise control (ACC) main switch differs from the hardware line of the main switch
- Fault of the cruise control/adaptive cruise control (ACC) main switch

Monitored component or system

♦ Cruise control/adaptive cruise control (ACC) operating lever

Fault finding notes

♦ Is the cruise control operating lever installed correctly (check coding)?
♦ Is the hardware line to the DME control unit connected correctly in addition to the CAN connection?
♦ Check component line

Function restrictions

♦ No cruise control/adaptive cruise control (ACC) operation possible in the current ignition cycle

Diagnosis information DME control module

P057100 Brake light switch - implausible signal

Diagnostic conditions

- No component fault on brake pedal sensor
- Ignition on
- Frequency count saved over driving cycle
- Diagnostics runs continuously

Fault setting condition(s)

- Plausibility check, brake pedal sensor short circuit to ground

Monitored component or system

♦ Brake light sensor

Fault finding notes

♦ Check plug connection for open circuit (corrosion, soiling, pin out of place)
♦ Check line for short circuit to ground
♦ Check signal line for open circuit
♦ Check power supply of the brake light sensor
♦ No fault found; replace the brake light sensor
♦ If the fault memory entry is entered again after replacement of the brake light sensor, the DME control unit must be replaced

Function restrictions

♦ Rejection of adaptive cruise control (ACC) /cruise control

P057B00

Diagnosis information DME control module

P057B00 Brake-pedal travel sender - implausible signal

Diagnostic conditions

- Brake not applied
- Ignition on
- Constant driving without foot on brake pedal

Fault setting condition(s)

- The learned offset is checked for implausibility
- The learned offset measured value is > 90% or < 55%
- The period of the PWM signal is too short
- The duty cycle of the PWM signal is too high
- The duty cycle of the PWM signal is too low

Monitored component or system

♦ Brake pedal travel sensor

Fault finding notes

♦ Observe installation calibration of the brake pedal travel sender according to the installation specification
♦ Check installation position or adjustment of the sensor and adjust if necessary
♦ Perform a line test
♦ Replace sensor

Function restrictions

♦ Different braking feel with larger pedal free play

Diagnostic information - DME control unit

P05A000 Radiator shutter, servo motor turns freely/mechanically blocked

Diagnostic conditions
- Allow the radiator shutter to move to both learned limit stops (e.g. via drive link)

Possible fault causes
- Radiator shutter was turned manually while the ignition was off
- Radiator shutter iced up
- Radiator shutter dirty
- Radiator shutter, vanes scrape/stick (incorrectly installed, positioned)
- Radiator shutter, mechanism broken
- Servo motor faulty

Fault setting conditions
- Increased current draw during movement
- No increased current draw when the learned limit stops are reached

Fault effects
- New initialization
- When the fault is active, the DME control unit sends the OPEN request to the radiator shutter servo motor

P05A200

Diagnostic information - DME control unit

P05A200 Radiator shutter - open circuit
P05A400 Radiator shutter - short circuit in signal line
P05A500 Radiator shutter - short circuit in signal line

Diagnostic conditions
- Ignition on

Possible fault causes

- ♦ Short circuit to B+/ground/between lines or open circuit in the signal line
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Servo motor faulty

Fault setting conditions
- Static signal on the servo motor signal line ◄► DME control unit

Fault effects
- ♦ If it still functions, the servo motor opens the shutter as far as possible

P05A300

Diagnostic information - DME control unit

P05A300 Radiator shutter, signal implausible

Diagnostic conditions
- Ignition on

Possible fault causes
- ♦ Implausible request from DME control unit, e.g. during reprogramming
- ♦ Servo motor signal line ◄► Open circuit in DME control unit
- ♦ Servo motor power supply or ground supply faulty
- ♦ Servo motor faulty

Fault setting conditions
- No signal on the servo motor signal line ◄► DME control unit

Fault effects
- ♦ If it still functions, the servo motor opens the shutter as far as possible

P05A400

Diagnostic information - DME control unit

P05A200 Radiator shutter - open circuit
P05A400 Radiator shutter - short circuit in signal line
P05A500 Radiator shutter - short circuit in signal line

Diagnostic conditions
- Ignition on

Possible fault causes

- ♦ Short circuit to B+/ground/between lines or open circuit in the signal line
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Servo motor faulty

Fault setting conditions
- Static signal on the servo motor signal line ◄► DME control unit

Fault effects
- ♦ If it still functions, the servo motor opens the shutter as far as possible

Diagnostic information - DME control unit

P05A200 Radiator shutter - open circuit
P05A400 Radiator shutter - short circuit in signal line
P05A500 Radiator shutter - short circuit in signal line

Diagnostic conditions
- Ignition on

Possible fault causes

- Short circuit to B+/ground/between lines or open circuit in the signal line
- Loose contact or corrosion on connectors or lines
- Servo motor faulty

Fault setting conditions
- Static signal on the servo motor signal line ◄► DME control unit

Fault effects
- If it still functions, the servo motor opens the shutter as far as possible

Diagnostic information - DME control unit

P05C000 Radiator shutter unit, overtemperature

Diagnostic conditions
- Allow the radiator shutter to move to both learned limit stops (e.g. via drive link)

Possible fault causes
- Ambient temperature too high
- Servo motor overloaded
- Servo motor faulty

Fault setting conditions
- Temperature in servo motor too high

Fault effects
- New initialization
- When the fault is active, the DME control unit sends the OPEN request to the radiator shutter servo motor

P060600

Diagnostic information - DME control unit

P060600 Control unit faulty

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- The DME control unit detects an internal fault

Monitored component or system

♦ DME control unit

ⓘ **INFORMATION**
As of model year 2014 (E):
- See Technical Information 96/13.
- If other faults are entered, correct these first.

Fault finding notes

♦ If further fault memory entries are present in the DME control unit, they must be corrected first
♦ Then erase the fault memory and establish the diagnostic conditions
♦ If fault code P060600 is then entered again:
♦ Replace DME control unit

Functional restrictions

♦ Functional restrictions depend on which components are served by which output stage
♦ Diagnostics of the sender supply non-functional

P060A00

Diagnosis information DME control module

P060A00 Control unit - internal processor monitoring

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Monitoring of the applied addresses

Monitored component or system

♦ Control unit

Function restrictions

♦ No function of the OBD radar

Diagnosis information DME control module

P060D00 Accelerator pedal module fault

Diagnostic conditions

- Diagnostics runs continuously
- Ignition on
- No fault in the 12V supply
- No fault in the 5 V supply

Fault setting condition(s)

- The accelerator pedal module sends a corresponding fault message over the data bus.
- The actual position of the actuator does not correspond to the setpoint position.

Monitored component or system

♦ Pedal value encoders 1 and 2

Fault finding notes

♦ Perform drive link test for the accelerator pedal module. Pay attention to the correct function of the actuator.
♦ Check power supply of the accelerator pedal module.
♦ Check data bus between the engine control unit and accelerator pedal module.

Function restrictions

♦ The adjuster for the additional pressure point in E-operation might no longer retract or extend at the right time.

P062B00

Diagnosis information DME control module

P062B00 Control unit faulty

Diagnostic conditions

- Ignition on
- Diagnostics runs several times per driving cycle

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics

Monitored component or system

♦ Fuel injector communication

Fault finding notes

♦ Control unit faulty

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P063400 Control unit - temperature switch-off

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- The output stage for fan control unit 1 in the DME control unit has detected an overtemperature. The temperature exceeds an applied threshold
- Direct temperature measurement in the output stage driver: when the threshold (150 °C/302 ° F) is reached, the output stage is switched off and a status is reported
- The output stage hardware reports the overtemperature fault

Monitored component or system

- Activation line to the first fan output stage
- DME control unit pre-delivery pump output stage
- Coolant bypass valve output stage for electric machine
- Generator
- Main water pump valve
- Auxiliary water pump
- Water pump supply shutoff valve
- Switch for electric driving
- Engine control unit output stage: Switching valve for control oil pump

Fault finding notes

- Switch engine off, switch ignition off and allow DME control unit to cool down
- Internal fault of the DME control unit; replace the DME control unit

Function restrictions

- Emergency operation of the fan means that the requirements for charging balance, acoustics and closed-circuit current are not met
- An empty battery is a possible result
- Output stage inactive, resulting in failure of the pre-delivery pump and engine failure
- Restricted power of the passenger compartment heating
- No boost possible
- Electric driving not possible

♦ Start/stop ban
♦ Shutoff of accessories possible
♦ Breakdown possible
♦ Oil pressure pump switch no longer operates, and the high oil pressure always sets in

Diagnostic information - DME control unit

P064100 Sender reference voltage A - open circuit

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- Direct voltage-measurement monitoring in the chip of the output stage. A status is reported when a minimum or maximum threshold is reached

Monitored component or system

♦ Sender reference voltage 5 V

Fault finding notes

♦ Check the electrical connection of the components connected to the shared power supply
♦ Check components
♦ Control unit:
  ♦ Connector [A], contact 26
  or
  ♦ Connector [A], contact 28
  or
  ♦ Connector [B], contact 63
  or
  ♦ Connector [B], contact 80

Function restrictions

♦ Limp-home mode

Diagnostic information - DME control unit

P065100 Sender reference voltage B - open circuit

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- Direct voltage-measurement monitoring in the chip of the output stage. A status is reported when a minimum or maximum threshold is reached

Monitored component or system

♦ Sender reference voltage 5 V

Fault finding notes

♦ Check the electrical connection of the components connected to the shared power supply
♦ Check components
♦ Control unit:
  ♦ Connector [A], contact 37
  or
  ♦ Connector [B], contact 19
  or
  ♦ Connector [B], contact 58

Function restrictions

♦ Limp-home mode

Diagnosis information DME control module

P068600 Main relay - short circuit to ground

Diagnostic conditions

- Main relay not activated
- Diagnostics runs several times

Fault setting condition(s)

- Signal voltage in the range 2.6V...3.7V
- Short circuit to ground of the main relay

Monitored component or system

♦ Main relay

Fault finding notes

♦ Check electrical connection to the main relay or replace main relay

P068800

Diagnosis information DME control module

P068800 Main relay - load circuit open circuit

Diagnostic conditions

- Main relay activated

Fault setting condition(s)

- Signal error - line open circuit, vehicle electrical system voltage via main relay

Monitored component or system

♦ Main relay

Fault finding notes

♦ Check electrical connection to the main relay or replace main relay

Diagnosis information DME control module

P068B00 Main relay opens too late

Diagnostic conditions

- Started driving cycle
- Diagnostics runs continuously

Fault setting condition(s)

- Sticking main relay

Monitored component or system

♦ Main relay

Fault finding notes

♦ Check electrical connection to the main relay or replace main relay

Function restrictions

♦ Battery discharge possible because the DME control unit does not switch off

Diagnosis information DME control module

P069100 Radiator fan activation 1 - short circuit to ground

Diagnostic conditions

- Ignition on; fault is entered immediately
- Last revs are maintained; limp-home mode occurs after 10 s

Fault setting condition(s)

- Short circuit to ground in PWM line to fan control unit 1

Monitored component or system

♦ Activation line to the first fan output stage

Fault finding notes

♦ Check of whether the control unit is short circuited to ground
♦ The instrument indicates nearly 0 V in a voltage measurement on the control line
♦ A current measurement on the control line with a clamp-on ammeter displays, if OK, a square-wave signal

Function restrictions

♦ Emergency operation of the fan means that the requirements for charging balance, acoustics and closed-circuit current are not met
♦ Battery discharging possible

Diagnosis information DME control module

P069200 Radiator fan activation 1 - short circuit to B+

Diagnostic conditions

- Ignition on; fault is entered immediately
- Last revs are maintained; limp-home mode occurs after 10 s

Fault setting condition(s)

- Short circuit to B+ in PWM line to fan control unit 1

Monitored component or system

♦ Activation line to the first fan output stage

Fault finding notes

♦ Check of whether the control unit is short circuited to B+
♦ In a voltage measurement on the control line, the measuring instrument indicates a value close to battery positive voltage
♦ A valid pulse/duty ratio lies between 10% and 90%
♦ A current measurement with a clamp-on ammeter displays, if OK, a square-wave signal

Function restrictions

♦ Emergency operation of the fan means that the requirements for charging balance, acoustics and closed-circuit current are not met
♦ Battery discharging possible

P069700

Diagnostic information - DME control unit

P069700 Sender reference voltage C - open circuit

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- Direct voltage-measurement monitoring in the chip of the output stage. A status is reported when a minimum or maximum threshold is reached

Monitored component or system

♦ Sender reference voltage 5 V

Fault finding notes

♦ Check the electrical connection of the components connected to the shared power supply
♦ Check components
♦ Control unit:
  ♦ Connector [A], contact 50
  or
  ♦ Connector [B], contact 36

Function restrictions

♦ In the most unfavorable case: engine off

P06D100

Diagnosis information DME control module

P06D100 Control unit faulty

Diagnostic conditions

● Initialization is performed at the start of the driving cycle when the ignition is switched on

Fault setting condition(s)

● If the ignition driver cannot be initialized within a certain number of attempts, an initialization error is triggered
● The initialization sends all parameters required for operation to the ignition driver
● Initialization takes place with the aid of an automatic state function in three steps : 1. Initialization procedure 2. Verification 3. Completion

Monitored component or system

♦ Ignition coil component driver

Fault finding notes

♦ Internal fault in the DME control unit

Function restrictions

♦ Breakdown

Diagnosis information DME control module

P070100 Brake light switch - electrical fault in circuit

Diagnostic conditions

- No undervoltage or overvoltage in the vehicle electrical system
- Diagnostics runs continuously

Fault setting condition(s)

- Raw signal from the brake pedal sensor is higher or lower than the applied threshold

Monitored component or system

♦ Brake pedal sensor

Fault finding notes

♦ Check of the signal line and the sensor for short circuit to B+
♦ Check of the signal line and the sensor for short circuit to ground
♦ Brake light switch faulty

Function restrictions

♦ Rejection of adaptive cruise control (ACC) /cruise control

P071600

Diagnosis information DME control module

Uxxxx00 Check XY control unit fault memory content

Diagnostic conditions

● Ignition on

Fault setting condition(s)

● Monitoring for stopped message counter: The same message count is received several times in sequence, the message counter received in the XY message always includes the same value for an applicable number of messages.
● Monitoring of the data length code: An incorrect message length was detected several times; the received XY message is shorter than the applied length
● Monitoring of the checksum: Incorrect checksum received several times in sequence; the checksum received in the XY message does not agree with the checksum calculated by the DME control unit for an applicable number of messages.
● Timeout monitoring: No message receipt. The identifier applied for the XY message is not received

Monitored component or system

♦ CAN communication with control unit message of the specified XY control unit

Fault finding notes

♦ Check XY control unit fault memory content

Function restrictions

♦ Control unit XY message is no longer evaluated

Diagnosis information DME control module

P085000 Start inhibit P/N signal - short circuit to B+/open circuit

Diagnostic conditions

- Diagnostics runs continuously during ignition on

Fault setting condition(s)

- P or N CAN signal from transmission control unit is present; hardware signal is neither P nor N

Monitored component or system

♦ P/N hardware signal is compared with the CAN message from the transmission

Fault finding notes

♦ Suspect list: P/N switch, wiring, CAN communication, transmission control unit

Function restrictions

♦ Automatic transmission vehicle cannot be started

Diagnosis information DME control module

P085100 Start inhibit P/N signal - short circuit to ground

Diagnostic conditions

- Diagnostics runs continuously during ignition on

Fault setting condition(s)

- Neither P nor N CAN signal from transmission control unit; hardware signal P or N

Monitored component or system

♦ P/N hardware signal is compared with the CAN message from the transmission

Fault finding notes

♦ Suspect list: P/N switch, wiring of the switch, CAN communication, transmission control unit

Function restrictions

♦ Automatic transmission vehicle cannot be started

P091900

Diagnosis information DME control module

Uxxxx00 Check XY control unit fault memory content

Diagnostic conditions

● Ignition on

Fault setting condition(s)

● Monitoring for stopped message counter: The same message count is received several times in sequence, the message counter received in the XY message always includes the same value for an applicable number of messages.
● Monitoring of the data length code: An incorrect message length was detected several times; the received XY message is shorter than the applied length
● Monitoring of the checksum: Incorrect checksum received several times in sequence; the checksum received in the XY message does not agree with the checksum calculated by the DME control unit for an applicable number of messages.
● Timeout monitoring: No message receipt. The identifier applied for the XY message is not received

Monitored component or system

♦ CAN communication with control unit message of the specified XY control unit

Fault finding notes

♦ Check XY control unit fault memory content

Function restrictions

♦ Control unit XY message is no longer evaluated

P109300

Diagnosis information DME control module

P109300 Bank 1 fuel metering system 2 - malfunction

Diagnostic conditions

- Engine speed > 1,200 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Error in the plausibility check of the predicted air flow (torque monitoring function)
- Error in the plausibility check of the mixture correction factors
- The lambda setpoint does not match the current operating mode
- Error in the plausibility check between injection time and fuel mass
- Error in the plausibility check of the relative fuel mass

Monitored component or system

♦ DME control unit

Fault finding notes

♦ Processing of all faults relating to the air and fuel system (see fault memory). If there are no more faults, the DME control unit is faulty
♦ The fault might lie in the fuel metering system or intake system, otherwise the DME control unit must be replaced

Function restrictions

♦ A reset can be performed when the fault occurs once
♦ If the fault is still present, the injection quantity will be limited (no more injections will be permitted above 1,500 rpm)

Diagnosis information DME control module

P10A000 Drive of control flap for intake air - electrical fault

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Short circuit to ground
- Short circuit to B+
- Line open circuit

Monitored component or system

♦ Compressor control flap output stage

Possible fault causes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Control flap control unit faulty

Diagnosis information DME control module

P10A400 Drive of control flap for intake air - mechanical malfunction

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Duty cycle > 79.9%

Monitored component or system

♦ Compressor control flap

P10A500

Diagnosis information DME control module

P10A500 Potentiometer of control flap for intake air - signal too high

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Sensor signal > 4.82 V

Monitored component or system

♦ Compressor control flap position sensor

P10A600

Diagnosis information DME control module

P10A600 Potentiometer of control flap for intake air - signal too low

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Sensor signal < 0.2979 V

Monitored component or system

♦ Compressor control flap position sensor

P10A700

Diagnosis information DME control module

P10A700 Adaptation - control flap for intake air soiled

Monitored component or system

♦ Compressor control flap offset adaptation

Possible fault causes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Control flap control unit faulty

P10A800

Diagnosis information DME control module

P10A800 Adaptation - control flap lower limit not reached

Monitored component or system

♦ Compressor control flap offset adaptation

Possible fault causes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Control flap control unit faulty

Diagnosis information DME control module

P111400 Bank 1 sensor 2 - internal resistance too high

Diagnostic conditions

- Filtered exhaust gas temperature 299.991 °C…819.998 °C (571.984 °F ...1,507.996 °F)
- Switch-off time > 630 sec
- Intake-air temperature > -48 °C (-54 °F)
- Overrun mode not active
- Diagnostics runs once per driving cycle

Fault setting condition(s)

- The internal resistance is compared with its setpoint (728.0...16,632.0 Ohm). If the resistance is higher, the fault is set after debouncing

Monitored component or system

♦ Bank 1 oxygen sensor 2 heating

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor behind cat. conv., bank 1 sensor 2 faulty

Diagnosis information DME control module

P114000 Bank 2 sensor 2 - internal resistance too high

Diagnostic conditions

- Filtered exhaust gas temperature 299.991 °C…819.998 °C (571.984 °F ...1,507.996 °F)
- Switch-off time > 630 sec
- Intake-air temperature > -48 °C (-54 °F)
- Overrun mode not active
- Diagnostics runs once per driving cycle

Fault setting condition(s)

- The internal resistance is compared with its setpoint (728.0...16,632.0 Ohm). If the resistance is higher, the fault is set after debouncing

Monitored component or system

♦ Bank 2 oxygen sensor 2 heating

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor heater behind cat. conv., bank 2 sensor 2 faulty

P119A00

Diagnosis information DME control module

P119A00 Fuel pressure sender - malfunction

Diagnostic conditions

- Diagnostics runs continuously

Monitored component or system

♦ Fuel pressure sensor

Fault finding notes

♦ High-pressure sensor faulty

Function restrictions

♦ Acute lack of power; vehicle possibly stalls at idle
♦ Engine off

Diagnosis information DME control module

P125000 Fuel level too low

Fault setting condition(s)

- Set along with another fault entry, if Reserve lamp of the tank is active

Monitored component or system

♦ Tank-empty information (this is set only together with another fault memory entry)

P130A00

Diagnosis information DME control module

P130A00 Cylinder shutoff

Fault setting condition(s)

- Misfiring rate damaging to catalytic converter

Monitored component or system

♦ Misfire detection, misfiring detected

Fault finding notes

♦ Fault occurs after misfiring faults

Function restrictions

♦ MIL on
♦ Power restriction
♦ Poor throttle response at high speeds
♦ Breakdown

P133500

Diagnosis information DME control module

P133500 Engine torque monitoring 2 - control limit exceeded

Fault setting condition(s)

● A fault in the torque comparison is entered if the filtered permissible torque plus offset is higher than the actual torque

Monitored component or system

♦ DME control unit

Fault finding notes

♦ DME control unit must be replaced

Function restrictions

♦ Engine speed limitation to 1,500 rpm

P133600

Diagnosis information DME control module

P133600 Engine torque monitoring 2 - control limit exceeded

Fault setting condition(s)

- Level 1 torque monitoring limits continuously (longer than 600 sec)

Monitored component or system

♦ DME control unit

Fault finding notes

♦ DME control unit must be replaced

Function restrictions

♦ Incorrect torque in DME control unit is limited
♦ Possibly increased idle speed
♦ Vehicle follows driver's command, possibly with post-acceleration

P138600

Diagnosis information DME control module

P138600 Control unit faulty

Diagnostic conditions

- Ignition on
- Engine speed > 80 rpm
- Diagnostics runs continuously

Monitored component or system

♦ Knock control/signal evaluation

Diagnosis information DME control module

P138700 Control unit faulty

Diagnostic conditions

- Ignition on
- Diagnostics runs several times/continuously
- Pressure sensor ahead of throttle valve ready, no fault

Fault setting condition(s)

- Electrical maximum fault: signal voltage > 4.902V
- Electrical minimum fault: signal voltage < 0.2002 V
- Check of whether the ambient pressure lies within a range that can be approached by a vehicle
- The signal is plausible if it has changed only slightly since the last driving cycle. Comparison is made with the ambient pressure limit model

Monitored component or system

♦ Ambient pressure sensor, electrical

Fault finding notes

♦ Replace DME control unit (ambient pressure sensor is installed in the control unit)

P138800

Diagnosis information DME control module

P138800 Control unit faulty

Diagnostic conditions

- Ignition on
- Diagnostics runs every 10 ms
- Engine running

Fault setting condition(s)

- Test fault occurred during monitoring of the analog-to-digital converter
- Error in the plausibility check of the accelerator pedal voltage
- The difference between the rpm value calculated in level 2 and the level 1 value exceeds a maximum permissible threshold
- The engine speed exceeds a maximum threshold in case of a level 1 injection quantity limit
- Error in the plausibility check of the ignition angle voltage

Monitored component or system

♦ DME control unit

Fault finding notes

♦ DME control unit must be replaced

Function restrictions

♦ Severe juddering if it is attempted to set engine speeds higher than 1,500 rpm using the accelerator pedal potentiometer
♦ Engine speed limitation to 1,500 rpm
♦ Electrical driving no longer possible; restart possible

Diagnosis information DME control module

P13EA00 Control unit faulty

Diagnostic conditions

- Diagnostics runs only during catalytic converter heating

Fault setting condition(s)

- Monitoring of ignition angle for advancing (via engine efficiency) during partial load

Monitored component or system

♦ Ignition angle

Fault finding notes

♦ Inform the product support department (possibly fuel quality)

Diagnosis information DME control module

P142100 Secondary-air injection valve - short circuit to ground

Diagnostic conditions

- Secondary-air valve output stage activated
- Engine speed > 40 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Secondary-air valve output stage - short circuit to ground (low side switch)
- The output stage of the secondary-air valve detects a short circuit to ground
- Diagnostic voltage < 0...3.25 V is measured at the output

Monitored component or system

♦ Secondary-air valve

Fault finding notes

♦ Check wiring between DME control unit and component for short circuit to ground
♦ If OK, remove plug from component and erase fault memory
♦ If the DME control unit detects open circuit, the fault is in the component
♦ Check power supply on the component

Function restrictions

♦ Output stage inactive -> failure of the secondary-air valve

Diagnosis information DME control module

P142200 Secondary-air injection valve - short circuit to B+

Diagnostic conditions

- Secondary-air valve output stage activated
- Engine speed > 40 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Secondary-air valve output stage - short circuit to B+ (low side switch)
- The output stage of the secondary-air valve detects a short circuit to B+
- Signal current > 2.2...4.0 A

Monitored component or system

♦ Secondary-air valve

Fault finding notes

♦ Check wiring between DME control unit and component for short circuit to B+
♦ If OK, remove plug from component and erase fault memory
♦ If the DME control unit detects open circuit, the fault is in the component
♦ Check power supply on the component

Function restrictions

♦ Output stage inactive -> failure of the secondary-air valve

Diagnosis information DME control module

P142700 Brake vacuum pump activation - short circuit to B+

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- Brake booster pump output stage short circuit to B+ (DME control unit switches relay to ground)
- Signal current > 2.2 A (output-stage diagnostics)

Monitored component or system

♦ Vacuum pump control for brake

Fault finding notes

♦ Check wiring between DME control unit and relay for short circuit to B+
♦ Check relay carrier for short circuits that jumper the relays
♦ If OK, check the DME control unit

Function restrictions

♦ Relay drops out, vacuum pump is not activated
♦ Higher pedal pressure may be required

Diagnosis information DME control module

P142800 Brake vacuum pump activation - short circuit to ground

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- Brake booster pump output stage short circuit to ground (DME control unit switches relay to ground)
- Diagnostic voltage < 2.15 V

Monitored component or system

♦ Vacuum pump control for brake

Fault finding notes

♦ Check wiring between DME control unit and relay for short circuit to ground
♦ Check relay power supply
♦ Check ground on DME control unit

Function restrictions

♦ Pump is in continuous operation

Diagnosis information DME control module

P142900 Brake vacuum pump activation - open circuit

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- Brake booster pump output stage line open circuit (DME control unit switches relay to ground)
- Diagnostic voltage > 4.4 ...5.6 V

Monitored component or system

♦ Vacuum pump control for brake

Fault finding notes

♦ Check wiring between DME control unit and relay for open circuit
♦ Check relay carrier/relay for open circuit
♦ If OK, check the DME control unit

Function restrictions

♦ Relay drops out, vacuum pump is not activated
♦ Higher pedal pressure may be required

Diagnosis information DME control module

P143200 Secondary-air injection valve - open circuit

Diagnostic conditions

- Secondary-air valve output stage activated
- Engine speed > 40 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Secondary-air valve output stage line open circuit (low side switch)
- The output stage of the secondary-air valve detects a load drop-off
- Internal voltage is measured at the output > 4.8...5.3 V

Monitored component or system

♦ Secondary-air valve

Fault finding notes

♦ Check wiring between DME control unit and component for open circuit
♦ The internal diagnostic voltage (between 3 V and 6 V) per output stage is measured
♦ Check power supply

Function restrictions

♦ Output stage inactive -> failure of the secondary-air valve

Diagnosis information DME control module

P143300 Relay for secondary-air pump - open circuit

Diagnostic conditions

- Secondary-air valve output stage activated
- Engine speed > 40 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Secondary-air pump output stage line open circuit (low side switch)
- The output stage of the secondary-air pump detects a load drop-off
- Internal voltage is measured at the output > 4.8...5.3 V

Monitored component or system

♦ Secondary-air pump output stage

Fault finding notes

♦ Check 12 V power supply
♦ Check component for continuity
♦ Alternatively, unplug the component and short-circuit pin to ground. Then evaluate the fault memory to determine whether the short circuit to ground is detected
♦ If the DME control unit detects open circuit, the fault is in the component

Function restrictions

♦ Output stage inactive -> failure of the secondary-air valve

Diagnosis information DME control module

P143400 Relay for secondary-air pump - short circuit to B+

Diagnostic conditions

- Secondary-air valve output stage activated
- Engine speed > 40 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Secondary-air pump output stage short circuit to battery positive voltage (low side switch)
- The output stage of the secondary-air pump detects a short circuit to B+
- Signal current > 2.2...4.0 A

Monitored component or system

♦ Secondary-air pump output stage

Fault finding notes

♦ Check wiring between DME control unit and component for short circuit to B+
♦ If OK, remove plug from component and erase fault memory
♦ If the DME control unit detects open circuit, the fault is in the component

Function restrictions

♦ Output stage inactive -> failure of the secondary-air valve

Diagnosis information DME control module

P143500 Relay for secondary-air pump - short circuit to ground

Diagnostic conditions

- Engine speed > 40 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- The output stage of the secondary-air pump detects a short circuit to ground
- Diagnostic voltage < 0...3.25 V is measured at the input

Monitored component or system

♦ Secondary-air pump output stage

Fault finding notes

♦ Check 12 V power supply
♦ Check wiring between control unit and component for short circuit to B+
Check ground
♦ If OK, remove plug from component and erase fault memory
♦ If the DME control unit detects open circuit, the fault is in the component

Function restrictions

♦ Output stage inactive; failure of the secondary-air valve
♦ Pump runs continuously (pump damage possible)

P147900

Diagnosis information DME control module

P147900 Brake vacuum system - mechanical fault

Monitored component or system

♦ Vacuum pump for brake

Diagnosis information DME control module

P148D00 Tank vent system diagnostic pump for tank leakage - implausible frequency

Diagnostic conditions

- Engine control unit run-on longer than 3 s
- MIL not on
- Elevation above sea level < 2,700 m (8,858 ft.)
- Engine start temperature 3.8 °C...35.3 °C (38.8 °F....95.5 °F)
- Diagnostics runs once per driving cycle in control unit run-on

Fault setting condition(s)

- The filling level-independent algorithm of tank leakage diagnostics via the tank leakage diagnostic module uses the pump frequency during the reference measurement to estimate the pumped volume flow rate. This, in turn, is used as the basis for calculating the evaluation values of tank pressure and volume flow rate during the diagnostic phases for major and fine leaks. The plausibility check of the filtered pump frequency at the end of the reference measurement indicates a sticking pump or stray electromagnetic interference that can falsify the frequency signal.
- Filtered pump frequency during the reference measurement > 120 1/s or < 60 1/s

Monitored component or system

♦ Fuel tank ventilation system

Fault finding notes

♦ If this fault occurs together with a leakage or tank leakage diagnostic module component fault, the tank leakage diagnostic module must be replaced. Otherwise, stray electromagnetic interference into the wiring harness could be the cause for this fault entry. If a workshop test for fine-leak diagnosis produces an OK result, this fault can be ignored.

Function restrictions

♦ None; the assumption of an incorrect pump frequency can lead to an incorrect tank leakage diagnostics result under unfavorable circumstances. MIL may be on.

Diagnosis information DME control module

P150A00 Ignition-off time period signal - implausible

Diagnostic conditions

- Ignition on
- Diagnostics runs once per driving cycle

Fault setting condition(s)

- Plausibility check of the Off time, which is calculated from the standstill time information from the instrument cluster, compared with the run-on counter of the control unit.

Monitored component or system

♦ Off-time counter in the instrument cluster

Fault finding notes

- If fault P308100 is entered
  ► Remedy this fault first

♦ Check **instrument cluster power supply**
♦ Check drive CAN
♦ Check **infotainment CAN**
♦ Clear fault memory and observe
♦ Off-time counter in the instrument cluster faulty

Function restrictions

♦ Off-time wrong
♦ In the event of a fault, a change is made to the substitute-value model. Function restrictions of the receiving functions can occur as a result

Diagnosis information DME control module

P068B00 Main relay opens too late

Diagnostic conditions

- Started driving cycle
- Diagnostics runs continuously

Fault setting condition(s)

- Sticking main relay

Monitored component or system

♦ Main relay

Fault finding notes

♦ Check electrical connection to the main relay or replace main relay

Function restrictions

♦ Battery discharge possible because the DME control unit does not switch off

P151B00

Diagnosis information DME control module

P151B00 Acceleration monitoring - control limit exceeded

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- Tampering with terminal 15 on any control unit in the system by connecting it with terminal 30 leads to the main contactors closing and thus to activation of the high-voltage system. Diagnostics detects the implausibility of terminal 15 against the CAN signal of the front-end electronics and prevents the main contactors from closing

Monitored component or system

♦ Control unit: voltage monitoring

Fault finding notes

♦ Check terminal 15 signal on the DME control unit pin
♦ Terminal 15 on the DME control unit must change together with the terminal change at the ignition lock
♦ CAN bus faulty
♦ Fault in area of the **front-end electronics**

Function restrictions

♦ Starting not possible

P152300

Diagnosis information DME control module

P152300 Crash signal from airbag control unit - implausible signal

Fault setting condition(s)

- Range error or failure of PWM signal from airbag control unit

Monitored component or system

♦ Crash switch-off

Fault finding notes

♦ Via airbag control unit drive link test

P154500

Diagnosis information DME control module

P154500 Throttle valve control - malfunction

Diagnostic conditions

- No throttle valve fault active
- Diagnostics runs continuously
- No output stage fault

Fault setting condition(s)

- Difference between measured and calculated throttle valve angles > 4.0009%...50.0008%
- Duty cycle > 80%

Monitored component or system

♦ Throttle valve adjusting unit control range

P155800

Diagnosis information DME control module

P155800 Throttle valve drive - electrical fault in circuit

Diagnostic conditions

- Ignition on and run-on during adaptation
- Diagnostics runs during adaptation

Fault setting condition(s)

- The fault is present if closing of the throttle valve over the reference point takes longer than 0.56 sec

Monitored component or system

♦ Throttle valve adjuster spring test; throttle valve does not open
♦ Throttle valve adjuster output stage, basic test after ignition on

P155900

Diagnosis information DME control module

P155900 Throttle valve control unit - basic setting fault

Diagnostic conditions

- Adaptation
- Diagnostics runs during adaptation

Monitored component or system

♦ Throttle valve adjuster fault during test of the emergency-air position

P155D00

Diagnosis information DME control module

P155D00 Bank 2 turbocharger/compressor boost pressure too high - mechanical

Diagnostic conditions

- Diagnostics runs continuously

Monitored component or system

♦ Bank 2 intake manifold pressure sensor

Fault finding notes

♦ Check wiring
♦ Check measured values: bank 1/2 intake-manifold pressure
♦ Mechanically check compressor module

Function restrictions

♦ Loss of power
♦ MIL on

Diagnosis information DME control module

P156400 Throttle valve control unit - undervoltage at basic setting

Diagnostic conditions

- Ignition on or run-on before and during adaptation
- Adaptation

Fault setting condition(s)

♦ Battery positive voltage < 10.0 V

Monitored component or system

♦ Throttle valve adjuster - adaptation cancellation due to environmental condition

P156500

Diagnosis information DME control module

P156500 Throttle valve control unit - lower limit not reached

Diagnostic conditions

- Adaptation active
- Diagnostics runs several times

Monitored component or system

♦ Throttle valve adjuster, basic setting

P157000

Diagnosis information DME control module

P157000 DME control unit blocked

Diagnostic conditions

- Ignition on or engine speed threshold exceeded
- Diagnostics once after ignition on

Fault setting condition(s)

- Check of the immobilizer communication
- Wrong application

Monitored component or system

♦ Immobilizer in DME control unit, P-class

Fault finding notes

♦ Check CAN communication in the vehicle
♦ Check gateway if present
♦ Check front-end electronics
♦ Check immobilizer vehicle system adaptation
♦ Read out of the "DME control unit immobilizer overall status"
♦ Check data record for P-class

Function restrictions

♦ No engine start

P157900

Diagnosis information DME control module

P157900 Throttle valve control unit - adaptation not started

Diagnostic conditions

- Ignition on or run-on before and during adaptation
- Adaptation

Monitored component or system

♦ Throttle valve adjuster - adaptation cancellation due to environmental condition

P159D00

Diagnosis information DME control module

P159D00 Oil level/temperature sender - implausible signal

Fault setting condition(s)

- Oil temperature/time implausible

Monitored component or system

♦ Oil level/oil temperature sender

Diagnosis information DME control module

P160300 Control unit faulty

Fault setting condition(s)

● Incorrect question/answer communication between monitoring module and function processor
● Control unit, component or incoming line fault leading to transmission of incorrect answers to the monitoring module

Monitored component or system

♦ DME control unit

Fault finding notes

♦ DME control unit must be replaced

Function restrictions

♦ Restart no longer possible

P160900

Diagnosis information DME control module

P160900 Crash shutoff was triggered

Fault setting condition(s)

- Crash intensity is greater than/equal to 4

Monitored component or system

♦ Crash signal from airbag control unit

Fault finding notes

♦ Via airbag control unit drive link test

P160A00

Diagnosis information DME control module

P160A00 Control unit faulty

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- Control unit internal diagnostics
- Control unit reset

Monitored component or system

♦ DME control unit

Fault finding notes

♦ DME control unit must be replaced
♦ Flash DME control unit again

Function restrictions

♦ Engine does not start or only with difficulty
♦ Fault is not entered and is thus also not noticed

P161200

Diagnosis information DME control module

P161200 DME control unit coded incorrectly

Diagnostic conditions

- Ignition on
- Only in the initialization phase

Fault setting condition(s)

- If neither the coding word in the EEPROM nor the value of the associated first initialization value represents a valid coding word

Monitored component or system

♦ DME control unit

Fault finding notes

♦ Read out fault memory and coding word and re-code the DME control unit. OK if the coding is accepted. Otherwise replace the DME control unit

P162400

Diagnosis information DME control module

Uxxxx00 Check XY control unit fault memory content

Diagnostic conditions

● Ignition on

Fault setting condition(s)

● Monitoring for stopped message counter: The same message count is received several times in sequence, the message counter received in the XY message always includes the same value for an applicable number of messages.
● Monitoring of the data length code: An incorrect message length was detected several times; the received XY message is shorter than the applied length
● Monitoring of the checksum: Incorrect checksum received several times in sequence; the checksum received in the XY message does not agree with the checksum calculated by the DME control unit for an applicable number of messages.
● Timeout monitoring: No message receipt. The identifier applied for the XY message is not received

Monitored component or system

♦ CAN communication with control unit message of the specified XY control unit

Fault finding notes

♦ Check XY control unit fault memory content

Function restrictions

♦ Control unit XY message is no longer evaluated

P163E00

Diagnosis information DME control module

P163E00 Control unit faulty

Diagnostic conditions

- Diagnostics runs once per driving cycle

Fault setting condition(s)

- CAN controller RAM monitoring

Monitored component or system

♦ CAN communication: CAN controller

Fault finding notes

♦ Replace DME control unit

Function restrictions

♦ DME control unit faulty

P164000

Diagnosis information DME control module

P164000 Control unit faulty

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- If deletion cannot be performed or was not performed successfully
- If at least three blocks cannot be read
- If a block cannot be written after more than three attempts

Monitored component or system

♦ DME control unit

Fault finding notes

♦ DME control unit must be replaced

Function restrictions

♦ DME control unit performs a reset

Diagnosis information DME control module

P164700 Check coding/variants of the control units in the drive train

Diagnostic conditions

● Release of diagnostic function takes place from ignition on

Fault setting condition(s)

● The DME control unit is not coded for a cruise control or adaptive cruise control (ACC) although the corresponding operating lever is installed

Monitored component or system

♦ Steering column switch module, DME control unit

Fault finding notes

♦ Check whether the DME control unit is correctly coded with regard to cruise control/adaptive cruise control

Function restrictions

♦ No cruise control/adaptive cruise control (ACC) operation possible in the current ignition cycle

Diagnosis information DME control module

P164A00 Oil pressure switch - implausible signal

Diagnostic conditions

- Ignition on
- Oil temperature > 0 °C (32 °F)

Fault setting condition(s)

- High pressure level switch implausible

Monitored component or system

♦ Oil pressure switch for high pressure detection

Fault finding notes

♦ Check engine oil level
♦ Check of the electrical wiring
♦ Plug and function of the oil pressure switch

P164B00

Diagnosis information DME control module

P164B00 Oil pressure switch - malfunction

Diagnostic conditions

- Engine running

Fault setting condition(s)

- Engine speed 2,500 ... 4,000 rpm
- Oil high pressure switch open > open 3 seconds

Monitored component or system

♦ Oil pressure switch for high pressure detection

Fault finding notes

♦ Check engine oil level
♦ Check electrical wiring
♦ Plug and function of the oil pressure switch

Function restrictions

♦ Rpm limitation

Diagnosis information DME control module

P164C00 Oil pressure switch for reduced oil pressure - implausible signal

Diagnostic conditions

- Ignition on
- Engine off

Fault setting condition(s)

- Oil low pressure switch closed
- Low pressure level switch implausible

Monitored component or system

♦ Oil pressure switch for low pressure detection

Fault finding notes

♦ Check of the electrical wiring and the functionality of the oil pressure switch

P164D00

Diagnosis information DME control module

P164D00 Oil pressure switch for reduced oil pressure - malfunction

Diagnostic conditions

- With engine running

Fault setting condition(s)

- Low pressure level not reached

Monitored component or system

♦ Oil pressure switch for low pressure detection

Fault finding notes

♦ Check whether there is sufficient oil/oil pressure to operate the switch
♦ Check of the electrical wiring, plug and the functionality of the oil pressure switch

Diagnosis information DME control module

P164E00 Oil pressure control valve - electrical fault

Diagnostic conditions

- Ignition on and low-side switch not connected through
- Ignition on and low-side switch connected through (valve is activated)
- Diagnostics runs continuously

Fault setting condition(s)

- Direct voltage measurement at the output stage driver: when a threshold is reached, the output stage is switched off and an output-stage status is reported

Monitored component or system

♦ Switching valve for control oil pump

Fault finding notes

♦ Check wiring between the DME control unit and oil pressure control switch for open circuit
♦ Check switching valve for open circuit
♦ If OK, check/replace the DME control unit

Function restrictions

♦ Oil pressure pump switch no longer operates, and the high oil pressure always sets in
♦ Higher consumption

Diagnosis information DME control module

P165F00 Oil pressure control valve - short circuit to ground

Diagnostic conditions

- Ignition on and low-side switch not connected through
- Diagnostics runs continuously

Fault setting condition(s)

- Direct voltage measurement at the output stage driver: when a threshold is reached, the output stage is switched off and an output-stage status is reported

Monitored component or system

♦ Switching valve for control oil pump

Fault finding notes

♦ Check wiring between the DME control unit and oil pressure control switch for short circuit
♦ Check switching valve for short circuit
♦ If OK, check/replace the DME control unit

Function restrictions

♦ Oil pressure pump switch switches continuously, and the low oil pressure always sets in
♦ Rpm limitation to prevent engine damage

P168200

Diagnosis information DME control module

Uxxxx00 Check XY control unit fault memory content

Diagnostic conditions

● Ignition on

Fault setting condition(s)

● Monitoring for stopped message counter: The same message count is received several times in sequence, the message counter received in the XY message always includes the same value for an applicable number of messages.
● Monitoring of the data length code: An incorrect message length was detected several times; the received XY message is shorter than the applied length
● Monitoring of the checksum: Incorrect checksum received several times in sequence; the checksum received in the XY message does not agree with the checksum calculated by the DME control unit for an applicable number of messages.
● Timeout monitoring: No message receipt. The identifier applied for the XY message is not received

Monitored component or system

♦ CAN communication with control unit message of the specified XY control unit

Fault finding notes

♦ Check XY control unit fault memory content

Function restrictions

♦ Control unit XY message is no longer evaluated

P169800

Diagnosis information DME control module

Uxxxx00 Check XY control unit fault memory content

Diagnostic conditions

● Ignition on

Fault setting condition(s)

● Monitoring for stopped message counter: The same message count is received several times in sequence, the message counter received in the XY message always includes the same value for an applicable number of messages.
● Monitoring of the data length code: An incorrect message length was detected several times; the received XY message is shorter than the applied length
● Monitoring of the checksum: Incorrect checksum received several times in sequence; the checksum received in the XY message does not agree with the checksum calculated by the DME control unit for an applicable number of messages.
● Timeout monitoring: No message receipt. The identifier applied for the XY message is not received

Monitored component or system

♦ CAN communication with control unit message of the specified XY control unit

Fault finding notes

♦ Check XY control unit fault memory content

Function restrictions

♦ Control unit XY message is no longer evaluated

Diagnosis information DME control module

P169A00 Loading mode active

Fault setting condition(s)

● The following conditions must be met at the same time: Current operating state: Control unit run-on; vehicle speed is less than 5 km/h (3 mph); engine speed is 0 rpm
● E-machine is switched off and its speed is 0 rpm
● The maximum distance of 100 km (62 miles) since vehicle commissioning has not been exceeded; production mode is locally deactivated
● The control unit run-on mode is active for a certain time period after the state has been changed from ignition on to ignition off. The transport mode can be activated/deactivated only when the DME control unit is in run-on mode. Furthermore, all fault setting conditions must be met. Transport mode remains activated/deactivated beyond the ignition change. Transport mode is deactivated by a locally active production mode

Monitored component or system

♦ DME control unit

Fault finding notes

♦ Transport mode set

Function restrictions

♦ MIL/warning message in instrument cluster "engine control fault" on
♦ Rev limitation, speed limitation, torque limitation
♦ Suppression of catalytic converter heating
♦ Suppression of electric motor operation including boosting

P172400

Diagnosis information DME control module

P172400 Start inhibit signal - short circuit to ground

Diagnostic conditions

- Diagnostics running continuously during ignition on

Fault setting condition(s)

- Clutch switch not actuated, interlock switch actuated
- Cruise control switch not actuated

Monitored component or system

♦ Interlock switch, clutch switch

Fault finding notes

♦ Interlock switch or clutch switch faulty
♦ Test via DME control unit actual values

Function restrictions

♦ No automatic start possible

Diagnosis information DME control module

P190E00 Coolant pump for charge air cooler diagnostic keying

Diagnostic conditions

- Diagnostics takes place only when the component is activated.

Fault setting condition(s)

- **DME control module** did not receive any valid information from the coolant pump

ⓘ Information
The coolant pump cyclically sends status information to the engine control unit by connecting the line to the engine control unit to ground for a defined duration.

Monitored component or system

♦ Coolant pump

Fault finding notes

♦ **Supply voltage** Check
♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ **Coolant pump** Faulty

Function restrictions

♦ The power of the combustion engine or the electric machine can be restricted.

P191300

Diagnosis information DME control module

P055700 Brake booster pressure sender - short circuit to ground
P191300 Brake booster pressure sender - short circuit to ground

Diagnostic conditions

- Diagnostics always running continuously from ignition on

Fault setting condition(s)

- This detects insufficient voltage of the brake booster vacuum sensor

Monitored component or system

♦ Pressure sensor for brake booster

Fault finding notes

♦ Unplug pressure sensor
♦ If the raw sensor voltage in the measured value block is the reference voltage (5 V), the sensor is faulty. If not, check the line to the DME control unit
♦ If the line to the DME control unit is OK, the DME control unit is faulty

Function restrictions

♦ Start/stop might not be available
♦ Electric mode might not be available
♦ On vehicles with electric vacuum pump, it is activated as long as the fault as present. The electric vacuum pump could be damaged as a result

P191B00

Diagnosis information DME control module

P191B00 Radiator fan control unit - implausible signal

Diagnostic conditions

● Diagnostics runs only when the DME control unit has been flashed again or coded
● The learning values are then deleted, and the request is re-sent after a terminal 87 reset (end of control unit run-on)

Fault setting condition(s)

● Plausibility check of the sent short-circuit times in the DME control unit
● Communication error with fan output stage 1

Monitored component or system

♦ Radiator fan on first output stage

Fault finding notes

♦ A faulty fan control unit might not be able to report back any variant when requested to do so. An incorrect or old fan module might not be able to report back any variant. The signal for flashing was sent during variant feedback, but flashing is cancelled for inexplicable reasons

Function restrictions

♦ No function restrictions, only the acoustics and control quality are impaired

P192A00

Diagnostic information - DME control unit

P192A00 Auxiliary coolant pump in high-temperature circuit - dry run

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Auxiliary water pump detects dry running and limits revs
- Pump reports fault by ground keying

Monitored component or system

♦ Auxiliary water pump

Fault finding notes

♦ Check whether air is present in the vehicle's heating branch
♦ Replace pump
- **ONLY Panamera - SY 2911**
  ▶ see PIWIS Information System ▶ 970 ▶ 2012-2013 ▶ 970130 or 970131 ▶ Workshop Manual ▶ 08-Symptoms ▶ 0850IN
  ⇒ 247025 Eliminating symptoms in body interior: Reprogramming DME control unit (fluctuating heat output and reduced driving performance in hybrid or E-power mode/SY2911)

Function restrictions

♦ In rare cases, reduction in the electric driving power

P192B00

Diagnosis information DME control module

P192B00 Auxiliary coolant pump in high-temperature circuit - mechanical fault

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Auxiliary water pump switched off due to excess current
- Pump reports fault by ground keying

Monitored component or system

♦ Auxiliary water pump

Fault finding notes

♦ Check of the electric water pump for sluggishness or blocking
♦ Replace pump
- **ONLY Panamera:**
  ► Pay attention to the documents: SY 2911

Function restrictions

♦ Reduced heating power when the combustion engine is at low revs
♦ In rare cases, reduction in the electric driving power

Diagnosis information DME control module

P192C00 Auxiliary coolant pump in high-temperature circuit - overtemperature

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Auxiliary water pump switched off due to overtemperature
- Pump reports fault by ground keying

Monitored component or system

♦ Auxiliary water pump

Fault finding notes

♦ Check of the pump for great external heating influence (>160 °C/320 °F)
♦ Replace pump
- **ONLY Panamera:**
  ► Pay attention to the documents: SY 2911

Function restrictions

♦ Reduced heating power when the combustion engine is at low revs
♦ Reduction in the electrical driving power possible

P192D00

Diagnosis information DME control module

P192D00 Auxiliary coolant pump in the high temperature circuit - dry run

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Auxiliary water pump detects dry running and limits revs
- Pump reports fault by ground keying

Monitored component or system

♦ Pump 1 for charge air cooler

Fault finding notes

♦ Check of whether there is air in the vehicle's low-temperature circuit. Bleed if necessary
♦ Replace pump

Function restrictions

♦ Reduction in the electric driving power up to stop ban by the power electronics
♦ Reduced engine power due to high charge-air temperatures

P192E00

Diagnosis information DME control module

P192E00 Auxiliary coolant pump in the low-temperature circuit - mechanical fault

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Auxiliary water pump switched off due to excess current
- Auxiliary water pump detects excessive power draw and limits the revs
- Pump reports fault by ground keying

Monitored component or system

♦ Pump 1 for charge air cooler

Fault finding notes

♦ Check of the electric water pump for sluggishness or blocking
♦ Replace pump if necessary

Function restrictions

♦ Reduction in the electric driving power up to stop ban by the power electronics
♦ Reduced engine power due to high charge-air temperatures

Diagnosis information DME control module

P192F00 Auxiliary coolant pump in the low-temperature circuit - overtemperature

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Auxiliary water pump switched off due to overtemperature
- Pump reports fault by ground keying

Monitored component or system

♦ Pump 1 for charge air cooler

Fault finding notes

♦ Check of the pump for great external heating influence (>160 °C/320 °F)
♦ Replace pump

Function restrictions

♦ Reduction in the electric driving power up to stop ban by the power electronics
♦ Reduced engine power due to high charge-air temperatures

Diagnosis information DME control module

P194400 Control unit 1 for radiator fans - overtemperature

Diagnostic conditions

● Switch ignition on and wait 6 min., then fault entry. Effect: fan decreases power or switches off. Procedure: drive link test, test according to specification. Signal every 2 sec., for 1 sec. to ground
● The fan must be activated with 10% pulse/duty ratio for at least 6 min.

Fault setting condition(s)

● The radiator fan output stage reduces the power from 110 °C (230 °F) and switches off above 130 °C (266 °F). When the temperature falls below 125 °C (257 °F) again, then heat-loss-reduced operation is in effect

Monitored component or system

♦ Radiator fan output stage 1

Fault finding notes

♦ Drive link test
♦ Visual inspection of whether the fan module is in the original condition

Function restrictions

♦ No or reduced fan power of the two possible fans on the first output stage
♦ The system can overheat in extreme situations (towing a trailer, hot countries, top speed). Symptoms are A/C rejection and "hot" light

P194500

Diagnosis information DME control module

P194500 Control unit for radiator fans - short circuit

Diagnostic conditions

- Ignition on
- The fan must be activated with 10% pulse/duty ratio for at least 6 min.

Fault setting condition(s)

- Plausibility check of the sent short-circuit times in the DME control unit

Monitored component or system

♦ Radiator fans

Fault finding notes

♦ Perform fan output stage_1 drive link diagnostics. The fan should accelerate to maximum speed in approx. 10 sec.

Function restrictions

♦ No fan power of the first fan at the first radiator fan output stage
♦ The system can overheat in extreme situations (trailer operation/hot country/Vmax)
♦ A/C function rejection and "hot" light are indications of this.

Diagnosis information DME control module

P194600 Control unit 1 for radiator fans - faulty/power supply open circuit

Diagnostic conditions

● Switch ignition on and wait 6 min., then fault entry. Effect: electronics fault or power supply interrupted. Procedure: Signal every 2 sec., for 4 sec. to ground
● The fan must be activated with 10% pulse/duty ratio for at least 6 min.

Fault setting condition(s)

● Electronics fault or power supply to the fan control unit interrupted

Monitored component or system

♦ Radiator fan output stage 1

Fault finding notes

♦ Drive link test
♦ Check power supply fuse
♦ Check of the supply line from the power supply to the fan
♦ Fan control unit faulty

Function restrictions

♦ No or reduced fan power of the two possible fans on the first output stage
♦ The system can overheat in extreme situations (towing a trailer, hot countries, top speed). Symptoms are A/C rejection and "hot" light

Diagnosis information DME control module

P195000 Coolant fan - sluggish/stalled

Diagnostic conditions

● Switch the ignition on and either drive the engine warm, or check via a measured value whether the air conditioner demands the correct number of fans. The measured value indicates the activation of the output stages
● The fan must be activated with 15% pulse/duty ratio for at least 6 min.

Fault setting condition(s)

● Soiling by leaves or ice, corrosion-related stalling due to the effects of road salt, accident damage or similar

Monitored component or system

♦ Radiator fan 1 on first output stage

Fault finding notes

♦ Fan output stage 1 drive link diagnostics
♦ The fan should accelerate to maximum speed in approx. 10 sec.

Function restrictions

♦ No fan power of the first fan on the first radiator fan output stage
♦ The system can overheat in extreme situations (towing a trailer, hot countries, top speed). Symptoms are A/C rejection and "hot" light

P197C00

Diagnosis information DME control module

P197C00 Secondary-air injection, bank 1 and bank 2 interchanged

Diagnostic conditions

- Diagnostics runs only at end of assembly line

Monitored component or system

♦ Secondary-air system (combination valves)

Fault finding notes

♦ Secondary-air system test
♦ Short trip, bank 1
♦ Secondary-air system test
♦ Short trip, bank 2

Diagnosis information DME control module

P200400 Bank 1 intake-manifold flap for air flow control - stuck open

Diagnostic conditions

- Diagnostics runs during adaptation

Monitored component or system

♦ Charge movement flap

Fault finding notes

♦ Perform basic setting. If OK, check low-pressure activation
♦ Perform adjustment by hand to check the operating smoothness of the module and check whether the vacuum cell deflection lever linkage is firmly engaged
♦ Perform electrical test on sensor wiring harness
♦ Visual check whether limit stops of the charge movement flap are damaged
♦ Visual inspection of sensor holder on intake manifold
♦ Removal of the sensor for visual check whether the holder is worn or broken

Function restrictions

♦ Juddering possible and/or full power may not be available

P200500

Diagnosis information DME control module

P200500 Intake pipe flap for bank 2 air flow control - stuck open

Diagnostic conditions

- Engine running
- Diagnostics runs during adaptation

Fault setting condition(s)

(Deviation between setpoint and actual for bank 2) < 100%

Monitored component or system

♦ Charge movement flap 2

Fault finding notes

♦ Perform basic setting. If OK, check low-pressure activation
♦ Perform adjustment by hand to check smoothness of operation of the module
♦ Perform electrical test on sensor wiring harness
♦ Visual inspection of sensor holder on intake pipe
♦ Visual check whether limit stops of the charge movement flap are damaged
♦ Removal of the sensor for visual check whether the holder is worn or broken

Function restrictions

♦ Juddering possible and/or full power may not be available

Diagnosis information DME control module

P200600 Intake pipe flap for bank 1 air flow control - stuck closed

Diagnostic conditions

- Engine running
- Diagnostics runs during adaptation
- Diagnostics runs continuously

Fault setting condition(s)

- Flap cannot reach the fail-safe position
- (Deviation between setpoint and actual) > 0%

Monitored component or system

♦ Charge movement flap

Fault finding notes

♦ Perform basic setting. If OK, check low-pressure activation
♦ Perform adjustment by hand to check smoothness of operation of the module
♦ Check whether vacuum cell/deflection lever linkage is firmly engaged
♦ Perform electrical test on sensor wiring harness
♦ Visual inspection of sensor holder on intake pipe
♦ Visual check whether limit stops of the charge movement flap are damaged
♦ Removal of the sensor for visual check whether the holder is worn or broken

Function restrictions

♦ Juddering possible and/or full power may not be available

P200700

Diagnosis information DME control module

P200700 Intake pipe flap for bank 2 air flow control - stuck closed

Diagnostic conditions

- Engine running
- Diagnostics runs during adaptation
- Diagnostics runs continuously

Fault setting condition(s)

- (Deviation between setpoint and actual for bank 2) > 0%

Monitored component or system

♦ Charge movement flap

Fault finding notes

♦ Perform basic setting. If OK, check low-pressure activation
♦ Perform adjustment by hand to check smoothness of operation of the module
♦ Check whether vacuum cell/deflection lever linkage is firmly engaged
♦ Perform electrical test on sensor wiring harness
♦ Visual inspection of sensor holder on intake pipe
♦ Visual check whether limit stops of the charge movement flap are damaged
♦ Removal of the sensor for visual check whether the holder is worn or broken

Function restrictions

♦ Juddering possible and/or full power may not be available

Diagnosis information DME control module

P200800 Intake pipe flap for air flow control - electrical fault

Diagnostic conditions

- Engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Charge movement flap output stage signal error (low side switch)
- Signal voltage 4.5 V ... 5.5 V

Monitored component or system

♦ Charge movement flap

Fault finding notes

♦ Check wiring between DME control unit and component for open circuit
♦ The internal diagnostic voltage (between 3 V and 6 V) per output stage is measured
♦ Check power supply

Function restrictions

♦ Output stage inactive
♦ Failure of the charge movement flap

Diagnosis information DME control module

P200900 Intake pipe flap for air flow control - short circuit to ground

Diagnostic conditions

- Engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Min. charge movement flap output stage signal error (low side switch)
- Signal voltage < 3.01 V

Monitored component or system

♦ Charge movement flap

Fault finding notes

♦ Check wiring between DME control unit and component for short circuit to ground
♦ If OK, remove plug from component and erase fault memory
♦ If the DME control unit detects open circuit, the fault is in the component
♦ Check power supply on the component

Function restrictions

♦ Output stage inactive
♦ Failure of the charge movement flap

Diagnosis information DME control module

P201000 Intake pipe flap for air flow control - short circuit to B+

Diagnostic conditions

- Engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Max. charge movement flap output stage signal error (low side switch)
- Signal current 2.2 A ... 4.0 A

Monitored component or system

♦ Charge movement flap

Fault finding notes

♦ Check wiring between DME control unit and component for short circuit to B+
♦ If OK, remove plug from component and erase fault memory
♦ If the DME control unit detects open circuit, the fault is in the component

Function restrictions

♦ Output stage inactive
♦ Failure of the charge movement flap

Diagnosis information DME control module

P201400 Intake pipe flap position sender - electr. fault in circuit

Diagnostic conditions

- Ignition on
- Engine running
- Control unit run-on
- Diagnostics runs continuously

Fault setting condition(s)

- signal voltage < 0.2002 V

Monitored component or system

♦ Charge movement flap potentiometer

Fault finding notes

♦ Perform basic setting
♦ If not OK, check firm seating of the sensor plug and the DME control unit plug
♦ Visual inspection for soiling in the sensor plug or corrosion on all contacts and cable lugs
♦ Visual inspection of the sensor lines for damage or crushing, possibly crimping of the cable lugs
♦ Perform electrical test on wiring harness
♦ Visual inspection of sensor holder on intake pipe
♦ Removal of the sensor for visual check whether the holder is worn or broken

Function restrictions

♦ Juddering possible and/or full power may not be available

P201500

Diagnosis information DME control module

P201500 Intake pipe flap position sender/air flow control - implausible signal

Diagnostic conditions

- Engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Deviation between setpoint and actual > 40%

Monitored component or system

♦ Charge movement flap

Fault finding notes

♦ Perform basic setting. If OK, check low-pressure activation
♦ Perform adjustment by hand to check smoothness of operation of the module
♦ Check whether vacuum cell/deflection lever linkage is firmly engaged
♦ Perform electrical test on sensor wiring harness
♦ Visual inspection of sensor holder on intake pipe
♦ Visual check whether limit stops of the charge movement flap are damaged
♦ Removal of the sensor for visual check whether the holder is worn or broken

Function restrictions

♦ Juddering possible and/or full power may not be available

Diagnosis information DME control module

P201700 Intake pipe flap position sender/air flow control - short circuit to B+

Diagnostic conditions

- Ignition on
- Engine running
- Control unit run-on
- Diagnostics runs continuously

Fault setting condition(s)

- signal voltage > 4.877 V

Monitored component or system

♦ Charge movement flap potentiometer

Fault finding notes

♦ Perform basic setting
♦ If not OK, check firm seating of the sensor plug and the DME control unit plug
♦ Visual inspection for soiling in the sensor plug or corrosion on all contacts and cable lugs
♦ Visual inspection of the sensor lines for damage or crushing, possibly crimping of the cable lugs
♦ Perform electrical test on wiring harness
♦ Visual inspection of sensor holder on intake pipe
♦ Removal of the sensor for visual check whether the holder is worn or broken

Function restrictions

♦ Juddering possible and/or full power may not be available

Diagnosis information DME control module

P201900 Intake pipe flap 2 position sender - electr. fault in circuit

Diagnostic conditions

- Ignition on
- Engine running
- Control unit run-on
- Diagnostics runs continuously

Fault setting condition(s)

- signal voltage < 0.2002 V

Monitored component or system

♦ Charge movement flap potentiometer

Fault finding notes

♦ Perform basic setting
♦ If not OK, check firm seating of the sensor plug and the DME control unit plug
♦ Visual inspection for soiling in the sensor plug or corrosion on all contacts and cable lugs
♦ Visual inspection of the sensor lines for damage or crushing, possibly crimping of the cable lugs
♦ Perform electrical test on wiring harness
♦ Visual inspection of sensor holder on intake pipe
♦ Removal of the sensor for visual check whether the holder is worn or broken

Function restrictions

♦ Juddering possible and/or full power may not be available

Diagnosis information DME control module

P202000 Intake pipe flap 2 position sender - implausible signal

Diagnostic conditions

- Engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Deviation between setpoint and actual for bank 2 > 40%

Monitored component or system

♦ Charge movement flap

Fault finding notes

♦ Perform basic setting. If OK, check low-pressure activation
♦ Perform adjustment by hand to check smoothness of operation of the module
♦ Check whether vacuum cell/deflection lever linkage is firmly engaged
♦ Perform electrical test on sensor wiring harness
♦ Visual inspection of sensor holder on intake pipe
♦ Visual check whether limit stops of the charge movement flap are damaged
♦ Removal of the sensor for visual check whether the holder is worn or broken

Function restrictions

♦ Juddering possible and/or full power may not be available

Diagnosis information DME control module

P202200 Intake pipe flap 2 position sender - short circuit to B+

Diagnostic conditions

- Ignition on
- Engine running
- Control unit run-on
- Diagnostics runs continuously

Fault setting condition(s)

- signal voltage > 4.877 V

Monitored component or system

♦ Charge movement flap potentiometer

Fault finding notes

♦ Perform basic setting
♦ If not OK, check firm seating of the sensor plug and the DME control unit plug
♦ Visual inspection for soiling in the sensor plug or corrosion on all contacts and cable lugs
♦ Visual inspection of the sensor lines for damage or crushing, possibly crimping of the cable lugs
♦ Perform electrical test on wiring harness
♦ Visual inspection of sensor holder on intake pipe
♦ Removal of the sensor for visual check whether the holder is worn or broken

Function restrictions

♦ Juddering possible and/or full power may not be available

P202500

Diagnosis information DME control module

P202500 Tank leakage detection sender in carbon canister - signal implausible

Diagnostic conditions

- Carbon canister load factor < 35 for 10 seconds
- Engine start temperature < 45 °C (113 °F)
- Vehicle speed > 10 km/h (6 mph) for 10 seconds
- Ambient temperature < 45 °C (113 °F)

Fault setting condition(s)

- Measured temperature at the sensor < ambient temperature - 30 °C (54 °F)
- Measured temperature at the sensor > ambient temperature + 40 °C (72 °F)
- Temperature difference between min. and max. < 0.06 °C (0.11 °F)

Monitored component or system

♦ Temperature sensor

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Temperature sensor faulty

Fault effects

♦ Combustion engine might run more frequently because the carbon canister load cannot be determined exactly.

Diagnosis information DME control module

P202600 Tank leakage detection sender in carbon canister - voltage too low
P202700 Tank leakage detection sender in carbon canister - voltage too high

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

P202600:
- Sensor voltage of the temperature sensor < 0.1 V

P202700:
- Sensor voltage of the temperature sensor > 4.5 V

Monitored component or system

♦ Temperature sensor

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Temperature sensor faulty

Fault effects

♦ Combustion engine might run more frequently because the carbon canister load cannot be determined exactly.

Diagnosis information DME control module

P202600 Tank leakage detection sender in carbon canister - voltage too low
P202700 Tank leakage detection sender in carbon canister - voltage too high

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

P202600:
- Sensor voltage of the temperature sensor < 0.1 V

P202700:
- Sensor voltage of the temperature sensor > 4.5 V

Monitored component or system

♦ Temperature sensor

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Temperature sensor faulty

Fault effects

♦ Combustion engine might run more frequently because the carbon canister load cannot be determined exactly.

P206600

Diagnosis information DME control module

P046100 Fuel level sender - signal implausible
P206600 Fuel level sender 2 - physical value range exceeded
P25D800 Fuel level sender 3 - physical value range exceeded

Diagnostic conditions

- Ignition on
- Continuously

Fault setting condition(s)

P046100
- Fuel level sender, signal > 110 l (liters)
- Resistance of sensor 1 > 1,100 Ohm

P206600
- Resistance of sensor 2 > 1,100 Ohm

P25D800
- Resistance of sensor 3 > 550 Ohm

Monitored component or system

♦ Fuel level sender

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Fuel level sender stuck
♦ Fault finding via instrument cluster

P206700

Diagnosis information DME control module

P046200 Fuel level sender, signal too low
P046300 Fuel level sender, signal too high
P206700 Fuel level indicator sender 2 - short circuit to ground
P206800 Fuel level indicator sender 2 - short circuit to B+

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- The fault is detected by the instrument cluster and transferred to the DME control unit, where the fault memory entry is made

Monitored component or system

♦ Fuel level sender

Fault finding notes

♦ Check instrument cluster fault memory content

Fault effects

♦ MIL on

P206800

Diagnosis information DME control module

P046200 Fuel level sender, signal too low
P046300 Fuel level sender, signal too high
P206700 Fuel level indicator sender 2 - short circuit to ground
P206800 Fuel level indicator sender 2 - short circuit to B+

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- The fault is detected by the instrument cluster and transferred to the DME control unit, where the fault memory entry is made

Monitored component or system

♦ Fuel level sender

Fault finding notes

♦ Check instrument cluster fault memory content

Fault effects

♦ MIL on

P208800

Diagnosis information DME control module

P208800 Bank 1 camshaft adjustment - short circuit to ground

Diagnostic conditions

- With engine running

Fault setting condition(s)

- Activation voltage less than diagnostic threshold 2.14...3.26 V

Monitored component or system

♦ Bank 1 intake camshaft adjuster output stage

Diagnosis information DME control module

P208900 Bank 1 camshaft adjustment - short circuit to B+

Diagnostic conditions

- Ignition on
- With engine running

Fault setting condition(s)

- Typically: I > 2.2...4.0 A, depending on which output stage type is used
- Output stage diagnostics, short circuit to B+

Monitored component or system

♦ Actuator for camshaft adjustment (intake, bank 1) output stage

Function restrictions

♦ Power restriction

P209200

Diagnosis information DME control module

P209200 Bank 2 camshaft adjustment - short circuit to ground

Diagnostic conditions

- With engine running

Fault setting condition(s)

- Activation voltage less than diagnostic threshold 2.14...3.26 V

Monitored component or system

♦ Bank 2 intake camshaft adjuster output stage

P209300

Diagnosis information DME control module

P209300 Bank 2 camshaft adjustment - short circuit to B+

Diagnostic conditions

- With engine running

Fault setting condition(s)

- Typically: I > 2.2...4.0 A, depending on which output stage type is used
- Output stage diagnostics, short circuit to B+

Monitored component or system

♦ Camshaft adjuster actuator (intake, bank 2) output stage

Function restrictions

♦ Power restriction

P209600

Diagnosis information DME control module

P209600 Bank 1 lambda correction behind catalytic converter - lean control limit exceeded

Fault setting condition(s)

- Delta of the sensor offset of setpoint control < -3% > -7%

Monitored component or system

♦ Oxygen sensor drift comparison by oxygen sensor

Possible fault causes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor behind cat. conv., bank 1 sensor 2 faulty

P209700

Diagnosis information DME control module

P209700 Bank 1 lambda correction behind catalytic converter - rich control limit exceeded

Fault setting condition(s)

- Delta of the sensor offset of setpoint control > 3% < 7%

Monitored component or system

♦ Oxygen sensor drift comparison by oxygen sensor, bank 1

Possible fault causes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor behind cat. conv., bank 1 sensor 2 faulty

P209800

Diagnosis information DME control module

P209800 Bank 2 lambda correction behind catalytic converter - lean control limit exceeded

Fault setting condition(s)

- Delta of the sensor offset of setpoint control < -3% > -7%

Monitored component or system

♦ Oxygen sensor drift comparison by oxygen sensor, bank 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor behind cat. conv., bank 2 sensor 2 faulty

P209900

Diagnosis information DME control module

P209900 Bank 2 lambda correction behind catalytic converter - rich control limit exceeded

Fault setting condition(s)

- Delta of the sensor offset of setpoint control > 3% < 7%

Monitored component or system

♦ Oxygen sensor drift comparison by oxygen sensor, bank 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor behind cat. conv., bank 2 sensor 2 faulty

Diagnosis information DME control module

P210600 Throttle valve control unit - limited power due to system fault

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- Short circuit in the DV-E output stage : I > 8.0...18.0 A
- DV-E output stage is overheated or carries excessive current: I > 5.5...7.7 A or T > 150 °C/302 °F (current limitation) or T> 175 °C/347 °F (overtemperature shutoff)
- SPI or signal error in the DV-E output stage : Maximum pulse/duty ratio > 80%
- Open-load fault in the DV-E output stage; output voltage 1 > 2 V and output voltage 2 < 0.8 V

Monitored component or system

♦ Throttle valve adjuster output stage

Fault finding notes

♦ Electrical test of the sensor line, power supply, ground, plug
♦ A power supply of 5 V with respect to sensor ground (in the plug) must be measured on the wiring harness of the throttle valve plug when the ignition is on (throttle valve unplugged)

Diagnosis information DME control module

P211900 Throttle valve control unit - fault in basic setting

Diagnostic conditions

- Ignition on
- Diagnostics runs during adaptation
- Speed 0 km/h / mph
- Engine speed < 300 rpm
- Intake-air temperature > 5.5 °C (41.9 °F)

Monitored component or system

♦ Throttle valve adjuster adaptation error

Diagnosis information DME control module

P212200 Accelerator pedal position sender - signal too low

Diagnostic conditions

- No fault in the 5 V supply

Fault setting condition(s)

- Electrical test of the pedal value encoder: signal too low

Monitored component or system

♦ Pedal sensor 1

Fault finding notes

♦ Electrical test of the plug connections and cables for short circuit to ground

Function restrictions

♦ The torque is greatly reduced above 3,000 rpm

P212300

Diagnosis information DME control module

P212300 Accelerator pedal position sender - signal too high

Diagnostic conditions

- No fault in the 5 V supply

Fault setting condition(s)

- Electrical test of the pedal value encoder: signal too high

Monitored component or system

♦ Pedal sensor 1

Fault finding notes

♦ Electrical test of the plug connections and cables for short circuit to B+

Function restrictions

♦ The torque is greatly reduced above 3,000 rpm

P212700

Diagnosis information DME control module

P212700 Accelerator pedal position sender 2 - signal too low

Diagnostic conditions

- No fault in the 5 V supply

Fault setting condition(s)

- Electrical test of the pedal value encoder: signal too low

Monitored component or system

♦ Pedal sensor 2

Fault finding notes

♦ Electrical test of the plug connections and cables for short circuit to ground

Function restrictions

♦ The torque is greatly reduced above 3,000 rpm

P212800

Diagnosis information DME control module

P212800 Accelerator pedal position sender 2 - signal too high

Diagnostic conditions

- No fault in the 5 V supply

Fault setting condition(s)

- Electrical test of the pedal value encoder: signal too high

Monitored component or system

♦ Pedal sensor 2

Fault finding notes

♦ Electrical test of the plug connections and cables for short circuit to B+

Function restrictions

♦ The torque is greatly reduced above 3,000 rpm

Diagnosis information DME control module

P213800 Accelerator pedal position sender 1/2 - implausible signal

Diagnostic conditions

- Diagnostics running continuously from ignition on
- No fault in the 5 V supply
- Control unit run-on

Fault setting condition(s)

- The difference of the two input signals exceeds the permissible maximum
- The two signal voltages of the pedal encoder are tested for synchronism
- The two pedal encoder signal voltages are observed in run-on for pedal encoder drift detection. A fault is present if one signal voltage lies within and one signal voltage lies outside the idle range
- When the idle range of the first channel is left, the voltage value of the second channel is stored. When the first channel exceeds a voltage threshold but the second one does not, a fault is detected
- A fault is also detected when the second channel falls below the voltage threshold before the first channel when reaching the idle range again from above

Monitored component or system

♦ Pedal encoder

Fault finding notes

♦ Electrical test of the plug connections, cables and components
♦ Test of the contact resistance values on sensors 1 and 2
♦ It might be necessary to replace the sensors

Function restrictions

♦ The torque is greatly reduced above 3,000 rpm

P214600

Diagnosis information DME control module

P214600 Supply for fuel injector(s) A - open circuit

Diagnostic conditions

- Engine speed > 80 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Short circuit of the high pressure fuel injector (high side) to battery positive voltage/ground
- Winding short circuit of the high pressure fuel injector (high side)

Monitored component or system

♦ High pressure fuel injector, high side, cylinder 1/2

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ Suppression of the high pressure fuel injectors with data

Diagnosis information DME control module

P214900 Supply for fuel injector(s) B - open circuit

Diagnostic conditions

- Engine speed > 80 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Short circuit of the high pressure fuel injector (high side) to battery positive voltage/ground
- Winding short circuit of the high pressure fuel injector (high side)

Monitored component or system

♦ High pressure fuel injector, high side, cylinder 3/4

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ Suppression of the high pressure fuel injectors with data

P215200

Diagnosis information DME control module

P215200 Supply for fuel injector(s) C - electrical fault

Diagnostic conditions

- Engine speed > 80 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Short circuit of the high pressure fuel injector (high side) to battery positive voltage/ground
- Winding short circuit of the high pressure fuel injector (high side)

Monitored component or system

♦ High pressure fuel injector, high side, cylinder 5/6

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ Suppression of the high pressure fuel injectors with data

P217700

Diagnostic information - DME control unit

P217700 Bank 1 fuel metering system - system too lean from idling speed

Diagnostic conditions

- Engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Diagnostics via adaptation values: Mixture adaptation learns systematic deviations of the lambda controller. The deviations are compensated as an offset or factor depending on the operating point.
- Multiplicative lambda adaptation value > 1.30

Monitored component or system

♦ Fuel system

Fault finding notes

♦ Check fuel tank level (fuel tank empty)
♦ Oil cap open
♦ Fuel quality (fuels with a higher ethanol content result in enrichment, for example)
♦ Visual inspection of intake duct: Air cleaner dirty; kinked or loose hoses
♦ Leaks in intake duct
♦ Leaks in brake booster
♦ Tank vent valve stuck/faulty
♦ Throttle valve adaptation
♦ Mass air flow sensor
♦ Check intake manifold pressure sensor(s)
♦ Intake manifold flap short test
♦ Camshafts short test
♦ Secondary-air valves drive link/short test
♦ Check oxygen sensors
♦ Oil thinning (does the engine oil contain too much gasoline?)
♦ Check low-pressure and high-pressure fuel system
♦ Fuel filter dirty/blocked
♦ Check fuel injectors

P217800

Diagnostic information - DME control unit

P217800 Bank 1 fuel metering system - system too rich from idling speed

Diagnostic conditions

- Engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Diagnostics via adaptation values: Mixture adaptation learns systematic deviations of the lambda controller. The deviations are compensated as an offset or factor depending on the operating point.
- Multiplicative lambda adaptation value < 0.70

Monitored component or system

♦ Fuel system

Fault finding notes

♦ Leak in exhaust system (**engine** ⇒ **oxygen sensor upstream of catalytic converter**)
♦ Exhaust system constricted/blocked
♦ **Fuel injector** faulty (mechanical fault)
♦ Timing set incorrectly
♦ Fault in areas: fuel high pressure, intake manifold pressure sensor, **throttle valve adjusting unit**, **ambient pressure sensor**, **intake air temperature sensor**, **rpm sensor**, **camshaft adjustment**
♦ Tank vent valve faulty (Tank vent valve short test)
♦ High fuel content in engine oil

P217900

Diagnostic information - DME control unit

P217900 Bank 2 fuel metering system - system too lean from idling speed

Diagnostic conditions

- Engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Diagnostics via adaptation values: Mixture adaptation learns systematic deviations of the lambda controller. The deviations are compensated as an offset or factor depending on the operating point.
- Multiplicative lambda adaptation value, bank 2 > 1.30

Monitored component or system

♦ Fuel system

Fault finding notes

♦ Check fuel tank level (fuel tank empty)
♦ Oil cap open
♦ Fuel quality (fuels with a higher ethanol content result in enrichment, for example)
♦ Visual inspection of intake duct: Air cleaner dirty; kinked or loose hoses
♦ Leaks in intake duct
♦ Leaks in brake booster
♦ Tank vent valve stuck/faulty
♦ Throttle valve adaptation
♦ Mass air flow sensor
♦ Check intake manifold pressure sensor(s)
♦ Intake manifold flap short test
♦ Camshafts short test
♦ Secondary-air valves drive link/short test
♦ Check oxygen sensors
♦ Oil thinning (does the engine oil contain too much gasoline?)
♦ Check low-pressure and high-pressure fuel system
♦ Fuel filter dirty/blocked
♦ Check fuel injectors

Diagnostic information - DME control unit

P218000 Bank 2 fuel metering system - system too rich from idling speed

Diagnostic conditions

- Engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Diagnostics via adaptation values: Mixture adaptation learns systematic deviations of the lambda controller. The deviations are compensated as an offset or factor depending on the operating point.
- Multiplicative lambda adaptation value, bank 2 < 0.700

Monitored component or system

♦ Fuel system

Fault finding notes

♦ Leak in exhaust system (**engine** ⇒ **oxygen sensor upstream of catalytic converter**)
♦ Exhaust system constricted/blocked
♦ **Fuel injector** faulty (mechanical fault)
♦ Timing set incorrectly
♦ Fault in areas: fuel high pressure, intake manifold pressure sensor, **throttle valve adjusting unit**, **ambient pressure sensor**, **intake air temperature sensor**, **rpm sensor**, **camshaft adjustment**
♦ Tank vent valve faulty (Tank vent valve short test)
♦ High fuel content in engine oil

Diagnostic information - DME control unit

P218100 Fault in cooling system

Diagnostic conditions

- Drive > 10 minute(s) with:
  - Engine start temperature -10 ... +60 °C (14 ... 140 °F)
  - Engine speed > 1,000 rpm

Fault setting condition(s)

- Difference between coolant temperature (sensor) and coolant temperature at radiator outlet (sensor) < 20.3 K for longer than 30...120 sec.

Monitored component or system

♦ Coolant temperature system, performance capacity

Fault finding notes

♦ Affected by block heater
♦ 3/2-way valve faulty if auxiliary heater is installed
♦ Seal in thermostat housing faulty
♦ Thermostat housing faulty
♦ Thermostat faulty
♦ Engine coolant temperature sensor faulty, loose contact or corrosion on connectors or lines

Fault effects

If radiator shutter is installed:
♦ Radiator shutter is opened
♦ Radiator shutter remains open until the fault has been healed or deleted from the fault memory

Functional restrictions

♦ If the thermostat is stuck open, the cooling system and engine heat up too slowly after a cold start or the engine temperature remains continuously too low.

Diagnosis information DME control module

P218300 Coolant temperature sender 2 - signal implausible

Diagnostic conditions

DFCC 24183
- Once per driving cycle
- No electrical fault present
- Switch-off time > 7 hours and 47 minutes
- Switch-off time valid
- End of starting completed or E-driving readiness set
- Vehicle speed > 25 km/h (16 mph) for 30 seconds
- No temperature difference between the individual cross-check sensors

DFCC 23633
- Once per driving cycle
- No electrical fault of the engine temperature sensor or radiator outlet temperature sensor
- Ambient temperature > -7.5 °C (+19 °F)
- Engine starting temperature at first start < 84 °C (183 °F)
- Engine temperature > 45 °C (113 °F)
- Vehicle speed 5...70 km/h (3 ... 44 mph)
- Engine speed >1,200 rpm
- Mass air flow for the period 15...200 seconds > 40 kg/h

Fault setting condition(s)

DFCC 24183
- Confirmed cross-check error for the cooling-circuit temperature sensor ● Threshold exceeded (map depending on engine switch-off time)
- No cross-check error of the other temperature sensors

DFCC 23633
- Temperature signal of engine cooling circuit temperature changed by less than 1.5 °C (2.7 ° F) in the range 4...45 °C (39 ... 113 °F)

Monitored component or system

♦ Coolant temperature sensor at radiator outlet

Fault finding notes

♦ Check of the temperature sensor compared to the other temperature sensors, ideally after engine cooling phase

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Coolant temperature sender 3 faulty

Fault effects

DFCC 24183
♦ Switchover of the sensor temperature to substitute value or substitute model
♦ Possibly restrictions in functions that use the sensor value

DFCC 23633
♦ Switchover of the sensor temperature to substitute value or substitute model

Diagnostic information - DME control unit

P218400 Coolant temperature sender 2 - signal below limit
P218500 Coolant temperature sender 2 - signal above limit
P218600 Coolant temperature sender 2 - loose contact

Diagnostic conditions

- Diagnostics always starts as soon as ignition is switched on
- Diagnostics runs continuously

Fault setting condition(s)

- The measured sensor signal voltage is below/above the limit value
- Pull-up connection; the sensor is passive and has a reference voltage of 3.3 V

Monitored component or system

♦ Coolant temperature sensor behind exhaust gas recirculation cooler

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ If P017B00 and P308100 are entered and radiator fan was activated fully ⇒ Consequential fault at low ambient temperatures < 0°C (32 °F)
♦ **Coolant temperature sender 2** faulty

Functional restrictions

♦ Radiator fans are activated

Diagnostic information - DME control unit

P218400 Coolant temperature sender 2 - signal below limit
P218500 Coolant temperature sender 2 - signal above limit
P218600 Coolant temperature sender 2 - loose contact

Diagnostic conditions

- Diagnostics always starts as soon as ignition is switched on
- Diagnostics runs continuously

Fault setting condition(s)

- The measured sensor signal voltage is below/above the limit value
- Pull-up connection; the sensor is passive and has a reference voltage of 3.3 V

Monitored component or system

♦ Coolant temperature sensor behind exhaust gas recirculation cooler

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ If P017B00 and P308100 are entered and radiator fan was activated fully ⇒ Consequential fault at low ambient temperatures < 0°C (32 °F)
♦ **Coolant temperature sender 2** faulty

Functional restrictions

♦ Radiator fans are activated

Diagnostic information - DME control unit

P218400 Coolant temperature sender 2 - signal below limit
P218500 Coolant temperature sender 2 - signal above limit
P218600 Coolant temperature sender 2 - loose contact

Diagnostic conditions

- Diagnostics always starts as soon as ignition is switched on
- Diagnostics runs continuously

Fault setting condition(s)

- The measured sensor signal voltage is below/above the limit value
- Pull-up connection; the sensor is passive and has a reference voltage of 3.3 V

Monitored component or system

♦ Coolant temperature sensor behind exhaust gas recirculation cooler

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ If P017B00 and P308100 are entered and radiator fan was activated fully ⇒ Consequential fault at low ambient temperatures < 0°C (32 °F)
♦ **Coolant temperature sender 2** faulty

Functional restrictions

♦ Radiator fans are activated

P218700

Diagnostic information - DME control unit

P218700 Bank 1 fuel metering system - system too lean at idling speed

Diagnostic conditions

- Engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Diagnostics via adaptation values: Mixture adaptation learns systematic deviations of the lambda controller. The deviations are compensated as an offset or factor depending on the operating point.
- Additive lambda adaptation value < -6.0%

Monitored component or system

♦ Fuel system

Fault finding notes

♦ Check fuel tank level (fuel tank empty)
♦ Oil cap open
♦ Fuel quality (fuels with a higher ethanol content result in enrichment, for example)
♦ Visual inspection of intake duct: Air cleaner dirty; kinked or loose hoses
♦ Leaks in intake duct
♦ Leaks in brake booster
♦ Tank vent valve stuck/faulty
♦ Throttle valve adaptation
♦ Mass air flow sensor
♦ Check intake manifold pressure sensor(s)
♦ Intake manifold flap short test
♦ Camshafts short test
♦ Secondary-air valves drive link/short test
♦ Check oxygen sensors
♦ Oil thinning (does the engine oil contain too much gasoline?)
♦ Check low-pressure and high-pressure fuel system
♦ Fuel filter dirty/blocked
♦ Check fuel injectors

P218800

Diagnostic information - DME control unit

P218800 Bank 1 fuel metering system - system too rich at idling speed

Diagnostic conditions

- Engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Diagnostics via adaptation values: Mixture adaptation learns systematic deviations of the lambda controller. The deviations are compensated as an offset or factor depending on the operating point.
- Additive lambda adaptation value > 6.0%

Monitored component or system

♦ Fuel system

Fault finding notes

♦ Leak in exhaust system (**engine** ⇒ **oxygen sensor upstream of catalytic converter**)
♦ Exhaust system constricted/blocked
♦ **Fuel injector** faulty (mechanical fault)
♦ Timing set incorrectly
♦ Fault in areas: fuel high pressure, intake manifold pressure sensor, **throttle valve adjusting unit**, **ambient pressure sensor**, **intake air temperature sensor**, **rpm sensor**, **camshaft adjustment**
♦ Tank vent valve faulty (Tank vent valve short test)
♦ High fuel content in engine oil

Diagnostic information - DME control unit

P218900 Bank 2 fuel metering system - system too lean at idling speed

Diagnostic conditions

- Engine running > 10 s
- Coolant temperature > 45 °C (113 °F)
- Engine speed 720 ... 1,440 rpm
- Engine load 6 ... 11%
- Diagnostics runs continuously

Fault setting condition(s)

- Diagnostics via adaptation values: Mixture adaptation learns systematic deviations of the lambda controller. The deviations are compensated as an offset or factor depending on the operating point.
- Additive lambda adaptation value, bank 2 > 6.0%

Monitored component or system

♦ Fuel system

Fault finding notes

♦ Check fuel tank level (fuel tank empty)
♦ Oil cap open
♦ Fuel quality (fuels with a higher ethanol content result in enrichment, for example)
♦ Visual inspection of intake duct: Air cleaner dirty; kinked or loose hoses
♦ Leaks in intake duct
♦ Leaks in brake booster
♦ Tank vent valve stuck/faulty
♦ Throttle valve adaptation
♦ Mass air flow sensor
♦ Check intake manifold pressure sensor(s)
♦ Intake manifold flap short test
♦ Camshafts short test
♦ Secondary-air valves drive link/short test
♦ Check oxygen sensors
♦ Oil thinning (does the engine oil contain too much gasoline?)
♦ Check low-pressure and high-pressure fuel system
♦ Fuel filter dirty/blocked
♦ Check fuel injectors

P219000

Diagnostic information - DME control unit

P219000 Bank 2 fuel metering system - system too rich at idle speed

Diagnostic conditions

- Engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Diagnostics via adaptation values: Mixture adaptation learns systematic deviations of the lambda controller. The deviations are compensated as an offset or factor depending on the operating point.
- Additive lambda adaptation value < 6.0%

Monitored component or system

♦ Fuel system

Fault finding notes

♦ Leak in exhaust system (**engine** ⇒ **oxygen sensor upstream of catalytic converter**)
♦ Exhaust system constricted/blocked
♦ **Fuel injector** faulty (mechanical fault)
♦ Timing set incorrectly
♦ Fault in areas: fuel high pressure, intake manifold pressure sensor, **throttle valve adjusting unit**, **ambient pressure sensor**, **intake air temperature sensor**, **rpm sensor**, **camshaft adjustment**
♦ Tank vent valve faulty (Tank vent valve short test)
♦ High fuel content in engine oil

P219500

Diagnosis information DME control module

P219500 Bank 1 oxygen sensor 1 - signal too lean

Fault setting condition(s)

- Delta of the sensor offset of setpoint control > 7%

Monitored component or system

♦ Oxygen sensor drift comparison by oxygen sensor

Possible fault causes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor ahead of catalytic converter, bank 1 sensor 1 faulty

P219600

Diagnosis information DME control module

P219600 Bank 1 oxygen sensor 1 - signal too rich

Fault setting condition(s)

- Delta of the sensor offset of setpoint control < -7%

Monitored component or system

♦ Oxygen sensor drift comparison by oxygen sensor

Possible fault causes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor ahead of catalytic converter, bank 1 sensor 1 faulty

P219700

Diagnosis information DME control module

P219700 Bank 2 oxygen sensor 1 - signal too lean

Fault setting condition(s)

- Delta of the sensor offset of setpoint control > 7%

Monitored component or system

♦ Oxygen sensor drift comparison by oxygen sensor

Possible fault causes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor ahead of catalytic converter, bank 2 sensor 1 faulty

P219800

Diagnosis information DME control module

P219800 Bank 2 oxygen sensor 1 - signal too rich

Fault setting condition(s)

- Delta of the sensor offset of setpoint control < -7%

Monitored component or system

♦ Oxygen sensor drift comparison by oxygen sensor

Possible fault causes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor ahead of catalytic converter, bank 2 sensor 1 faulty

P219900

Diagnosis information DME control module

P219900 Intake-air temperature sender - 1<>2 deviation

Diagnostic conditions

● Diagnostics runs continuously

Fault setting condition(s)

● Absolute value (measured intake-pipe temperature of bank 1 - measured intake-pipe temperature of bank 2) > 10.022 °C (50.040 °F)

Monitored component or system

♦ Boost pressure sensor

Fault finding notes

♦ Check sensor wiring
♦ Check charge air cooler for blockage

Function restrictions

♦ Loss of power
♦ MIL on

P219A00

Diagnostic information - DME control unit

P219A00 Bank 1 fuel/air mixture, unbalanced
P219B00 Bank 2 fuel/air mixture, unbalanced

Diagnostic conditions

Information
Diagnostics evaluates the signal of the oxygen sensor ahead of the catalytic converter at defined times and uses the signal to calculate the individual lambda value for each cylinder. The information about the individual cylinder mixture (fuel/air mixture) is used to equalize the cylinders through adaptation of the injection quantity. This fault is set if the correction factors exceed the fault threshold.

- Once per driving cycle
- Engine speed 1,320…2,280 rpm
- Relative fresh-air charge (load) 39.8… 75%
- Engine temperature > 45 °C (113 °F)

Enabling of individual cylinder lambda calculation with the following sub-conditions:
♦ Lambda control ahead of catalytic converter active
♦ Lambda setpoint is approximately 1
♦ Short tests for oxygen sensor dynamic response upstream of catalytic converter performed

The following conditions must be met for the time > 1 s:
♦ Oxygen sensor upstream of catalytic converter is ready for operation
♦ No fault during intake camshaft adjustment
♦ No misfire detection fault
♦ Crankshaft/intake camshaft adaptation completed
♦ Secondary-air system not active

Fault setting condition(s)

Bank 1
Clear fault code in the extended fault memory or vehicle analysis log 14703
♦ Control factor > 1.18 (enrichment)
Clear fault code in the extended fault memory or vehicle analysis log 14704
♦ Control factor <= 0.82 (leaning)

Bank 2
Clear fault code in the extended fault memory or vehicle analysis log 14705
♦ Control factor > 1.18 (enrichment)
Clear fault code in the extended fault memory or vehicle analysis log 14706
♦ Control factor <= 0.82 (leaning)

Monitored component or system

♦ Fuel injectors

Fault finding notes

♦ Leak in intake system
♦ Fuel supply system
♦ High-pressure fuel injectors of the conspicuous cylinder bank faulty

Functional restrictions

♦ Not perceptible
♦ Rough-running engine
♦ Perceptible misfiring
♦ Stop ban

P219B00

Diagnostic information - DME control unit

P219A00 Bank 1 fuel/air mixture, unbalanced
P219B00 Bank 2 fuel/air mixture, unbalanced

Diagnosis information DME control module

P223700 Bank 1 oxygen sensor 1 - pump current open circuit

Diagnostic conditions

- Heater control active
- Lambda control active
- Diagnostics runs continuously

Fault setting condition(s)

- The sensor voltage is in a voltage band, and the gradient of lambda control factor is higher than the maximum value

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor ahead of catalytic converter, bank 1 sensor 1 faulty

P224000

Diagnosis information DME control module

P224000 Bank 2 oxygen sensor 1 - pump current open circuit

Diagnostic conditions

- Heater control active
- Lambda control active
- Diagnostics runs continuously

Fault setting condition(s)

- The sensor voltage is in a voltage band, and the gradient of lambda control factor is higher than the maximum value

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter, bank 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor ahead of catalytic converter, bank 2 sensor 1 faulty

P224300

Diagnosis information DME control module

P224300 Bank 1 oxygen sensor 1 - reference voltage open circuit

Diagnostic conditions

- Heater control active
- Dew point end reached
- 3-kHz measuring frequency of the internal resistance not active for 2 sec
- Diagnostics runs continuously

Fault setting condition(s)

- The sensor voltage is either greater than the maximum voltage or less than the minimum voltage, and the internal resistance is implausibly high

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor ahead of catalytic converter, bank 1 sensor 1 faulty

Diagnosis information DME control module

P224700 Bank 2 oxygen sensor 1 - reference voltage open circuit

Diagnostic conditions

- Heater control active
- Dew point end reached
- 3-kHz measuring frequency of the internal resistance not active for 2 sec
- Diagnostics runs continuously

Fault setting condition(s)

- The sensor voltage is either greater than the maximum voltage or less than the minimum voltage, and the internal resistance is implausibly high

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter, bank 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor ahead of catalytic converter, bank 2 sensor 1 faulty

P225100

Diagnosis information DME control module

P225100 Bank 1 oxygen sensor 1 - ground line open circuit

Diagnostic conditions

- Dew point end reached
- With oxygen sensor 4.9 heater control active for > 5 sec
- Overrun mode not active for > 35 sec
- Diagnostics runs continuously

Fault setting condition(s)

- The sensor voltage is in the voltage band, and the internal resistance is higher than the maximum resistance

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor ahead of catalytic converter, bank 1 sensor 1 faulty

P225400

Diagnosis information DME control module

P225400 Bank 2 oxygen sensor 1 - ground line open circuit

Diagnostic conditions

- Dew point end reached
- With oxygen sensor 4.9 heater control active for > 5 sec
- Overrun mode not active for > 35 sec
- Diagnostics runs continuously

Fault setting condition(s)

- The sensor voltage is in the voltage band, and the internal resistance is higher than the maximum resistance

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter, bank 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor ahead of catalytic converter, bank 2 sensor 1 faulty

P226200

Diagnosis information DME control module

P226200 Turbocharger/compressor - no pressure - mechanical

Diagnostic conditions

- Boost pressure control active
- Compressor control flap closed
- Diagnostics runs several times

Fault setting condition(s)

- If the compressor pressure ratio falls below a minimum threshold at full load, it is assumed that one of the components is faulty.

Monitored component or system

♦ Boost pressure control

Fault finding notes

♦ Check sensor wiring
♦ Check charge air cooler for blockage/leakage
♦ Sensor faulty

Function restrictions

♦ Loss of power
♦ MIL on

P226300

Diagnosis information DME control module

P226300 Turbocharger/compressor system - no power/malfunction

Diagnostic conditions

- Full load plus in a defined rpm and elevation range
- Diagnostics runs several times

Fault setting condition(s)

- If the actual pressure does not reach the setpoint pressure despite full deflection of the I share of the boost pressure controller, it is assumed that one of the components is faulty.

Monitored component or system

♦ Boost pressure control

Fault finding notes

♦ Check sensor wiring
♦ Check charge air cooler for blockage/leakage
♦ Sensor faulty

Function restrictions

♦ Loss of power
♦ MIL on

P226B00

Diagnosis information DME control module

P226B00 Turbocharger/compressor - boost pressure too high - mechanical

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- A maximum intake-pipe pressure is specified to protect the component
- The maximum value depends on the engine speed

Monitored component or system

♦ Boost pressure sensor

Fault finding notes

♦ Check sensor wiring
♦ Check measured values: bank 1/2 boost pressure sensor
♦ Mechanically check compressor module

Function restrictions

♦ Loss of power
♦ MIL on

P227000

Diagnosis information DME control module

P227000 Bank 1 oxygen sensor 2 - signal too lean

Diagnostic conditions

- Engine speed > 25 rpm
- Lambda adjustment for diagnostics ended
- P-share of control behind catalytic converter active
- All fuel injectors active
- Diagnostics runs several times in the driving cycle

Fault setting condition(s)

- Oxygen sensor voltage behind catalytic converter < 0.659 V
- Vibration test

Monitored component or system

♦ Bank 1 oxygen sensor 2

Possible fault causes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor behind cat. conv., bank 1 sensor 2 faulty

P227100

Diagnosis information DME control module

P227100 Bank 1 oxygen sensor 2 - signal too rich

Diagnostic conditions

- Sensor ready for operation
- Engine speed > 25 rpm
- Lambda adjustment for diagnostics ended
- P-share of control behind catalytic converter active
- All fuel injectors active
- Diagnostics runs several times in the driving cycle

Fault setting condition(s)

- Oxygen sensor voltage behind catalytic converter > 0.659 V
- Vibration test

Monitored component or system

♦ Bank 1 oxygen sensor 2

Possible fault causes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor behind cat. conv., bank 1 sensor 2 faulty

P227200

Diagnosis information DME control module

P227200 Bank 2 oxygen sensor 2 - signal too lean

Diagnostic conditions

- Engine speed > 25 rpm
- Lambda adjustment for diagnostics ended
- P-share of control behind catalytic converter active
- All fuel injectors active
- Diagnostics runs several times in the driving cycle

Fault setting condition(s)

- Oxygen sensor voltage behind catalytic converter < 0.659 V
- Vibration test

Monitored component or system

♦ Bank 2 oxygen sensor 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor behind cat. conv., bank 2 sensor 2 faulty

P227300

Diagnosis information DME control module

P227300 Bank 2 oxygen sensor 2 - signal too rich

Diagnostic conditions

- Engine speed > 25 rpm
- Lambda adjustment for diagnostics ended
- P-share of control behind catalytic converter active
- All fuel injectors active
- Diagnostics runs several times in the driving cycle

Fault setting condition(s)

- Oxygen sensor voltage behind catalytic converter > 0.659 V
- Vibration test

Monitored component or system

♦ Bank 2 oxygen sensor 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor behind cat. conv., bank 2 sensor 2 faulty

P227900

Diagnosis information DME control module

P227900 Leakage air in intake system

Diagnostic conditions

- Setpoint air mass in the range 0.0 kg/h ... 37.5 kg/h
- Exhaust gas recirculation not active
- Engine at operating temperature
- Tank vent closed
- Fuel shutoff not active
- Diagnostics runs continuously

Fault setting condition(s)

- Offset value > 15 kg/h

Monitored component or system

♦ Intake pipe leakage

P229400

Diagnosis information DME control module

P229400 Fuel pressure control valve - open circuit

Diagnostic conditions

- Ignition on
- Valve not activated
- Diagnostics runs continuously

Fault setting condition(s)

- Quantity control valve output stage load reduction

Monitored component or system

♦ High pressure quantity control valve

Fault finding notes

♦ Check line connection
♦ Cable break or output stage faulty

P229500

Diagnosis information DME control module

P229500 Fuel pressure control valve - short circuit to ground

Diagnostic conditions

- Valve not activated
- Diagnostics runs continuously

Fault setting condition(s)

- Quantity control valve short circuit to ground, low side

Monitored component or system

♦ High pressure quantity control valve

Fault finding notes

♦ Pull plug off quantity control valve and read out the fault memory again. If there is an additional fault, replace the quantity control valve
♦ Check the line connection between the quantity control valve and DME control unit. If it is OK, then replace the DME control unit

P229600

Diagnosis information DME control module

P229600 Fuel pressure control valve - short circuit to B+

Diagnostic conditions

- Valve activated
- Diagnostics runs continuously

Fault setting condition(s)

- Quantity control valve short circuit to battery positive voltage, low side

Monitored component or system

♦ High pressure quantity control valve

Fault finding notes

♦ Pull plug off quantity control valve and read out the fault memory again. If there is an additional fault, replace the quantity control valve
♦ Check the line connection between the quantity control valve and DME control unit. If it is OK, then replace the DME control unit

Diagnosis information DME control module

P230000 Ignition coil 1 activation - short circuit to ground

Diagnostic conditions

- Engine speed > 1,400 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage < 0.5 V...1.0 V
- In case of short circuit to ground, an internal register is set after a filtering time. A monitoring function for the lines to the output stage is integrated. A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

Fault finding notes

♦ Perform line check
♦ Check resistance of the ignition coil

Function restrictions

♦ Breakdown possible

Diagnosis information DME control module

P230100 Ignition coil 1 activation - short circuit to B+

Diagnostic conditions

- Engine speed > 1,400 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal current < 5.0 mA...8.8 mA
- In case of short circuit to battery positive voltage, an internal register is set after a filtering time. A monitoring function for the lines to the output stage is integrated. A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

Fault finding notes

♦ Perform line check
♦ Check resistance of the ignition coil

Function restrictions

♦ Breakdown possible

Diagnosis information DME control module

P230300 Ignition coil 2 activation - short circuit to ground

Diagnostic conditions

- Engine speed > 1,400 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage < 0.5 V...1.0 V
- In case of short circuit to ground, an internal register is set after a filtering time. A monitoring function for the lines to the output stage is integrated. A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

Fault finding notes

♦ Perform line check
♦ Check resistance of the ignition coil

Function restrictions

♦ Breakdown possible

Diagnosis information DME control module

P230400 Ignition coil 2 activation - short circuit to B+

Diagnostic conditions

- Engine speed > 1,400 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal current < 5.0 mA...8.8 mA
- In case of short circuit to battery positive voltage, an internal register is set after a filtering time. A monitoring function for the lines to the output stage is integrated. A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

Fault finding notes

♦ Perform line check
♦ Check resistance of the ignition coil

Function restrictions

♦ Breakdown possible

Diagnosis information DME control module

P230600 Ignition coil 3 activation - short circuit to ground

Diagnostic conditions

- Engine speed > 1,400 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage < 0.5 V...1.0 V
- In case of short circuit to ground, an internal register is set after a filtering time. A monitoring function for the lines to the output stage is integrated. A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

P233600

Diagnosis information DME control module

P233600 Cylinder 1 knock control - control limit reached

Fault setting condition(s)

- Knock control runs against limit for > 100 ignitions

Monitored component or system

♦ Cylinder-specific knock control intervention monitoring (cylinder 1)

Diagnosis information DME control module

P233700 Cylinder 2 knock control - control limit reached

Fault setting condition(s)

- Knock control runs against limit for > 100 ignitions

Monitored component or system

♦ Cylinder-specific knock control intervention monitoring (cylinder 2)

P233800

Diagnosis information DME control module

P233800 Cylinder 3 knock control - control limit reached

Fault setting condition(s)

- Knock control runs against limit for > 100 ignitions

Monitored component or system

♦ Cylinder-specific knock control intervention monitoring (cylinder 3)

P233900

Diagnosis information DME control module

P233900 Cylinder 4 knock control - control limit reached

Fault setting condition(s)

- Knock control runs against limit for > 100 ignitions

Monitored component or system

♦ Cylinder-specific knock control intervention monitoring (cylinder 4)

Diagnosis information DME control module

P234000 Cylinder 5 knock control - control limit reached

Fault setting condition(s)

- Knock control runs against limit for > 100 ignitions

Monitored component or system

♦ Cylinder-specific knock control intervention monitoring (cylinder 5)

P234100

Diagnosis information DME control module

P234100 Cylinder 6 knock control - control limit reached

Fault setting condition(s)

- Knock control runs against limit for > 100 ignitions

Monitored component or system

♦ Cylinder-specific knock control intervention monitoring (cylinder 6)

Diagnosis information DME control module

P240000 Tank vent system, tank leak diagnostic pump activation - electrical fault/open circuit

Diagnostic conditions

- Tank leakage short test

or

- **Power supply voltage** 9 V ... 16 V
- For detection of open circuit or short circuit to ground:
  - Ignition on
- For detection of short circuit to B+:
  - Tank leak test

Fault setting condition(s)

- The output stage of the leakage diagnostic pump detects a load decrease

Monitored component or system

♦ Tank leakage diagnostic module pump motor

Fault finding notes

♦ Short circuit to B+/ground or open circuit in the line ▶ Activation line to DMTL pump
♦ DMTL power supply faulty
♦ **Tank leakage diagnostic module** - DMTL faulty

Function restrictions

♦ MIL lights up

Diagnosis information DME control module

P240100 Tank vent system, tank leak diagnostic pump activation - short circuit to ground

Diagnostic conditions

- Tank leakage short test

or

- **Power supply voltage** 9 V ... 16 V
- For detection of open circuit or short circuit to ground:
  - Ignition on
- For detection of short circuit to B+:
  - Tank leak test

Fault setting condition(s)

- The output stage of the leakage diagnostic pump detects a short circuit to ground

Monitored component or system

♦ Tank leakage diagnostic module pump motor

Fault finding notes

♦ Short circuit to B+/ground or open circuit in the line ▶ Activation line to DMTL pump
♦ DMTL power supply faulty
♦ **Tank leakage diagnostic module** - DMTL faulty

Function restrictions

♦ MIL lights up

Diagnosis information DME control module

P240200 Tank vent system, tank leak diagnostic pump activation - short circuit to B+

Diagnostic conditions

- Tank leakage short test

or

- **Power supply voltage** 9 V ... 16 V
- For detection of open circuit or short circuit to ground:
  - Ignition on
- For detection of short circuit to B+:
  - Tank leak test

Fault setting condition(s)

- The output stage of the leakage diagnostic pump detects a short circuit to B+

Monitored component or system

♦ Tank leakage diagnostic module pump motor

Fault finding notes

♦ Short circuit to B+/ground or open circuit in the line ▶ Activation line to DMTL pump
♦ DMTL power supply faulty
♦ **Tank leakage diagnostic module** - DMTL faulty

Function restrictions

♦ MIL lights up

P240700

Diagnosis information DME control module

P240700 Tank vent system leakage diagnostics - pump current fluctuating

Diagnostic conditions

● Tank leakage short test
then:
● Tank vent valve short test

or

● Drive for longer than 10 minutes
● Tank vent adaptation value < 5.00
then:
● Engine and ignition off for longer than 15 minutes
at:
● Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
● **Ambient temperature** 4 ... 35 °C (39 ... 95 °F)
● Vehicle standstill
● Constant supply voltage (change < 1 V)
● Constant current draw of the tank leak diagnostic module - DMTL (fluctuation < 1 mA)
then:
● Engine start with the following conditions:
● **Engine temperature** > 4 °C (39 °F)
● Difference between engine compartment temperature and intake-air temperature < 15 °C (27 °F)

Fault setting condition(s)

● Difference between the maximum and the minimum current during the reference measurement in the run-on phase with engine running < 1.001 mA

Monitored component or system

♦ Tank leakage diagnostic module

Fault finding notes

♦ Vent line from DMTL clogged
♦ Vent line to DMTL clogged
♦ Short circuit to B+/ground or open circuit in the line ▶ Activation line to DMTL
♦ DMTL power supply faulty

♦ **Tank leakage diagnostic module** - DMTL faulty

Function restrictions

♦ MIL lights up

Diagnosis information DME control module

P240A00 Tank vent system leakage diagnostics pump heater activation - open circuit

Diagnostic conditions

- Tank leakage short test

or

- **Power supply voltage** 9 V ... 16 V
- For detection of open circuit or short circuit to ground:
  - Ignition on
- For detection of short circuit to B+:
  - Tank leak test

Fault setting condition(s)

- The output stage of the leakage diagnostic pump detects a line open circuit

Monitored component or system

♦ Tank leakage diagnostic module heater output stage

Fault finding notes

♦ Short circuit to B+/ground or open circuit in the line ▶ Activation line to DMTL heater
♦ DMTL power supply faulty
♦ **Tank leakage diagnostic module** - DMTL faulty

Function restrictions

♦ MIL lights up

Diagnosis information DME control module

P240B00 Tank vent system leakage diagnostics pump heater activation - short circuit to ground

Diagnostic conditions

- Tank leakage short test

or

- **Power supply voltage** 9 V ... 16 V
- For detection of open circuit or short circuit to ground:
  - Ignition on
- For detection of short circuit to B+:
  - Tank leakage test

Fault setting condition(s)

- The output stage of the leakage diagnostic pump detects a short circuit to ground

Monitored component or system

♦ Tank leakage diagnostic module heater output stage

Fault finding notes

♦ Short circuit to B+/ground or open circuit in the line ▶ Activation line to DMTL heater
♦ DMTL power supply faulty
♦ **Tank leakage diagnostic module** - DMTL faulty

Function restrictions

♦ MIL lights up

Diagnosis information DME control module

P240C00 Tank vent system leakage diagnostics pump heater activation - short circuit to B+

Diagnostic conditions

- Tank leakage short test

or

- **Power supply voltage** 9 V ... 16 V
- For detection of open circuit or short circuit to ground:
  - Ignition on
- For detection of short circuit to B+:
  - Tank leak test

Fault setting condition(s)

- The output stage of the leakage diagnostic pump detects a short circuit to B+

Monitored component or system

♦ Tank leakage diagnostic module heater output stage

Fault finding notes

♦ Short circuit to B+/ground or open circuit in the line ▶ Activation line to DMTL heater
♦ DMTL power supply faulty
♦ **Tank leakage diagnostic module** - DMTL faulty

Function restrictions

♦ MIL lights up

P241400

Diagnosis information DME control module

P241400 Bank 1 sensor 1 - voltage too low/leakage air

Fault setting condition(s)

- Signal voltage > 2.5 V...3.2 V

Monitored component or system

♦ Oxygen sensor in air

Possible fault causes

♦ **Injection valve** Mechanical fault / blocked
(e.g. due to chip in the fuel rail)
♦ **Oxygen sensor in front of catalytic converter** Bank 1 not installed (only electrically connected)
♦ **Oxygen sensor in front of catalytic converter** Bank 1 Sensor 1 Faulty

P241500

Diagnosis information DME control module

P241500 Bank 2 sensor 1 - voltage too low/leakage air

Fault setting condition(s)

- Signal voltage > 2.5 V...3.2 V

Monitored component or system

♦ Oxygen sensor in air

Possible fault causes

♦ **Injection valve** Mechanical fault / blocked
(e.g. due to chip in the fuel rail)
♦ **Oxygen sensor in front of catalytic converter** Bank 1 not installed (only electrically connected)
♦ **Oxygen sensor in front of catalytic converter** Bank 2 Sensor 1 Faulty

Diagnostic information - DME control unit

P242100 Pressure tank, fuel tank isolation valve, permanently open

Diagnostic conditions

- Once per driving cycle after cold start, max. 10 attempts for a successful test.
- Change in ambient pressure < 3 hPa
- Ambient pressure > 680 hPa
- Ambient temperature 3.75...35.25 °C (38.75...95.45 °F)
- No refueling requested
- Fuel level < 80 l (21.1 gallons)

Fault setting condition(s)

- Diagnostic time >= 5 s
- Current gradient of DMTL test < 2 mA

Monitored component or system

♦ Tank vent system

Fault finding notes

♦ Check function of fuel tank isolation valve (FTIV) ⇒ Tank leak test: the FTIV is activated here.
♦ Check line from pressure tank to fuel tank isolation valve (FTIV)
♦ Remove fuel tank isolation valve (FTIV) connector, plug it onto dummy valve and check for function

Functional restrictions

♦ MIL on
♦ Extended waiting time before opening of filler flap
♦ Fuel odor from carbon canister

Diagnostic information - DME control unit

P242200 Pressure tank, fuel tank isolation valve, permanently closed

Diagnostic conditions

- Once per driving cycle after cold start, max. 10 attempts for a successful test.
- Change in ambient pressure < 3 hPa
- Ambient pressure > 680 hPa
- Ambient temperature 3.75...35.25 °C (38.75...95.45 °F)
- No refueling requested
- Fuel level < 80 l (21.1 gallons)

Fault setting condition(s)

- Diagnostic time >= 5 s
- Current gradient of DMTL test > 1 mA

Monitored component or system

♦ Tank vent system

Fault finding notes

♦ Check function of fuel tank isolation valve (FTIV) ⇒ Tank leak test: the FTIV is activated here.
♦ Check line from pressure tank to fuel tank isolation valve (FTIV)
♦ Remove fuel tank isolation valve (FTIV) connector, plug it onto dummy valve and check for function

Functional restrictions

♦ MIL on
♦ Extended waiting time before opening of filler flap
♦ Fuel odor from carbon canister

Diagnostic information - DME control unit

P243100 Bank 1 secondary-air injection system flow/pressure sensor - implausible signal

Diagnostic conditions

- Ambient-pressure signal valid
- No repeat start
- Secondary-air injection ended
- Diagnostics runs once per driving cycle after active secondary air

Fault setting condition(s)

- The plausibility of the secondary-air pressure sensor is checked by comparing it with the ambient pressure sensor
- The deviation from the ambient pressure signal is too high in the initialization phase of the DME control unit

Monitored component or system

♦ Pressure sensor in the secondary-air supply line

Fault finding notes

♦ Compare secondary-air pressure sensor against ambient pressure sensor and tester with >> engine off, ignition on<<
♦ Check power supply for pressure sensor
♦ Secondary-air pressure sensor faulty

Valid for **Panamera/Cayenne S e-Hybrid**:
♦ Compare S040 (pressure sensor) with A340, A360 (ambient pressure)

P243200

Diagnosis information DME control module

P243200 Bank 1 secondary-air injection system - short circuit to ground

Diagnostic conditions

- Ambient-pressure signal valid
- No repeat start
- Secondary-air injection ended
- Diagnostics runs continuously after active secondary air

Fault setting condition(s)

- Voltage at the secondary-air pressure sensor < 0.498 V

Monitored component or system

♦ Secondary-air system, pressure sensor

Fault finding notes

♦ Check plug on pressure sensor
♦ Check pressure-sensor wiring for short circuits
♦ Remove plug from sensor. Delete fault memory entry. If a short circuit to B+ is detected, the component power supply is not OK or the component is faulty
♦ If a short circuit to ground is detected again, check the wiring to the DME control unit

Diagnosis information DME control module

P243300 Bank 1 secondary-air injection system - short circuit to B+

Diagnostic conditions

- Ambient-pressure signal valid
- No repeat start
- Secondary-air injection ended
- Diagnostics runs continuously after active secondary air

Fault setting condition(s)

- Voltage at the secondary-air pressure sensor > 4.502 V

Monitored component or system

♦ Secondary-air system, pressure sensor

Fault finding notes

♦ Check plug on pressure sensor
♦ Check pressure-sensor wiring for short circuits
♦ Remove plug from sensor and measure reference voltage (5 V) at the signal line
♦ If 12 V is present: short circuit to B+
♦ If 0 V is present: open circuit
♦ If 5 V is present, then check for short circuit of the 5 V supply line
♦ If OK, the component is faulty

P244000

Diagnosis information DME control module

P244000 Bank 1 secondary-air injection system - switching valve stuck open

Diagnostic conditions

- Diagnostics runs once per driving cycle

Fault setting condition(s)

- Excessive pressure fluctuations in the offset phase with the valve closed

Monitored component or system

♦ Secondary-air system

Fault finding notes

♦ Bank 1 secondary valve stuck open
♦ If the fault occurs in combination with fault system (fault code P2442), it is leakage from the secondary-air valves
♦ Perform bank 1 and bank 2 short trip

Function restrictions

♦ Untreated exhaust gas can escape into the environment from the open secondary-air valve. The car smells like exhaust gas; the secondary-air pressure sensor and the air supply can be thermally affected by the hot exhaust gas
♦ MIL lights up

P244200

Diagnosis information DME control module

P244200 Bank 2 secondary-air injection system - switching valve stuck open

Diagnostic conditions

- Diagnostics runs once per driving cycle

Fault setting condition(s)

- Excessive pressure fluctuations in the offset phase with the valve closed

Monitored component or system

♦ Secondary-air system

Fault finding notes

♦ Bank 1 secondary valve stuck open
♦ If the fault occurs in combination with fault system (fault code P2440), it is leakage from the secondary-air valves
♦ Perform bank 1 and bank 2 short trip

Function restrictions

♦ Untreated exhaust gas can escape into the environment from the open secondary-air valve. The car smells like exhaust gas; the secondary-air pressure sensor and the air supply can be thermally affected by the hot exhaust gas
♦ MIL lights up

P245000

Diagnosis information DME control module

P245000 Tank vent system switchover valve stuck open

Diagnostic conditions

● Tank leakage short test
then:
● Tank vent valve short test

or

● Drive for longer than 10 minutes
● Tank vent adaptation value < 5.00
then:
● Engine and ignition off for longer than 15 minutes
at:
● Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
● **Ambient temperature** 4 ... 35 °C (39 ... 95 °F)
● Vehicle standstill
● Constant supply voltage (change < 1 V)
● Constant current draw of the tank leak diagnostic module - DMTL (fluctuation < 1 mA)
then:
● Engine start with the following conditions:
● **Engine temperature** > 4 °C (39 °F)
● Difference between engine compartment temperature and intake-air temperature < 15 °C (27 °F)

Fault setting condition(s)

● Difference between reference current and idle current < 3.9001 mA

Monitored component or system

♦ Tank leakage diagnostic module

Fault finding notes

♦ Vent line from DMTL clogged
♦ Vent line to DMTL clogged
♦ Short circuit to B+/ground or open circuit in the line ▶ Activation line to DMTL
♦ DMTL power supply faulty

♦ **Tank leakage diagnostic module** - DMTL faulty

Function restrictions

♦ MIL lights up

Diagnosis information DME control module

P253300 Ignition starter switch circuit - short circuit to ground/open circuit
P253500 Ignition starter switch circuit - short circuit to B+

Diagnostic conditions

● During starting process

Fault setting condition(s)

● Comparison of terminal 50 component signal with terminal 50 CAN signal from the front-end electronics control unit
● If valid terminal 50 CAN information is available, it is used to check the cable information

Monitored component or system

♦ Terminal 50 component signal

Fault finding notes

♦ Check the electric line to the front-end electronics control unit
♦ Check front-end electronics control unit fault memory

Function restrictions

♦ Manual start with delay (delay due to CAN delay)

Diagnosis information DME control module

P253300 Ignition starter switch circuit - short circuit to ground/open circuit
P253500 Ignition starter switch circuit - short circuit to B+

Diagnostic conditions

● During starting process

Fault setting condition(s)

● Comparison of terminal 50 component signal with terminal 50 CAN signal from the front-end electronics control unit
● If valid terminal 50 CAN information is available, it is used to check the cable information

Monitored component or system

♦ Terminal 50 component signal

Fault finding notes

♦ Check the electric line to the front-end electronics control unit
♦ Check front-end electronics control unit fault memory

Function restrictions

♦ Manual start with delay (delay due to CAN delay)

Diagnosis information DME control module

P253900 Fuel low pressure sensor - open circuit

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Analogue value measurement detects that a maximum value was exceeded (4.8047 V)
- Monitoring of the electrical signal of the pressure sensor for the demand-controlled fuel system (low pressure) for minimum and maximum limits
- The sensor voltage is read into the DME control unit via an analogue/digital channel

Monitored component or system

♦ Fuel low-pressure sensor

Fault finding notes

♦ Check wiring, sensor and the engine control unit

Diagnosis information DME control module

P254100 Fuel low pressure sensor - short circuit to ground

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Analogue value measurement detects that a value fell below the minimum value (0.2002 V)
- Monitoring of the electrical signal of the pressure sensor for the demand-controlled fuel system (low pressure) for minimum and maximum limits
- The sensor voltage is read into the DME control unit via an analogue/digital channel

Monitored component or system

♦ Fuel low-pressure sensor

Fault finding notes

♦ Check wiring, sensor and the engine control unit

Diagnosis information DME control module

P254F00 Contact switch for hood - electrical fault

Fault setting condition(s)

- The fault is reported as soon as an open hood is detected above an applicable vehicle speed

Monitored component or system

♦ Debounced hood switch signal

Fault finding notes

♦ Check hood and hood switch

Function restrictions

♦ Prevention of electric driving operation and stop mode

Diagnosis information - DME control module

P25C500 Temperature sensor Vacuum pump, signal implausible/stuck
P25C600 Temperature sensor Vacuum pump Short circuit to ground
P25C700 Temperature sensor Vacuum pump Short circuit to B+

Diagnostic conditions

● Diagnostics runs continuously

P25C500
● Cold start: Switch-off time > 28,000 s (7h 47min)
● No electrical fault present
● Vehicle speed > 25 km/h (16 mph) for 30 seconds
or
● electric vacuum pump in current driving cycle active for more than 300 seconds or change in temperature at the radiator outlet

Fault setting condition(s)

● Short circuit to ground :
Sensor voltage < 0.20 V
● Short circuit to B+ :
Sensor voltage > 3.99 V

P25C500
● Cold-start temperature of vacuum pump: Difference compared with the other temperature sensors > 25 Kelvin
or
● Difference between min and max value of the sensor raw signal since beginning of the driving cycle < 0.46 °C (0.83 °F)

Monitored component or system

♦ **Temperature sensor Vacuum pump**

Fault effects

♦ The combustion engine is started more frequently during hard braking, because the electric vacuum pump is no longer activated.

Line test

Short circuit to B+:

♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:

♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:

♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:

♦ Setpoint resistance **> 0.9 MOhm**

Diagnosis information - DME control module

● electric vacuum pump in current driving cycle active for more than 300 seconds or change in temperature at the radiator outlet

Fault setting condition(s)

● Short circuit to ground :
Sensor voltage < 0.20 V
● Short circuit to B+ :
Sensor voltage > 3.99 V

P25C500
● Cold-start temperature of vacuum pump: Difference compared with the other temperature sensors > 25 Kelvin
or
● Difference between min and max value of the sensor raw signal since beginning of the driving cycle < 0.46 °C (0.83 °F)

Monitored component or system

♦ **Temperature sensor Vacuum pump**

Fault effects

♦ The combustion engine is started more frequently during hard braking, because the electric vacuum pump is no longer activated.

Line test

Short circuit to B+:

♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:

♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:

♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:

♦ Setpoint resistance **> 0.9 MOhm**

P25D800

Diagnosis information DME control module

P046100 Fuel level sender - signal implausible
P206600 Fuel level sender 2 - physical value range exceeded
P25D800 Fuel level sender 3 - physical value range exceeded

Diagnostic conditions

- Ignition on
- Continuously

Fault setting condition(s)

P046100
- Fuel level sender, signal > 110 l (liters)
- Resistance of sensor 1 > 1,100 Ohm

P206600
- Resistance of sensor 2 > 1,100 Ohm

P25D800
- Resistance of sensor 3 > 550 Ohm

Monitored component or system

♦ Fuel level sender

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Fuel level sender stuck
♦ Fault finding via instrument cluster

P25D900

Diagnosis information DME control module

P25D900 Fuel level sender 3 - short circuit to ground
P25DA00 Fuel level sender 3 - short circuit to B+/open circuit

Diagnostic conditions

- Ignition on
- Continuously

Fault setting condition(s)

- The fault is detected by the instrument cluster and transferred to the DME control unit, where it is entered in the fault memory.

Monitored component or system

♦ Fuel level sender

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Fuel level sender 3 faulty
♦ see Guided fault finding for instrument cluster control unit

P25DA00

Diagnosis information DME control module

P25D900 Fuel level sender 3 - short circuit to ground
P25DA00 Fuel level sender 3 - short circuit to B+/open circuit

Diagnostic conditions

- Ignition on
- Continuously

Fault setting condition(s)

- The fault is detected by the instrument cluster and transferred to the DME control unit, where it is entered in the fault memory.

Monitored component or system

♦ Fuel level sender

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Fuel level sender 3 faulty
♦ see Guided fault finding for instrument cluster control unit

Diagnosis information DME control module

P260000 Coolant pump - open circuit

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- The output stage reports the load decrease fault
- Monitoring of the electrical components for line open circuit

Monitored component or system

♦ Main water pump valve

Fault finding notes

♦ Check component
♦ Line test

Diagnosis information DME control module

P260200 Coolant pump - short circuit to ground

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- The output stage reports the short circuit to ground fault
- Monitoring of the electrical components for short circuit to ground

Monitored component or system

♦ Main water pump valve

Fault finding notes

♦ Check valve internal resistance
♦ Line test

Function restrictions

♦ Restrictions in this sequence: no interior heating and no boost possible, lower recuperation, start/stop ban, no electric driving possible, disabling of accessories, breakdown possible.
♦ The driver is informed via the instrument cluster

P260300

Diagnosis information DME control module

P260300 Coolant pump - short circuit to B+

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- The output stage reports the short circuit to battery positive voltage fault
- Monitoring of the electrical components for short circuit to B+

Monitored component or system

♦ Main water pump valve

Fault finding notes

♦ Check valve internal resistance
♦ Line test

P261A00

Diagnosis information DME control module

P261A00 Coolant pump 2 - open circuit

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- The output stage reports the load decrease fault
- Monitoring of the electrical components for line open circuit

Monitored component or system

♦ Auxiliary water pump

Fault finding notes

♦ Line test

Diagnosis information DME control module

P261B00 Auxiliary coolant pump HT circuit diagnostic keying

Diagnostic conditions

- Diagnostics takes place only when the component is activated.

Fault setting condition(s)

- **DME control module** did not receive any valid information from the auxiliary coolant pump

ⓘ Information
The auxiliary coolant pump cyclically sends status information to the engine control unit by connecting the line to the engine control unit to ground for a defined duration.

Monitored component or system

♦ Auxiliary coolant pump

Fault finding notes

♦ **Supply voltage** Check
♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ **Coolant pump** Faulty

Function restrictions

♦ The power of the electric machine can be restricted.

P261C00

Diagnosis information DME control module

P261C00 Coolant pump 2 - short circuit to ground

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- The output stage reports the short circuit to ground fault
- Monitoring of the electrical components for short circuit to ground

Monitored component or system

♦ Auxiliary water pump

Fault finding notes

♦ Line test

Function restrictions

♦ Restrictions in this sequence: no interior heating, power restriction of the combustion engine, no boost possible, lower recuperation, start/stop ban, no electric driving possible, disabling of accessories, breakdown possible.

♦ Breakdown possible

P261D00

Diagnosis information DME control module

P261D00 Coolant pump 2 - short circuit to B+

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- The output stage reports the short circuit to battery positive voltage fault
- Monitoring of the electrical components for short circuit to B+

Monitored component or system

♦ Auxiliary water pump

Fault finding notes

♦ Line test

Diagnosis information DME control module

P262600 Bank 1 linear oxygen sensor/comparison line pump current - open circuit

Diagnostic conditions

- Dew point end reached
- Heater control active
- Overrun mode active
- Exhaust temperature from model < 800.006 °C (1,472.011 °F)
- Diagnostics runs continuously

Fault setting condition(s)

- Offset-corrected sensor voltage > 4.81006 V
- In overrun mode, the sensor voltage is higher than the maximum voltage

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor ahead of catalytic converter, bank 1 sensor 1 faulty

Diagnosis information DME control module

P262900 Bank 2 linear oxygen sensor/comparison line pump current - open circuit

Diagnostic conditions

- Dew point end reached
- Heater control active
- Overrun mode active
- Exhaust temperature from model < 800.006 °C (1,472.011 °F)
- Diagnostics runs continuously

Fault setting condition(s)

- Offset-corrected sensor voltage > 4.81006 V
- In overrun mode, the sensor voltage is higher than the maximum voltage

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter, bank 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor ahead of catalytic converter, bank 2 sensor 1 faulty

Diagnosis information DME control module

P268100 Bypass valve activation for coolant - open circuit

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Monitoring of the electrical components for line open circuit
- The output stage hardware reports the load decrease fault

Monitored component or system

♦ Coolant bypass valve output stage for electric machine

Fault finding notes

♦ Line test

Diagnosis information DME control module

P268200 Bypass valve activation for coolant - short circuit to ground

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Monitoring of the electrical components for short circuit to ground
- The output stage hardware reports the short circuit to ground fault

Monitored component or system

♦ Coolant bypass valve output stage for electric machine

Function restrictions

♦ Restrictions in this sequence: no boost possible, lower recuperation, start/stop ban, no electric driving possible, disabling of accessories, breakdown possible.

Fault finding notes

♦ Line test

Diagnosis information DME control module

P268300 Bypass valve activation for coolant - short circuit to B+

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Monitoring of the electrical components for short circuit to B+
- The output stage hardware reports the short circuit to B+ fault

Monitored component or system

♦ Coolant bypass valve output stage for electric machine

Fault finding notes

♦ Line test

P304000

Diagnosis information DME control module

Uxxxx00 Check XY control unit fault memory content

Diagnostic conditions

● Ignition on

Fault setting condition(s)

● Monitoring for stopped message counter: The same message count is received several times in sequence, the message counter received in the XY message always includes the same value for an applicable number of messages.
● Monitoring of the data length code: An incorrect message length was detected several times; the received XY message is shorter than the applied length
● Monitoring of the checksum: Incorrect checksum received several times in sequence; the checksum received in the XY message does not agree with the checksum calculated by the DME control unit for an applicable number of messages.
● Timeout monitoring: No message receipt. The identifier applied for the XY message is not received

Monitored component or system

♦ CAN communication with control unit message of the specified XY control unit

Fault finding notes

♦ Check XY control unit fault memory content

Function restrictions

♦ Control unit XY message is no longer evaluated

Diagnosis information DME control module

P304300 Fuel pump - mechanical fault

Diagnostic conditions

- Ignition on
- Activation of fuel-pump control unit/electronic fuel pump
- Diagnostics runs continuously

Fault setting condition(s)

- If the fuel-pump control unit detects a fault, it reports this back to the DME control unit by connecting the signal line to ground at defined times corresponding to the fault. The length of ground clocking corresponds to the respective fault and is interpreted accordingly by the DME control unit. When a fault occurs, the fault is sent only once in the form of 5 equal ground clock pulses in series in case of the electronic fuel pump. This is repeated in the same driving cycle if the fault is no longer present in the meantime (no healing!)

Monitored component or system

♦ Control unit for fuel pump

Fault finding notes

♦ Check of the electric lines between fuel-pump control unit and fuel pump (visual inspection; if possible, continuity measurements and short circuit measurements between the supply lines with disconnected plugs)
♦ Check of the fuel system (fuel filter, pump, kinked fuel line)
♦ Replace fuel pump

Function restrictions

♦ Fuel pump stationary

Diagnosis information DME control module

P304400 Fuel pump - short circuit

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- if the fuel-pump control unit detects a fault, it reports this back to the DME control unit by connecting the signal line to ground at defined times corresponding to the fault. The length of ground clocking corresponds to the respective fault and is interpreted accordingly by the DME control unit. When a fault occurs, the fault is sent only once in the form of 5 equal ground clock pulses in series in case of the electronic fuel pump. This is repeated in the same driving cycle if the fault is no longer present in the meantime (no healing!)

Monitored component or system

♦ Control unit for fuel pump

Fault finding notes

♦ Check of the electrical lines between the fuel-pump control unit and fuel pump for damage (visual inspection)
♦ Remove plug on the fuel pump and erase the fault memory. If the fuel-pump control unit now detects an open line, the fuel pump is faulty. Otherwise, check the lines between the fuel-pump control unit and the fuel pump. If the lines are OK, then replace the fuel-pump control unit

Function restrictions

♦ Fuel pump can be stationary

P304500

Diagnosis information DME control module

P304500 Fuel-pump control unit faulty

Diagnostic conditions

- If the DME control unit is awake, e.g. due to door contact wake-up
- Diagnostics runs continuously

Fault setting condition(s)

- If the fuel-pump control unit detects a fault, it reports this back to the DME control unit by connecting the signal line to ground at defined times corresponding to the fault. The length of ground clocking corresponds to the respective fault and is interpreted accordingly by the DME control unit. When a fault occurs, the fault is sent only once in the form of 5 equal ground clock pulses in series in case of the electronic fuel pump. This is repeated in the same driving cycle if the fault is no longer present in the meantime (no healing!)

Monitored component or system

♦ Control unit for fuel pump

Fault finding notes

♦ Replace fuel-pump control unit

Function restrictions

♦ Speed limitation of the fuel pump
♦ Possibly torque restriction

P304C00

Diagnostic information - DME control unit

P304C00 Separating clutch adaptation above limit value

Diagnostic conditions

- Vehicle stationary in electric mode
- Restart (from electric driving)

Fault setting condition(s)

- Contact point is shifted too much toward >>clutch closed<<; separating clutch system malfunctioning.
- Clutch adaptation value is less than the lower limit during contact point adaptation.

Monitored component or system

♦ Hybrid clutch

Fault finding notes

♦ This fault memory entry is used for information purposes. If there are no other fault memory entries, the system is still OK.

If there are other faults in the separating clutch system:
♦ Air in system
♦ Loss of hydraulic fluid (leak)
♦ Visual inspection of reservoir fill level
♦ Select Maintenance/repairs ⇒ Clutch actuator and separating clutch ⇒ Perform **hydraulic air/leak test**

P304D00

Diagnostic information - DME control unit

P304D00 Separating clutch adaptation below limit value

Diagnostic conditions

- Vehicle stationary in electric mode
- Restart (from electric driving)

Fault setting condition(s)

- Contact point is shifted too much toward >>clutch open<<;
separating clutch system malfunctioning.
- Clutch adaptation value exceeds the upper limit during contact point adaptation.

Monitored component or system

♦ Hybrid clutch

Fault finding notes

♦ This fault memory entry is used for information purposes. If there are no other fault memory entries, the system is still OK.

If there are other faults in the separating clutch system:
♦ Hybrid clutch power input actual value (Y250) < 3 GJ = 3,000,000,000 J
► If this value is much lower, the separating clutch can be adapted using the Tester by selecting Maintenance/repairs ⇒ Clutch actuator and separating clutch ⇒ **Clutch adaptation**
► If this value was exceeded but no relevant fault memory entries exist, the clutch must not be replaced. This theoretical value is merely an indication of a worn-out separating clutch. If a new DME control unit was installed, this value no longer reflects the real power input of the clutch.
► After the separating clutch has been adapted, read out the measured values (Y110), (Y120) and see F1 Help.
⇒ If the actual values deviate significantly from the specified range, the clutch may be worn, otherwise the separating clutch has lost the values.

Functional restrictions

♦ It might no longer be possible to transmit the full torque.

Diagnosis information DME control module

P304F00 Switch for electric driving

Diagnostic conditions

- Ignition on
- Diagnostics runs several times

Fault setting condition(s)

- Monitoring of the electrical components for line open circuit and short circuit to B+/ground
- The fault setting condition is monitored by output stage diagnostics
- The E-drive switch info is routed from the A/C operator control unit via the gateway and is forwarded to the DME control unit in a gateway message.

Monitored component or system

♦ Switch for electric driving

Fault finding notes

♦ Line test; replace component
♦ Check infotainment CAN and A/C operator control unit

Function restrictions

♦ Driver can no longer select electric driving. The lamp does not light up despite being actuated
♦ "E-drive" switch information is described as a predefined fault value

P305C00

Diagnosis information DME control module

P305C00 Sensor for intake-air temperature behind throttle valve - short circuit to ground

Diagnostic conditions

- Ignition on
- Continuously

Fault setting condition(s)

- Monitoring of electrical components for short circuit to ground

Monitored component or system

♦ Intake-air temperature sensor

Fault finding notes

♦ Perform line test
♦ Spray sensor with cooling spray, observe measured value

P305D00

Diagnosis information DME control module

P305D00 Sensor for intake-air temperature behind throttle valve - short circuit to B+/open circuit

Diagnostic conditions

- Ignition on
- Continuously

Fault setting condition(s)

- Monitoring of electrical components for short circuit to B+

Monitored component or system

♦ Intake-air temperature sensor

Fault finding notes

♦ Perform line test
♦ Spray sensor with cooling spray, observe measured value

Diagnosis information DME control module

P305E00 Intake-air temperature sender 2 - implausible signal

Diagnostic conditions

- Engine temperature > 25 °C (77 °F)
- Enabling of "master cross-check"
- Once per driving cycle with conditioned vehicle

Fault setting condition(s)

- Temperature cross-check after engine start in the conditioned vehicle state.
- Comparison of intake-air temperature behind the throttle valve with engine temperature or intake-air temperature in the intake pipe

Monitored component or system

♦ Intake-air temperature sensor

Fault finding notes

♦ Check of the temperature sensor compared to the other temperature sensors, ideally after engine cooling phase
♦ If plug and wiring are OK, replace
sensor

P307300

Diagnosis information DME control module

P307300 Fuel pump - electrical fault in circuit

Diagnostic conditions

- Ignition on
- Activation of the fuel-pump control unit/fuel pump
- Diagnostics runs continuously

Fault setting condition(s)

- If the fuel-pump control unit detects a fault, it reports this back to the DME control unit by connecting the signal line to ground at defined times corresponding to the fault. The length of ground clocking corresponds to the respective fault and is interpreted accordingly by the DME control unit. This fault can also indicate a blocked pump or a short circuit (collective fault). When a fault occurs, the fault is sent only once in the form of 5 equal ground clock pulses in series in case of the fuel pump. This is repeated in the same driving cycle if the fault is no longer present in the meantime (no healing!)

Monitored component or system

♦ Control unit for fuel pump

Fault finding notes

♦ Check plug connections and lines between the fuel-pump control unit and fuel pump for continuity.
♦ The fuel pump can be measured (continuity between all phases on the pump). If OK, then replace the fuel-pump control unit

Function restrictions

♦ Fuel pump can be stationary

P307800

Diagnosis information DME control module

P307800 Throttle valve control unit - air throughput at idle too low

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Offset standardized mass air flow through throttle valve < -8.0 kg/h

Monitored component or system

♦ Throttle valve adjuster

Fault finding notes

♦ Electrical test of the sensor line, power supply, ground, plug
♦ A power supply of 5 V with respect to sensor ground (in the plug) must be measured on the wiring harness of the throttle valve plug when the ignition is on (throttle valve unplugged)

Diagnostic information - DME control unit

P308100 Engine temperature too low

Diagnostic conditions

- No electr. fault of the engine temperature sensor present
- Intake air temperature < 35 °C (95 °F)
- Currently no block heater detection
- Engine running
- Diagnostics runs once per driving cycle

Fault setting condition(s)

- Measured engine temperature is plausibility-tested compared to a modelled reference temperature

Monitored component or system

♦ Engine cooling system

Fault finding notes

♦ Affected by block heater
♦ Seal in thermostat housing faulty
♦ Thermostat housing faulty
♦ **Thermostat** faulty
♦ Engine temperature sensor faulty

- **ONLY Cayenne and Panamera hybrid:**
  ► Air in **cooling system** if P192A00 is also entered in the fault memory

- **ONLY Cayenne:**
  ► Check the Porsche part number in the DME control unit.
  (See **DME control unit** ⇒ Identification ⇒ Porsche part number)
  Are the last two digits of the Porsche part number higher than 05?
  - **NO** (e.g. 95860165**04**) ⇒ Program **DME control unit**.
  ► Then check whether the problem has been corrected.

Functional restrictions

♦ Engine temperature too low

♦ In combination with P017B00 ⇒ Activation of radiator fan

Diagnosis information DME control module

P308D00 Fuel pump - too slow

Diagnostic conditions

- Ignition on
- Activation of the fuel-pump control unit/fuel pump
- Diagnostics runs continuously

Fault setting condition(s)

- the fault is entered after identical sequential ground pulses

Monitored component or system

♦ Control unit for fuel pump

Fault finding notes

♦ Check of the fuel system, e.g. fuel filter, sluggish pump (flow measurement), kinked fuel line
♦ Check for line damage between the fuel-pump control unit and fuel pump or shunts in the plug contacts (visual inspection and, if possible, measurements between the supply lines of the pump with plugs disconnected; test for short circuits)
♦ Replace fuel pump

Function restrictions

♦ Speed limitation of the fuel pump
♦ Possibly torque restriction

Diagnosis information DME control module

P308E00 Fuel-pump control unit - overtemperature

Diagnostic conditions

- Ignition on
- Activation of the fuel-pump control unit/fuel pump
- Diagnostics runs continuously

Fault setting condition(s)

- Overtemperature in fuel-pump control unit output stage (load circuit); the temperature is measured by means of NTC thermistors on the PCB next to the output stage outputs
- If the fuel-pump control unit detects a fault, it reports this back to the DME control unit by connecting the signal line to ground at defined times corresponding to the fault. The length of the ground clocking corresponds to the respective fault.

Monitored component or system

♦ Control unit for fuel pump

Fault finding notes

♦ Check for sluggish pump (flow measurement). If OK, then replace the fuel-pump control unit

Function restrictions

♦ Fuel pump stationary
♦ Speed limitation of the fuel pump
♦ Possibly torque restriction

P309600

Diagnosis information DME control module

P309600 Control unit faulty

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- The evaluation IC reports "low supply voltage" (< 9.0 V)
- The evaluation IC reports a communication error

Monitored component or system

♦ Control unit: Evaluation IC for oxygen sensor

Fault finding notes

♦ Replace DME control unit

Function restrictions

♦ No detection of electrical faults on the signal lines possible, and lambda control is therefore no longer possible

P309700

Diagnosis information DME control module

P309700 Control unit faulty

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- The evaluation IC reports "low supply voltage" (< 9.0 V)
- The evaluation IC reports a communication error

Monitored component or system

♦ Control unit: Evaluation IC for oxygen sensor

Fault finding notes

♦ Replace DME control unit

Function restrictions

♦ No detection of electrical faults on the signal lines possible, and lambda control is therefore no longer possible

P309A00

Diagnostic information - DME control unit

P309A00 Separating clutch, pressure sensor, signal implausible

Diagnostic conditions

- Clutch closed
- Diagnostics runs continuously

Fault setting condition(s)

- Pressure greater than limit value detected in hydraulic system at spindle actuator position.

Monitored component or system

♦ Hybrid clutch

Fault finding notes

♦ Check spindle actuator pressure sensor using a brake servicing unit by applying pressure to the brake reservoir
⇒ Visible reaction to pressure (Y100)
♦ Check hydraulic line for blockage
♦ Check expansion port for blockage
♦ Pressure sensor faulty

P309C00

Diagnostic information - DME control unit

P309C00 Separating clutch, actuator, mechanical fault

Diagnostic conditions

● Diagnostics runs continuously

Fault setting condition(s)

● Spindle actuator detected an internal hardware fault
and switches to >>emergency operation mode<<, no electric driving
● Spindle actuator detected a component temperature above the critical threshold
● Spindle actuator detected an input voltage < 9 V

Monitored component or system

♦ Hybrid clutch

Fault finding notes

♦ DC/DC converter failed if vehicle electrical system voltage (with vehicle ready to drive after terminal 50) < 13 V
♦ Short circuit to B+/ground or open circuit in the line/connector
♦ Spindle actuator faulty

Functional restrictions

♦ Electric driving no longer possible

P309D00

Diagnostic information - DME control unit

P309D00 Separating clutch, actuator, insufficient slip with open clutch

Diagnostic conditions

- Diagnostics runs during electric driving
- Phase angle adaptation

Fault setting condition(s)

- When the contact point is approached for diagnostic purposes, the combustion engine was dragged along (engine speed > 60 rpm)
- Clutch should be open, but combustion engine continues to turn (engine speed > 60 rpm)
- Clutch should be open, but combustion engine is turned along by rotating phase angle adaptation (engine speed > 60 rpm)

Monitored component or system

♦ Hybrid clutch

Fault finding notes

♦ Air in system
♦ Loss of hydraulic fluid (leak)
♦ Visual inspection of reservoir fill level
♦ Select Maintenance/repairs ⇒ Clutch actuator and separating clutch ⇒ Perform **hydraulic air/leak test**

Functional restrictions

♦ Electric driving no longer possible

P309E00

Diagnostic information - DME control unit

P309E00 Separating clutch, position sensor for actuator, signal implausible

Diagnostic conditions

- Actuator in >>operation mode<<
- Diagnostics runs continuously

Fault setting condition(s)

- Position signal from clutch actuator is implausible

Monitored component or system

♦ Hybrid clutch

Fault finding notes

♦ Ignition on ⇒ Establish driving readiness and compare (Y080) and (Y090)
♦ Check fault memory content for hardware fault in spindle actuator
♦ Hydraulic lines kinked/blocked

P309F00

Diagnostic information - DME control unit

P309F00 Separating clutch, actuator, slip with closed clutch

Diagnostic conditions

● Combustion engine running
● Diagnostics runs continuously. (To reproduce the fault, carry out a test drive with some full-load operations, as this is when the clutch is more likely to slip.)

Fault setting condition(s)

● Speed difference between the combustion engine and the electric motor > 200...300 rpm, even though the clutch is closed
● Separating clutch does not close completely, slips

Monitored component or system

♦ Hybrid clutch

Fault finding notes

ⓘ **INFORMATION**
As of model year 2014 (E):
● See Technical Information 96/13.
● If other faults are entered, correct these first.

♦ Read out the fault memory; check for faults in the spindle actuator
♦ The hydraulic pressure actual value (Y100) in the clutch system must not be greater than 1 bar (14.5 psi) when the clutch is closed during engine warm-up

► If there is pressure when the clutch is closed:
  ♦ Expansion bore blocked
  ♦ Line for the brake reservoir of the spindle actuator blocked
► If pressure test is OK:
  ♦ Hydraulic line between spindle actuator and separating clutch blocked
  ♦ Separating clutch worn/faulty

♦ Hybrid clutch power input actual value (Y250) < 3 GJ = 3,000,000,000 J
⇒ If this value was exceeded but no relevant fault memory entries exist, the clutch must not be replaced. This theoretical value is merely an indication of a worn-out separating clutch. If a new DME control unit was installed, this value no longer reflects the real power input of the clutch.

♦ Visually inspect/check the separating clutch linings for transmission oil residues

⇒ If there is transmission oil on the linings, the transmission must be repaired/replaced following consultation with the importer.
Otherwise, a new separating clutch would wear out relatively quickly due to the leaking transmission.

Functional restrictions

♦ Vehicle can be driven only with limited combustion engine torque or not at all in some cases.
♦ After switching the ignition off and on again, it may be possible to continue driving electrically until the high-voltage battery is flat .

Diagnosis information DME control module

P30A100 Aborted engine starts - permitted number exceeded

Diagnostic conditions

- Ignition off, ignition on
- Diagnostics runs each time the combustion engine is started

Fault setting condition(s)

- Maximum permissible number of failed start attempts per ignition cycle exceeded

Monitored component or system

♦ Hybrid mode

Fault finding notes

♦ This fault path does not permit a concrete conclusion to be made about a certain component
♦ Attention must be paid to fault memory entries of other components involved in the starting process

Function restrictions

♦ The vehicle remains in the last stationary state (standby, E-driving)

P30A200

Diagnosis information DME control module

P30A200 Brake pedal travel sender/brake light switch - implausible signal

Diagnostic conditions

- Ignition on, apply brake
- Ignition on, release brake

Fault setting condition(s)

- Cross-check of brake pedal travel sender compared to brake light switch
- The brake light switch is set, and the evaluated brake pedal travel indicates a value > 27.002%
- The brake light switch value is deleted, and the evaluated brake pedal travel indicates a value < 2.002%

Monitored component or system

♦ Brake pedal travel sensor

Fault finding notes

♦ Perform fault finding on brake light switch
♦ Observe installation calibration of the brake pedal travel sender according to the installation specification
♦ Check installation position or adjustment of the sensor and adjust if necessary
♦ Line test
♦ Replace sensor

Function restrictions

♦ In the event of a fault, recuperation can only be controlled via the brake pressure. In the event of a fault, it is no longer possible to set recuperation in the free play range of the brake pedal. Different braking feel with larger pedal free play

Diagnosis information DME control module

P30C300 High-voltage system charging current monitoring implausible

Diagnostic conditions

- Charging or pre-conditioning state active
- Diagnostics runs continuously

ⓘ The charging current monitoring function is a higher-level function and acts only if the charging manager or battery does not limit the charging current.

Fault setting condition(s)

- Momentary charging current of the high-voltage battery for the duration of 1 s > 1,022 A

or

- Sum of the high-voltage currents (load currents and battery charging current) is not equal to the charging manager current

Monitored component or system

♦ High-voltage system

Fault finding notes

♦ Read out and work through the fault memories of the high-voltage components (high-voltage battery control unit, high-voltage power electronics, high-voltage charger) and the A/C operating panel.

Fault effects

♦ No charging of the high-voltage battery
♦ No high-voltage air-conditioning compressor available
♦ No high-voltage auxiliary heater available

P30DC00

Diagnostic information - DME control unit

P30DC00 Pressure tank, pressure reduction for refueling not possible

Diagnostic conditions

● Tank selector button actuated

Fault setting condition(s)

● After a refueling request from the front-end electronics (button actuated), the pressure does not decrease to below 20 hPa within 95 s, even though the fuel tank isolation valve (FTIV) is opened with the refueling request.

Monitored component or system

♦ Tank vent system

Fault finding notes

♦ Check fuel tank isolation valve (FTIV)
♦ Carefully open the tank cap, vent the tank, check the tank pressure sensor value after approx. 60 s
♦ Check lines between the tank, carbon canister and fresh-air filter for clogging and kinks

Functional restrictions

♦ Tank may be pressurized during opening
♦ Time until filler flap unlocking is extended (approx. 30 s)
♦ Vehicle cannot be refueled, because the fuel nozzle keeps switching off

ⓘ INFORMATION

♦ Possible as consequential fault of: P242200, P045000, P045200, P045300

Diagnostic information - DME control unit

P30E200 Pressure tank, refueling control, fault

Fault setting condition(s)

● Refueling request sent from front-end electronics permanently >>Fault/no pressure tank functionality<<

Monitored component or system

♦ Communication

Fault finding notes

♦ Tank selector button has been actuated for longer than 30 s
♦ Check front-end electronics control unit fault memory content
♦ Check front-end electronics coding

Functional restrictions

♦ Filler flap cannot be opened by button actuation
♦ Fuel nozzle keeps switching off during refueling

ⓘ INFORMATION

A pressure tank is necessary in order to comply with statutory requirements regarding evaporative emissions.

Since the engine control unit activates the fuel tank isolation valve (FTIV), there must be communication between the front-end electronics and the DME control unit in order to forward the refueling request so that the tank is ventilated for refueling.

In the event of incorrect coding of the front-end electronics or a faulty switch, the corresponding signal is zero, which indicates a fault in the front-end electronics.
⇒ Check front-end electronics control unit fault memory content

P310B00

Diagnosis information DME control module

P310B00 Fuel low pressure control - fuel pressure out of tolerance

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- The measured fuel low pressure deviates significantly from the setpoint pressure.

Monitored component or system

♦ Fuel low pressure system

Fault finding notes

♦ Check fuel lines (tightness)
♦ Check fuel filter (soiled/clogged)
♦ Check pressure retaining valve
♦ Check pressure limiting valve
♦ Check activation of electric fuel pump (low pressure)
♦ Check low pressure sensor (in the high pressure pump)
♦ Check electric fuel pump (low pressure) (pressure, delivery quantity)

Diagnosis information DME control module

P310F00 Fuel tank empty, electric limp-home mode active

Diagnostic conditions

● Diagnostics runs continuously

Fault setting condition(s)

The fault setting condition involves two main steps:
● A breakdown due to an empty fuel tank is detected.
● No independent engine operation is detected during a subsequent restart.

Monitored component or system

♦ Fuel system, low-pressure side

Fault finding notes

♦ Check fuel tank content and supply
♦ Perform a restart

Function restrictions

♦ Engine starting during active electric limp-home mode is suppressed; only purely electrical operation is available.
♦ Possible restrictions regarding electrical performance (depending on battery condition, aging, charge state, temperature).

ⓘ **Information**
Electrical onward travel is not enabled if one of the deactivation conditions is met:
● Ignition is off
● Battery charge state below threshold value
● Electrical limp-home mode is blocked by another fault

Diagnosis information DME control module

P325500 Bank 1 oxygen sensor ahead of catalytic converter, heating circuit - control at upper limit

Diagnostic conditions

- Dew point end reached
- Heater control active for 50.0 sec
- Overrun mode not active for 50.0 sec
- Exhaust gas temperature at the sensor > 299.991 °C (571.984 °F)
- Diagnostics runs continuously

Fault setting condition(s)

- If the setpoint temperature of the sensor ceramic element (684.998 °C/1,264.996 °F) is not reached during control operation of the heater, the pulse/duty ratio converges to 100%. The fault is set if this state is present for 60.0 sec.

Monitored component or system

♦ Oxygen sensor heating ahead of catalytic converter

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor heater ahead of cat. conv., bank 1 sensor 1 faulty

Diagnosis information DME control module

P325700 Bank 2 oxygen sensor ahead of catalytic converter, heating circuit - control at upper limit

Diagnostic conditions

- Dew point end reached
- Heater control active for 50.0 sec
- Overrun mode not active for 50.0 sec
- Exhaust gas temperature at the sensor > 299.991 °C (571.984 °F)
- Diagnostics runs continuously

Fault setting condition(s)

- If the setpoint temperature of the sensor ceramic element (684.998 °C/1,264.996 °F) is not reached during control operation of the heater, the pulse/duty ratio converges to 100%. The fault is set if this state is present for 60.0 sec.

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter, bank 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor heater ahead of cat. conv., bank 2 sensor 1 faulty

P326600

Diagnosis information DME control module

P326600 Bank 1 sensor 1 - internal resistance implausible

Diagnostic conditions

● Only during the starting phase : Dew point end reached, heater control active, minimum off time > 180.0 sec, time after activation of heater control = 40.0 sec
● Diagnostics runs once per driving cycle

Fault setting condition(s)

● The ceramic element temperature is less than the minimum temperature (719.991 °C/1,327.984 °F)

Monitored component or system

♦ Oxygen sensor heating ahead of catalytic converter

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor heater ahead of cat. conv., bank 1 sensor 1 faulty

P326700

Diagnosis information DME control module

P326700 Bank 2 sensor 1 - internal resistance implausible

Diagnostic conditions

● Only during the starting phase : Dew point end reached, heater control active, minimum off time > 180.0 sec, time after activation of heater control = 40.0 sec
● Diagnostics runs once per driving cycle

Fault setting condition(s)

● The ceramic element temperature is less than the minimum temperature (719.991 °C/1,327.984 °F)

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter, bank 2

Fault finding notes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Oxygen sensor heater ahead of cat. conv., bank 2 sensor 1 faulty

U000100

Diagnosis information - DME control module

Communication with CAN bus (drive)

ⓘ INFORMATION

♦ This fault entry was set when the **DME control module** could **not** communicate via the CAN bus (drive).
♦ The fact that the fault memory can be read out means that there is no problem with communication via the CAN bus (drive) at the moment.

Fault effects

♦ Communication no longer possible via the CAN bus.
♦ The radiator fans are running at full speed.

Possible fault causes

♦ Temporary short circuit or open circuit in CAN bus (drive)
♦ A control unit in the CAN bus (drive) system is faulty at times

U000200

Diagnosis information - DME control module

Communication with CAN bus (drive)

ⓘ INFORMATION

♦ This fault entry was set when the **DME control module** could **not** communicate via the CAN bus (drive).
♦ The fact that the fault memory can be read out means that there is no problem with communication via the CAN bus (drive) at the moment.

Fault effects

♦ Communication no longer possible via the CAN bus.
♦ The radiator fans are running at full speed.

Possible fault causes

♦ Temporary short circuit or open circuit in CAN bus (drive)
♦ A control unit in the CAN bus (drive) system is faulty at times

Diagnosis information DME control module

U002800 Sensor/hybrid CAN faulty

Diagnostic conditions

- Ignition on

Fault setting condition(s)

- Bus-off monitoring: the fault entry is made after 250 ms continuous BUS OFF

Monitored component or system

♦ CAN communication: turbocharger/NOX sensor

Fault finding notes

♦ Check electrical connection of the B-CAN line

U002900

Diagnosis information DME control module

U002900 Sensor/hybrid CAN - no communication

Diagnostic conditions

- Ignition on

Fault setting condition(s)

- Timeout monitoring: no message received on turbocharger/NOX sensor CAN

Monitored component or system

♦ CAN communication: turbocharger/NOX sensor

Fault finding notes

♦ Check CAN Low-High and plug contacts

Function restrictions

♦ Failure of the turbocharger/NOX sensor

C05xxxx Check PSM control unit fault memory content

Diagnostic conditions

C050000, C050100, C050200, C050300, C050600, C050700, C050800, C050900, C050D00, C050E00, C050F00, C051300, C051400, C051500

- Time after ignition on > 0.5 second

C053D00, C054000

- Once in driving cycle: Vehicle speed > 5 km/h (3 mph)

Monitored component or system

C050000, C050100, C050200, C050300, C050600, C050700, C050800, C050900, C050D00, C050E00, C050F00, C051300, C051400, C051500

♦ Speed sensor

C053D00, C054000

♦ Pressure sensor

Fault finding notes

♦ Check PSM control unit fault memory content

Function restrictions

♦ No recuperation during vehicle deceleration (example: battery charging during braking process)

C053D00

Diagnosis information DME control module

U010100

Diagnosis information DME control module

Communication with control unit not possible

NOTE
Internal function test completed.

Diagnostic conditions
The PAS control unit initially tests internal function sequences after wake-up. If they are OK, all diagnosable outputs are then tested and any faults are stored.
Wake-up of the control unit by:

- Event-controlled CAN message
- Key contact (terminal S)
- Ignition ON

Possible fault causes

- No control unit power supply
- Incorrect coding of control unit
- Short circuit or open circuit in CAN network
- Control unit faulty (in most cases, faulty coding is the cause and not the control unit!)

Fault effects

- Communication no longer possible via the CAN bus
- The control unit can no longer be addressed by any other control unit

U011000

Diagnosis information DME control module

Communication with control unit not possible

NOTE
Internal function test completed.

Diagnostic conditions
The PAS control unit initially tests internal function sequences after wake-up. If they are OK, all diagnosable outputs are then tested and any faults are stored.

Diagnosis information DME control module

U030200 Transmission control unit - check data record

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- DME control unit is coded for manual transmission, but nevertheless still receives transmission messages

Monitored component or system

♦ CAN communication: transmission messages

Fault finding notes

♦ This fault is entered if the DME control unit in an automatic vehicle is incorrectly coded for a manual transmission

Diagnosis information DME control module

U032300 Dashboard insert control unit - software incompatible

Diagnostic conditions

- Ignition on

Monitored component or system

♦ CAN communication:
Ambient temperature
Air conditioner
Front-end electronics
Gateway
Instrument cluster

Fault finding notes

♦ Re-code gateway and instrument cluster

U040200

Diagnosis information DME control module

Uxxxx00 Check XY control unit fault memory content

Diagnostic conditions

● Ignition on

Fault setting condition(s)

● Monitoring for stopped message counter: The same message count is received several times in sequence, the message counter received in the XY message always includes the same value for an applicable number of messages.
● Monitoring of the data length code: An incorrect message length was detected several times; the received XY message is shorter than the applied length
● Monitoring of the checksum: Incorrect checksum received several times in sequence; the checksum received in the XY message does not agree with the checksum calculated by the DME control unit for an applicable number of messages.
● Timeout monitoring: No message receipt. The identifier applied for the XY message is not received

Monitored component or system

♦ CAN communication with control unit message of the specified XY control unit

Fault finding notes

♦ Check XY control unit fault memory content

Function restrictions

♦ Control unit XY message is no longer evaluated

Fault setting condition(s)

● Monitoring for stopped message counter: The same message count is received several times in sequence, the message counter received in the XY message always includes the same value for an applicable number of messages.
● Monitoring of the data length code: An incorrect message length was detected several times; the received XY message is shorter than the applied length
● Monitoring of the checksum: Incorrect checksum received several times in sequence; the checksum received in the XY message does not agree with the checksum calculated by the DME control unit for an applicable number of messages.
● Timeout monitoring: No message receipt. The identifier applied for the XY message is not received

Monitored component or system

♦ CAN communication with control unit message of the specified XY control unit

Fault finding notes

♦ Check XY control unit fault memory content

Function restrictions

♦ Control unit XY message is no longer evaluated

U100300

Diagnosis information DME control module

Communication with control unit not possible

NOTE
Internal function test completed.

Diagnostic conditions
The PAS control unit initially tests internal function sequences after wake-up. If they are OK, all diagnosable outputs are then tested and any faults are stored.
Wake-up of the control unit by:

- Event-controlled CAN message
- Key contact (terminal S)
- Ignition ON

Possible fault causes

- No control unit power supply
- Incorrect coding of control unit
- Short circuit or open circuit in CAN network
- Control unit faulty (in most cases, faulty coding is the cause and not the control unit!)

Fault effects

- Communication no longer possible via the CAN bus
- The control unit can no longer be addressed by any other control unit

- Communication no longer possible via the CAN bus
- The control unit can no longer be addressed by any other control unit

U103B00

Diagnosis information - DME control module

Communication with CAN bus (drive)

ⓘ INFORMATION

♦ This fault entry was set when the **DME control module** could **not** communicate via the CAN bus (drive).
♦ The fact that the fault memory can be read out means that there is no problem with communication via the CAN bus (drive) at the moment.

Fault effects

♦ Communication no longer possible via the CAN bus.
♦ The radiator fans are running at full speed.

Possible fault causes

♦ Temporary short circuit or open circuit in CAN bus (drive)
♦ A control unit in the CAN bus (drive) system is faulty at times

U103C00

Diagnosis information DME control module

U110300 Production mode active

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Production mode set

Monitored component or system

♦ Control unit

Fault finding notes

♦ Perform vehicle handover with Tester

Function restrictions

♦ MIL or warning message in instrument cluster "engine control fault" on
♦ Rpm limitation
♦ Speed limitation
♦ Torque limitation
♦ Suppression of catalytic converter heating

Diagnosis information DME control module

U110600 Customer service mode active

Diagnostic conditions

● Diagnostics runs continuously

Fault setting condition(s)

● Local activation of customer service mode in the engine control unit takes place as soon as the following conditions are met simultaneously:
● Customer service mode activation request active during ignition on
● Control unit run-on mode
● Vehicle speed < 5 km/h (3 mph)
● Engine speed = 0 rpm
● E-machine is switched off and its speed is 0 rpm

Monitored component or system

♦ DME control unit

Fault finding notes

♦ Local deactivation of customer service mode in the engine control unit takes place as soon as the following conditions are met simultaneously:
● Customer service mode deactivation request during ignition on or the maximum distance of 50 km (31 miles) since activation is exceeded
● Control unit run-on mode
● Vehicle speed < 5 km/h (3 mph)
● Engine speed = 0 rpm
● E-machine is switched off and its speed is 0 rpm

Function restrictions

♦ MIL on
♦ The vehicle behaves like a conventional vehicle with combustion engine with regard to engine starting and operation.
♦ When customer service mode is active, the combustion engine can be manually started independently of criteria such as the hood state, driver's door position, buckle switch, etc.
♦ Automatic starting or stopping of the combustion engine is not permissible while customer service mode is active.
♦ The recuperation and boost operation modes are deactivated when customer service mode is active.

Diagnosis information DME control module

U111200 Function restriction due to implausible message

Diagnostic conditions

● If the DME control unit is coded for cruise control, the corresponding operating lever is installed and cruise control is selected, the diagnostic function is released from ignition on
● If the DME control unit is coded for adaptive cruise control (ACC), the adaptive cruise control (ACC) is in the ACTIVE or OVERRIDE state and the driver performs braking intervention, the diagnostic function is released from ignition on
● If the DME control unit is coded for adaptive cruise control (ACC) and no corresponding CAN faults occur, the diagnostic function is released from terminal 15 on.
● Diagnostics runs continuously from ignition on

Fault setting condition(s)

● The driver brakes and the adaptive cruise control (ACC) remains in the ACTIVE or OVERRIDE state
● The adaptive cruise control ACC/cruise control main switch is "OFF", but an adaptive cruise control (ACC) torque request continues to be sent
● Speed signals in the instrument cluster and the vehicle speed deviate from each other
● Signals of the cruise control operating lever received in the DME control unit indicate an implausible button combination

Monitored component or system

♦ Adaptive cruise control (ACC) sensor
♦ TSK in DME control unit
♦ Speed in instrument cluster
♦ Cruise control operating lever

Fault finding notes

♦ Check brake light switch information
♦ Check whether the adaptive cruise control (ACC) control unit receives the brake light switch information
♦ Check whether the adaptive cruise control (ACC) control unit properly receives the plausibility-checked main switch (CAN and component signal)
♦ Check speed signals in/to the instrument cluster
♦ Check measurement of the vehicle speed
♦ Check coding in the instrument cluster
♦ Contact product support
♦ Ensure unambiguous actuation of the cruise control operating lever buttons. Use actual value to check whether plausible button combinations are sent from the cruise control operating lever.

If one button is pressed and two buttons are measured, then update the control unit and then replace the operating unit if necessary. If two buttons are pressed and two buttons are measured, then perform a software setpoint/actual comparison. If the fault is still present or recurs or updating is not possible, then contact the product support department

Function restrictions

♦ No adaptive cruise control (ACC)/cruise control operation possible in the current ignition cycle

Diagnosis information DME control module

U111300 Function restriction due to received fault value

Diagnostic conditions

● If the DME control unit is coded for cruise control, the corresponding operating lever is installed and cruise control is selected, the diagnostic function is released from ignition on
● If a longitudinal acceleration sensor is installed in the vehicle

Fault setting condition(s)

● Instrument cluster sends fault value for speed signal
● Front-end electronics control unit or steering wheel electronics reports a fault of the cruise control operating lever
● Longitudinal acceleration sensor sends a fault value

Monitored component or system

♦ Instrument cluster (dashboard insert)
♦ Adaptive cruise control (ACC)/cruise control operating lever
♦ Longitudinal acceleration sensor

Fault finding notes

♦ Read out instrument cluster fault memory
♦ Function test of the cruise control operating lever
♦ Read out fault memory of the front-end electronics and steering wheel electronics
♦ Read out fault memory of PSM or parking brake

Function restrictions

♦ No adaptive cruise control (ACC)/cruise control operation possible in the current ignition cycle
♦ No correct calculation of the road gradient

P001600

Diagnosis information DME control module

Crankshaft position sensor (crankshaft sensor)

INFORMATION
♦ The crankshaft sensor is an rpm and reference mark sender

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition off, Ignition on
or
● Engine running

● no faults on crankshaft sensor and camshaft sensor

Possible fault causes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Timing fault (camshaft controller, oil pressure, control valves)
♦ Pickup (sensor) wheel not installed correctly
♦ **Crankshaft position sensor** not installed correctly
♦ **Crankshaft position sensor** faulty

Fault effects

♦ Dynamic response is reduced (torque limitation)
♦ Engine runs irregularly up to engine off.
♦ none camshaft adjustment

Setpoint definitions

NOTE

The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:

♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:

♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:

♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:

♦ Setpoint resistance **> 0.9 MOhm**

P004500

Diagnosis information DME control module

Electronic adjuster for turbocharger

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

P004500
● Control unit run-on (See ⓘ)

P004700, P004800, P334800
● Control unit run-on (See ⓘ)
or
● Ignition on

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line (feedback signal lead ▶ **DME control unit**)
♦ Loose contact or corrosion on connectors or lines
♦ **Electronic adjuster for turbocharger** Faulty

Fault effects

♦ none Particle filter regeneration
♦ Limp-home

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:

♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines :

♦ Setpoint resistance **> 0.9 MOhm**

INFORMATION

After the ignition is switched off (terminal 15), the DME control unit switches to control unit after-run mode.
The run-on period depends on many boundary conditions (e.g. engine temperature for fan operation).
The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.

P004700

Diagnosis information DME control module

Electronic adjuster for turbocharger

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

P004500
● Control unit run-on (See ⓘ)

P004700, P004800, P334800

The run-on period depends on many boundary conditions (e.g. engine temperature for fan operation).
The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.

P007100

Diagnosis information - DME control module

Ambient temperature via CAN

Diagnostic conditions

- NO fault stored in **DME control module**
- Driving > 80 **km/h** > 15 Minute(s)
- then Driving > 1 Minute(s) under the following conditions:
  - **Coolant temperature** 47 ... 108 °C (°F)
  - **Engine speed** 1,200 ... 4,000 1/min
  - **Vehicle speed** 30 ... 180 **km/h**

Possible fault causes

♦ **Ambient temperature** incorrect (**Sensor** incorrectly trimmed / Faulty)
♦ **Intake air temperature** incorrect (**Sensor** incorrectly trimmed / Faulty)
♦ **Charge air cooler** Blocked

, Faulty, changed ...

Fault setting condition(s)

ⓘ INFORMATION

The temperature model depends mainly on the measured intake air temperature.

- Deviation between **Ambient temperature** via CAN and Substitute value from model > 25 °C (°F)

Fault effects

♦ Substitute value from model
♦ Positive crankcase ventilation is continuously activated if a fault is present when recording the ambient temperature.

Diagnosis information - DME control module

Ambient temperature via CAN (See **Air-conditioning system regulator**)

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on > 5 Second(s)

Possible fault causes

- Fault **Outside temperature sensor**
- The expected signal or message deviates from the specified value.

Fault effects

- Substitute value from model

P007300

Diagnosis information - DME control module

Ambient temperature via CAN (See **Air-conditioning system regulator**)

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on > 5 Second(s)

Possible fault causes

♦ Fault **Outside temperature sensor**
♦ The expected signal or message deviates from the specified value.

Fault effects

♦ Substitute value from model

P008700

Diagnosis information DME control module

Fuel high-pressure rail /System pressure

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- No fault entered for Low-pressure fuel circuit
- Ignition on

or

- Engine running

Possible fault causes

- Open circuit
- Short circuit to B+
- Short circuit to ground
- Loose contact or corrosion on connectors or lines
- Fuel high-pressure system pressure drop
- Metering unit at the **Fuel high-pressure pump** faulty
- **Fuel high-pressure pump** faulty
- **Fuel pressure regulating valve** faulty
- Fuel pressure sensor faulty

Fault effects

- Torque reduction or shut-off

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
- Setpoint voltage **- 0.5 V** ⇒ **+ 0.5 V**

Short circuit to ground:

- Setpoint resistance **> 0.9 MOhm**

Open circuit:

- Setpoint resistance **< 2 Ohm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

ⓘ INFORMATION

After the ignition is switched off (terminal 15), the DME control unit switches to control unit after-run mode.
The run-on period depends on many boundary conditions (e.g. engine temperature for fan operation).
The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.

P00C600

Diagnosis information DME control module

Fuel high-pressure rail /System pressure - Fuel pressure/quantity too low at start

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- No fault entered for Low-pressure fuel circuit
- Starting process
- **Ambient temperature** > - 7 °C (°F)
- Ambient pressure > 750 mbar (hPa)
- Minimum speed when starting > 70 1/min
- Vehicle voltage > 9.5V

Possible fault causes

- Fuel tank empty
- Electrical fault in circuit
- Loose contact or corrosion on connectors or lines
- Low-pressure fuel circuit Limited function
- Fuel high-pressure system Pressure decrease/ Leak
- Metering unit at the **Fuel high-pressure pump** faulty
- **Fuel high-pressure pump** faulty
- **Fuel pressure regulating valve** faulty
- Fuel pressure sensor faulty

Fault effects

- It might not be possible to start the engine

Setpoint definitions

Short circuit between lines :

♦ Setpoint resistance **> 0.9 MOhm**

Diagnostic information - DME control unit

P017100 Bank 1 fuel metering system - system too lean
P017200 Bank 1 fuel metering system - system too rich

Diagnostic conditions

- Continuously
- Engine running
- Heating phase reached (oxygen sensor dew point end reached)
- Gradient of injection quantity < 30 mg/stroke
- Ambient temperature > -7 °C (+19 °F)
- Ambient pressure > 700 hPa
- Battery positive voltage > 11 V

Fault setting condition(s)

- A correction quantity is formed for the injection system due to a deviation between the setpoint lambda and actual lambda. If this is outside a certain window, the fault is displayed.
- System too lean/rich

Monitored component or system

♦ Fuel quantity control

Possible fault causes

♦ Oxygen sensor faulty
♦ Intake air tract
E.g. mass air flow sensor faulty
♦ Injector/injectors faulty
♦ Charge-air tract
E.g. boost-pressure sensor
♦ Exhaust gas recirculation
E.g. EGR actuator
♦ Exhaust system
E.g. all temperature sensors, differential-pressure sensor

Further fault causes:
♦ Leakage (e.g. intake-air tract, charge-air tract, exhaust gas recirculation, exhaust system)
♦ Oil entrainment in combustion chamber (e.g. due to leakage in the engine block, piston rings, turbocharger, etc.)
⇒ Ask customer about oil consumption

Fault effects

- ♦ Rough-running engine possible
- ♦ Blue smoke possible

P017B00

Diagnosis information DME control module

Temperature sender Cylinder head

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

P017B00
- Cold start after > 9 hours
- Test drive ► Drive for at least 60 s and drive at least 20 s of this at a speed of > 40 km/h (25 mph)

P017C00, P017D00
- Ignition on

Possible fault causes

- ♦ Open circuit
- ♦ Short circuit to B+
- ♦ Short circuit to ground
- ♦ Loose contact or corrosion on connectors or lines
- ♦ **Temperature sender Cylinder head** faulty

P017B00
ELECTRICAL FAULT FOR: coolant temperature, intake air temperature, exhaust gas recirculation temperature, cylinder head temperature, oil and fuel temperature

Fault setting condition(s)

P017B00
♦ Electrical fault Temperature sensor/s
Comparison of the cylinder head temperature sender with the oil temperature, coolant temperature, intake air temperature, exhaust gas recirculation temperature, oil and fuel temperature during cold starting. The fault is set if the permissible tolerance threshold is exceeded.

Fault effects

♦ none

Setpoint definitions

NOTE

The specified values and value ranges correspond to the OK state in each case.

♦ Setpoint resistance **> 0.9 MOhm**

INFORMATION

After the ignition is switched off (terminal 15), the DME control unit switches to control unit after-run mode.
The run-on period depends on many boundary conditions (e.g. engine temperature for fan operation).
The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.

Fault setting condition(s)

P01E300
- Voltage > 4.921 V

P01E500
- Voltage < 0.224 V

Monitored component or system

♦ Coolant temperature sensor

Possible fault causes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Coolant temperature sensor for engine temperature control (engine outlet) faulty

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:

- Setpoint resistance **< 2 Ohm**

Short circuit between lines:

- Setpoint resistance **> 0.9 MOhm**

P020100

Diagnosis information DME control module

Injection valve (injector) Cylinder 1

⚠WARNING
High voltage
Death or severe injuries due to high voltage or high current!

♦ Perform work only with the ignition switched off

INFORMATION
When a fuel injector is replaced, the adaptation value for the new injector must be written to the engine control unit .

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Engine running

Possible fault causes

P020100, P123700

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ **Injection valve (injector)** faulty

P026300

♦ Adaptation value incorrect

Fault effects

P020100, **P123700**

♦ Rough-running engine,
♦ Limp-home
♦ Engine failure

P026300

♦ Fuel injection quantity incorrect

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V** ⇒ **+ 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

P020200

Diagnosis information DME control module

Injection valve (injector) Cylinder 2

⚠WARNING
High voltage
Death or severe injuries due to high voltage or high current!

♦ Perform work only with the ignition switched off

INFORMATION
When a fuel injector is replaced, the adaptation value for the new injector must be written to the engine control unit .

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Engine running

Possible fault causes

P020200, P123800

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ **Injection valve (injector)** faulty

P026600

♦ Adaptation value incorrect

Fault effects

P020200, P123800

♦ Rough-running engine,
♦ Limp-home
♦ Engine failure

P026600

♦ Fuel injection quantity incorrect

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

P020300

Diagnosis information DME control module

Injection valve (injector) Cylinder 3

⚠WARNING
High voltage
Death or severe injuries due to high voltage or high current!

♦ Perform work only with the ignition switched off

INFORMATION
When a fuel injector is replaced, the adaptation value for the new injector must be written to the engine control unit .

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Engine running

Possible fault causes

P020300, P123900

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ **Injection valve (injector)** faulty

P026900

♦ Adaptation value incorrect

Fault effects

P020300, P123900

♦ Rough-running engine,
♦ Limp-home
♦ Engine failure

P026900

♦ Fuel injection quantity incorrect

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Diagnosis information DME control module

Injection valve (injector) Cylinder 4

⚠WARNING
High voltage
Death or severe injuries due to high voltage or high current!

♦ Perform work only with the ignition switched off

INFORMATION
When a fuel injector is replaced, the adaptation value for the new injector must be written to the engine control unit .

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Engine running

Possible fault causes

P020400, P124000

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ **Injection valve (injector)** faulty

P020B00

Diagnosis information DME control unit

Cylinder 2 injection time outside tolerance P020B00

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Engine running

- at operating temperature

Possible fault causes

- Poor fuel quality
- Leaks/fouling of the injectors (Cylinder 2)
- Loss of compression

P020E00

Diagnosis information DME control unit

Cylinder 2 injection time outside tolerance P020E00

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Engine running

- at operating temperature

Possible fault causes

- Poor fuel quality
- Leaks/fouling of the injectors (Cylinder 5)
- Loss of compression

P021900

Diagnosis information - DME control module

Overspeed detection

INFORMATION
♦ If the engine limit speed is exceeded, the throttle valve is closed and is then opened again only when the speed has fallen below this limit.

Fault setting condition(s)

Maximum engine speed exceeded

Fault effects

♦ Engine damage possible

P023400

Diagnostic information - DME control unit

Charge-air tract

⚠ CAUTION
The maximum pressure for testing the charge-air tract must not exceed the value of 0.4 bar (5.8 psi).

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Driving under load

Possible fault causes

♦ Leak in the intake system
- Only Panamera up to MY E (2014):
  ♦ For more information, see Technical Information for main group 2:
2143 - Fault finding for dealing with customer complaint >Engine will not start or goes off again immediately< at outside temperatures below 0 °C (32 °F) and fault code P159200 entered (60/13)

Fault effects

♦ Boost pressure control off
♦ Reduced power
♦ No particulate filter regeneration

Diagnosis information DME control module

Boost-pressure sensor

INFORMATION
♦ The boost pressure sensor and intake air temperature sensor are combined in one component and cannot be replaced individually.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Engine running

Possible fault causes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ **Boost-pressure sensor** Faulty

Fault effects

♦ none Particle filter regeneration
♦ Engine torque limitation.
♦ No boost pressure control possible.

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:

♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:

♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:

♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:

♦ Setpoint resistance **> 0.9 MOhm**

P023800

Diagnosis information DME control module

Boost-pressure sensor

INFORMATION
♦ The boost pressure sensor and intake air temperature sensor are combined in one component and cannot be replaced individually.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Engine running

Possible fault causes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ **Boost-pressure sensor** Faulty

Fault effects

♦ none Particle filter regeneration
♦ Engine torque limitation.
♦ No boost pressure control possible.

P032100

Diagnosis information DME control module

Crankshaft position sensor (crankshaft sensor)

INFORMATION
♦ The crankshaft sensor is an rpm and reference mark sender

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition off, Ignition on

or

- Engine running

- no faults on camshaft sensor

Possible fault causes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ Pickup (sensor) wheel not installed correctly , faulty
♦ Crankshaft sensor not installed correctly
♦ Crankshaft sensor faulty

Fault effects

♦ Dynamic response is reduced (torque limitation)
♦ Higher idle speed
♦ Deactivation of smooth-running regulator and surge damper
♦ none Particle filter regeneration
♦ Deactivation of EGR
♦ none camshaft diagnosis

Setpoint definitions

NOTE

The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

- Setpoint resistance **> 0.9 MOhm**

Diagnosis information DME control module

P038100 Warning light for preglow time - signal implausible

Diagnostic conditions

● Ignition on
● An open circuit in the line or short circuit to B+ in the instrument cluster can only be detected when the light is activated

Fault setting condition(s)

● The lamp status received from the instrument cluster via CAN does not match the lamp activation signal from the DME control unit that is currently sent via CAN

Monitored component or system

♦ Diesel indicator light

Possible fault causes

♦ Open circuit/short circuit to B+ in the instrument cluster
♦ **Instrument cluster** faulty

Diagnosis information DME control module

Exhaust gas recirculation Throughput

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

P040100 Throughput too low

- Exhaust gas recirculation Active
- **Engine speed** 1,100 ... 2,500 1/min
- Injection quantity 5 ... 35 mg

P040200 Throughput too high

- Exhaust gas recirculation not active
- Intake manifold flap position > 94 %
- Throttle valve position > 94 %
- **Engine speed** 1,100 ... 2,500 1/min
- Injection quantity < 0.5 mg/stroke
- **Coolant temperature** > 60 °C (°F)

Possible fault causes

- **Exhaust recirculation valve** stuck
- **Exhaust recirculation valve** Faulty
- **Exhaust gas recirculation line** Leak / leaks
- **Exhaust gas recirculation line** Blocked

- **Radiator** Exhaust gas recirculation Blocked

- **Radiator** Exhaust gas recirculation Faulty
- **Turbocharger** Function Faulty
- **Intake system** Leak / leaks
- **Air flow sensor** Function Faulty

Fault effects

- none Exhaust gas recirculation
- none Particle filter regeneration

Diagnosis information DME control module

Exhaust gas recirculation Throughput

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Catalytic converter Effect

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Particle filter regeneration Active
- one time during Particle filter regeneration

Possible fault causes

NOTE
Diagnosis/Fault finding!
DME control module: ► First process the other faults.

- Rough running Check
- Zero-quantity calibration Check
- Fault in area :
  - **Exhaust temperature sensor** 2(Ahead of catalytic converter)
  - **Exhaust temperature sensor** 3(Behind catalytic converter)
  - Exhaust gas recirculation
  - **Throttle valve**
  - Injection system
  - **Air flow sensor**
- **Catalytic converter**

Diagnostic information - DME control unit

P042100 Slip catalytic converter effect insufficient at cold start

Diagnostic conditions
Cold start conditions must be met:
● Engine switch-off time > 6 hours
● Exhaust temperature 4 (behind DPF) -7.04...+49.96 °C (+19.33...+121.93 °F)
● Vehicle speed < 100 km/h (62 mph)
● Time after engine start until exhaust gas temperature 5 (behind slip catalytic converter) is reached < 20 minutes

Possible fault causes

♦ No correct installation of exhaust gas temperature sensors 4 and 5 (behind DPF= ahead of slip catalytic converter (4) and behind slip catalytic converter (5))
♦ Damage to the exhaust system

Check/remedy fault entries in the following areas:
♦ Temperature sensor 4 ahead of slip catalytic converter
♦ Temperature sensor 5 behind slip catalytic converter
♦ Ambient temperature sensor
♦ Mass air flow sensor

♦ Slip catalytic converter faulty

P042600

Diagnosis information DME control module

P042600 Temp. sensor for catalytic converter - implausible signal

Diagnostic conditions

● Diagnostics runs continuously after engine start

Fault setting condition(s)

● Exhaust temperature sensor in oxi. cat.: Average difference over a given time between sensor and model value implausible

Monitored component or system

♦ Exhaust temperature sensor 2

Fault finding notes

♦ Check installation position of sensor in oxi. cat. and correct it if necessary, or replace exhaust temperature sensor

P046C00

Diagnosis information DME control module

Exhaust recirculation valve

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Open circuit:

♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:

♦ Setpoint resistance **> 0.9 MOhm**

INFORMATION

After the ignition is switched off (terminal 15), the DME control unit switches to control unit after-run mode.
The run-on period depends on many boundary conditions (e.g. engine temperature for fan operation).
The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.

P048000

Diagnosis information DME control module

Radiator fan control module 1

⚠WARNING
Open-running fan blades!
Danger of limbs being cut off!
Risk of serious injuries due to foreign bodies being thrown out!

♦ **DO NOT** allow hair or clothing close to the rotating range of the fan.
♦ **DO NOT** reach into the rotating fan.
♦ **DO NOT** place tools or other items in the rotating range of the fan.
♦ Perform work on the fan only with the ignition switched off.
♦ Secure the ignition to prevent accidental switching on by other persons.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ **Radiator fan control module** 1 faulty

Fault effects

♦ Radiator limp-home mode 10 s after Ignition on (full activation)

ⓘ NOTE
Limp-home mode of the radiator fans means that the requirements for load balance, acoustics and closed-circuit current are not met.

Setpoint definitions

NOTE

In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Idle speed
- Vehicle is stationary

Possible fault causes

- Fault in injection system
- Leaks/fouling of the injectors
- Oil or fuel entering the combustion chamber
- Loss of compression
- Engine/turbocharger damage (for example: bearings)

P050E00

Diagnostic information - DME control unit Diesel

Exhaust gas temperature Cold start

Diagnostic conditions
- to Engine start

Possible fault causes
- **Exhaust temperature sensor behind particle filter** Faulty
- Fault in area **Exhaust system**
- Fault in area Exhaust gas recirculation

P052F00

Diagnosis information DME control module

Control unit for automatic glow time:

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- no communication errors present
- no faults for Overtemperature present
- no faults for Control unit for automatic glow time: present
- no ground offset faults present
- no faults for incorrect Control unit for automatic glow time: present
- **Power supply** OK
- Engine cold
- Ignition on

Possible fault causes

- Open circuit
- Short circuit to B+
- Short circuit to ground
- Loose contact or corrosion on connectors or lines
- **Engine ground strap** /**Body** faulty
- **Ground line** Engine control unit/ **Body** faulty
- **Control unit for automatic glow time:** faulty

Fault effects

- Preglow system does not function
- Poor Engine can be started
- Smoke may come from engine during start-up

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:

♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:

♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:

♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:

♦ Setpoint resistance **> 0.9 MOhm**

P054400

Diagnosis information DME control module

Exhaust temperature sensor ahead of turbocharger

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

- ♦ Open circuit
- ♦ Short circuit to B+
- ♦ Short circuit to ground
- ♦ Loose contact or corrosion on connectors or lines
- ♦ **Exhaust temperature sensor ahead of turbocharger** faulty

Fault effects

P054400
♦ none Particle filter regeneration

P054500
♦ none Particle filter regeneration
♦ Torque limitation

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines :

♦ Setpoint resistance **> 0.9 MOhm**

P054500

♦ Setpoint resistance **> 0.9 MOhm**

P054E00

Diagnosis information DME control unit

DME control module Idle speed control P054F00, P054E00, P050A00, P050600, P050700

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Idle speed
- Vehicle is stationary

Possible fault causes

- Fault in injection system
- Leaks/fouling of the injectors
- Oil or fuel entering the combustion chamber
- Loss of compression
- Engine/turbocharger damage (for example: bearings)

P054F00

Diagnosis information DME control unit

DME control module Idle speed control P054F00, P054E00, P050A00, P050600, P050700

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Diagnostic information - DME control unit

P05A000 Radiator shutter, servo motor turns freely/mechanically blocked

Diagnostic conditions
- Allow the radiator shutter to move to both learned limit stops (e.g. via drive link)

Possible fault causes
- Radiator shutter was turned manually while the ignition was off
- Radiator shutter iced up
- Radiator shutter dirty
- Radiator shutter, vanes scrape/stick (incorrectly installed, positioned)
- Radiator shutter, mechanism broken
- Servo motor faulty

Fault setting conditions
- Increased current draw during movement
- No increased current draw when the learned limit stops are reached

Fault effects
- New initialization
- When the fault is active, the DME control unit sends the OPEN request to the radiator shutter servo motor

P05A200

Diagnostic information - DME control unit

P05A200 Radiator shutter - open circuit
P05A400 Radiator shutter - short circuit in signal line
P05A500 Radiator shutter - short circuit in signal line

Diagnostic conditions
- Ignition on

Possible fault causes

- ♦ Short circuit to B+/ground/between lines or open circuit in the signal line
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Servo motor faulty

Fault setting conditions
- Static signal on the servo motor signal line ◄► DME control unit

Fault effects
- ♦ If it still functions, the servo motor opens the shutter as far as possible

Diagnostic information - DME control unit

P05A300 Radiator shutter, signal implausible

Diagnostic conditions
- Ignition on

Possible fault causes
- Implausible request from DME control unit, e.g. during reprogramming
- Servo motor signal line ◄► Open circuit in DME control unit
- Servo motor power supply or ground supply faulty
- Servo motor faulty

Fault setting conditions
- No signal on the servo motor signal line ◄► DME control unit

Fault effects
- If it still functions, the servo motor opens the shutter as far as possible

P05A400

Diagnostic information - DME control unit

P05A200 Radiator shutter - open circuit
P05A400 Radiator shutter - short circuit in signal line
P05A500 Radiator shutter - short circuit in signal line

Diagnostic conditions
- Ignition on

Possible fault causes

- Short circuit to B+/ground/between lines or open circuit in the signal line
- Loose contact or corrosion on connectors or lines
- Servo motor faulty

Fault setting conditions
- Static signal on the servo motor signal line ◄► DME control unit

Fault effects
- If it still functions, the servo motor opens the shutter as far as possible

P05A500

Diagnostic information - DME control unit

P05A200 Radiator shutter - open circuit
P05A400 Radiator shutter - short circuit in signal line
P05A500 Radiator shutter - short circuit in signal line

Diagnostic conditions
- Ignition on

Possible fault causes

- Short circuit to B+/ground/between lines or open circuit in the signal line
- Loose contact or corrosion on connectors or lines
- Servo motor faulty

Fault setting conditions
- Static signal on the servo motor signal line ◄► DME control unit

Fault effects
- If it still functions, the servo motor opens the shutter as far as possible

Diagnostic information - DME control unit

P05C000 Radiator shutter unit, overtemperature

Diagnostic conditions
● Allow the radiator shutter to move to both learned limit stops (e.g. via drive link)

Possible fault causes
♦ Ambient temperature too high
♦ Servo motor overloaded
♦ Servo motor faulty

Fault setting conditions
● Temperature in servo motor too high

Fault effects
♦ New initialization
♦ When the fault is active, the DME control unit sends the OPEN request to the radiator shutter servo motor

P060200

Diagnosis information DME control module

Coding cruise control/ACC

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

- Vehicle data incorrect
  (See **PIWIS Tester II** ▶ Additional menu [F7] ▶ Maintenance of vehicle data)
- Vehicle equipment incorrect
- **Control module** incorrectly coded - The data record does not match the vehicle.
- **Steering wheel electronics control module** incorrectly coded

P060500

Diagnosis information DME control module

Engine DME control module Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

only P060500
- Control unit run-on (See ⓘ)

Possible fault causes

♦ **Engine DME control module Faulty**

Fault effects

♦ Rough-running engine
♦ no Engine running

♦ Starting problems
♦ Significant jerking
♦ none Particle filter regeneration
♦ Exhaust gas recirculation No function
♦ Reduced Engine output

ⓘ INFORMATION
After the ignition is switched off (terminal 15), the DME control unit switches to control unit after-run mode.
The run-on period depends on many boundary conditions (e.g. engine temperature for fan operation).
The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.

P060600

Diagnosis information DME control module

Engine DME control module Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.

The run-on period depends on many boundary conditions (e.g. engine temperature for fan operation).
The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.

P064100

Diagnostic information - DME control unit

Engine DME control unit sender reference voltage A

Diagnostic conditions

- Ignition on

Monitored component or system

♦ Sender reference voltage 5 V

Fault finding notes

♦ Check the electrical connection of the components connected to the shared power supply
♦ Check components
♦ Control unit:
  ♦ Connector [A], contact 16
  or
  ♦ Connector [A], contact 38
  or
  ♦ Connector [A], contact 57
  or
  ♦ Connector [A], contact 60
  or
  ♦ Connector [A], contact 103
  or
  ♦ Connector [B], contact 34

Fault effects

♦ Limp-home mode
♦ Failure of the affected sensors

P064C00

Diagnosis information DME control module

Control unit for automatic glow time:

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- no communication errors present
- no faults for Overtemperature present
- no faults for Control unit for automatic glow time: present
- no ground offset faults present
- no faults for incorrect Control unit for automatic glow time: present
- **Power supply** OK
- Engine cold
- Ignition on

Possible fault causes

- Open circuit
- Short circuit to B+
- Short circuit to ground
- Loose contact or corrosion on connectors or lines
- **Engine ground strap** /**Body** faulty
- **Ground line** Engine control unit/ **Body** faulty
- **Control unit for automatic glow time:** faulty

Fault effects

- Preglow system does not function
- Poor Engine can be started
- Smoke may come from engine during start-up

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:

♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:

♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:

♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:

♦ Setpoint resistance **> 0.9 MOhm**

Diagnosis information DME control module

Radiator fan control module 1

⚠WARNING
Open-running fan blades!
Danger of limbs being cut off!
Risk of serious injuries due to foreign bodies being thrown out!

♦ **DO NOT** allow hair or clothing close to the rotating range of the fan.
♦ **DO NOT** reach into the rotating fan.
♦ **DO NOT** place tools or other items in the rotating range of the fan.
♦ Perform work on the fan only with the ignition switched off.
♦ Secure the ignition to prevent accidental switching on by other persons.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ **Radiator fan control module** 1 faulty

Fault effects

♦ Radiator limp-home mode 10 s after Ignition on (full activation)

ⓘ NOTE
Limp-home mode of the radiator fans means that the requirements for load balance, acoustics and closed-circuit current are not met.

Short circuit between lines:

♦ Setpoint resistance **> 0.9 MOhm**

P069300

Diagnosis information DME control module

Radiator fan control module 2

⚠WARNING
Open-running fan blades!
Danger of limbs being cut off!
Risk of serious injuries due to foreign bodies being thrown out!

♦ **DO NOT** allow hair or clothing close to the rotating range of the fan.
♦ **DO NOT** reach into the rotating fan.
♦ **DO NOT** place tools or other items in the rotating range of the fan.
♦ Perform work on the fan only with the ignition switched off.
♦ Secure the ignition to prevent accidental switching on by other persons.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ **Radiator fan control module** 2 faulty

Fault effects

♦ Radiator limp-home mode 10 s after Ignition on (full activation)

ⓘ NOTE
Limp-home mode of the radiator fans means that the requirements for load balance, acoustics and closed-circuit current are not met.

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:

♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:

♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:

♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:

♦ Setpoint resistance **> 0.9 MOhm**

ⓘ INFORMATION

After the ignition is switched off (terminal 15), the DME control unit switches to control unit after-run mode.
The run-on period depends on many boundary conditions (e.g. engine temperature for fan operation).
The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.

Diagnosis information DME control unit

Sensor 1 for NOx Signal
P101900

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- once at the transition from traction mode to overrun mode
- No fault entered for
  - Exhaust gas recirculation
  - **Sensor 1 for NOx** / **Sensor 2 for NOx**
  - DeNOx catalytic converter

Possible fault causes

- Sender 1 for NOx faulty due to the following possible causes
  - increased oil consumption
  - Coolant leak into combustion chamber

P102800

Diagnosis information DME control module

Engine intake manifold flap

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault effects

♦ Consequential faults: Torque limitation due to excessively high temperatures
ⓘ Work through all other fault memory entries first

Diagnosis information DME control module

Engine DME control module torque limitation

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

P102A00
♦ Coolant level too low
P102B00
♦ Oil level too low
♦ Poor oil quality
P102C00
♦ Fuel line routing incorrect
♦ Fuel filter Blocked

P102D00
♦ Charge air cooler soiled
P102E00
♦ Timing incorrect
♦ Mixture formation error

Fault effects

♦ Consequential faults: Torque limitation due to excessively high temperatures
ⓘ Work through all other fault memory entries first

Diagnosis information DME control unit

Sensor 1 for NOx
P103200, P103300

INFORMATION
This fault can result from other faults relating to engine control (DME control unit). Please correct all existing fault memory entries in the DME control unit first.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Engine temperature**: at operating temperature
- Particle filter regeneration inactive
- Idle speed

Possible fault causes

- **Intake system** Leak / leaks
- Exhaust gas recirculation Leak / leaks
- **Injection valve** leaks
- **Evaluation unit/control unit, sensor 1 for NOx**

Diagnosis information DME control unit

Sensor 1 for NOx
P103200, P103300

P106500

Diagnosis information DME control module

Fuel high-pressure rail /System pressure

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- No fault entered for Low-pressure fuel circuit
- Ignition on

or

- Engine running

Possible fault causes

- Open circuit
- Short circuit to B+
- Short circuit to ground
- Loose contact or corrosion on connectors or lines
- Fuel high-pressure system pressure drop
- Metering unit at the **Fuel high-pressure pump** faulty
- **Fuel high-pressure pump** faulty
- **Fuel pressure regulating valve** faulty
- Fuel pressure sensor faulty

Fault effects

- Torque reduction or shut-off

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
- Setpoint voltage **- 0.5 V** ⇒ **+ 0.5 V**

Short circuit to ground:

- Setpoint resistance **> 0.9 MOhm**

Open circuit:

- Setpoint resistance **< 2 Ohm**

Short circuit between lines:

- Setpoint resistance **> 0.9 MOhm**

P123700

Diagnosis information DME control module

Injection valve (injector) Cylinder 1

⚠WARNING
High voltage
Death or severe injuries due to high voltage or high current!

♦ Perform work only with the ignition switched off

INFORMATION
When a fuel injector is replaced, the adaptation value for the new injector must be written to the engine control unit .

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Engine running

Possible fault causes

P020100, P123700

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ **Injection valve (injector)** faulty

Diagnosis information DME control module

P125A00 Temperature of stagnant water during cold start implausible

Diagnostic conditions

● Cold start (off time > 9 hours)

Fault setting condition(s)

● Difference between temperature of coolant at engine outlet and temperature of cylinder head is less than 5 °C (9 °F)

Monitored component or system

♦ Coolant temperature system, performance capacity

Possible fault causes

♦ Head block valve including vacuum supply
⇒ Check vacuum hoses
⇒ Remove valve and check for smooth operation
⇒ Check function of vacuum unit
⇒ Valve should shut off when vacuum is applied

♦ Inflow check valves for block
⇒ Balls in the check valves should move freely and shut off in one flow direction

♦ Continuous bleeding
⇒ When the bleeder valve is upright, air should be able to pass through, not water - viewed from the bottom up

Diagnosis information DME control module

Engine DME control module Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

only P060500
- Control unit run-on (See ⓘ)

Possible fault causes

♦ **Engine DME control module Faulty**

Fault effects

♦ Rough-running engine
♦ no Engine running

♦ Starting problems
♦ Significant jerking
♦ none Particle filter regeneration
♦ Exhaust gas recirculation No function
♦ Reduced Engine output

ⓘ INFORMATION
After the ignition is switched off (terminal 15), the DME control unit switches to control unit after-run mode.
The run-on period depends on many boundary conditions (e.g. engine temperature for fan operation).
The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Terminal 15
- Reducing-agent tank temperature > 5 °C (41 °F)

Possible fault causes

- Short circuit to B+
- Short circuit to ground
- Open circuit
- **Sensor for reducing agent tank filling level** Faulty
- **DME control module** Faulty

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V** ⇒ **+ 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Diagnosis information DME control module

P148B00 Output stage 1 for tank heater for reducing agent faulty

Diagnostic conditions

- Always when line/pump heating is switched off
- Also with Ignition on

Fault setting condition(s)

- Tank heater sensor current when heater circuit is not activated > 200 micro amps

Monitored component or system

♦ SCR - Tank heating system

Possible fault causes

♦ Output stage 1 for tank heater for reducing agent faulty

Fault effects

♦ Tank heater for reducing agent runs continuously (Unintentional heating)

Diagnosis information DME control module

P148C00 Output stage 2 for reducing-agent pump and line heating faulty

Diagnostic conditions

- Always when line/pump heating is switched off
- Also with Ignition on

Fault setting condition(s)

- Tank heater sensor current when heater circuit is not activated > 200 micro amps

Monitored component or system

♦ SCR - Line/pump heating system

Possible fault causes

♦ Output stage 2 for reducing-agent pump and line heating faulty

Fault effects

♦ Heater for reducing-agent pump and line runs continuously (Unintentional heating)

P150A00

Diagnosis information - DME control module

Fault Switch-off time

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Engine running

- then Switch off ignition
- immediately afterward Ignition on > 10 Minute(s) , at:
  - **Instrument cluster** ready for operation

Possible fault causes

- The power supply of the DME control unit was interrupted during control unit run-on
- Incorrect software version **Control module** DME
- Incorrect software version **Gateway control module**
- Incorrect software version **Instrument cluster**
- Fault in area CAN drive or **CAN comfort**
- **Instrument cluster** failed or Faulty

Fault setting condition(s)

- The power supply of the DME control unit was interrupted during control unit run-on

or

- No or implausible time pulse from the gateway control unit within 60 seconds. , at:
  - Ignition on

INFORMATION

The DME control unit receives time information from the gateway control unit at regular intervals when the ignition is on. (approx. 4 Second(s))

P151D00

Diagnosis information - DME control module

Fault component protection

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Start-up (engine not yet at idle speed)

Possible fault causes

♦ Engine switch-off during start-up as a result of shifting out of selector lever position P/N too quickly

Diagnosis information - DME control module

Control module blocked

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Vehicle voltage > 11 V
- Ignition on

or

- Engine running

> 1 minute detected:
- Switch off ignition
- Switch on ignition after approx. 1 minute

Possible fault causes

- Power supply of the DME control unit was interrupted (See ⓘ)
- Immobilizer code incorrect from front-end electronics
- Control unit faulty

ⓘ INFORMATION

This fault can be entered if the power supply of the DME control unit is interrupted within the first 45 seconds after ignition off (discharge time of the R/C) and is then restored again immediately afterwards and the ignition is switched on.
- After the ignition is switched off (terminal 15), the DME control unit switches to control unit after-run mode.
- The run-on period depends on many boundary conditions (e.g. engine temperature for fan operation).

The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.
- The run-on time is 1 ... 60 minutes.

Diagnosis information - DME control module

Fault entry in the specified control unit

ⓘ **NOTE**
Internal function test completed.

Diagnostic conditions

The control unit first tests internal function sequences upon wake-up. If they are OK, all diagnosable outputs are then tested and any faults are stored.
Wake-up of the control unit by:

- Event-controlled CAN message
- Wake-up signal via wake-up line
- Key contact (terminal S)
- "Ignition on"

Possible fault causes

- Incorrect coding of control unit
- The peripheral device connected to the specified control unit is faulty
- Control unit faulty (in most cases, faulty coding is the cause and not the control unit!)

Fault effects

- The specified control unit sends only substitute values via CAN
- Other control units detect these substitute values and set this fault code

Diagnosis information DME control module

Engine DME control module Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

P164D00

Diagnosis information DME control module

Oil pressure switch low pressure

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

P164C00
- Engine off for at least 60 seconds
- Ignition on
- **Oil temperature** > 0 °C (32 °F)

P164D00
- Engine running

> 10 seconds

Possible fault causes

- Open circuit
- Short circuit to B+
- Short circuit to ground
- Loose contact or corrosion on connectors or lines
- **Engine oil pressure** too low
  (Oil level, Oil dilution, Soiling **Oil circuit**, **Oil circuit** Faulty)
- **Oil pressure switch** low pressure faulty

Fault effects

- None

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:

P167E00

Diagnosis information - DME control module

Start/Stop max. start time exceeded

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Restart after Start/Stop

Possible fault causes

♦ Fault memory entry in the front-end electronics

Fault effects

♦ **Start/Stop function blocked**

Diagnosis information - DME control module

Fault entry in the specified control unit

NOTE
Internal function test completed.

Diagnostic conditions

The control unit first tests internal function sequences upon wake-up. If they are OK, all diagnosable outputs are then tested and any faults are stored.
Wake-up of the control unit by:

- Event-controlled CAN message
- Wake-up signal via wake-up line
- Key contact (terminal S)
- "Ignition on"

Possible fault causes

- Incorrect coding of control unit
- The peripheral device connected to the specified control unit is faulty
- Control unit faulty (in most cases, faulty coding is the cause and not the control unit!)

Fault effects

- The specified control unit sends only substitute values via CAN
- Other control units detect these substitute values and set this fault code

P169800

Diagnosis information - DME control module

Fault entry in the specified control unit

NOTE
Internal function test completed.

Diagnostic conditions

The control unit first tests internal function sequences upon wake-up. If they are OK, all diagnosable outputs are then tested and any faults are stored.
Wake-up of the control unit by:

- Event-controlled CAN message
- Wake-up signal via wake-up line
- Key contact (terminal S)
- "Ignition on"

Possible fault causes

- The peripheral device connected to the specified control unit is faulty
- Control unit faulty (in most cases, faulty coding is the cause and not the control unit!)

Fault effects

- The specified control unit sends only substitute values via CAN
- Other control units detect these substitute values and set this fault code

P169A00

Diagnosis information DME control module

DME control unit loading mode

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Control unit run-on (See ⓘ)

Possible fault causes

♦ Loading mode active

Fault effects

♦ Torque reduction
♦ Rpm limitation
♦ Speed limitation

ⓘ INFORMATION
After the ignition is switched off (terminal 15), the DME control unit switches to control unit after-run mode.
The run-on period depends on many boundary conditions (e.g. engine temperature for fan operation).
The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.

Diagnosis information DME control module

Start inhibit switch (P/N signal)

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Diagnosis information DME control module

P191A00 Loss of crankshaft synchronisation

Diagnostic conditions

- Engine running
- Engine running at between 450 and 4,000 rpm when fault occurs
- Diagnostics runs continuously

Fault setting condition(s)

- Sporadic, rare, short-term faults are detected on the crankshaft
- Short-term faults on the crankshaft can cause perceptible jerking, or cause the engine to stall

Monitored component or system

♦ Crankshaft sensor

Fault finding notes

♦ Check the sensor for correct installation (distance from sensor to sender wheel, correct seating)
♦ Check sensor supply voltage (only when sensor is active); check sensor signal with the engine running
♦ Check wiring
♦ Check sender wheel

Function restrictions

♦ Jerking while driving, engine stalls

P192500

Diagnosis information DME control module

Relay for auxiliary coolant pump

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Diagnosis information DME control module

Thermostat

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Diagnosis runs continuously

Possible fault causes

- Open circuit
- Short circuit to B+
- Short circuit to ground
- Loose contact or corrosion on connectors or lines
- **Thermostat** faulty

Fault effects

- Final stage deactivated
- **Thermostat failure**
- **Insufficient Engine cooling**

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
- Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
- Setpoint resistance **> 0.9 MOhm**

Open circuit:
- Setpoint resistance **< 2 Ohm**

Short circuit between lines:
- Setpoint resistance **> 0.9 MOhm**

P199F00

Diagnosis information DME control module

Thermostat

INFORMATION
The thermostat and coolant pump are in a shared housing outside of the engine.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

- **DME control module** - driver overloaded
- **DME control module** Faulty

INFORMATION

► Erase the fault memory
If the fault occurs again: Control unit replacement

P200200

Diagnostic information - DME control unit

Bank 1 particulate filter

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Engine at operating temperature
- Driving at low load
- No particulate filter regeneration

Possible fault causes

♦ Bank 1 **particulate filter** overloaded
♦ Exclusively short-distance driving (regeneration is not possible during driving, because the required exhaust gas temperature is not reached, e.g. due to stop-and-go traffic.)
♦ Differential-pressure hoses leaking/blocked/iced up/kinked/pinched (In case of iced-up hoses, for example, the fault would no longer be active and the load in the extended fault memory entry would be significantly higher than in the state in which the hoses are no longer iced up.)
♦ Differential-pressure sensor faulty
♦ Exhaust gas recirculation valve faulty
♦ Mass air flow sensor faulty
♦ Leak in charge-air tract
♦ Bank 1 exhaust gas temperature sensors ahead of and behind particulate filter faulty

Fault effects

♦ Torque limitation
♦ No exhaust gas recirculation
♦ Particulate filter regeneration no longer possible during driving. Depends on loading (see actual-value group K: comparison of K100 and K105 with limits K112 and K113. Observe F1 Help texts for this purpose.)

P200400

Diagnosis information DME control module

Engine intake manifold flap

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Engine running

- Exhaust gas temperature to **Particle filter** > 100°C (212 °F)

Possible fault causes

- ♦ Open circuit
- ♦ Short circuit to B+
- ♦ Short circuit to ground
- ♦ Short circuit between the lines
- ♦ Reducing agent injector Faulty
- ♦ **DME control module** Faulty

Fault setting condition(s)

- Open circuit (Voltage > 4.5 V)
- Short circuit to ground (Voltage < 2.8V)
- Short circuit to B+ (Current consumption > 2.2 A or < 200 mA)

Fault effects

No metering of the reducing agent

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Diagnosis information DME control module

Reducing agent injector P208E00

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Engine running

- **Engine temperature**: at operating temperature
- No fault entered for **System for reducing agent injection**

Possible fault causes

- Reducing agent injector Faulty

Fault setting condition(s)

- Reducing agent injector stuck Closed

Fault effects

No metering of the reducing agent

Diagnosis information DME control module P204700, P204800, P204900, P208E00

Reducing agent injector P204700, P204800, P204900

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

P207F00

Diagnosis information DME control module

Reducing agent P207F00

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Engine temperature**: at operating temperature
- **System for reducing agent injection**: ready for operation
- Temperature of the DeNOx catalytic converter 230 ... 349 °C (°F)
- **Sensor 1 for NOx** - No relevant fault in fault memory
- **Sensor 2 for NOx** - No relevant fault in fault memory
- particle filter not overloaded

Possible fault causes

♦ Fault in area **System for reducing agent injection**
► Remedy existing faults
♦ Reducing agent insufficient
♦ **Exhaust temperature sensor behind particle filter** Faulty
♦ **Intake system** Leak / leaks
♦ **Exhaust system** Leak / leaks
♦ Reducing agent injector: Spray pattern , Metered quantity incorrect
♦ **System pressure**
♦ DeNOx catalytic converter : Mechanical fault

Diagnosis information DME control module

Exhaust temperature sensor ahead of turbocharger

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Diagnostic conditions
- Ignition on
- Engine running

or

- Cold start after > 9 hours

then
- Engine running

- No temperature increase due to active auxiliary heater, block heater or intense solar irradiation

Fault setting condition(s)

- Average temperature difference over a given time between sensor and model value outside of permitted tolerance threshold

Monitored component or system

♦ **Exhaust temperature sensor** ahead of turbocharger

Possible fault causes

♦ Open circuit
♦ Short circuit to B+
♦ Short circuit to ground
♦ Loose contact or corrosion on connectors or lines
♦ **Exhaust temperature sensor upstream of catalytic converter** faulty

Setpoint definitions

NOTE

The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:

♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Diagnosis information DME control module
P20B500, P20B700, P20B800

External heater driver for reducing agent

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

P20B500
● Power peak detected when the tank heater is switched on. This generally takes place several seconds after the tank heater for the reducing agent is switched on.

P20B700, P20B800
● once per heating cycle

Possible fault causes

♦ Line between DME and external heater driver （Electrical fault）
♦ Line between external heater driver and heating element （Electrical fault）
♦ **External heater driver for reducing agent** Faulty
♦ Heating element Faulty
♦ **DME control module** Faulty

Fault effects

♦ No heating

Setpoint definitions

Diagnosis information DME control module

DeNOx catalytic converter P20EE00

INFORMATION
This fault can result from other faults in the system for reducing agent injection. Please remedy all existing fault memory entries relating to the system for reducing agent injection first.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Engine temperature**: at operating temperature
- **System for reducing agent injection**: ready for operation
- Temperature of the DeNOx catalytic converter 230 ... 349 °C (°F)
- **Sensor 1 for NOx** - No relevant fault in fault memory
- **Sensor 2 for NOx** - No relevant fault in fault memory
- particle filter not overloaded

Possible fault causes

- Reducing agent insufficient
- **Exhaust temperature sensor behind particle filter** Faulty
- **Intake system** Leak / leaks
- **Exhaust system** Leak / leaks
- Reducing agent injector: Spray pattern , Metered quantity incorrect
- **System pressure**
- DeNOx catalytic converter
- **Sensor 1 for NOx** or **Sensor 2 for NOx** Faulty

Diagnosis information DME control module

System for reducing agent injection P20F400, P20F500

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Engine temperature**: at operating temperature
- Temperature of the DeNOx catalytic converter > 220 °C (°F)
- **Vehicle speed** > 50 **km/h** (constant)

Possible fault causes

P20F400

♦ Fault in area **System for reducing agent injection**
► Remedy existing faults
♦ **Exhaust temperature sensor behind particle filter** Faulty
♦ Reducing agent injector: Spray pattern , Metered quantity incorrect
♦ **System pressure**
♦ DeNOx catalytic converter : poisoned (hydrocarbon inclusions)
♦ DeNOx catalytic converter : Mechanical fault

P20F500

♦ **System pressure**

Diagnosis information DME control module

P20FE00 Reducing-agent metering unit malfunction

Diagnostic conditions

- Reducing-agent temperature = 250...350 °C (482...662 °F)
- Diagnostics runs several times per driving cycle

Fault setting condition(s)

- The speed signal of the reducing-agent metering pump is used to assess whether a deviation occurs between the requested setpoint quantity and the actual quantity

Monitored component or system

♦ Metering valve

Fault finding notes

♦ Remove metering valve
♦ Check spray head and metering valve receptacle for deposits
♦ Deposits found? Yes: Take note of deposits and remove them
♦ No: Continue to measure metering quantity
♦ Quantity OK? Yes: Install metering valve and reset adaptation factor
♦ No: Replace metering valve

Function restrictions

♦ Less efficient NOx reduction

P210000

Diagnosis information DME control module

Throttle adjusting unit

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

or

- Control unit run-on (See ⓘ)

Possible fault causes

- Open circuit
- Short circuit to B+
- Short circuit to ground
- Loose contact or corrosion on connectors or lines
- **Throttle adjusting unit** Faulty

Fault effects

- none Particle filter regeneration

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- 5-volt power supply for signal line OK

P213800
- Control unit run-on (See)

P212200, P212300
- Ignition on

Possible fault causes

- Open circuit
- Short circuit to B+
- Short circuit to ground
- Loose contact or corrosion on connectors or lines
- **Pedal sensor** 1 faulty

Fault effects

- **Engine speed > 3,000 rpm, torque significantly reduced**

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
- Setpoint voltage **- 0.5 V** ⇒ **+ 0.5 V**

Short circuit to ground:

♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:

♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:

♦ Setpoint resistance **> 0.9 MOhm**

INFORMATION

After the ignition is switched off (terminal 15), the DME control unit switches to control unit after-run mode.
The run-on period depends on many boundary conditions (e.g. engine temperature for fan operation).
The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.

P212700

Diagnosis information DME control module

Pedal sensor 2

INFORMATION
Pedal sensor 1 and Pedal sensor 2 are combined in one component and are integrated in the accelerator pedal module.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- 5-volt power supply for signal line OK
- Ignition on

Possible fault causes

- Open circuit
- Short circuit to B+

- **Engine temperature**: at operating temperature

P229F
- Transition from load to overrun mode followed by long overrun phase

P22A0, P22A1, P220B
- NOx control active

Possible fault causes

♦ Lines/connections or **Sensor 2 for NOx**
♦ **Evaluation unit/control unit, sensor 2 for NOx**

Diagnosis information DME control unit

Sensor 2 for NOx
P220B, P229E, P229F, P22A0, P22A1

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

P229E
- Measured lambda value > 1
- Lambda control Active
- Exhaust gas temperature (to **Particle filter**) 99 ... 600 °C (210.2 … 1,112 °F)
- **Engine temperature**: at operating temperature

P229F
- Transition from load to overrun mode followed by long overrun phase

P22A0, P22A1, P220B
- NOx control active

Possible fault causes

♦ Lines/connections or **Sensor 2 for NOx**
♦ **Evaluation unit/control unit, sensor 2 for NOx**

Diagnosis information DME control unit

Sensor 2 for NOx
P220B, P229E, P229F, P22A0, P22A1

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

P229E
- Measured lambda value > 1
- Lambda control Active
- Exhaust gas temperature (to **Particle filter**) 99 ... 600 °C (210.2 … 1,112 °F)
- **Engine temperature**: at operating temperature

P229F
- Transition from load to overrun mode followed by long overrun phase

P22A0, P22A1, P220B
- NOx control active

Possible fault causes

♦ Lines/connections or **Sensor 2 for NOx**
♦ **Evaluation unit/control unit, sensor 2 for NOx**

Diagnosis information DME control unit

Sensor 2 for NOx
P220B, P229E, P229F, P22A0, P22A1

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

P229E
- Measured lambda value > 1
- Lambda control Active
- Exhaust gas temperature (to **Particle filter**) 99 ... 600 °C (210.2 … 1,112 °F)
- **Engine temperature**: at operating temperature

P229F
- Transition from load to overrun mode followed by long overrun phase

P22A0, P22A1, P220B
- NOx control active

Possible fault causes

♦ Lines/connections or **Sensor 2 for NOx**
♦ **Evaluation unit/control unit, sensor 2 for NOx**

Diagnosis information DME control unit

Sensor 2 for NOx Heating
P22A700

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Exhaust gas temperature (to **Particle filter**) 99 ... 600 °C (210 ... 1,112 °F)
- one time after fulfillment of the diagnostic conditions

Possible fault causes

- Lines/connections or **Sensor 2 for NOx**
- **Evaluation unit/control unit, sensor 2 for NOx**

P240F00

Diagnosis information DME control module

P240F00 Exhaust gas recirculation system - signal too slow

Diagnostic conditions

- Engine running

- Change in air mass
- Once per air mass jump

Fault setting condition(s)

- If there is a change in mass air flow, the actual value of the air mass only follows the setpoint value with a delay

Monitored component or system

♦ Exhaust gas recirculation system

Possible fault causes

♦ Fault in air system
♦ Changes in the intake tract
♦ Leaks or blockages in the intake and exhaust gas recirculation tract
♦ **Air flow sensor** Faulty

P241400

Diagnosis information DME control module

Oxygen sensor Bank 1

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- no fault entry
- Test drive with full throttle point

Possible fault causes

- ♦ Open circuit
- ♦ Short circuit to B+
- ♦ Short circuit to ground
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Charge-air system leaks
- ♦ Exhaust system leaks
- ♦ **Oxygen sensor Bank 1** faulty

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

P242500

Diagnosis information DME control module

Bypass valve for exhaust gas recirc. cooler

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

- ♦ Open circuit
- ♦ Short circuit to B+
- ♦ Short circuit to ground
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Bypass valve for exhaust gas recirc. cooler faulty

Fault effects

P242500, P242700
♦ Failure of bypass valve for exhaust gas recirc. cooler

P242600
♦ Permanent activation of bypass valve for exhaust gas recirc. cooler

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:

♦ Setpoint resistance **> 0.9 MOhm**

P242600

Diagnosis information DME control module

Bypass valve for exhaust gas recirc. cooler

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

- ♦ Open circuit
- ♦ Short circuit to B+
- ♦ Short circuit to ground
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Bypass valve for exhaust gas recirc. cooler faulty

Fault effects

P242500, P242700
- ♦ Failure of bypass valve for exhaust gas recirc. cooler

P242600
- ♦ Permanent activation of bypass valve for exhaust gas recirc. cooler

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

- ♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
- ♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
- ♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:

♦ Setpoint resistance **> 0.9 MOhm**

P242700

Diagnosis information DME control module

Bypass valve for exhaust gas recirc. cooler

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

- ♦ Open circuit
- ♦ Short circuit to B+
- ♦ Short circuit to ground
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Bypass valve for exhaust gas recirc. cooler faulty

Fault effects

P242500, P242700
- ♦ Failure of bypass valve for exhaust gas recirc. cooler

P242600
- ♦ Permanent activation of bypass valve for exhaust gas recirc. cooler

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
- ♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
- ♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
- ♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:

♦ Setpoint resistance **> 0.9 MOhm**

P242A00

Diagnosis information DME control module

Exhaust temperature sensor ahead of particle filter

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

P242B00
- Cold start (engine and ignition off > 9 hours)
- Test drive (at least 1 minute > 25 mph (40 km/h))

P242C00, P242D00
- Ignition on

Possible fault causes

- ♦ Open circuit
- ♦ Short circuit to B+
- ♦ Short circuit to ground
- ♦ Loose contact or corrosion on connectors or lines
- ♦ **Exhaust temperature sensor ahead of particle filter** faulty

Fault effects

- ♦ none Particle filter regeneration

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:

P242F00

Diagnosis information DME control module

Particle filter Bank 1

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

- **Particle filter** Bank 1 overloaded
- **Diff. pressure sensor** not installed correctly
- **Exhaust temperature sensor** not installed correctly

Fault effects

- Torque limitation
- none Exhaust gas recirculation
- none Particle filter regeneration

Diagnosis information DME control module

P244C00 - Bank 1 exhaust temperature too low for diesel particulate filter regeneration

Diagnostic conditions

- Diesel particulate filter regeneration is active
- Once in regeneration mode

Fault setting condition(s)

- Response time following regeneration request until exhaust gas temperature controller is active is out of tolerance

Monitored component or system

♦ Exhaust gas temperature sensor

Possible fault causes

♦ Exhaust temperature sensor downstream of catalytic converter
♦ Exhaust gas recirculation
♦ Throttle valve
♦ Injector/injectors
♦ Mass air flow sensor
♦ Diesel particulate filter
♦ Catalytic converter

P245200

Diagnosis information DME control module

Diff. pressure sensor / Pressure sensor 1 for exhaust

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

ⓘ INFORMATION

After the ignition is switched off (terminal 15), the DME control unit switches to control unit after-run mode.
The run-on period depends on many boundary conditions (e.g. engine temperature for fan operation).
The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.

Particle sensor Measuring electrode P24AE00, P24B000, P24B100, P24AF00

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

P24AE00, P24AF00
- Battery Voltage 11 ... 16V
- to Particle filter regeneration

P24B000
- Diagnostics active in the regeneration phase of the particle sensor (after self-cleaning)

P24B100
- Battery Voltage 11 ... 16V

Possible fault causes

- Electrical fault internal
- **Particle sensor** Function restriction

Diagnosis information DME control module

Particle sensor Heating current circuit P24B500, P24B600, P24B300

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

P24B500, P24B600
- Battery Voltage 11 ... 16 V

P24B300
- Battery Voltage 11 ... 16 V
- one time after fulfillment of the diagnostic conditions

Possible fault causes

- Electrical fault internal
- **Particle sensor** Function restriction

Diagnosis information DME control module

Particle sensor Heating current circuit P24B500, P24B600, P24B300

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

P24B500, P24B600
- Battery Voltage 11 ... 16 V

P24B300
- Battery Voltage 11 ... 16 V
- one time after fulfillment of the diagnostic conditions

Possible fault causes

- Electrical fault internal
- **Particle sensor** Function restriction

Diagnosis information DME control module

Particle sensor Heating current circuit P24B500, P24B600, P24B300

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

P24B500, P24B600
- Battery Voltage 11 ... 16 V

P24B300
- Battery Voltage 11 ... 16 V
- one time after fulfillment of the diagnostic conditions

Possible fault causes

- Electrical fault internal
- **Particle sensor** Function restriction

Diagnosis information DME control unit

Particle sensor Temperature recording P24C600, P24C700

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

P24C700
- Cold start (Switch-off time > 9 h)
- ► Drive for at least 60 s and drive at least 20 s of this at a speed of > 40 km/h (25 mph)

P24C600
- No fault entered for
  - ♦ Power supply **Particle sensor**
  - ♦ Communication **Particle sensor**
  - ♦ **Exhaust gas temperature sensor behind particle filter** -25 ... 800 °C (°F)

Possible fault causes

- **Particle sensor** not installed correctly
- **Particle sensor** Function restriction / Faulty

Diagnosis information DME control unit

Particle sensor Temperature recording P24C600, P24C700

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

P24C700
- Cold start (Switch-off time > 9 h)
- ► Drive for at least 60 s and drive at least 20 s of this at a speed of > 40 km/h (25 mph)

P24C600
- No fault entered for
  - ♦ Power supply **Particle sensor**
  - ♦ Communication **Particle sensor**
  - ♦ **Exhaust gas temperature sensor behind particle filter** -25 ... 800 °C (°F)

Possible fault causes

- **Particle sensor** not installed correctly
- **Particle sensor** Function restriction / Faulty

Diagnosis information DME control module

Particle sensor Supply voltage

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Battery Voltage 11 ... 16 V
- No fault entered for
  - ♦ CAN bus
  - ♦ Battery

Possible fault causes

- Electrical fault in circuit (**Sensor supply voltage**)
- **Particle sensor** Faulty

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V** ⇒ **+ 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

P253300

Diagnosis information - DME control module

Fault entry in the specified control unit

NOTE
Internal function test completed.

Diagnostic conditions

The control unit first tests internal function sequences upon wake-up. If they are OK, all diagnosable outputs are then tested and any faults are stored.
Wake-up of the control unit by:

- Event-controlled CAN message
- Wake-up signal via wake-up line
- Key contact (terminal S)
- "Ignition on"

Possible fault causes

- Incorrect coding of control unit
- The peripheral device connected to the specified control unit is faulty
- Control unit faulty (in most cases, faulty coding is the cause and not the control unit!)

Fault effects

- The specified control unit sends only substitute values via CAN
- Other control units detect these substitute values and set this fault code

P253500

Diagnosis information - DME control module

Fault entry in the specified control unit

NOTE
Internal function test completed.

Diagnostic conditions

The control unit first tests internal function sequences upon wake-up. If they are OK, all diagnosable outputs are then tested and any faults are stored.
Wake-up of the control unit by:

- Event-controlled CAN message
- Wake-up signal via wake-up line
- Key contact (terminal S)
- "Ignition on"

Possible fault causes

- Incorrect coding of control unit
- The peripheral device connected to the specified control unit is faulty
- Control unit faulty (in most cases, faulty coding is the cause and not the control unit!)

Fault effects

- The specified control unit sends only substitute values via CAN
- Other control units detect these substitute values and set this fault code

P256400

Diagnosis information DME control module

Position sensor for Boost pressure adjuster

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Control unit run-on (See ⓘ)

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line (Feedback line ▶ **DME control module**)
♦ Loose contact or corrosion on connectors or lines
♦ **Position sensor** Faulty

Fault effects

♦ none Particle filter regeneration
♦ Limp-home

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

INFORMATION

After the ignition is switched off (terminal 15), the DME control unit switches to control unit after-run mode.
The run-on period depends on many boundary conditions (e.g. engine temperature for fan operation).
The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.

P256500

Diagnosis information DME control module

Position sensor for Boost pressure adjuster

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Control unit run-on (See ⓘ)

♦ Setpoint resistance **> 0.9 MOhm**

INFORMATION

After the ignition is switched off (terminal 15), the DME control unit switches to control unit after-run mode.
The run-on period depends on many boundary conditions (e.g. engine temperature for fan operation).
The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.

P268A00

Diagnosis information DME control module

Injection valve Calibration

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Engine running

- This fault is set if no result of the zero-quantity calibration is supplied within the following time: 40 s

Possible fault causes

- Control deviation of the rail pressure too high
- **Speed sensor not** adapted (Crankshaft)

P2BA700

Diagnosis information DME control module

Tank for reducing agent empty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Terminal 15

Possible fault causes

♦ **Tank for reducing agent** empty
♦ **Sensor for reducing agent tank filling level** Function not available or available only to a limited extent / Faulty

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V** ⇒ **+ 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

P300700

Diagnosis information DME control module

Camshaft position sensor

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition off Ignition on

or

- Engine running

- none faults for crankshaft sensor

Possible fault causes

- Open circuit
- Short circuit to B+
- Short circuit to ground
- Loose contact or corrosion on connectors or lines
- Pickup (sensor) wheel not installed correctly , faulty
- **Camshaft position sensor** not installed correctly
- **Camshaft position sensor** faulty

Fault effects

- none camshaft control
- Crankshaft diagnosis disabled
- none camshaft adaptation

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
- Setpoint voltage **- 0.5 V** ⇒ **+ 0.5 V**

Short circuit to ground:

- Setpoint resistance **> 0.9 MOhm**

Open circuit:

- Setpoint resistance **< 2 Ohm**

Short circuit between lines:

- Setpoint resistance **> 0.9 MOhm**

P304000

Diagnosis information - DME control module

Transmission control unit fault

Diagnostic conditions

- Engine running

Possible fault causes

♦ Fault entry in the transmission control unit

P304300

Diagnosis information DME control module

Fuel pump module (Fuel-pump control)

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **Electric fuel pump** activate

Possible fault causes

- Open circuit
- Short circuit to B+
- Short circuit to ground
- Loose contact or corrosion on connectors or lines
- **Fuel pump module** faulty
- **Control module Fuel pump module** faulty

Fault effects

- **Engine failure**

Setpoint definitions

♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:

♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:

♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:

♦ Setpoint resistance **> 0.9 MOhm**

Diagnosis information - DME control module

Switch-over valve 2 Radiator Exhaust gas recirculation

Diagnostic conditions

- **Engine speed** 1,200 ... 2,500 1/min
- Injection quantity 9 ... 50 mg
- Exhaust gas recirculation < 90 %
- Exhaust gas recirculation Active
- **Exhaust gas temperature sensor behind particle filter** > 220 °C (°F)
- **Temperature** Exhaust gas recirculation < 350 °C (°F)
- one time after fulfillment of the diagnostic conditions

Possible fault causes

- **Vacuum system** (Activation)
- **Switch-over valve**
- **Radiator** Exhaust gas recirculation
- Temperature sensor/s Exhaust gas recirculation
- Micro catalytic converter Exhaust gas recirculation

Diagnosis information DME control module

Throttle adjusting unit

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

or

- Control unit run-on (See ⓘ)

Possible fault causes

- ♦ Open circuit
- ♦ Short circuit to B+
- ♦ Short circuit to ground
- ♦ Loose contact or corrosion on connectors or lines
- ♦ **Throttle adjusting unit** Faulty

Fault effects

- ♦ none Particle filter regeneration

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:

♦ Setpoint resistance **> 0.9 MOhm**

INFORMATION

After the ignition is switched off (terminal 15), the DME control unit switches to control unit after-run mode.
The run-on period depends on many boundary conditions (e.g. engine temperature for fan operation).
The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.

P334800

Diagnosis information DME control module

Electronic adjuster for turbocharger

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

The run-on period depends on many boundary conditions (e.g. engine temperature for fan operation).
The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.

Diagnosis information DME control module

C10A700 Rolling test mode detected

Diagnostic conditions

● Diagnostics runs continuously

Fault setting condition(s)

● Ignition on
● Tester requests deactivation
● No faults in the fault memory
● Gear-selector lever in neutral position
● Engine off
● Vehicle speed = 0 km/h (0 mph)
● Rolling test mode specifically deactivates functions and components to guarantee safe operation on the roller test stand and allow you to perform comparable fuel-efficiency test drives

Monitored component or system

♦ DME control unit

Fault finding notes

♦ Deactivate rolling test mode
♦ Read out DME control unit fault memory
♦ If the fault is still entered, replace the DME control unit

U000100

Diagnosis information - DME control module

Communication with CAN bus (drive)

ⓘ INFORMATION

♦ This fault entry was set when the **DME control module** could **not** communicate via the CAN bus (drive).
♦ The fact that the fault memory can be read out means that there is no problem with communication via the CAN bus (drive) at the moment.

Fault effects

♦ Communication no longer possible via the CAN bus.
♦ The radiator fans are running at full speed.

Possible fault causes

♦ Temporary short circuit or open circuit in CAN bus (drive)
♦ A control unit in the CAN bus (drive) system is faulty at times

U000200

Diagnosis information - DME control module

Communication with CAN bus (drive)

ⓘ INFORMATION

♦ This fault entry was set when the **DME control module** could **not** communicate via the CAN bus (drive).
♦ The fact that the fault memory can be read out means that there is no problem with communication via the CAN bus (drive) at the moment.

Fault effects

♦ Communication no longer possible via the CAN bus.
♦ The radiator fans are running at full speed.

Possible fault causes

♦ Temporary short circuit or open circuit in CAN bus (drive)
♦ A control unit in the CAN bus (drive) system is faulty at times

U010100

Diagnosis information DME control module

Communication with control unit not possible

NOTE
Internal function test completed.

Diagnostic conditions
The PAS control unit initially tests internal function sequences after wake-up. If they are OK, all diagnosable outputs are then tested and any faults are stored.
Wake-up of the control unit by:

- Event-controlled CAN message
- Key contact (terminal S)
- Ignition ON

Possible fault causes

- No control unit power supply
- Incorrect coding of control unit
- Short circuit or open circuit in CAN network
- Control unit faulty (in most cases, faulty coding is the cause and not the control unit!)

Fault effects

- Communication no longer possible via the CAN bus
- The control unit can no longer be addressed by any other control unit

U010600

Diagnosis information DME control module

Control unit for automatic glow time: communication

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- The electrical fault LinBusOff must not be active.
- no incorrect Control unit for automatic glow time: installed
- Ignition on

Possible fault causes

- Open circuit
- Short circuit to B+
- Short circuit to ground
- Loose contact or corrosion on connectors or lines
- **Control unit for automatic glow time:** faulty

Fault effects

- Preglow system does not function
- Poor Engine can be started
- Smoke may come from engine during start-up

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

- The specified control unit sends only substitute values via CAN
- Other control units detect these substitute values and set this fault code

U041900

Diagnosis information - DME control module

Fault entry in the specified control unit

NOTE
Internal function test completed.

Diagnostic conditions

The control unit first tests internal function sequences upon wake-up. If they are OK, all diagnosable outputs are then tested and any faults are stored.
Wake-up of the control unit by:

- Event-controlled CAN message
- Wake-up signal via wake-up line
- Key contact (terminal S)
- "Ignition on"

Possible fault causes

- Incorrect coding of control unit
- The peripheral device connected to the specified control unit is faulty
- Control unit faulty (in most cases, faulty coding is the cause and not the control unit!)

Fault effects

- The specified control unit sends only substitute values via CAN
- Other control units detect these substitute values and set this fault code

Diagnosis information - DME control module

Fault entry in the specified control unit

NOTE
Internal function test completed.

Diagnostic conditions

The control unit first tests internal function sequences upon wake-up. If they are OK, all diagnosable outputs are then tested and any faults are stored.
Wake-up of the control unit by:

- Event-controlled CAN message
- Wake-up signal via wake-up line
- Key contact (terminal S)
- "Ignition on"

Possible fault causes

- Incorrect coding of control unit
- The peripheral device connected to the specified control unit is faulty
- Control unit faulty (in most cases, faulty coding is the cause and not the control unit!)

Fault effects

- The specified control unit sends only substitute values via CAN
- Other control units detect these substitute values and set this fault code

Diagnosis information - DME control module

Ambient temperature via CAN

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on > 5 Second(s)

Possible fault causes

♦ **Gateway control module** incorrect (See ⓘ)

♦ Message via CAN Faulty or missing

Fault setting condition(s)

- No time information from the gateway control unit (0.5 ... 5 Second(s)).

and

- There is also no other available time information via satellite (e.g. via garage).

Fault effects

♦ Substitute value from model
♦ Positive crankcase ventilation is continuously activated if a fault is present when recording the ambient temperature.

P000A

Diagnostic information - DME (DFI) control unit

Bank 1 intake camshaft adjustment

Diagnostic conditions
- Perform a short test

or:
- **Engine oil temperature** -10 ... +120 °C (14 … 248 °F)
- **Engine speed** 1,200 ... 6,000 rpm
- None of the following faults stored: P0010, P0020, P2088, P2089, P2092, P2093

Possible fault causes
- ♦ Dynamic driving style when oil level is near minimum (oil foaming)
- ♦ Solenoid valve for hydraulic camshaft adjustment faulty
  ⇒ (e.g. mechanical fault or dirt (oil circuit))
- ♦ Engine oil pressure too low
  ⇒ (e.g. oil thinning, oil thickening, wrong oil quality, oil pressure control or oil pump faulty)
- ♦ Camshaft adjustment faulty
- ♦ Intake camshaft stuck

Fault setting condition(s)
- Actual value/setpoint deviation > 10° on intake camshaft

or
- Intake camshaft adjustment slow

Diagnostic information - DME (DFI) control unit

Bank 2 intake camshaft adjustment

Diagnostic conditions
- Perform a short test

or:
- Engine oil temperature -10 ... +120 °C (14 … 248 °F)
- Engine speed 1,200 .... 6,000 rpm
- None of the following faults stored: P0010, P0020, P2088, P2089, P2092, P2093

Possible fault causes
- Dynamic driving style when oil level is near minimum (oil foaming)
- Solenoid valve for hydraulic camshaft adjustment faulty
  ⇒ (e.g. mechanical fault or dirt (oil circuit))
- Engine oil pressure too low
  ⇒ (e.g. oil thinning, oil thickening, wrong oil quality, oil pressure control or oil pump faulty)
- Camshaft adjustment faulty
- Intake camshaft stuck

Fault setting condition(s)
- Actual value/setpoint deviation > 10° on intake camshaft

or
- Intake camshaft adjustment slow

P0010

Diagnostic information - DME (DFI) control unit

Intake camshaft adjustment output stage, bank 1

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

Diagnostic information - DME (DFI) control unit

Bank 1 intake camshaft adjustment

Diagnostic conditions
- Perform a short test

or:
- **Engine oil temperature** -10 ... +120 °C (14 … 248 °F)
- **Engine speed** 1,200 ... 6,000 rpm
- None of the following faults stored: P0010, P0020, P2088, P2089, P2092, P2093

Possible fault causes
- ♦ Dynamic driving style when oil level is near minimum (oil foaming)
- ♦ Solenoid valve for hydraulic camshaft adjustment faulty
  ⇒ (e.g. mechanical fault or dirt (oil circuit))
- ♦ Engine oil pressure too low
  ⇒ (e.g. oil thinning, oil thickening, wrong oil quality, oil pressure control or oil pump faulty)
- ♦ Camshaft adjustment faulty
- ♦ Intake camshaft stuck

Fault setting condition(s)
- Actual value/setpoint deviation > 10° on intake camshaft

or
- Intake camshaft adjustment slow

P0013

Diagnostic information - DME (DFI) control unit

Bank 1 exhaust camshaft adjustment output stage

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

P0016

Diagnostic information - DME (DFI) control unit

Crankshaft position in relation to bank 1 intake camshaft

Diagnostic conditions
- Time since engine start > 10 second(s)

Possible fault causes
- Timing set incorrectly
- Timing chain stretched
- Camshaft adjustment faulty (locking)
- Hall sender rotor (camshaft) wrong or damaged
- Intake camshaft sensor wrong

Fault setting condition(s)
- Adaptation not within the valid value range

P0018

Diagnostic information - DME (DFI) control unit

Crankshaft position in relation to bank 2 intake camshaft

Diagnostic conditions
- Time since engine start > 10 second(s)

Possible fault causes
- ♦ Timing set incorrectly
- ♦ Timing chain stretched
- ♦ Camshaft adjustment faulty (locking)
- ♦ Hall sender rotor (camshaft) wrong or damaged
- ♦ Intake camshaft sensor wrong

Fault setting condition(s)
- Adaptation not within the valid value range

P0020

Diagnostic information - DME (DFI) control unit

Intake camshaft adjustment output stage, bank 2

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- ♦ Short circuit to B+/ground or open circuit in the line (activation)
- ♦ Short circuit to ground or open circuit in the lines (power supply)
- ♦ Fuse faulty
- ♦ Solenoid valve for hydraulic camshaft adjustment faulty

Diagnostic information - DME (DFI) control unit

Bank 2 intake camshaft adjustment

Diagnostic conditions
- Perform a short test

or:
- Engine oil temperature -10 ... +120 °C (14 … 248 °F)
- Engine speed 1,200 .... 6,000 rpm
- None of the following faults stored: P0010, P0020, P2088, P2089, P2092, P2093

Possible fault causes
- Dynamic driving style when oil level is near minimum (oil foaming)
- Solenoid valve for hydraulic camshaft adjustment faulty
  ⇒ (e.g. mechanical fault or dirt (oil circuit))
- Engine oil pressure too low
  ⇒ (e.g. oil thinning, oil thickening, wrong oil quality, oil pressure control or oil pump faulty)
- Camshaft adjustment faulty
- Intake camshaft stuck

Fault setting condition(s)
- Actual value/setpoint deviation > 10° on intake camshaft

or
- Intake camshaft adjustment slow

P0023

Diagnostic information - DME (DFI) control unit

Bank 2 exhaust camshaft adjustment output stage

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

P0030

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor upstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

● Engine running > 10 second(s)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor upstream of catalytic converter, bank 1
faulty

P0031

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor upstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

● Engine running > 10 second(s)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor upstream of catalytic converter, bank 1
faulty

P0032

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor upstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

● Engine running > 10 second(s)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor upstream of catalytic converter, bank 1
faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor downstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 10 second(s)
- Oxygen sensor heater active

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor downstream of catalytic converter, bank 1
faulty

P0037

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor downstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 10 second(s)
- Oxygen sensor heater active

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor downstream of catalytic converter, bank 1
faulty

P0038

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor downstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 10 second(s)
- Oxygen sensor heater active

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor downstream of catalytic converter, bank 1
faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor(s) upstream of catalytic converter interchanged

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Lambda control active
- Driving with:
  - small valve lift (See Actual value A220)
  - large valve lift (See Actual value A220)

Possible fault causes

♦ Oxygen sensors upstream of catalytic converter bank 1 and bank 2 interchanged

Diagnostic information - DME (DFI) control unit

Oxygen sensor(s) downstream of catalytic converter interchanged

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Steady driving > 20 minute(s) at:
  - approx. 80 km/h (50 mph)
  - in the highest gear
  - Lambda control (behind catalytic converter) active

Possible fault causes

♦ Oxygen sensors downstream of catalytic converter bank 1 and bank 2 interchanged

P0049

Diagnostic information - DME (DFI) control unit

Turbocharger governor

Diagnostic conditions
- Full-load acceleration

Possible fault causes
- Ambient pressure too low (e.g. at high altitude)
- Boost pressure too high (P0234) at high altitude

Fault setting condition(s)
Turbocharger exceeds speed limits ⇒ approx. 170,000 ... 180,000 rpm (See ⓘ)

Fault effects
- Reduced engine torque
- Wastegate open

ⓘ INFORMATION
The turbocharger's speed is calculated from various input variables.

P0050

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor upstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

● Engine running > 10 second(s)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor upstream of catalytic converter, bank 2
faulty

P0051

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor upstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

● Engine running > 10 second(s)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor upstream of catalytic converter, bank 2
faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor upstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

● Engine running > 10 second(s)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor upstream of catalytic converter, bank 2
faulty

P0053

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater upstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 10 minute(s) with:
  - Engine at operating temperature
  - at least 1 overrun phase(s) > 6 second(s)
- then idling > 40 second(s)

Possible fault causes

♦ Electrical fault in electric circuit (short circuit) for oxygen sensor heater

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

P0056

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor downstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 10 second(s)
- Oxygen sensor heater active

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor downstream of catalytic converter, bank 2
faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor downstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 10 second(s)
- Oxygen sensor heater active

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor downstream of catalytic converter, bank 2 faulty

P0058

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor downstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 10 second(s)
- Oxygen sensor heater active

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor downstream of catalytic converter, bank 2
faulty

P0059

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater upstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 10 minute(s) with:
  - Engine at operating temperature
  - at least 1 overrun phase(s) > 6 second(s)
- then idling > 40 second(s)

Possible fault causes

♦ Electrical fault in electric circuit (short circuit) for oxygen sensor heater

♦ Oxygen sensor upstream of catalytic converter bank 2 faulty

P0068

Diagnostic information - DME (DFI) control unit

Mass air flow implausible

ⓘ INFORMATION

Totals fault

One or more additional faults are entered that more precisely indicate the operating ranges in which the fault occurred.

- Near idle speed range:
  - ♦ P1069 + P1070 + P1071 + P1072 + P1073
- Lower partial-load range :
  - ♦ P1074 + P1075
- Upper partial-load range :
  - ♦ P1076 + P1077

P0069

Diagnostic information - DME (DFI) control unit

Intake manifold pressure sensor implausible

Diagnostic conditions
- Ignition on > 10 second(s)
- then: Acceleration with wide-open throttle for as long as possible, immediately followed by an overrun phase lasting as long as possible
- None of the following faults stored: P1638, P1639, P0107, P0108, P2228, P2229, P1183, P1184, P1187, P1188, P1189, P1190

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Ground supply faulty
- Intake manifold pressure sensor faulty

- **ONLY** for '**40-Time after Start**' greater than **0** (see Extended fault memory):
  - Throttle valve adjusting unit soiled

Fault effects
- Substitute value from model

Diagnostic information - DME (DFI) control unit

Ambient temperature via CAN

Diagnostic conditions
- NO fault stored in the DME (DFI) control unit
- Driving > 80 km/h (49 mph) for > 15 minute(s)
- then driving > 1 minute(s) under the following conditions:
  - Coolant temperature 47 ... 108 °C (116 … 226 °F)
  - Engine speed 1,200 ... 4,000 rpm
  - Vehicle speed 40 ... 180 km/h (24 … 111 mph)

Possible fault causes
- ♦ Ambient temperature incorrect (sensor trimming incorrect/faulty)
- ♦ Intake air temperature incorrect (sensor trimming incorrect/faulty)
- Turbo only:
  - ♦ Charge-air cooler blocked, faulty, modified …

Fault setting condition(s)

ⓘ INFORMATION

The temperature model depends mainly on the measured intake air temperature.
- Deviation between ambient temperature via CAN and substitute value from model > 25 °C (77 °F)

Fault effects

♦ Substitute value from model
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

Diagnostic information - DME (DFI) control unit

Ambient temperature via CAN

Diagnostic conditions
- Ignition on > 5 second(s)

Possible fault causes
♦ Outside temperature sensor fault (See Fault memory for air-conditioning system regulator)

Fault setting condition(s)
Outside temperature sensor fault (See Fault memory for **air-conditioning system regulator**)

Fault effects
♦ Substitute value from model
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

Diagnostic information - DME (DFI) control unit

Ambient temperature via CAN

Diagnostic conditions
- Ignition on > 5 second(s)

Possible fault causes
♦ Outside temperature sensor fault (See Fault memory for air-conditioning system regulator)

Fault setting condition(s)
Outside temperature sensor fault (See Fault memory for **air-conditioning system regulator**)

Fault effects
♦ Substitute value from model
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

P0076

Diagnostic information - DME (DFI) control unit

Valve lift control driver, bank 1

Diagnostic conditions
- Idle speed > 10 second(s)
- then increase engine speed until the large valve lift has been switched (See Actual value A220)

Possible fault causes
- ♦ Short circuit to B+/ground or open circuit in the line (activation)
- ♦ Short circuit to ground or open circuit in the lines (power supply)
- ♦ Fuse faulty
- ♦ Solenoid valve for hydraulic valve lift control faulty

P0077

Diagnostic information - DME (DFI) control unit

Valve lift control driver, bank 1

Diagnostic conditions
- Idle speed > 10 second(s)
- then increase engine speed until the large valve lift has been switched (See Actual value A220)

Possible fault causes
- ♦ Short circuit to B+/ground or open circuit in the line (activation)
- ♦ Short circuit to ground or open circuit in the lines (power supply)
- ♦ Fuse faulty
- ♦ Solenoid valve for hydraulic valve lift control faulty

P0082

Diagnostic information - DME (DFI) control unit

Valve lift control driver, bank 2

Diagnostic conditions
- Idle speed > 10 second(s)
- then increase engine speed until the large valve lift has been switched (See Actual value A220)

Possible fault causes
- ♦ Short circuit to B+/ground or open circuit in the line (activation)
- ♦ Short circuit to ground or open circuit in the lines (power supply)
- ♦ Fuse faulty
- ♦ Solenoid valve for hydraulic valve lift control faulty

P0083

Diagnostic information - DME (DFI) control unit

Valve lift control driver, bank 2

Diagnostic conditions
- Idle speed > 10 second(s)
- then increase engine speed until the large valve lift has been switched (See Actual value A220)

Possible fault causes
- ♦ Short circuit to B+/ground or open circuit in the line (activation)
- ♦ Short circuit to ground or open circuit in the lines (power supply)
- ♦ Fuse faulty
- ♦ Solenoid valve for hydraulic valve lift control faulty

P0089

Diagnostic information - DME (DFI) control unit

Fuel low pressure implausible

Diagnostic conditions
- Engine running > 2 second(s)
- Engine temperature 60 ... 110 °C (140 ... 230 °F)

Possible fault causes
- ♦ Fuel tank (driven) empty
  - ► See Extended fault memory
  - ⇒ Actual value **40-Fuel Level Input** [**0%**]
- ♦ Fuel filter clogged up
- ♦ Fuel line kinked/trapped
- ♦ Pressure relief valve in fuel delivery unit leaking
- ♦ Fuel delivery unit leaking
- ♦ Electric fuel pump faulty
- ♦ Fuel low-pressure sensor out of adjustment

Fault setting condition(s)
Setpoint-to-actual comparison of fuel pump control unit activation.
♦ If the actual fuel low-pressure value cannot follow the setpoint or cannot follow it quickly enough, a fault entry is made for a deviation of the actual fuel low-pressure value of:
- > 1,200 hPa below the setpoint for > 15 seconds

or
- > 2,400 hPa above the setpoint for > 15 seconds

P008A

Diagnostic information - DME (DFI) control unit

Fuel low-pressure system pressure too low

Diagnostic conditions
- Engine running > 2 second(s)

Possible fault causes
- ♦ Fuel tank (driven) empty
  - ► See Extended fault memory
  - ⇒ Actual value **40-Fuel Level Input** [**0%**]
- ♦ Fuel line detached
- ♦ Electric fuel pump faulty
- ♦ Fuel low-pressure sensor faulty

Fault setting condition(s)
Actual fuel low pressure value below 3,000 hPa minimum pressure for 0.7 seconds.

P008B

Diagnostic information - DME (DFI) control unit

Fuel low-pressure system pressure too high

Diagnostic conditions
- Engine running > 2 second(s)

Possible fault causes
- ♦ Fuel low-pressure sensor faulty
- ♦ Fuel high-pressure pump faulty (supplies high pressure to low-pressure side)

Fault setting condition(s)
Actual fuel low pressure value above 9,000 hPa maximum pressure for 0.7 seconds.
ⓘ The pressure relief valve in the fuel delivery unit opens at approx. 7,000 hPa.

P0090

Diagnostic information - DME (DFI) control unit

Bank 1 quantity control valve output stage

Diagnostic conditions
- Ignition on > 5 second(s)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Quantity control valve faulty (in bank 1 fuel high-pressure pump)

P0091

Diagnostic information - DME (DFI) control unit

Bank 1 quantity control valve output stage

Diagnostic conditions
- Ignition on > 5 second(s)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Quantity control valve faulty (in bank 1 fuel high-pressure pump)

P0092

Diagnostic information - DME (DFI) control unit

Bank 1 quantity control valve output stage

Diagnostic conditions
- Ignition on > 5 second(s)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Quantity control valve faulty (in bank 1 fuel high-pressure pump)

Diagnostic information - DME (DFI) control unit

Intake manifold pressure sensor implausible

Diagnostic conditions
- Ignition on > 10 second(s)
- then: Acceleration with wide-open throttle for as long as possible, immediately followed by an overrun phase lasting as long as possible
- None of the following faults stored: P1638, P1639, P0107, P0108, P2228, P2229, P1183, P1184, P1187, P1188, P1189, P1190

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Ground supply faulty
- Intake manifold pressure sensor faulty

- **ONLY** for '**40-Time after Start**' greater than **0** (see Extended fault memory):
  - Throttle valve adjusting unit soiled

Fault effects
- Substitute value from model

Diagnostic information - DME (DFI) control unit

Intake manifold pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running
- None of the following faults stored: P0234

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Ground supply faulty
- ♦ Intake manifold pressure sensor faulty

- **Turbo only**
  - Only if fault P1638 or P1639 (boost pressure sensor) is entered at the same time:
- ♦ Leak in vacuum hose at boost pressure control cycle valve or wastegate
- ♦ Boost pressure control cycle valve leaking
- ♦ Wastegate leaking

Fault effects
- ♦ Substitute value from model

Diagnostic information - DME (DFI) control unit

Intake manifold pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running
- None of the following faults stored: P0234

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Ground supply faulty
- ♦ Intake manifold pressure sensor faulty

- **Turbo only**
  - Only if fault P1638 or P1639 (boost pressure sensor) is entered at the same time:
- ♦ Leak in vacuum hose at boost pressure control cycle valve or wastegate
- ♦ Boost pressure control cycle valve leaking
- ♦ Wastegate leaking

Fault effects
- ♦ Substitute value from model

Diagnostic information - DME (DFI) control unit

Intake air temperature implausible

Diagnostic conditions
- Vehicle has NOT been and is NOT standing in the sun.
- Engine off > 9 hour(s)
- Engine coolant temperature cooling > 35 °C (95 °F), with:
  - Engine off
- then cold start, at:
  - Coolant temperature < 37 °C (98.6 °F)
  - Difference between intake air temperature <=> engine coolant temperature < 6 °C (42.8 °F)
- then driving, with:
  - Engine running > 23 minute(s)
  - Distance driven > 7 km (4 mi.)
  - Engine coolant temperature up to > 94 °C (201 °F)

Possible fault causes
- ♦ Intake air temperature sensor faulty (in intake manifold pressure sensor)
- ♦ Resistor installed (instead of intake air temperature sensor)

Fault setting condition(s)
- Change in intake air temperature < 1.5 °C (34.7 °F), at:
  - Diagnostic conditions

Fault effects
- ♦ Substitute coolant temperature value

P0112

Diagnostic information - DME (DFI) control unit

Intake air temperature sensor: electrical fault

Diagnostic conditions
- Engine running > 2 minute(s)
- Mass air flow < 150 kg/h

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Intake air temperature sensor faulty

Fault effects
- ♦ Substitute value from model

P0113

Diagnostic information - DME (DFI) control unit

Intake air temperature sensor: electrical fault

Diagnostic conditions
- Engine running > 2 minute(s)
- Mass air flow < 150 kg/h

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Intake air temperature sensor faulty

Fault effects
- ♦ Substitute value from model

P0114

Diagnostic information - DME (DFI) control unit

Intake air temperature sensor: electrical fault

Diagnostic conditions
- Ignition on > 10 second(s)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Intake air temperature sensor faulty

Diagnostic information - DME (DFI) control unit

Engine coolant temperature implausibly high

Diagnostic conditions
- Thermal management system test (if available)

or
- Driving with:
  - Engine start temperature > 35 °C (95 °F)
  - Engine speed > 1,300 rpm
  - Vehicle speed > 40 km/h (24 mph)
  - Cooling performance high and low
- Then vehicle standstill, with:
  - Idle speed > 75 second(s)
- None of the following faults stored: P0117, P0118, P0119, P3081, P3082

Possible fault causes
- ♦ Engine coolant temperature sensor faulty
- ♦ Resistor installed (instead of coolant temperature sensor)

Fault setting condition(s)
- Change in engine coolant temperature < setpoint value (See ⓘ)

ⓘ INFORMATION
Change in setpoint value = depending on engine start temperature

Diagnostic information - DME (DFI) control unit

Engine coolant temperature sensor: electrical fault

Diagnostic conditions
- Ignition on

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Engine coolant temperature sensor faulty

Fault setting condition(s)
- Engine coolant temperature (measured) < -40 °C (-40 °F) (P0117), with:
  - Ignition on or engine running

  and
  - Intake air temperature > -30 °C (-22 °F)

  or
  - Engine running > 300 second(s)

or
- Engine coolant temperature (measured) > +130 °C (266 °F) (P0118), with:
  - Ignition on or engine running

Diagnostic information - DME (DFI) control unit

Engine coolant temperature sensor: electrical fault

Diagnostic conditions
- Ignition on

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Engine coolant temperature sensor faulty

Fault setting condition(s)
- Engine coolant temperature (measured) < -40 °C (-40 °F) (P0117), with:
  - Ignition on or engine running

  and
  - Intake air temperature > -30 °C (-22 °F)

  or
  - Engine running > 300 second(s)

or
- Engine coolant temperature (measured) > +130 °C (266 °F) (P0118), with:
  - Ignition on or engine running

P0119

Diagnostic information - DME (DFI) control unit

Engine coolant temperature sensor: loose contact

Diagnostic conditions
- Ignition on
- None of the following faults stored: P0117, P0118

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Engine coolant temperature sensor faulty

Fault setting condition(s)
- Engine coolant temperature: Actual-value jumps > 3 °C (37 °F)

Fault effects
- Substitute value = last actual value that was detected as OK, with:
  - Actual-value jumps > 9.75 °C (49.5 °F)

Diagnostic information - DME (DFI) control unit

Accelerator pedal potentiometer implausible

Diagnostic conditions
- Ignition on > 3 second(s)
- then accelerator pedal pressed down fully > 3 second(s)
- then release accelerator pedal fully
- then idling > 10 second(s)

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in wiring to potentiometer 1 or 2
- ♦ Accelerator pedal potentiometer 1 or 2 faulty

Fault setting condition(s)
- The two potentiometer values differ too greatly from each other.
- It is not clear which value is incorrect.

Fault effects
- ♦ Engine does not respond to throttle, engine speed 1,000 rpm

P0122

Diagnostic information - DME (DFI) control unit

Accelerator pedal potentiometer 1

Diagnostic conditions
- Ignition on > 3 second(s)
- then accelerator pedal pressed down fully > 3 second(s)
- then release accelerator pedal fully
- then idling > 10 second(s)

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in wiring to potentiometer 1
- ♦ Accelerator pedal potentiometer 1 faulty

Fault effects
- ♦ The accelerator pedal angle is calculated from the remaining potentiometer signal.
- ♦ No acceleration initially + increased idle speed (approx. 800 rpm)
  - ▶ until the accelerator pedal is released fully.
  - ♦ Then acceleration, with
    - ♦ significantly reduced engine torque (max. approx.100 ... 180 Nm)
    - ♦ and limited engine speed (max. approx. 5,000 rpm)
  - ♦ If the accelerator and brake are pressed at the same time, the engine will run at idle speed.

P0123

Diagnostic information - DME (DFI) control unit

Accelerator pedal potentiometer 1

Diagnostic conditions
- Ignition on > 3 second(s)
- then accelerator pedal pressed down fully > 3 second(s)
- then release accelerator pedal fully
- then idling > 10 second(s)

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in wiring to potentiometer 1
- ♦ Accelerator pedal potentiometer 1 faulty

Fault effects
- ♦ The accelerator pedal angle is calculated from the remaining potentiometer signal.
- ♦ No acceleration initially + increased idle speed (approx. 800 rpm)
  - ▶ until the accelerator pedal is released fully.
  - ♦ Then acceleration, with
    - ♦ significantly reduced engine torque (max. approx.100 ... 180 Nm)
    - ♦ and limited engine speed (max. approx. 5,000 rpm)
  - ♦ If the accelerator and brake are pressed at the same time, the engine will run at idle speed.

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

● Idling > 3 second(s)

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

● Idling > 3 second(s)

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter bank 1, dynamic response

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Engine running > 2 minute(s) with:
  - Engine at operating temperature
  - All oxygen sensor(s) ready for operation
- then steady driving > 10 minute(s) at:
  - Engine speed < 800 ... 3,200 rpm
  - Mass air flow 120 … 520 mg/stroke
  - No overrun phase(s)

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Different air flow to oxygen sensor downstream of catalytic converter if:

  ♦ Catalytic converter is damaged

  ♦ Components modified or non-genuine components

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty (aged)

P0135

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater circuit upstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running, with:
  - **Oxygen sensor heater** downstream of catalytic converter active > 180 second(s)
  - Lambda control active
- None of the following faults stored: P0030, P0031, P0032

Possible fault causes

♦ Contact resistance (power supply or activation)

♦ Shunt (high resistance) in heater circuit ⇒ Signal line

♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Driving with:
  - Engine at operating temperature
  - Overrun phase(s)

Possible fault causes

♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 2 minute(s) with:
  - Engine at operating temperature
  - Mass air flow > 10 kg/h
- then idling > 30 second(s)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line

♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

P0138

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 2 minute(s) with:
  - Engine at operating temperature
  - Mass air flow > 10 kg/h
- then idling > 30 second(s)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line

♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

P013A

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Driving with:
  - Engine at operating temperature
  - Overrun phase(s)

Possible fault causes

♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

P013B

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Driving with:
  - Engine at operating temperature
  - Overrun phase(s)

Possible fault causes

♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Driving with:
  - Engine at operating temperature
  - Overrun phase(s)

Possible fault causes

♦ Oxygen sensor downstream of catalytic converter, bank 2 faulty

P013D

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Driving with:
  - Engine at operating temperature
  - Overrun phase(s)

Possible fault causes

♦ Oxygen sensor downstream of catalytic converter, bank 2 faulty

P013E

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence

or

- Engine temperature > 60 °C (140 °F)
- Time since engine start > 10 second(s)
- Catalytic converter temperature 540 ... 750 °C (1,004 ... 1,382 °F)
- Drive for 60 seconds with slight acceleration at 40 ... 130 km/h (24 … 80 mph)
- Active carbon filter loading < 0.7
- Engine speed < 3,000 rpm
- Lambda control ahead of catalytic converter active
- Lambda control behind catalytic converter active
- None of the following faults stored: Oxygen sensor(s) - electrical fault, intake manifold pressure sensor or throttle adjusting unit

Possible fault causes

♦ Different air flow to oxygen sensor downstream of catalytic converter if:
  ♦ Catalytic converter is damaged
  ♦ Components modified or non-genuine components

Fault setting condition(s)

- Excessive time offset during edge changes between the lean and rich cycle or between the rich and lean cycle.

P013F

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line

♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

P0141

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater circuit downstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running, with:
  - **Oxygen sensor heater** downstream of catalytic converter active > 180 second(s)
  - Lambda control active
- None of the following faults stored: P0036, P0037, P0038

Possible fault causes

♦ Contact resistance (power supply or activation)

♦ Shunt (high resistance) in heater circuit ⇒ Signal line

♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

P014A

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

● Perform all short tests in sequence

or

● Engine temperature > 60 °C (140 °F)
● Time since engine start > 10 second(s)
● Catalytic converter temperature 540 ... 750 °C (1,004 ... 1,382 °F)
● Drive for 60 seconds with slight acceleration at 40 ... 130 km/h (24 … 80 mph)
● Active carbon filter loading < 0.7
● Engine speed < 3,000 rpm
● Lambda control ahead of catalytic converter active
● Lambda control behind catalytic converter active
● None of the following faults stored: Oxygen sensor(s) - electrical fault, intake manifold pressure sensor or throttle adjusting unit

Possible fault causes

♦ Different air flow to oxygen sensor downstream of catalytic converter if:
  ♦ Catalytic converter is damaged
  ♦ Components modified or non-genuine components

Fault setting condition(s)

● Excessive time offset during edge changes between the lean and rich cycle or between the rich and lean cycle.

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

● Idling > 3 second(s)

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line

♦ Oxygen sensor upstream of catalytic converter bank 2 faulty

P0152

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

● Idling > 3 second(s)

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line

♦ Oxygen sensor upstream of catalytic converter bank 2 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter bank 2, dynamic response

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 2 minute(s) with:
  - Engine at operating temperature
  - All oxygen sensor(s) ready for operation
- then steady driving > 10 minute(s) at:
  - Engine speed < 800 ... 3,200 rpm
  - Mass air flow 120 … 520 mg/stroke
  - No overrun phase(s)

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Different air flow to oxygen sensor downstream of catalytic converter if:

♦ Catalytic converter is damaged

♦ Components modified or non-genuine components

♦ Oxygen sensor upstream of catalytic converter bank 2 faulty (aged)

P0155

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater circuit upstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running, with:
  - **Oxygen sensor heater** downstream of catalytic converter active > 180 second(s)
  - Lambda control active
- None of the following faults stored: P0050, P0051, P0052

Possible fault causes

Oxygen sensor heater circuit downstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running, with:
  - **Oxygen sensor heater** downstream of catalytic converter active > 180 second(s)
  - Lambda control active
- None of the following faults stored: P0056, P0057, P0058

Possible fault causes

♦ Contact resistance (power supply or activation)

♦ Shunt (high resistance) in heater circuit ⇒ Signal line

♦ Oxygen sensor downstream of catalytic converter, bank 2 faulty

P0171

Diagnostic information - DME (DFI) control unit

Lambda control adaptation, bank 1: system too lean

Diagnostic conditions
- Short test

or:
- Lambda control active
- Lambda control adapted
- Engine temperature > 60 °C (140 °F)
- Intake air temperature < 80 °C (176 °F)
- Engine running > 45 second(s), at:
  - Engine speed < 800 rpm
- then drive with different operating conditions in the lower and upper load ranges with valve lift switchover from small lift to large lift (A220).

Possible fault causes
- ♦ Leak in exhaust system (engine ⇒ oxygen sensor upstream of catalytic converter)
- ♦ Exhaust system constricted/blocked
- ♦ Fuel injector faulty (mechanical fault)
- ♦ Timing set incorrectly
- ♦ Fault in areas: fuel high pressure, intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, Intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment

Fault setting condition(s)
The diagnostic function should indicate a deviation of more than 30% (3.5 mg/stroke in the range near idle) of the lambda control adaptation + 30% deviation of the lambda controller for longer than 30 seconds.
(positive deviation ⇒ enrichment)

ⓘ INFORMATION
Opposed adaptation values in connection with misfires indicate that the timing is out of adjustment.

P0172

Diagnostic information - DME (DFI) control unit

Lambda control adaptation, bank 1: system too rich

Diagnostic conditions
- Short test

or
- Lambda control active
- Lambda control adapted
- Engine temperature > 60 °C (140 °F)
- Intake air temperature < 80 °C (176 °F)
- Engine running > 45 second(s), at:
  - Engine speed < 800 rpm
- then drive with different operating conditions in the lower and upper load ranges with valve lift switchover from small lift to large lift (A220).

Possible fault causes
- ♦ High fuel content in engine oil.
- ♦ Leak in exhaust system (engine ⇒ oxygen sensor upstream of catalytic converter)
- ♦ Fuel injector faulty (mechanical fault)
- ♦ Timing set incorrectly
- ♦ Fault in areas: fuel high pressure, intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment

Fault setting condition(s)
The diagnostic function should indicate a deviation of more than 30% (3.5 mg/stroke in the range near idle) of the lambda control adaptation + 30% deviation of the lambda controller for longer than 30 seconds.
(negative deviation ⇒ leaning)

ⓘ INFORMATION
Opposed adaptation values in connection with misfires indicate that the timing is out of adjustment.

P0174

Diagnostic information - DME (DFI) control unit

Lambda control adaptation, bank 2: system too lean

Diagnostic conditions
- Short test

or
- Lambda control active
- Lambda control adapted
- Engine temperature > 60 °C (140 °F)
- Intake air temperature < 80 °C (176 °F)
- Engine running > 45 second(s), at:
  - Engine speed < 800 rpm
- then drive with different operating conditions in the lower and upper load ranges with valve lift switchover from small lift to large lift (A220).

- Short circuit to B+/ground/between lines or open circuit in the lines
- Cylinder 7 fuel injector faulty

P0208

Diagnostic information - DME (DFI) control unit

Fuel injector, cylinder 8

Diagnostic conditions
- Engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Cylinder 8 fuel injector faulty

P0222

Diagnostic information - DME (DFI) control unit

Accelerator pedal potentiometer 2

Diagnostic conditions
- Ignition on > 3 second(s)
- then accelerator pedal pressed down fully > 3 second(s)
- then release accelerator pedal fully
- then idling > 10 second(s)

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in wiring to potentiometer 2
- ♦ Accelerator pedal potentiometer 2 faulty

Fault effects
- ♦ The accelerator pedal angle is calculated from the remaining potentiometer signal.
- ♦ No acceleration initially + increased idle speed (approx. 800 rpm)
  - ▶ until the accelerator pedal is released fully.
  - ♦ Then acceleration, with
    - ♦ significantly reduced engine torque (max. approx.100 ... 180 Nm)
    - ♦ and limited engine speed (max. approx. 5,000 rpm)
  - ♦ If the accelerator and brake are pressed at the same time, the engine will run at idle speed.

P0223

Diagnostic information - DME (DFI) control unit

Accelerator pedal potentiometer 2

Diagnostic conditions
- Ignition on > 3 second(s)
- then accelerator pedal pressed down fully > 3 second(s)
- then release accelerator pedal fully
- then idling > 10 second(s)

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in wiring to potentiometer 2
- ♦ Accelerator pedal potentiometer 2 faulty

Fault effects
- ♦ The accelerator pedal angle is calculated from the remaining potentiometer signal.
- ♦ No acceleration initially + increased idle speed (approx. 800 rpm)
  - ▶ until the accelerator pedal is released fully.
  - ♦ Then acceleration, with
    - ♦ significantly reduced engine torque (max. approx.100 ... 180 Nm)
    - ♦ and limited engine speed (max. approx. 5,000 rpm)
  - ♦ If the accelerator and brake are pressed at the same time, the engine will run at idle speed.

P0234

Diagnostic information - DME (DFI) control unit

Boost pressure control limit exceeded

Diagnostic conditions
- 3 full-load accelerations:
  - in 3rd gear (no gearshift)
  - Engine speed between 1,500 rpm and max. engine speed

Possible fault causes
- ♦ Insufficient vacuum supply due to leak in vacuum system or faulty vacuum pump (see ⓘ)
- ♦ Leak in vacuum hose at boost pressure control cycle valve or wastegate
- ♦ Boost pressure control cycle valve faulty (mechanical fault or leak)
- ♦ Wastegate faulty (mechanical fault or leak)

Fault setting condition(s)
- Boost pressure (measured) > setpoint value (depending on operating condition)
- Deviation of boost pressure (measured) with respect to ambient pressure too high > 2 second(s)

ⓘ INFORMATION

The vacuum system includes:
- ♦ Mechanical vacuum pump
- ♦ Main load circuit:
  - ♦ Brake booster
- ♦ Auxiliary load circuit:
  - ♦ Boost pressure control cycle valve
  - ♦ Diverter solenoid valve
  - ♦ Exhaust flap (if fitted)
  - ♦ Acoustic simulator (V6 Turbo only)
  - ♦ Tank leakage diagnosis pump (USA, Canada and South Korea only)

P0244

Diagnostic information - DME (DFI) control unit

Boost pressure control cycle valve driver

Diagnostic conditions
- Engine running
- Boost pressure control cycle valve activated

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+ or open circuit in the lines (power supply or boost pressure control cycle valve activation)
- Boost pressure control cycle valve faulty

Fault effects
- Only basic boost pressure is built up

P0245

Diagnostic information - DME (DFI) control unit

Boost pressure control cycle valve driver

Diagnostic conditions
- Time since engine start > 10 second(s)

Possible fault causes
- Short circuit to ground (boost pressure control cycle valve activation)

Fault effects
- Only basic boost pressure is built up

P0246

Diagnostic information - DME (DFI) control unit

Boost pressure control cycle valve driver

Diagnostic conditions
- Engine running
- Boost pressure control cycle valve activated

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+ or open circuit in the lines (power supply or boost pressure control cycle valve activation)
- Boost pressure control cycle valve faulty

Fault effects
- Only basic boost pressure is built up

P025A

Diagnostic information - DME (DFI) control unit

Fuel pump control unit: activation

Diagnostic conditions
- Engine start (electric fuel pump activated)

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Open circuit in control line for DME (DFI) control unit ⇒ Fuel pump control unit
- Faulty power supply or ground supply for fuel pump control unit
- Fuel pump control unit faulty

Diagnostic information - DME (DFI) control unit

Fuel pump control unit: activation

Diagnostic conditions
- Engine start (electric fuel pump activated)

Possible fault causes
- ♦ Short circuit to B+ in control line for DME (DFI) control unit ⇒ Fuel pump control unit
- ♦ Short circuit to ground in control line for DME (DFI) control unit ⇒ Fuel pump control unit
- ♦ Fuel pump control unit faulty

P025D

Diagnostic information - DME (DFI) control unit

Fuel pump control unit: activation

Diagnostic conditions
- Engine start (electric fuel pump activated)

Possible fault causes
- ♦ Short circuit to B+ in control line for DME (DFI) control unit ⇒ Fuel pump control unit
- ♦ Short circuit to ground in control line for DME (DFI) control unit ⇒ Fuel pump control unit
- ♦ Fuel pump control unit faulty

P0261

Diagnostic information - DME (DFI) control unit

Fuel injector, cylinder 1

Diagnostic conditions
- Engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Cylinder 1 fuel injector faulty

P0262

Diagnostic information - DME (DFI) control unit

Fuel injector, cylinder 1

Diagnostic conditions
- Engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Cylinder 1 fuel injector faulty

P0264

Diagnostic information - DME (DFI) control unit

Fuel injector, cylinder 2

Diagnostic conditions
- Engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Cylinder 2 fuel injector faulty

P0265

Diagnostic information - DME (DFI) control unit

Fuel injector, cylinder 2

Diagnostic conditions
- Engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Cylinder 2 fuel injector faulty

P0267

Diagnostic information - DME (DFI) control unit

Fuel injector, cylinder 3

Diagnostic conditions
- Engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Cylinder 3 fuel injector faulty

P0268

Diagnostic information - DME (DFI) control unit

Fuel injector, cylinder 3

Diagnostic conditions
- Engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Cylinder 3 fuel injector faulty

P0270

Diagnostic information - DME (DFI) control unit

Fuel injector, cylinder 4

Diagnostic conditions
- Engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Cylinder 4 fuel injector faulty

P0271

Diagnostic information - DME (DFI) control unit

Fuel injector, cylinder 4

Diagnostic conditions
- Engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Cylinder 4 fuel injector faulty

P0273

Diagnostic information - DME (DFI) control unit

Fuel injector, cylinder 5

Diagnostic conditions
- Engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Cylinder 5 fuel injector faulty

P0274

Diagnostic information - DME (DFI) control unit

Fuel injector, cylinder 5

Diagnostic conditions
- Engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Cylinder 5 fuel injector faulty

P0276

Diagnostic information - DME (DFI) control unit

Fuel injector, cylinder 6

Diagnostic conditions
- Engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Cylinder 6 fuel injector faulty

P0277

Diagnostic information - DME (DFI) control unit

Fuel injector, cylinder 6

Diagnostic conditions
- Engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Cylinder 6 fuel injector faulty

P0279

Diagnostic information - DME (DFI) control unit

Fuel injector, cylinder 7

Diagnostic conditions
- Engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Cylinder 7 fuel injector faulty

P0280

Diagnostic information - DME (DFI) control unit

Fuel injector, cylinder 7

Diagnostic conditions
- Engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Cylinder 7 fuel injector faulty

P0282

Diagnostic information - DME (DFI) control unit

Fuel injector, cylinder 8

Diagnostic conditions
- Engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Cylinder 8 fuel injector faulty

P0283

Diagnostic information - DME (DFI) control unit

Fuel injector, cylinder 8

Diagnostic conditions
- Engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Cylinder 8 fuel injector faulty

Diagnostic information - DME (DFI) control unit

Oil temperature implausibly high
- Panamera up to MY D
- Panamera GTS from MY E
- Cayenne up to MY E

Diagnostic conditions
- Time since engine start > 10 second(s)
- Coolant temperature < 70 °C (158 °F)
- None of the following faults stored: Coolant temperature or oil temperature sensor

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit between lines
- Oil cooler damaged or blocked
- Oil temperature sensor faulty

Fault setting condition(s)
- Coolant temperature < 70 °C (158 °F), with:
  - Oil temperature > 110 °C (230 °F)

P0299

Diagnostic information - DME (DFI) control unit

Boost pressure control deviation

Diagnostic conditions
- 3 full-load accelerations:
  - in 3rd gear (no gearshift)
  - Engine speed between 1,500 rpm and max. engine speed
- then steady driving

Possible fault causes
- ♦ Insufficient vacuum supply due to leak in vacuum system or faulty vacuum pump (see ⓘ)
- ♦ Leak between turbocharger (on pressure side) and intake valve (engine)
- ♦ Leak between diverter solenoid valve and turbocharger or engine
- ♦ Vacuum hose leaking at boost pressure control cycle valve or diverter solenoid valve
- ♦ Diverter solenoid valve not installed or installed incorrectly
- ♦ Diverter solenoid valve leaking or stuck
- ♦ Diverter valve not installed or installed incorrectly
- ♦ Diverter valve leaking or stuck
- ♦ Boost pressure control cycle valve stuck open electrically or mechanically
- ♦ Wastegate mechanical fault, leaking or stuck open
- ♦ Turbocharger (1 or 2) stiff or stuck

Fault setting condition(s)
- Boost pressure (measured) < setpoint value (depending on operating condition)

ⓘ INFORMATION

The vacuum system includes:
- ♦ Mechanical vacuum pump
- ♦ Main load circuit:
  - ♦ Brake booster
- ♦ Auxiliary load circuit:
  - ♦ Boost pressure control cycle valve
  - ♦ Diverter solenoid valve
  - ♦ Exhaust flap (if fitted)
  - ♦ Acoustic simulator (V6 Turbo only)
  - ♦ Tank leakage diagnosis pump (USA, Canada and South Korea only)

P0300

Diagnostic information - DME (DFI) control unit

Misfiring

Diagnostic conditions
- Engine temperature > -20 °C (-4 °F)
- Idle speed up to the red range on the tachometer
- No overrun phase(s)
- None of the following faults stored: P0335, P0336, P0371, P0373

Possible fault causes

ⓘ INFORMATION

See also Workshop Manual ▶ 0 Entire vehicle - General ▶ 08 Symptoms ▶ 0820IN.

♦ Affected by block heater

♦ Loose contact or corrosion on connectors or lines
♦ Power supply or ground supply faulty

♦ Spark plug(s) oily due to oil entrainment in the cylinder
♦ Wrong spark plug(s)
♦ Mechanical or electrical fault in spark plug(s)
♦ Bar ignition module faulty
♦ Power supply or ground supply faulty

♦ Wrong fuel quality
♦ Fuel tank empty
♦ Water in fuel tank
♦ Fuel line dirty/blocked
♦ Mechanical fault in electric fuel pump
♦ Mechanical fault in fuel high-pressure pump

♦ Fuel injector faulty or borderline
(opens too late/not long enough/not enough or leaking)
♦ Oxygen sensor(s) faulty

♦ Exhaust system constricted/blocked
♦ Catalytic converter faulty

♦ Leak in intake-air distributor
♦ Foreign bodies in intake-air distributor
♦ Camshaft adjustment fault
♦ Wrong timing - exhaust camshaft
♦ Valve lift control fault
♦ Valve lifter faulty
(Intake valve has not switched to the other lift or has not switched quickly enough)
♦ Mechanical fault in valve drive
♦ Insufficient compression

(e.g. cylinder liner damaged, valve seat ring faulty, ...)

Fault setting condition(s) (see ⓘ)
- The diagnostic function detects uneven running for the specified cylinder.
- Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.
- Uneven running is interpreted as a misfire or valve lift fault, depending on type.

ⓘ INFORMATION
♦ It is possible that only one cylinder (or the cylinders of one bank) has/have exceeded the uneven running threshold for a fault entry.
♦ Other cylinders may be just below the level which would result in a fault entry.
♦ See Actual values M005 ... M080 (Uneven running)

P0301

Diagnostic information - DME (DFI) control unit

Misfiring

Diagnostic conditions
- Engine temperature > -20 °C (-4 °F)
- Idle speed up to the red range on the tachometer

♦ Valve lifter faulty
(Intake valve has not switched to the other lift or has not switched quickly enough)
♦ Mechanical fault in valve drive
♦ Insufficient compression

(e.g. cylinder liner damaged, valve seat ring faulty, ...)

Fault setting condition(s) (see ⓘ)

- The diagnostic function detects uneven running for the specified cylinder.
- Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.
- Uneven running is interpreted as a misfire or valve lift fault, depending on type.

ⓘ INFORMATION

♦ It is possible that only one cylinder (or the cylinders of one bank) has/have exceeded the uneven running threshold for a fault entry.
♦ Other cylinders may be just below the level which would result in a fault entry.
♦ See Actual values M005 ... M080 (Uneven running)

Diagnostic information - DME (DFI) control unit

Knock sensor 1

Diagnostic conditions
- Short test

or
- Engine running, with:
  - Time since engine start > 10 second(s)
  - Engine temperature > 50 °C (122 °F)
  - Engine speed > 1,000 rpm
  - Different load ranges

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground or open circuit in the lines
- Knock sensor 1 loose
- Knock sensor 1 faulty
- Engine oil filling level significantly too high

Fault setting condition(s)
The fault is detected if the knock sensor signal does not change sufficiently, depending on the engine speed and load, and possibly also if it is too quiet (noise is less dynamic than expected).

Fault effects
- If the fault is stored, the ignition timing is retarded for all cylinders affecting this knock sensor in the >knock control active< range.
- Knock control adaptation is idle.

Diagnostic information - DME (DFI) control unit

Knock sensor 1

Diagnostic conditions
- Short test

or
- Engine running, with:
  - Time since engine start > 10 second(s)
  - Engine temperature > 50 °C (122 °F)
  - Engine speed > 1,000 rpm
  - Different load ranges

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Knock sensor 1 loose or stuck
- Knock sensor 1 faulty
- Engine oil filling level significantly too high

Fault setting condition(s)
The fault is detected if the knock sensor signal is too weak (noise is >quieter< than expected), depending on the engine speed and load.

Fault effects
- If the fault is stored, the ignition timing is retarded for all cylinders affecting this knock sensor in the >knock control active< range.
- Knock control adaptation is idle.

Diagnostic information - DME (DFI) control unit

Knock sensor 3

Diagnostic conditions
- Short test

or
- Engine running, with:
  - Time since engine start > 10 second(s)
  - Engine temperature > 50 °C (122 °F)
  - Engine speed > 1,000 rpm
  - Different load ranges

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground or open circuit in the lines
- Knock sensor 3 loose
- Knock sensor 3 faulty
- Engine oil filling level significantly too high

Fault setting condition(s)
The fault is detected if the knock sensor signal does not change sufficiently, depending on the engine speed and load, and possibly also if it is too quiet (noise is less dynamic than expected).

Fault effects
- If the fault is stored, the ignition timing is retarded for all cylinders affecting this knock sensor in the >knock control active< range.
- Knock control adaptation is idle.

Diagnostic information - DME (DFI) control unit

Knock sensor 3

Diagnostic conditions
- Short test

or
- Engine running, with:
  - Time since engine start > 10 second(s)
  - Engine temperature > 50 °C (122 °F)
  - Engine speed > 1,000 rpm
  - Different load ranges

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Knock sensor 3 loose or stuck
- Knock sensor 3 faulty
- Engine oil filling level significantly too high

Fault setting condition(s)
The fault is detected if the knock sensor signal is too weak (noise is >quieter< than expected), depending on the engine speed and load.

Fault effects
- If the fault is stored, the ignition timing is retarded for all cylinders affecting this knock sensor in the >knock control active< range.
- Knock control adaptation is idle.

Diagnostic information - DME (DFI) control unit

Knock sensor 2

Diagnostic conditions
- Short test

or
- Engine running, with:
  - Time since engine start > 10 second(s)
  - Engine temperature > 50 °C (122 °F)
  - Engine speed > 1,000 rpm
  - Different load ranges

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground or open circuit in the lines
- Knock sensor 2 loose
- Knock sensor 2 faulty
- Engine oil filling level significantly too high

Fault setting condition(s)
The fault is detected if the knock sensor signal does not change sufficiently, depending on the engine speed and load, and possibly also if it is too quiet (noise is less dynamic than expected).

Fault effects
- If the fault is stored, the ignition timing is retarded for all cylinders affecting this knock sensor in the >knock control active< range.
- Knock control adaptation is idle.

Diagnostic information - DME (DFI) control unit

Knock sensor 2

Diagnostic conditions
- Short test

or
- Engine running, with:
  - Time since engine start > 10 second(s)
  - Engine temperature > 50 °C (122 °F)
  - Engine speed > 1,000 rpm
  - Different load ranges

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Knock sensor 2 loose or stuck
- Knock sensor 2 faulty
- Engine oil filling level significantly too high

Fault setting condition(s)
The fault is detected if the knock sensor signal is too weak (noise is >quieter< than expected), depending on the engine speed and load.

Fault effects
- If the fault is stored, the ignition timing is retarded for all cylinders affecting this knock sensor in the >knock control active< range.
- Knock control adaptation is idle.

P0335

Diagnostic information - DME (DFI) control unit

Crankshaft sensor

Diagnostic conditions
- Engine running
- PDK only:
  - then automatic engine stop and restart by the Start/Stop system

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Phase sensor wheel faulty (damaged/bent)
- ♦ Crankshaft sensor not installed or installed incorrectly
- ♦ Crankshaft sensor faulty

Fault setting condition(s)
- Signal not OK (missing or implausible)

Diagnostic information - DME (DFI) control unit

Crankshaft sensor

Diagnostic conditions
- Engine start
- then driving with overrun phase(s)
- PDK only:
  - then automatic engine stop and restart by the Start/Stop system

Possible fault causes
- Starter battery flat at low ambient temperature
- Loose contact or corrosion on connectors or lines
- Phase sensor wheel faulty (damaged/bent)
- Crankshaft sensor loose
- Crankshaft sensor not installed or installed incorrectly
- Crankshaft sensor faulty

Fault setting condition(s)
- The crankshaft sensor detects too many or not enough tooth flanks on the sensor wheel:
  - Engine start
  - Engine running
  - Overrun phase(s)

P033B

Diagnostic information - DME (DFI) control unit

Knock sensor 4

Diagnostic conditions
- Short test

or
- Engine running, with:
  - Time since engine start > 10 second(s)
  - Engine temperature > 50 °C (122 °F)
  - Engine speed > 1,000 rpm
  - Different load ranges

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground or open circuit in the lines
- Knock sensor 4 loose
- Knock sensor 4 faulty
- Engine oil filling level significantly too high

Fault setting condition(s)
The fault is detected if the knock sensor signal does not change sufficiently, depending on the engine speed and load, and possibly also if it is too quiet (noise is less dynamic than expected).

Fault effects
- If the fault is stored, the ignition timing is retarded for all cylinders affecting this knock sensor in the >knock control active< range.
- Knock control adaptation is idle.

Diagnostic information - DME (DFI) control unit

Knock sensor 4

Diagnostic conditions
- Short test

or
- Engine running, with:
  - Time since engine start > 10 second(s)
  - Engine temperature > 50 °C (122 °F)
  - Engine speed > 1,000 rpm
  - Different load ranges

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Knock sensor 4 loose or stuck
- Knock sensor 4 faulty
- Engine oil filling level significantly too high

Fault setting condition(s)
The fault is detected if the knock sensor signal is too weak (noise is >quieter< than expected), depending on the engine speed and load.

Fault effects
- If the fault is stored, the ignition timing is retarded for all cylinders affecting this knock sensor in the >knock control active< range.
- Knock control adaptation is idle.

P0341

Diagnostic information - DME (DFI) control unit

Bank 1 intake camshaft sensor

Diagnostic conditions
- Engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Bank 1 intake camshaft sensor faulty
- ♦ Camshaft adjustment faulty (locking) ⇒ only for P0344

P0342

Diagnostic information - DME (DFI) control unit

Bank 1 intake camshaft sensor

Diagnostic conditions
- Engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Bank 1 intake camshaft sensor faulty
- ♦ Camshaft adjustment faulty (locking) ⇒ only for P0344

P0343

Diagnostic information - DME (DFI) control unit

Bank 1 intake camshaft sensor

Diagnostic conditions
- Engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Bank 1 intake camshaft sensor faulty
- ♦ Camshaft adjustment faulty (locking) ⇒ only for P0344

Diagnostic information - DME (DFI) control unit

- ♦ Bank 2 intake camshaft sensor faulty
- ♦ Camshaft adjustment faulty (locking) ⇒ only for P0349

Diagnostic information - DME (DFI) control unit

Power supply, bar ignition module

⚠WARNING
High voltage!
Risk of death or serious injury due to high voltage or high current!
♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE
Sensitive electronics!
Risk of irreparable damage to electronic components!
♦ **DO NOT** carry out electrical tests.
♦ **DO NOT** connect external power sources.
♦ Check ground supply.

Diagnostic conditions
- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)

Possible fault causes
♦ Fuse faulty
♦ Short circuit to ground or open circuit in the lines (power supply)

Fault setting condition(s)
The fault is detected only if there is no voltage present at ALL bar ignition modules at contact 3.

P0351

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 1

⚠WARNING

High voltage !

Risk of death or serious injury due to high voltage or high current!

♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE

Sensitive electronics!

Risk of irreparable damage to electronic components!

♦ **DO NOT** carry out electrical tests.

♦ **DO NOT** connect external power sources.

♦ Check ground supply.

Diagnostic conditions

- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+ or open circuit in the lines (ground supply)

♦ Short circuit to ground or open circuit in the lines (power supply)

♦ Short circuit to B+/ground or open circuit in the line (activation)

♦ Bar ignition module on cylinder 1 faulty

P0352

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 2

⚠WARNING

High voltage !

Risk of death or serious injury due to high voltage or high current!

♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE

Sensitive electronics!

Risk of irreparable damage to electronic components!

♦ **DO NOT** carry out electrical tests.

♦ **DO NOT** connect external power sources.

♦ Check ground supply.

Diagnostic conditions

- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+ or open circuit in the lines (ground supply)

♦ Short circuit to ground or open circuit in the lines (power supply)

♦ Short circuit to B+/ground or open circuit in the line (activation)

♦ Bar ignition module on cylinder 2 faulty

P0353

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 3

⚠WARNING

High voltage !

Risk of death or serious injury due to high voltage or high current!

♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE

Sensitive electronics!

Risk of irreparable damage to electronic components!

♦ **DO NOT** carry out electrical tests.

♦ **DO NOT** connect external power sources.

♦ Check ground supply.

Diagnostic conditions

- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+ or open circuit in the lines (ground supply)

♦ Short circuit to ground or open circuit in the lines (power supply)

♦ Short circuit to B+/ground or open circuit in the line (activation)

♦ Bar ignition module on cylinder 3 faulty

P0354

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 4

⚠WARNING

- ♦ Camshaft adjustment faulty (locking) ⇒ Only for P0394

Diagnostic information - DME (DFI) control unit

Secondary-air system, bank 1 and bank 2

Diagnostic conditions
- Perform all short tests from top to bottom, up to and including secondary air.

or
- The diagnostic function starts under the following conditions:
  - Engine running, with:
    - Ambient temperature > 5 °C (41 °F)
    - Engine start temperature 5 ... 40 °C (41 … 90 °F)
    - Secondary-air injection active
  - None of the following faults stored: Oxygen sensor upstream of catalytic converter, engine coolant temperature sensor, camshaft adjustment, ambient pressure, ambient temperature
- Diagnostics is interrupted for as long as the following conditions exist:
  - Engine speed > 3,500 rpm
  - Mass air flow > 750 mg/stroke
  - Overrun phase(s)

ⓘ INFORMATION
♦ The diagnostic function ends with the end of secondary-air injection.
♦ A certain number of measurements must have taken place within diagnostics, between operational readiness of the oxygen sensors and the end of secondary-air injection.
♦ If this is not the case, diagnostics is ended without a result.

Possible fault causes
♦ Air intake duct (secondary pump) constricted/blocked
♦ Short circuit to B+/ground or open circuit in the secondary-air pump relay line (working current circuit)
♦ Secondary-air pump relay faulty
♦ Leak in secondary-air injection lines
♦ Secondary-air valve stuck/frozen
♦ Air intake duct (engine) constricted/coked
♦ Fuel/air mixture preparation not adapted
♦ Secondary air at oxygen sensor upstream of catalytic converter
♦ Catalytic converter faulty (broken)

Fault setting condition(s)
- Actual value <> setpoint lambda control deviation
  - The diagnostic function checks whether deviation of the lambda controllers is as expected upon activation.

P0418

Diagnostic information - DME (DFI) control unit

Secondary-air pump relay driver

Diagnostic conditions
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in lines for secondary-air pump relay activation
- Secondary-air pump relay faulty

P0421

Diagnostic information - DME (DFI) control unit

Primary catalytic converter, bank 1 - inadequate effect

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

Diagnostic conditions

- Perform the following short tests in sequence:
  1. All oxygen sensor short tests
  2. Tank vent valve short test
  3. Partial-load fuel supply short test
  4. Idle fuel supply short test
  5. Catalytic converter conversion short test

or:

- Engine temperature > 60 °C (140 °F)
- Time since engine start > 10 second(s)
- Catalytic converter temperature 540 ... 750 °C (1,004 ... 1,382 °F)
- Drive for 60 seconds with slight acceleration at 40 ... 130 km/h (24 ... 80 mph)
- Active carbon filter loading < 0.7
- Engine speed < 3,000 rpm
- Secondary-air injection not active (EU5 only)
- Lambda control ahead of catalytic converter active
- Lambda control behind catalytic converter active
- None of the following faults stored: Oxygen sensor(s) - electrical fault, intake manifold pressure sensor or throttle adjusting unit

Possible fault causes

- If an oxygen sensor fault is entered:
  - ♦ corresponding fault cause
    - ► Correct oxygen sensor fault according to instructions
      - ► then perform short test as described above

♦ Leak in exhaust system between engine and oxygen sensor downstream of catalytic converter

⇒ particularly with mass air flow < 400 mg/stroke

♦ Oxygen sensor upstream and downstream of catalytic converter bank 1 interchanged

♦ Oxygen sensor upstream of catalytic converter bank 1 and bank 2 interchanged

♦ Oxygen sensor downstream of catalytic converter bank 1 and bank 2 interchanged

♦ Catalytic converter bank 1 faulty

P0431

Diagnostic information - DME (DFI) control unit

Primary catalytic converter, bank 2 - inadequate effect

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

Diagnostic conditions

- Perform the following short tests in sequence:
  1. All oxygen sensor short tests
  2. Tank vent valve short test
  3. Partial-load fuel supply short test
  4. Idle fuel supply short test
  5. Catalytic converter conversion short test

or:

- Engine temperature > 60 °C (140 °F)
- Time since engine start > 10 second(s)
- Catalytic converter temperature 540 ... 750 °C (1,004 ... 1,382 °F)
- Drive for 60 seconds with slight acceleration at 40 ... 130 km/h (24 … 80 mph)
- Active carbon filter loading < 0.7
- Engine speed < 3,000 rpm
- Secondary-air injection not active (EU5 only)
- Lambda control ahead of catalytic converter active
- Lambda control behind catalytic converter active
- None of the following faults stored: Oxygen sensor(s) - electrical fault, intake manifold pressure sensor or throttle adjusting unit

Possible fault causes

- If an oxygen sensor fault is entered:
  - ♦ corresponding fault cause
    - ► Correct oxygen sensor fault according to instructions
      - ► then perform short test as described above

♦ Leak in exhaust system between engine and oxygen sensor downstream of catalytic converter

⇒ particularly with mass air flow < 400 mg/stroke

♦ Oxygen sensor upstream and downstream of catalytic converter bank 2 interchanged

♦ Oxygen sensor upstream of catalytic converter bank 1 and bank 2 interchanged

♦ Oxygen sensor downstream of catalytic converter bank 1 and bank 2 interchanged

♦ Catalytic converter bank 2 faulty

P0441

Diagnostic information - DME (DFI) control unit

Tank vent system
- **NOT** V6 Turbo

Diagnostic conditions
- Perform tank vent valve short test and tank leak short test

or
- Time since engine start > 2 minute(s)
- Idling > 15 second(s)
- Engine temperature > 40 °C (104 °F)
- Ambient temperature > 4 °C (39 °F)
- Ambient pressure > 730 hPa (= location below approx. 2,400 ... 2,700 m/7,874 ... 8,858 ft.) (A060)
- Vehicle speed = 0 km/h (0 mph)
- Selector-lever position P or N, or no gear engaged
- Steering wheel in center position
- Air conditioning switched off
- All loads switched off
- All oxygen sensor(s) ready for operation
- None of the following faults stored: Oxygen sensor(s), tank vent valve output stage

Possible fault causes
- ♦ Tank vent valve faulty (stuck open or closed)
- ♦ Tank vent valve not installed or installed incorrectly
- ♦ Line between active carbon filter and tank vent valve leaking/trapped/blocked
- ♦ Purge-air line between tank vent valve and intake manifold leaking/trapped/blocked

Diagnostic information - DME (DFI) control unit

Tank system - leak

Diagnostic conditions
- Perform tank leak short test

or:
- Driving > 150 second(s) with:
  - Engine start temperature 5 ... 40 °C (41 … 104 °F)
  - Time since engine start 5 second(s) ... 20 minute(s)
  - Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
  - Height difference < 20 m (66 ft.)
  - Intake air temperature > 5 °C (41 °F)
  - Intake air temperature: fluctuation(s) < 10 °C (50 °F)
  - Vehicle speed 7 ... 120 km/h (5 … 75 mph)
  - Acceleration/deceleration max. -2 m/s² … +2 m/s²
  - High partial-load share

Possible fault causes
- ♦ Tank cap loose/does not close (properly)
- ♦ Tank cap leaking/faulty
- ♦ Vacuum system leaking (See ⓘ 1)
- ♦ Vacuum pump faulty
- ♦ Tank vent valve (TEV) mechanically faulty (does not close (properly))
- ♦ Leakage diagnosis pump - fresh-air side constricted (dust/dirt)
- ♦ Internal (diaphragm) or external leak in leakage diagnosis pump
- ♦ Fuel tank system (with hoses) leaking

Fault setting condition(s)
- Total leakage in fuel tank system (See ⓘ 2):
  - ♦ Diameter approx. 0.5 - 1 mm - micro leak P0456
  - ♦ Diameter approx. 1 - 2 mm - minor leak P0442
  - ♦ Diameter > 2 mm - major leak P0455

ⓘ INFORMATION

1. The vacuum system includes:
- ♦ Mechanical vacuum pump
- ♦ Main load circuit:
  - ♦ Brake booster
- ♦ Auxiliary load circuit:
  - ♦ Variable intake manifold (not Turbo)
  - ♦ Boost pressure control cycle valve (Turbo only)
  - ♦ Diverter solenoid valve (Turbo only)
  - ♦ Exhaust flap (if fitted)
  - ♦ Acoustic simulator (V6 Turbo only)
  - ♦ Tank leakage diagnosis pump (USA, Canada and South Korea only)

2. There may be several small leaks, which correspond in total to the leak determined here.

P0444

Diagnostic information - DME (DFI) control unit

Tank vent valve driver

Diagnostic conditions
- Perform tank vent valve short test

or:
- Time since engine start > 10 second(s)
- Tank vent valve activated

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+ or open circuit in the lines (power supply or tank vent valve activation)
- Tank vent valve faulty

P0455

Diagnostic information - DME (DFI) control unit

Tank system - leak

Diagnostic conditions
- Perform tank leak short test

or:
- Driving > 150 second(s) with:
  - Engine start temperature 5 ... 40 °C (41 … 104 °F)
  - Time since engine start 5 second(s) ... 20 minute(s)
  - Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
  - Height difference < 20 m (66 ft.)
  - Intake air temperature > 5 °C (41 °F)
  - Intake air temperature: fluctuation(s) < 10 °C (50 °F)
  - Vehicle speed 7 ... 120 km/h (5 … 75 mph)
  - Acceleration/deceleration max. -2 m/s² … +2 m/s²
  - High partial-load share

Possible fault causes
- ♦ Tank cap loose/does not close (properly)
- ♦ Tank cap leaking/faulty
- ♦ Vacuum system leaking (See ⓘ 1)
- ♦ Vacuum pump faulty
- ♦ Tank vent valve (TEV) mechanically faulty (does not close (properly))
- ♦ Leakage diagnosis pump - fresh-air side constricted (dust/dirt)
- ♦ Internal (diaphragm) or external leak in leakage diagnosis pump
- ♦ Fuel tank system (with hoses) leaking

Fault setting condition(s)
- Total leakage in fuel tank system (See ⓘ 2):
  - ♦ Diameter approx. 0.5 - 1 mm - micro leak P0456
  - ♦ Diameter approx. 1 - 2 mm - minor leak P0442
  - ♦ Diameter > 2 mm - major leak P0455

ⓘ INFORMATION

1. The vacuum system includes:
- ♦ Mechanical vacuum pump

P0458

Diagnostic information - DME (DFI) control unit

Tank vent valve driver: below limit value

Diagnostic conditions
- Perform tank vent valve short test

or:
- Time since engine start > 10 second(s)
- Leakage diagnosis pump not activated

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground (tank vent valve activation)
- Tank vent valve faulty

P0459

Diagnostic information - DME (DFI) control unit

Tank vent valve driver

Diagnostic conditions
- Perform tank vent valve short test

or:
- Time since engine start > 10 second(s)
- Tank vent valve activated

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+ or open circuit in the lines (power supply or tank vent valve activation)
- Tank vent valve faulty

P0460

Diagnostic information - DME (DFI) control unit

Fuel level sensor

Diagnostic conditions
- Ignition on

Possible fault causes
♦ See Instrument cluster fault memory

P0461

Diagnostic information - DME (DFI) control unit

Fuel level sensor

Diagnostic conditions
- Ignition on

Possible fault causes
♦ See Instrument cluster fault memory

Diagnostic information - DME (DFI) control unit

Radiator fan control unit driver

⚠WARNING

Exposed running fan blades!
Danger of limbs being severed!
Risk of serious injury due to ejected foreign bodies!

- ♦ **ALWAYS** keep hair or clothing out of the rotating range of the fan.
- ♦ DO NOT reach into the rotating fan.
- ♦ **DO NOT** place tools or other items in the rotating range of the fan.
- ♦ Perform work on the fan only with the ignition switched off.
- ♦ Secure the ignition to prevent it from being switched on accidentally by other persons.

NOTE

Sensitive electronics!
Risk of irreparable damage to electronic components!

- ♦ **DO NOT** carry out electrical tests.
- ♦ **DO NOT** connect external power sources.

Diagnostic conditions

- ● Ignition on

Possible fault causes

- ♦ Short circuit to ground or open circuit in lines (power supply to radiator fan control unit terminal 30)
- ♦ Short circuit to B+/ground or open circuit in the line (radiator fan control unit activation)
- ♦ Radiator fan control unit faulty

P0491

Diagnostic information - DME (DFI) control unit

Bank 1 secondary-air system

Diagnostic conditions

- Perform all short tests from top to bottom, up to and including secondary air.

or

- The diagnostic function starts under the following conditions:
  - Engine running, with:
    - Ambient temperature > 5 °C (41 °F)
    - Engine start temperature 5 ... 32 °C (41 … 90 °F)
    - Secondary-air injection active
  - None of the following faults stored: Oxygen sensor upstream of catalytic converter, engine coolant temperature sensor, camshaft adjustment, ambient pressure, ambient temperature
- The diagnostic function ends under the following conditions:
  - Oxygen sensor upstream of catalytic converter not ready for operation
  - Total time period (diagnostics) exceeded (depending on: engine start temperature)
- Diagnostics is interrupted for as long as the following conditions exist:
  - Engine speed > 3,500 rpm
  - Mass air flow > 750 mg/stroke
  - Overrun phase(s)

ⓘ INFORMATION

♦ The diagnostic function ends with the end of secondary-air injection.
♦ A certain number of measurements must have taken place within diagnostics, between operational readiness of the oxygen sensors and the end of secondary-air injection.
♦ If this is not the case, diagnostics is ended without a result.

Possible fault causes

♦ Catalytic converter faulty (broken)
♦ Leak in secondary-air injection line
♦ Bank 1 secondary-air valve stuck/frozen
♦ Air intake duct (engine) constricted/coked
♦ Fuel/air mixture preparation not adapted

Fault setting condition(s)

- Actual value <> setpoint lambda control deviation
  - The diagnostic function checks whether deviation of the lambda controllers is as expected upon activation.

P0492

Diagnostic information - DME (DFI) control unit

Bank 2 secondary-air system

Diagnostic conditions

- Perform all short tests from top to bottom, up to and including secondary air.

or

- The diagnostic function starts under the following conditions:
  - Engine running, with:
    - Ambient temperature > 5 °C (41 °F)
    - Engine start temperature 5 ... 32 °C (41 ... 90 °F)
    - Secondary-air injection active
  - None of the following faults stored: oxygen sensor ahead of catalytic converter, engine coolant temperature sensor, camshaft adjustment, ambient pressure, ambient temperature
- The diagnostic function ends under the following conditions:
  - Oxygen sensor ahead of catalytic converter not ready for operation
  - Total time period (diagnostics) exceeded (depending on: engine start temperature)
- Diagnostics is interrupted for as long as the following conditions exist:
  - Engine speed > 3,500 rpm
  - Mass air flow > 750 mg/stroke
  - Overrun phase(s)

ⓘ INFORMATION

♦ The diagnostic function ends with the end of secondary-air injection.
♦ A certain number of measurements must have taken place within diagnostics, between operational readiness of the oxygen sensors and the end of secondary-air injection.
♦ If this is not the case, diagnostics is ended without a result.

Possible fault causes

♦ Catalytic converter faulty (broken)
♦ Leak in secondary-air injection line
♦ Bank 2 secondary-air valve stuck/frozen
♦ Air intake duct (engine) constricted/coked
♦ Fuel-air mixture preparation not adapted

Fault setting condition(s)

- Actual value <> setpoint lambda control deviation
  - The diagnostic function checks whether deviation of the lambda controllers is as expected upon activation.

P0501

Diagnostic information - DME (DFI) control unit

Vehicle speed PSM

Diagnostic conditions
- Driving with:
  - Brake pedal not pressed
- None of the following faults stored: U0129, P0503

Possible fault causes
- Fault in PSM area

Fault setting condition(s)
- Delay implausible, too long (measured value), with:
  - Brake pedal not pressed

P0502

Diagnostic information - DME (DFI) control unit

Vehicle speed PSM

Diagnostic conditions
- Driving with:
  - Engine temperature > 30 °C (86 °F)
  - Overrun phase(s) > 1.5 second(s)
  - Engine speed 1.408 .... 3,000 rpm
- None of the following faults stored: U0129, P0503

Possible fault causes
♦ Fault in PSM area

Fault setting condition(s)
- Vehicle speed < 3 km/h or 1 mph (measured value), with:
  - Diagnostic conditions

P0503

Diagnostic information - DME (DFI) control unit

Vehicle speed PSM

Diagnostic conditions
- Driving
- None of the following faults stored: U0129

Possible fault causes
- Fault in PSM area

Fault setting condition(s)
- Vehicle speed > 350 km/h or 218 mph (measured value)

Diagnostic information - DME (DFI) control unit

Idle speed control at stop, lower limit value

Diagnostic conditions
- Engine temperature > 60 °C (140 °F)
- Idling > 20 second(s)
- Vehicle standstill
- Engine without load (A/C system off, steering straight ahead)
- Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
  ⇒ See actual value A060-Ambient pressure from DME (measured)
- None of the following functions active: Tank ventilation, Secondary air injection
- None of the following faults stored: Speed, throttle potentiometer, engine temperature, intake air temperature, tank vent valve, tank ventilation system

Possible fault causes
- Fuel quality insufficient
- Air cleaner blocked/frozen
- Air guide ahead of throttle valve blocked
- Ancillary units sluggish
- Exhaust system blocked

Fault setting condition(s)
Idle speed deviation > 20 second(s)

Diagnostic information - DME (DFI) control unit

Idle speed control at stop, upper limit value

Diagnostic conditions
- Engine temperature > 60 °C (140 °F)
- Idling > 20 second(s)
- Vehicle standstill
- Engine without load (A/C system off, steering straight ahead)
- Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
  ⇒ See actual value A060-Ambient pressure from DME (measured)
- None of the following functions active: Tank ventilation, Secondary air injection
- None of the following faults stored: Speed, throttle potentiometer, engine temperature, intake air temperature, tank vent valve, tank ventilation system

Possible fault causes
- ♦ Intake manifold leaking
- ♦ Positive crankcase ventilation leaking
- ♦ Throttle valve adjusting unit faulty

Fault setting condition(s)
Idle speed deviation > 20 second(s)

P050A

Diagnostic information - DME (DFI) control unit

Idle speed control after cold start at stop, upper limit value

Diagnostic conditions
- Engine temperature -10 °C (14 °F)
- Cold start (catalytic converter heating measure)
- Idling > 20 second(s)
- Vehicle standstill
- Engine without load (A/C system off, steering straight ahead)
- Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
  ⇒ See actual value A060-Ambient pressure from DME (measured)
- None of the following functions active: Tank ventilation, Secondary air injection
- None of the following faults stored: Speed, throttle potentiometer, engine temperature, intake air temperature, tank vent valve, tank ventilation system

Possible fault causes
- ♦ Intake manifold leaking
- ♦ Positive crankcase ventilation leaking
- ♦ Throttle valve adjusting unit faulty

Fault setting condition(s)
- Idle speed deviation > 20 second(s) during cold start

P050B

Diagnostic information - DME (DFI) control unit

Ignition timing angle after cold start

Diagnostic conditions
- Cold start
- then driving

Possible fault causes
ⓘ This fault entry is used for information purposes only; the actual cause of the fault is in another area.
♦ Significant engine running problems force the engine control system to leave the permitted ignition timing range in order to keep the engine running.

Diagnostic information - DME (DFI) control unit

Engine coolant temperature stuck **(stuck low)**

Diagnostic conditions
- Thermal management system test (if available)

or
- Engine start temperature < 35 °C (95 °F)
- Engine running > 3 minute(s)
- Cooling performance high and low
- None of the following faults stored: P0116, P0117, P0118, P0119, P3081, P3082

Possible fault causes
- Engine coolant temperature sensor faulty
- Resistor installed (instead of engine coolant temperature sensor)
- Thermostat stuck open (faulty)

Fault setting condition(s)
- Increase in engine coolant temperature (measured) < 22.5 °C (72.5 °F), with:
  - Increase in engine coolant temperature model > 22.5 °C (72.5 °F)

P050D

Diagnostic information - DME (DFI) control unit

Idle speed control after cold start at stop, lower limit value

Diagnostic conditions
- Engine temperature -10 °C (14 °F)
- Cold start (catalytic converter heating measure)
- Idling > 20 second(s)
- Vehicle standstill
- Engine without load (A/C system off, steering straight ahead)
- Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
  ⇒ See actual value A060-Ambient pressure from DME (measured)
- None of the following functions active: Tank ventilation, Secondary air injection
- None of the following faults stored: Speed, throttle potentiometer, engine temperature, intake air temperature, tank vent valve, tank ventilation system

Possible fault causes
- Fuel quality insufficient
- Air cleaner blocked/frozen
- Air guide ahead of throttle valve blocked
- Ancillary units sluggish
- Exhaust system blocked

Fault setting condition(s)
Idle speed deviation > 20 second(s) during cold start

P0513

Diagnostic information - DME (DFI) control unit

Immobilizer code incorrect from front-end electronics

Diagnostic conditions
- Ignition on

Possible fault causes
- Immobilizer code incorrect from front-end electronics

Fault effects
- Engine cannot be started

Diagnostic information - DME (DFI) control unit

Oil pressure sensor

Diagnostic conditions
- Idling > 1 minute(s), then:
- Engine speed > 3,010 rpm, then:
- Switch off ignition and remove ignition key > 1 minute(s)

Possible fault causes
- Engine oil pressure too low
  (oil level, oil thinning, dirt in oil circuit, oil circuit faulty)
- Oil pressure sensor faulty (incorrect trimming compared with ambient pressure sensor)

Fault setting condition(s)
- Engine oil pressure > 6.2 bar at engine speed < 1,000 rpm

or
- Engine oil pressure < 1.5 bar at engine speed > 3,008 rpm

or
- Deviation between engine oil pressure and ambient pressure > 0.4 bar in control unit run-on (after ignition off)

P0522

Diagnostic information - DME (DFI) control unit

Oil pressure sensor

Diagnostic conditions
- Engine start detected

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground or open circuit in the lines
- Oil pressure sensor faulty

P0523

Diagnostic information - DME (DFI) control unit

Oil pressure sensor

Diagnostic conditions
- Engine start detected

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground or open circuit in the lines
- Oil pressure sensor faulty

P0524

Diagnostic information - DME (DFI) control unit

Engine oil pressure too low

ⓘ INFORMATION
Technical Information 29/10 (in repair group 1703) must be observed in case of vehicles that have been stationary for an extended period (> 150 days).

Diagnostic conditions
- Engine running
- None of the following faults stored: P0521, P0522, P0523

Possible fault causes
- ♦ Engine oil pressure too low (oil level, oil thinning, dirt in oil circuit, oil circuit faulty)

Fault setting condition(s)
- Engine oil pressure < setpoint value for longer than 3 second(s)

P052A

Diagnostic information - DME (DFI) control unit

Intake camshaft adjustment, bank 1 after cold start
- **during catalytic converter heating measure**

ⓘ INFORMATION
If only the fault for camshaft adjustment after cold start is entered, particular attention should be paid to causes such as viscous engine oil or components that stick when cold.

ⓘ INFORMATION
♦ The catalytic converter heating measures take place for a limited time under certain conditions (cold start).
♦ These include dual injection, timing retardation, additional camshaft adjustment, ...

Diagnostic conditions
- Cold start with catalytic converter heating measure
- then engine speed 1,200 ... 6,000 rpm
- None of the following faults stored: P0010, P0020, P2088, P2089, P2092, P2093

Possible fault causes
♦ Engine oil pressure too low
⇒ (e.g. oil thickening, wrong oil quality, oil pressure control or oil pump sluggish/stuck)
♦ Solenoid valve for hydraulic camshaft adjustment sluggish/stuck
♦ Camshaft adjustment sluggish/stuck
♦ Intake camshaft sluggish/stuck

Fault setting condition(s)
- Intake camshaft actual value/setpoint value deviation too high

Diagnostic information - DME (DFI) control unit

Intake camshaft adjustment, bank 2 after cold start
- **during catalytic converter heating measure**

ⓘ INFORMATION
If only the fault for camshaft adjustment after cold start is entered, particular attention should be paid to causes such as viscous engine oil or components that stick when cold.

ⓘ INFORMATION
♦ The catalytic converter heating measures take place for a limited time under certain conditions (cold start).
♦ These include dual injection, timing retardation, additional camshaft adjustment, ...

Diagnostic conditions
- Cold start with catalytic converter heating measure
- then engine speed 1,200 ... 6,000 rpm
- None of the following faults stored: P0010, P0020, P2088, P2089, P2092, P2093

Possible fault causes
♦ Engine oil pressure too low
⇒ (e.g. oil thickening, wrong oil quality, oil pressure control or oil pump sluggish/stuck)
♦ Solenoid valve for hydraulic camshaft adjustment sluggish/stuck
♦ Camshaft adjustment sluggish/stuck
♦ Intake camshaft sluggish/stuck

Fault setting condition(s)
- Intake camshaft actual value/setpoint value deviation too high

P053A

Diagnostic information - DME (DFI) control unit

Positive crankcase ventilation driver

ⓘ INFORMATION

♦ Diagnosis only takes place when the component has been activated.
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

Diagnostic conditions

- Ambient temperature < 0 °C (32 °F)
- Engine start detected
- Vehicle voltage > 12 V

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Positive crankcase ventilation heating tube faulty

P053B

Diagnostic information - DME (DFI) control unit

Positive crankcase ventilation driver

ⓘ INFORMATION

♦ Diagnosis only takes place when the component has been activated.
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

Diagnostic conditions

- Ambient temperature < 0 °C (32 °F)
- Engine start detected
- Vehicle voltage > 12 V

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Positive crankcase ventilation heating tube faulty

Diagnostic information - DME (DFI) control unit

Positive crankcase ventilation driver

ⓘ INFORMATION

♦ Diagnosis only takes place when the component has been activated.
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

Diagnostic conditions

- Ambient temperature < 0 °C (32 °F)
- Engine start detected
- Vehicle voltage > 12 V

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Positive crankcase ventilation heating tube faulty

P053F

Diagnostic information - DME (DFI) control unit

Fuel high pressure after cold start

ⓘ INFORMATION

♦ Faults in the fuel high-pressure injection system area are frequently caused by defects in the pre-delivery circuit (fuel low pressure).
♦ Therefore, the pre-delivery circuit must be checked first in case of problems in the area of the fuel high-pressure injection system.

ⓘ INFORMATION

♦ The catalytic converter heating measures take place for a limited time under certain conditions after the engine is started.
♦ These include dual injection, timing retardation, additional camshaft adjustment, ...

Diagnostic conditions
- Engine start (cold start + catalytic converter heating measure)
- Engine temperature > -10 °C (14 °F)
- Engine running > 5 second(s)

Possible fault causes
♦ Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
♦ Quantity control valve faulty (in fuel high-pressure pump)
♦ Fuel high-pressure pump faulty

Fault setting condition(s)
Fuel high pressure deviation > 20% (actual value - setpoint value) during catalytic converter heating measure.

Diagnostic information - DME (DFI) control unit

Brake vacuum sensor: implausible

Diagnostic conditions
- Brake pedal fully depressed 5 times with:
  - Engine off
- then engine running > 1 minute(s) with:
  - Brake pedal not actuated > 40 second(s)
- None of the following faults stored: P0557, P0558

Possible fault causes
- Vacuum system leaking
- Brake light switch faulty
- Brake light switch aligned incorrectly at brake pedal
- Brake vacuum sensor faulty

Fault setting condition(s)
- A specified vacuum value was not reached, during:
  - Engine start, then:
    - Engine running > 1 minute(s)

    and
    - Brake pedal not actuated (or apparently not actuated) > 40 second(s)

Fault effects
- Start/Stop system not active

Diagnostic information - DME (DFI) control unit

Brake vacuum sensor: implausible

Diagnostic conditions
- Under the following conditions 5x while driving:
  - Driving > 60 second(s) with:
    - Brake pedal not pressed
  - then driving with brake pedal pressed, at:
    - Vehicle speed > 50 km/h (31 mph)
    - Brake pressure > 10 bar
  - then driving > 30 second(s) with:
    - Brake pedal not pressed
  - then driving with brake pedal pressed, at:
    - Vehicle speed > 50 km/h (31 mph)
    - Brake pressure > 10 bar

Possible fault causes
- ♦ Vacuum system faulty
- ♦ Brake booster faulty
- ♦ Brake vacuum sensor faulty

Fault setting condition(s)
Vacuum is retained despite braking operations under diagnostic conditions

Fault effects
- ♦ Start/Stop system not active

P0557

Diagnostic information - DME (DFI) control unit

Brake vacuum sensor: electrical fault

Diagnostic conditions
- Ignition on

Possible fault causes
- Short circuit to B+/ground/between lines or open circuit in the lines
- Brake vacuum sensor faulty

Fault effects
- Start/Stop system not active

P0558

Diagnostic information - DME (DFI) control unit

Brake vacuum sensor: electrical fault

Diagnostic conditions
- Ignition on

Possible fault causes
- Short circuit to B+/ground/between lines or open circuit in the lines
- Brake vacuum sensor faulty

Fault effects
- Start/Stop system not active

P0562

Diagnostic information - DME (DFI) control unit

Supply voltage

Diagnostic conditions
- Engine running > 6 second(s)

Possible fault causes
- ♦ Vehicle electrical system supply voltage too high > 5 second(s), (e.g. jump-lead starting)
- ♦ Vehicle electrical system supply voltage too low
- ♦ Contact resistance, loose contact or corrosion on connectors or lines (DME (DFI) control unit)

Fault setting condition(s)
- Deviation in supply voltage :
  - ♦ < 10 V (P0562)

  or
  - ♦ > 16 V (P0563)

P0563

Diagnostic information - DME (DFI) control unit

Supply voltage

Diagnostic conditions
- Engine running > 6 second(s)

Possible fault causes
- ♦ Vehicle electrical system supply voltage too high > 5 second(s), (e.g. jump-lead starting)
- ♦ Vehicle electrical system supply voltage too low
- ♦ Contact resistance, loose contact or corrosion on connectors or lines (DME (DFI) control unit)

Fault setting condition(s)
- Deviation in supply voltage :
  - ♦ < 10 V (P0562)

  or
  - ♦ > 16 V (P0563)

P0601

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

P0603

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

P0604

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

P0605

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

P0606

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

Diagnostic information - DME (DFI) control unit

Control unit function monitoring

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill

Possible fault causes
- ♦ Faults that lead to limp-home mode (See ⓘ)
- ♦ DME (DFI) control unit software error

  ► Re-programming (See ⓘ)

ⓘ INFORMATION
- ♦ When a serious fault is detected in the engine control system (control unit or parts such as the throttle valve, etc.), the control unit switches to a limp-home program and simultaneously stores a corresponding fault. The >Reduced engine power< warning message is displayed in the instrument cluster.
- ♦ This fault might not be detected again immediately away after a restart.
- ♦ Fault P0607 is therefore stored as well, and the control unit already switches to the limp-home program during the restart.
- ♦ If one or more **other faults** are entered in addition to fault P0607:
  - ♦ First correct the other faults,
  - ♦ then clear the fault memory and meet the diagnostic conditions (see above).
- ♦ If **only** fault P0607 is stored, there is an error in the software (DME (DFI) control unit).

P0611

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

Diagnostic information - DME (DFI) control unit

Sensor voltage 1

Diagnostic conditions
- Ignition on > 10 second(s)

Possible fault causes
- Short circuit to B+/ground or open circuit in the line
- Pedal sensor faulty
- Oil pressure sensor faulty
- Fuel high-pressure sensor faulty
- Boost pressure sensor faulty, with:
  - Turbocharger
- Clutch rpm sensor faulty , with:
  - Manual transmission

Fault setting condition(s)
- Deviation in sensor voltage:
  - < 4.7 V (P0642)

  or
  - > 5.3 V (P0643)

at:
  - Connector [A], contact 40

  or
  - Connector [A], contact 42

  or
  - Connector [B], contact 18

Diagnostic information - DME (DFI) control unit

Sensor voltage 1

Diagnostic conditions
- Ignition on > 10 second(s)

Possible fault causes
- Short circuit to B+/ground or open circuit in the line
- Pedal sensor faulty
- Oil pressure sensor faulty
- Fuel high-pressure sensor faulty
- Boost pressure sensor faulty, with:
  - Turbocharger
- Clutch rpm sensor faulty , with:
  - Manual transmission

Fault setting condition(s)
- Deviation in sensor voltage:
  - < 4.7 V (P0642)

  or
  - > 5.3 V (P0643)

at:
- Connector [A], contact 40

  or
- Connector [A], contact 42

  or
- Connector [B], contact 18

P0650

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

Diagnostic information - DME (DFI) control unit

Sensor voltage 2

Diagnostic conditions
- Ignition on > 10 second(s)

Possible fault causes
- ♦ Short circuit to B+/ground or open circuit in the line
- ♦ Pedal sensor faulty
- ♦ Throttle valve adjusting unit faulty

Fault setting condition(s)
- Deviation in sensor voltage:
  - ♦ < 4.7 V (P0652)

  or
  - ♦ > 5.3 V (P0653)

at:
- ♦ Connector [A], contact 53

  or
- ♦ Connector [B], contact 62

Diagnostic information - DME (DFI) control unit

Sensor voltage 2

Diagnostic conditions
- Ignition on > 10 second(s)

Possible fault causes
- ♦ Short circuit to B+/ground or open circuit in the line
- ♦ Pedal sensor faulty
- ♦ Throttle valve adjusting unit faulty

Fault setting condition(s)
- Deviation in sensor voltage:
  - ♦ < 4.7 V (P0652)

  or
  - ♦ > 5.3 V (P0653)

at:
- ♦ Connector [A], contact 53

  or
- ♦ Connector [B], contact 62

Diagnostic information - DME (DFI) control unit

Variable intake manifold driver

Diagnostic conditions
- Ignition on

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)
- ♦ Solenoid valve for intake manifold switch-over faulty

P0661

Diagnostic information - DME (DFI) control unit

Variable intake manifold driver

Diagnostic conditions
- Ignition on

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)
- ♦ Solenoid valve for intake manifold switch-over faulty

P0662

Diagnostic information - DME (DFI) control unit

Variable intake manifold driver

Diagnostic conditions
- Ignition on

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)
- ♦ Solenoid valve for intake manifold switch-over faulty

Diagnostic information - DME (DFI) control unit

Start delay due to undervoltage

Diagnostic conditions
- DME (DFI) control unit is viable (voltage > 5 V at A34 (terminal15) + ground)
- Ignition is switched on (voltage present at A34)

Possible fault causes
- If the actual value >A010-DME SUPPLY VOLTAGE< in the FreezeFrame of the fault entry P0685 was stored at **<** 8.0 V:
  - ♦ Voltage is too low or voltage will drop when the engine starts (see ⓘ).

- If the actual value >A010-DME SUPPLY VOLTAGE< in the FreezeFrame of the fault entry P0685 was stored at **>** 8.0 V:
  - ♦ Open circuit in power supply for main-relay control circuit
  - ♦ Short circuit to ground or open circuit in the lines between main relay and DME (DFI) control unit (DME (DFI) control unit power supply)
  - ♦ Short circuit to B+ or open circuit in the lines between DME (DFI) control unit and main relay (main relay activation)
  - ♦ Main relay faulty

Fault setting condition(s)
- A check is carried out once to determine whether the voltage at A3/A5/A6 has exceeded a minimum value:
  - ♦ Panamera
    > 6.0 V
  - ♦ Cayenne with program version up to WS5880
    > 6.0 V
  - ♦ Cayenne with program version WS5890 or higher (week 45/10)
    > 5.0 V
- Test duration 0.0 to approx. 0.5 seconds after ignition on, or after control unit reset.

Fault effects
♦ Fuel injection is blocked.

ⓘ INFORMATION
♦ According to specifications, the DME main relay must work only at 8.0 V or higher.
♦ There are also relays that work at a significantly lower voltage.
♦ The entire engine control system can work at 5.0 V or higher.
♦ If the start voltage drops, this can cause the diagnosis to detect the fault >START DELAY DUE TO UNDERVOLTAGE< and fuel injection will be blocked.
♦ The starter relay can also pick up at 3 V.
♦ This means that the starter might still turn, but the engine cannot start.
♦ The various software versions can result in various types of behavior and displays:

I. Possible behavior and displays in the Panamera and Cayenne with program version up to WS5880:

- Start voltage < 5 V:
  - Starter might turn
  - Engine does not start
  - NO DME fault entries because the DME (DFI) control unit is not viable.

- Start voltage < 5 V, but > 5 V … < 6 V before and after the start attempt
+ DME main relay does NOT work:
  - Starter might turn
  - Engine does not start
  - DME fault entry P0685 with FreezeFrame actual value
>A010-DME SUPPLY VOLTAGE< = 0 V
  - NO DME fault entry P0686 because these diagnostic conditions (> 8.0 V at A34) were not met.
  - DME fault entry P1572 because the control unit voltage dropped to < 5 V and as a result, control unit run-on could not be completed.

- Start voltage < 5 V, but > 5 V … < 6 V before and after the start attempt
+ DME main relay is working:
  - Starter might turn
  - Engine does not start
  - DME fault entry P0685 with FreezeFrame actual value
>A010-DME SUPPLY VOLTAGE< > 5 V … < 6 V
  - NO DME fault entry P0686 because these diagnostic conditions (> 8.0 V at A34) were not met.
  - DME fault entry P1572 because the control unit voltage dropped to < 5 V and as a result, control unit run-on could not be completed.

- Start voltage > 5 V … < 6 V
+ DME main relay does NOT work:
  - Starter might turn
  - Engine does not start
  - DME fault entry P0685 with FreezeFrame actual value
>A010-DME SUPPLY VOLTAGE< = 0 V
  - NO DME fault entry P0686 because these diagnostic conditions (> 8.0 V at A34) were not met.

- Start voltage > 5 V … < 6 V
+ DME main relay is working:
  - Starter turns
  - Engine does not start
  - DME fault entry P0685 with FreezeFrame actual value
>A010-DME SUPPLY VOLTAGE< > 5 V … < 6 V
  - NO DME fault entry P0686 because these diagnostic conditions (> 8.0 V at A34) were not met.

- Start voltage > 6V … < 8 V

+ DME main relay does NOT work:
  ♦ Starter turns
  ♦ Engine does not start
  ♦ DME fault entry P0685 with FreezeFrame actual value
>A010-DME SUPPLY VOLTAGE< = 0 V
  ♦ NO DME fault entry P0686 because these diagnostic conditions (> 8.0 V at A34) were not met.

- Start voltage > 6V
+ DME main relay is working:
  ♦ Starter turns
  ♦ Engine starts
  ♦ NO DME fault entries

- Start voltage > 8 V
+ DME main relay does NOT work:
  ♦ Starter turns
  ♦ Engine does not start
  ♦ DME fault entry P0685 with FreezeFrame actual value
>A010-DME SUPPLY VOLTAGE< = 0 V
  ♦ DME fault entry P0686 with FreezeFrame actual value
>A010-DME SUPPLY VOLTAGE< = 0 V

II. Behavior and displays in the E2 with WS5890 or higher:

- Start voltage < 5 V:
  ♦ Starter might turn
  ♦ Engine does not start
  ♦ NO DME fault entries because the DME (DFI) control unit is not viable.

- Start voltage > 5 V … < 8 V
+ DME main relay does NOT work:
  ♦ Starter turns
  ♦ Engine does not start
  ♦ DME fault entry P0685 with FreezeFrame actual value
>A010-DME SUPPLY VOLTAGE< = 0 V
  ♦ NO DME fault entry P0686 because these diagnostic conditions (> 8.0 V at A34) were not met.

- Start voltage > 5 V … < 8 V
+ DME main relay is working:
  ♦ Starter turns
  ♦ Engine starts
  ♦ NO DME fault entries

- Start voltage > 8 V
+ DME main relay does NOT work:
  ♦ Starter turns

♦ Engine does not start
♦ DME fault entry P0685 with FreezeFrame actual value
>A010-DME SUPPLY VOLTAGE< = 0 V
♦ DME fault entry P0686 with FreezeFrame actual value
>A010-DME SUPPLY VOLTAGE< = 0 V

- Start voltage > 8 V

+ DME main relay is working:
♦ Starter turns
♦ Engine starts
♦ NO DME fault entries

P0686

Diagnostic information - DME (DFI) control unit

Main relay off

Diagnostic conditions
- Vehicle voltage > 8.0 V
- Ignition off
- Control unit run-on completed (See ⓘ)
- Then ignition on

Possible fault causes
♦ Main relay faulty (contact stuck)
♦ Short circuit to B+ in line between main relay and DME (DFI) control unit (DME (DFI) control unit power supply)
♦ Short circuit to ground in line between DME (DFI) control unit and main relay (main relay activation)

Fault setting condition(s)
- Power supply for DME (DFI) control unit > 4.0 V at connector [A], contact 3/5/6, with :
- Power supply for DME (DFI) control unit > 0.0 V at connector [A], contact 34 (terminal 15)

ⓘ INFORMATION
♦ After the ignition is switched off (terminal 15), the DME control unit switches to control unit run-on mode.
♦ The run-on period depends on many underlying conditions (e.g. engine temperature for fan operation).
The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.

P0687

Diagnostic information - DME (DFI) control unit

Main relay ON

Diagnostic conditions
- Vehicle voltage > 8.0 V
- Ignition on

Possible fault causes
♦ Main relay faulty
♦ Open circuit in power supply for main-relay control circuit
♦ Short circuit to ground or open circuit in the lines between main relay and DME (DFI) control unit (DME (DFI) control unit power supply)
♦ Short circuit to B+ or open circuit in the lines between DME (DFI) control unit and main relay (main relay activation)

Fault setting condition(s)
- Power supply for DME (DFI) control unit < 6.0 V at connector [A], contact 3/5/6, with :
  - Power supply for DME (DFI) control unit > 8.0 V at connector [A], contact 34 (terminal 15)

P0700

Diagnostic information - DME (DFI) control unit

Transmission control unit fault

Diagnostic conditions

Engine running

Possible fault causes

♦ Fault entry in PDK control unit (see ⓘ)

ⓘ INFORMATION

Different fault healing strategies in the engine and transmission control units can lead to a situation in which the original transmission fault no longer exists in the transmission fault memory (healed) but the note (P0700) nevertheless remains entered in the engine control unit (not yet healed).

P0701

Diagnostic information - DME (DFI) control unit

Torque intervention from transmission control unit implausible

Diagnostic conditions
- Drive with gear changes

Possible fault causes
- ♦ Shifting in PDK takes too long

Fault setting condition(s)
- The torque intervention by the PDK control unit takes too long; it is therefore implausible for the DME control unit.

P0716

Diagnostic information - DME (DFI) control unit

Manual transmission speed sensor

Diagnostic conditions
- Time since engine start > 5 second(s)
- Clutch closed

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Manual transmission speed sensor faulty

Fault effects
- Reduced engine torque

P0717

Diagnostic information - DME (DFI) control unit

Manual transmission speed sensor

Diagnostic conditions
- Time since engine start > 5 second(s)
- Clutch closed

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Manual transmission speed sensor faulty

Fault effects
- Reduced engine torque

P0850

Diagnostic information - DME (DFI) control unit

P/N input signal, open circuit/short circuit to B+

Diagnostic conditions
- Ignition on > 3 second(s)
- then start engine, with:
  - Brake pressed
  - Selector-lever position P or N

Possible fault causes
♦ Open circuit/short circuit to B+ in signal line

Fault setting condition(s)
Deviation in signal for P/N input signal and signal via CAN

Fault effects
♦ Starter does not turn

Diagnostic information - DME (DFI) control unit

P/N input signal, short circuit to ground

Diagnostic conditions
- Ignition on > 3 second(s)
- then start engine, with:
  - Brake pressed
  - Selector-lever position P or N

Possible fault causes
♦ Short circuit to ground in signal line

Fault setting condition(s)
Deviation in signal for P/N input signal and signal via CAN

Fault effects
♦ Engine start possible, with:
- Selector-lever position R or D or M

Diagnostic information - DME (DFI) control unit

Torque request from PSM implausible

Diagnostic conditions
● Drive with PSM intervention for vehicle stabilization

Possible fault causes
♦ Fault in PSM control unit area

Fault setting condition(s)
● Torque request from PSM is implausibly high compared to driver setpoint torque (via accelerator pedal).

Fault effects
♦ All torque requests from the PSM are ignored for this trip ⇒ PSM interventions restricted.

P1001

Diagnostic information - DME (DFI) control unit

Fuel level sensor

Diagnostic conditions
- Ignition on

Possible fault causes
♦ See Instrument cluster fault memory

Diagnostic information - DME (DFI) control unit

Fuel high pressure quantity

ⓘ INFORMATION

♦ Faults in the fuel high-pressure injection system area are frequently caused by defects in the pre-delivery circuit (fuel low pressure).
♦ Therefore, the pre-delivery circuit must be checked first in case of problems in the area of the fuel high-pressure injection system.

Diagnostic conditions
- Engine speed 450 .... 4,000 rpm
- Engine temperature - 10 ... +100 °C (14 … 212 °F)
- Driving with different operating conditions

Possible fault causes
♦ Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
♦ Quantity control valve faulty (in fuel high-pressure pump)
♦ Fuel high-pressure pump faulty

Fault setting condition(s)
Deviation in quantity control actual value (fuel high pressure)

Diagnostic information - DME (DFI) control unit

Fuel pressure/quantity too low at start

ⓘ INFORMATION 1

This fault entry can be caused by various reasons.
♦ If the fault was **NOT entered while the engine was starting**, but while the engine was running normally, a check must be carried out in the **crankshaft sensor** area (**See** ⓘ **2**).
♦ Fault finding in the fuel area must only be carried out if a customer complains that starting times are too long AND if the fault was entered while the engine was starting.
♦ If there is no such customer complaint, however, the only measure to be taken is to clear the fault memory.

Diagnostic conditions
● Engine start
● Engine temperature - 10 ... +100 °C (14 … 212 °F)
● Engine running > 5 second(s)

Possible fault causes
♦ Short-term failure of the engine speed signal as a result of a crankshaft sensor fault with or without a corresponding fault entry
(See ⓘ 2)
♦ Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
(See ⓘ **3**)
♦ Quantity control valve faulty (in fuel high-pressure pump)
♦ Fuel high-pressure pump faulty

Fault setting condition(s)
● The fuel pressure required for carrying out a high-pressure start was not reached or was not reached quickly enough
ⓘ Low-pressure start is enabled; starting takes considerably longer (up to 2 sec.).

ⓘ INFORMATION 2

● If engine speed = 0, a starting setpoint value is set for the fuel high pressure that is higher than the setpoint value at idle speed or at a low load.
● An engine start is detected if the engine speed increases from 0 to > 300 rpm.
● When an engine start is detected, a check determines whether the measured fuel high pressure reaches the setpoint value within a certain number of engine revolutions.
⇒ If the engine's speed signal fails briefly (e.g. 6/1,000 seconds) and is then restored, the following things happen:
1. Engine speed = 0 ▶ Starting setpoint value for the fuel high pressure is set.
2. Engine speed increases to over 300 rpm ▶ Engine start is detected.
3. Comparison of setpoint value and actual value of the fuel high pressure ▶ Fault entry P1023, although there was no actual engine start.
4. Entries in the extended fault memory for P1023 are as follows:
♦ *40_Time after Start* > 5 s
♦ *40_Engine RPM* > 600 rpm

♦ *40_Vehicle Speed* > 0 km/h (0 mph)

ⓘ INFORMATION 3

Faults in the fuel high-pressure injection system area are frequently caused by defects in the pre-delivery circuit (fuel low pressure).
♦ Therefore, the pre-delivery circuit must be checked first in case of problems in the area of the fuel high-pressure injection system.

P1024

Diagnostic information - DME (DFI) control unit

Fuel high pressure too high after engine off

Diagnostic conditions
- Engine temperature - 10 ... +100 °C (14 … 212 °F)
- Engine running > 5 second(s)
- then ignition off > 10 second(s)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines ▶ Fuel high-pressure sensor
- ♦ Quantity control valve faulty (in fuel high-pressure pump)

Fault setting condition(s)
- Fuel high pressure drops too slowly after engine off

Diagnostic information - DME (DFI) control unit

Fuel high pressure adaptation

ⓘ INFORMATION 1

♦ Faults in the fuel high-pressure injection system area are frequently caused by defects in the pre-delivery circuit (fuel low pressure).
♦ Therefore, the pre-delivery circuit must be checked first in case of problems in the area of the fuel high-pressure injection system.

Diagnostic conditions
- Engine speed 450 .... 4,000 rpm
- Engine temperature - 10 ... +100 °C (14 … 212 °F)
- Driving with different operating conditions

Possible fault causes
♦ Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
♦ Fuel high-pressure adaptation required (See ⓘ 2)
♦ Fuel high-pressure pump faulty

ⓘ INFORMATION 2

♦ The old values must be deleted prior to a new adaptation of the fuel high-pressure ranges.
♦ The fuel high-pressure adaptation values can be deleted using >PIWIS Tester II< as follows: >DME< ⇒ >Maintenance/repairs< ⇒ >Delete adaptation values<

P1026

Diagnostic information - DME (DFI) control unit

Fuel high pressure implausible

ⓘ INFORMATION

♦ Faults in the fuel high-pressure injection system area are frequently caused by defects in the pre-delivery circuit (fuel low pressure).
♦ Therefore, the pre-delivery circuit must be checked first in case of problems in the area of the fuel high-pressure injection system.

Diagnostic conditions
- Time since engine start > 5 second(s)
- Engine temperature - 10 ... +100 °C (14 … 212 °F)
- Engine running/driving

Possible fault causes (See Fault setting condition(s))
- Below limit value:
  - ♦ Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
  - ♦ Fuel tank (driven) empty
    - ► See Extended fault memory
    - ⇒ Actual value **40-Fuel Level Input** [**0%**]

- Below limit value or above limit value :
  - ♦ Quantity control valve faulty (in fuel high-pressure pump)
  - ♦ Fuel high-pressure pump faulty

Fault setting condition(s) (See ⓘ)
♦ Below limit value:
- Continuous average fuel high pressure < 10 bar

♦ Above limit value:
- Continuous average fuel high pressure > 135 bar

ⓘ INFORMATION

► See Extended fault memory
⇒ 21-Environmental condition for first fault occurrence /B070-Fuel high pressure actual value
⇒ 21-Environmental condition for first fault occurrence /B060-Fuel high pressure setpoint value

Conversion:
♦ 10,000 hPa = 10 bar = 10,000 mbar
♦ 1,000 kPa = 10 bar = 10,000 mbar
♦ 1 MPa = 10 bar = 10,000 mbar

P1027

Diagnostic information - DME (DFI) control unit

Fuel high pressure fluctuates

Diagnostic conditions
- Engine speed 450 .... 4,000 rpm
- Engine temperature - 10 ... +100 °C (14 … 212 °F)
- Driving with different operating conditions

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines ▶ Fuel high-pressure sensor
- ♦ Quantity control valve sluggish (in fuel high-pressure pump)

Fault setting condition(s)
The fuel high pressure fluctuates by +/- 25 bar from the setpoint fuel pressure.

Diagnostic information - DME (DFI) control unit

Fuel high-pressure sensor stuck

ⓘ INFORMATION

♦ Faults in the fuel high-pressure injection system area are frequently caused by defects in the pre-delivery circuit (fuel low pressure).
♦ Therefore, the pre-delivery circuit must be checked first in case of problems in the area of the fuel high-pressure injection system.

Diagnostic conditions
- Engine running (driving)
- Engine temperature - 10 ... +100 °C (14 … 212 °F)

Possible fault causes
♦ Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
♦ Fuel high-pressure sensor faulty

Fault setting condition(s)
No change in the fuel high-pressure sensor voltage line, with:
- Engine running

Diagnostic information - DME (DFI) control unit

Fuel high-pressure sensor stuck at engine start

ⓘ INFORMATION

♦ Faults in the fuel high-pressure injection system area are frequently caused by defects in the pre-delivery circuit (fuel low pressure).
♦ Therefore, the pre-delivery circuit must be checked first in case of problems in the area of the fuel high-pressure injection system.

Diagnostic conditions
- Engine start
- Engine temperature - 10 ... +100 °C (14 … 212 °F)

Possible fault causes
♦ Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
♦ Fuel high-pressure sensor faulty

Fault setting condition(s)
No change in the **fuel high-pressure sensor** voltage line, at:
- Engine start

P1036

Diagnostic information - DME (DFI) control unit

Fuel high pressure: too low/too high

Diagnostic conditions
- Engine running
- Fuel high-pressure pump operates normally, i.e.:
  - no engine stop
  - no overrun phase

Possible fault causes
- Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
- Loose contact or corrosion on connectors or lines ▶ **Fuel high-pressure sensor**
- **Quantity control valve** sluggish (in **fuel high-pressure pump**)
- **Fuel high-pressure pump** faulty

Fault setting condition(s)
- The actual fuel high-pressure value deviates from the setpoint fuel pressure by more than 20 bar for longer than 5 seconds.
  - Actual value too low ⇒ P1036
  - Actual value too high ⇒ P1037

ⓘ INFORMATION
•V6 Turbo engines ONLY
The >Fuel high-pressure pump< system tests can be used for testing
⇒ See Diagnostics ▶ DME ▶ Maintenance/repairs ▶ System tests
ⓘ See F1 Help there!

Diagnostic information - DME (DFI) control unit

Fuel high pressure: too low/too high

Diagnostic conditions
- Engine running
- Fuel high-pressure pump operates normally, i.e.:
  - no engine stop
  - no overrun phase

Possible fault causes
- Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
- Loose contact or corrosion on connectors or lines ▶ **Fuel high-pressure sensor**
- **Quantity control valve** sluggish (in **fuel high-pressure pump**)
- **Fuel high-pressure pump** faulty

Fault setting condition(s)
- The actual fuel high-pressure value deviates from the setpoint fuel pressure by more than 20 bar for longer than 5 seconds.
  - Actual value too low ⇒ P1036
  - Actual value too high ⇒ P1037

ⓘ INFORMATION
•V6 Turbo engines ONLY

⇒ See Diagnostics ▶ DME ▶ Maintenance/repairs ▶ System tests
ⓘ See F1 Help there!

P1038

Diagnostic information - DME (DFI) control unit

Fuel high-pressure pump: bank 1 adaptation faulty

Diagnostic conditions
● Perform system test >Fuel high-pressure pump, bank 1<

ⓘ INFORMATION
If the system test takes longer than approx. 5 minutes, it will be canceled without a result.
● This is the case if the tested fuel high-pressure pump can no longer build up high pressure, i.e. can no longer pump fuel
(e.g. low-pressure supply blocked, pump tappets broken, pump faulty, ...).

Possible fault causes
♦ Fuel high-pressure pump, bank 1 faulty

Fault setting condition(s)
ⓘ During the >Fuel high-pressure pump, bank 1< system test, the fuel high-pressure pump for bank 2 is adjusted to zero quantity (switched off) and the fuel high-pressure pump for bank 1 is adapted.
● A fault is entered if the result is not within the permissible adaptation range.

P1039

Diagnostic information - DME (DFI) control unit

Fuel high-pressure pump: bank 2 adaptation faulty

Diagnostic conditions
● Perform system test >Fuel high-pressure pump, bank 2<

ⓘ INFORMATION
If the system test takes longer than approx. 5 minutes, it will be canceled without a result.
● This is the case if the tested fuel high-pressure pump can no longer build up high pressure, i.e. can no longer pump fuel
(e.g. low-pressure supply blocked, pump tappets broken, pump faulty, ...).

Possible fault causes
♦ Fuel high-pressure pump, bank 2 faulty

Fault setting condition(s)
ⓘ During the >Fuel high-pressure pump, bank 2< system test, the fuel high-pressure pump for bank 1 is adjusted to zero quantity (switched off) and the fuel high-pressure pump for bank 2 is adapted.
● A fault is entered if the result is not within the permissible adaptation range.

P1041

Diagnostic information - DME (DFI) control unit

Air cleaner flap solenoid valve driver

Diagnostic conditions
- Engine start

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Air cleaner flap solenoid valve faulty

ⓘ INFORMATION
The air cleaner flap solenoid valve is briefly switched on and is then switched off again after the engine start.

Diagnostic information - DME (DFI) control unit

Air cleaner flap solenoid valve driver

Diagnostic conditions
- Engine start

Possible fault causes
- Short circuit to B+/ground/between lines or open circuit in the lines
- Air cleaner flap solenoid valve faulty

ⓘ INFORMATION
The air cleaner flap solenoid valve is briefly switched on and is then switched off again after the engine start.

P1043

Diagnostic information - DME (DFI) control unit

Air cleaner flap solenoid valve driver

Diagnostic conditions
- Engine start

Possible fault causes
- Short circuit to B+/ground/between lines or open circuit in the lines
- Air cleaner flap solenoid valve faulty

ⓘ INFORMATION
The air cleaner flap solenoid valve is briefly switched on and is then switched off again after the engine start.

P1044

Diagnostic information - DME (DFI) control unit

Acoustic simulator solenoid valve driver

Diagnostic conditions
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground or open circuit in the line (power supply or activation)
- Acoustic simulator solenoid valve faulty

P1045

Diagnostic information - DME (DFI) control unit

Acoustic simulator solenoid valve driver

Diagnostic conditions
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground or open circuit in the line (power supply or activation)
- Acoustic simulator solenoid valve faulty

P1046

Diagnostic information - DME (DFI) control unit

Acoustic simulator solenoid valve driver

Diagnostic conditions
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground or open circuit in the line (power supply or activation)
- Acoustic simulator solenoid valve faulty

P1053

Diagnostic information - DME (DFI) control unit

Tank vent pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Ground supply faulty
- Tank vent pressure sensor faulty

P1054

Diagnostic information - DME (DFI) control unit

Tank vent pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Ground supply faulty
- Tank vent pressure sensor faulty

P1055

Diagnostic information - DME (DFI) control unit

Tank vent pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Ground supply faulty
- Tank vent pressure sensor faulty

P1056

Diagnostic information - DME (DFI) control unit

Tank vent pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Ground supply faulty
- Tank vent pressure sensor faulty

Diagnostic information - DME (DFI) control unit

Tank vent pressure sensor implausible

Diagnostic conditions
● Drive with different operating conditions (idling, full-load acceleration, uniform partial-load operation and overrun phases)
then
♦ Switch off engine and wait for control unit run-on (approx. 90 seconds)
then
♦ Switch on ignition
then
♦ Engine start

Possible fault causes
♦ Tank vent pressure sensor faulty
♦ Tank vent valve stuck closed (see P0441)
♦ Both check valves stuck closed or installed backward (see P0441)

Fault setting condition(s)
Diagnostics part 1:
♦ In the area of the tank vent pressure sensor, a vacuum exists between the tank vent valve and the check valves when the engine is switched off.
♦ Immediately after the engine is switched off, the tank vent valve is opened briefly so that ambient pressure exists there.
♦ After the ignition is switched on, the pressure in the tank vent system is compared with the ambient pressure.
♦ The fault is set if the two pressure values differ by too much from each other.
♦ A deviation of the ambient pressure due to weather changes between the time when the engine is switched off and the time when the ignition is switched on again is taken into account.
♦ Diagnostics is rejected if the differences in the ambient pressure are too high.

Diagnostics part 2:
♦ When the engine is started, the pressure in the tank vent system must decrease by a certain amount due to the vacuum in the intake manifold.
♦ If this does not happen, a check is performed to determine whether the pressure in the tank vent system now decreases when the boost pressure is sufficient.
♦ The fault is set if the pressure does not change sufficiently in both cases.

P1069

Diagnostic information - DME (DFI) control unit

Mass air flow implausibly high (leakage adaptation)

Diagnostic conditions
- Idling > 2 minute(s)
- Driving with different operating conditions
- None of the following faults stored: Intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Possible fault causes
- Oil filler cap leaking
- Positive crankcase ventilation hose leaking (see ⓘ 1)
- Leak in intake system - between throttle valve and engine (intake valve)
- Tank vent valve faulty - closed
- Intake manifold pressure sensor - electr. plug connection loose, oxidized, corroded, interrupted
- Fault in area of intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Fault setting condition(s)
Unacceptably large deviation between measured mass air flow and calculated mass air flow , with:
- increasing deviation over an extended time period (see ⓘ 2)

ⓘ INFORMATION

1. (Turbo only)
The following components are **NOT** tested when an overpressure test is carried out on the intake duct:
- Ventilation check valve (intake-air distributor)
- Ventilation check valve (turbocharger suction hose)
- Positive crankcase ventilation hose between ventilation check valve and crankcase
- Crankcase

2.
This diagnostic function monitors the intake system between the throttle valve and engine (intake valves).
- A mass air flow is calculated from the signals from the throttle valve potentiometer, engine speed sensor, intake air temperature sensor and ambient pressure sensor as well as other engine operating values.
- The calculated mass air flow is compared with that measured by the pressure sensor.
- A deviation may be due to both the calculated mass air flow and the measured mass air flow.

Diagnostic information - DME (DFI) control unit

Mass air flow implausibly low (leakage adaptation)

Diagnostic conditions
- Idling > 2 minute(s)
- Driving with different operating conditions
- None of the following faults stored: Intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Possible fault causes
- Throttle valve adjusting unit soiled
- Exhaust system blocked/cross-section constricted
- Intake manifold pressure sensor - electr. plug connection loose, oxidized, corroded, interrupted
- Tank vent valve faulty (mechanical/electrical fault)
- Fault in area of intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Fault setting condition(s)
Unacceptably large deviation between measured mass air flow and calculated mass air flow , with:
- increasing deviation over an extended time period (see ⓘ)

ⓘ INFORMATION
This diagnostic function monitors the intake system between the throttle valve and engine (intake valves).
- A mass air flow is calculated from the signals from the throttle valve potentiometer, engine speed sensor, intake air temperature sensor and ambient pressure sensor as well as other engine operating values.
- The calculated mass air flow is compared with that measured by the pressure sensor.
- A deviation may be due to both the calculated mass air flow and the measured mass air flow.

P1071

Diagnostic information - DME (DFI) control unit

Mass air flow in near idle speed range, implausibly high

Diagnostic conditions
- Idling > 30 s,
  - then engine speed > 1,500 rpm > 1 s,
    - then idling > 30 s
- None of the following faults stored: Intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Possible fault causes
- Oil filler cap lost
- Positive crankcase ventilation hose leaking (see ⓘ **1**)
- Leak in intake system - between throttle valve and engine (intake valve)
- Tank vent valve faulty - open
- Intake manifold pressure sensor - electr. plug connection loose, oxidized, corroded, interrupted
- Fault in area of intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Fault setting condition(s)
Excessive deviation of the throttle valve position during the current engine idling phase compared to the most recent and the penultimate engine idling phases (see ⓘ **2**)

ⓘ INFORMATION

1. (Turbo only)
The following components are NOT tested when an overpressure test is carried out on the intake duct:
- Ventilation check valve (intake-air distributor)
- Ventilation check valve (turbocharger suction hose)
- Positive crankcase ventilation hose between ventilation check valve and crankcase
- Crankcase

2.
The diagnostic function checks whether the value >H040-Mass air flow correction factor< recorded during the current engine idling phase deviates too much from the value during the last engine idling phase:
- If NO, the new value is used as the next reference value, and diagnostics begins again in the next engine idling phase.
- If YES, the test is repeated in the next engine idling phase and compared with the value of the penultimate engine idling phase:
  - If NO relevant deviation still exists, the new value is used as the next reference value.
- The fault is entered if a relevant deviation exists AGAIN. The following information, among other data, is stored in the extended fault memory:

1. XX-Correction value after throttle valve adaptation

This percentage is determined from a characteristic, depending on the intake air temperature, during every throttle valve adaptation.
It serves to prevent incorrect diagnoses that can occur due to adaptation taking place when the throttle valve is too warm or cold.

2. XX-Correction value for mass air flow at idle

Snapshot of the actual value H040 approx. 3 sec. after idling begins (= stabilized state). It is used for comparison with the same value of the most recent (or penultimate if a fault is suspected) idling phase.

3. XX-Difference between the correction values of two idling phases

Difference in the snapshot of actual value H040 between the current idling phase and the same value of the most recent (or penultimate if a fault is suspected) idling phase.

4. XX-Throttle value taught in case of violated environmental conditions

1=YES / 0=NO

Diagnostic information - DME (DFI) control unit

Mass air flow in lower partial-load range, implausibly high

Diagnostic conditions
- Driving with different operating conditions
- None of the following faults stored: Intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Possible fault causes
- Variable intake manifold - mechanical fault (if fitted)
- Intake manifold pressure sensor - electric plug connection loose, oxidized, corroded, interrupted
- Fault in area of intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Fault setting condition(s)
Unacceptably large deviation between measured mass air flow and calculated mass air flow (see ⓘ)

ⓘ INFORMATION
This diagnostic function monitors the intake system between the throttle valve and engine (intake valves).
- A mass air flow is calculated from the signals from the throttle valve potentiometer, engine speed sensor, intake air temperature sensor and ambient pressure sensor as well as other engine operating values.
- The calculated mass air flow is compared with that measured by the pressure sensor.
- A deviation may be due to both the calculated mass air flow and the measured mass air flow.

Diagnostic information - DME (DFI) control unit

Mass air flow in lower partial-load range, implausibly low

Diagnostic conditions
- Driving with different operating conditions
- None of the following faults stored: Intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Possible fault causes
- Throttle valve adjusting unit soiled

ⓘ A thin film of dirt in the closing area of the throttle valve in the throttle housing suffices, especially if engine adaptation values were reset previously.
- Air cleaner dirty/blocked/frozen
- Air intake (ahead of air cleaner) constricted
- Air guide ahead of throttle valve blocked/cross-section constricted
- Exhaust system blocked/cross-section constricted
- Variable intake manifold - mechanical fault (if fitted)
- Intake manifold pressure sensor - electr. plug connection loose, oxidized, corroded, interrupted
- Tank vent valve faulty - closed (mechanical/electrical fault)
- Fault in area of intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Fault setting condition(s)
Unacceptably large deviation between measured mass air flow and calculated mass air flow (see ⓘ)

P1147

Diagnostic information - DME (DFI) control unit

Oil pressure control valve: power supply

ⓘ INFORMATION

♦ The oil pressure control valve is supplied with 12 V while the engine is running.
♦ A short circuit to B+ can be detected only during control unit run-on.

Diagnostic conditions

- Engine running, then:
- Ignition off > 1 minute(s)

Possible fault causes

♦ Short circuit to B+ (power supply to oil pressure control valve)
♦ Oil pressure control valve faulty

P1148

Diagnostic information - DME (DFI) control unit

Oil pressure control valve: power supply

Diagnostic conditions
- Engine running

Possible fault causes
- ♦ Open circuit/short circuit to ground (power supply to oil pressure control valve)
- ♦ Short circuit to B+/ground or open circuit in the line (oil pressure control valve activation)
- ♦ Oil pressure control valve faulty

P1149

Diagnostic information - DME (DFI) control unit

Oil pressure control valve: power supply

Diagnostic conditions
- Engine running

Possible fault causes
- ♦ Open circuit/short circuit to ground (power supply to oil pressure control valve)
- ♦ Short circuit to B+/ground or open circuit in the line (oil pressure control valve activation)
- ♦ Oil pressure control valve faulty

Diagnostic information - DME (DFI) control unit

Oil pressure control valve: activation

ⓘ INFORMATION

♦ The oil pressure control valve is controlled via a PWM signal.
♦ The PWM signal depends, among other things, on the ambient conditions (temperatures, off time, etc.), operating point of the engine (rpm, load, oil temperature), measured oil pressure (at the oil pressure sensor) …
♦ A fault is detected if the PWM signal is outside a defined range for > 8 seconds.

Diagnostic conditions
● Engine running

Possible fault causes
♦ Short circuit to B+ (oil pressure control valve activation)
♦ Open circuit/short circuit to B+ (power supply to oil pressure control valve)
♦ Oil pressure control valve faulty

Diagnostic information - DME (DFI) control unit

Oil pressure control valve: activation

ⓘ INFORMATION

♦ The oil pressure control valve is controlled via a PWM signal.
♦ The PWM signal depends, among other things, on the ambient conditions (temperatures, off time, etc.), operating point of the engine (rpm, load, oil temperature), measured oil pressure (at the oil pressure sensor) …
♦ A fault is detected if the PWM signal is outside a defined range for > 8 seconds.
♦ The oil pressure is reduced to the minimum pressure in the event of a short circuit to ground.

Diagnostic conditions
● Engine running

Possible fault causes
♦ Short circuit to ground (oil pressure control valve activation)
♦ Open circuit/short circuit to ground (power supply to oil pressure control valve)
♦ Oil pressure control valve faulty

Fault effects
♦ Power supply to oil pressure control valve - is switched off

Diagnostic information - DME (DFI) control unit

Oil pressure control valve: activation

ⓘ INFORMATION

♦ The oil pressure control valve is controlled via a PWM signal.
♦ The PWM signal depends, among other things, on the ambient conditions (temperatures, off time, etc.), operating point of the engine (rpm, load, oil temperature), measured oil pressure (at the oil pressure sensor) …
♦ A fault is detected if the PWM signal is outside a defined range for > 8 seconds.

Diagnostic conditions
● Engine running

Possible fault causes
♦ Open circuit (oil pressure control valve activation)
♦ Open circuit/short circuit to ground (power supply to oil pressure control valve)
♦ Oil pressure control valve faulty

Diagnostic information - DME (DFI) control unit

Positive crankcase ventilation driver

ⓘ INFORMATION

♦ Diagnosis only takes place when the component has been activated.
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

Diagnostic conditions

- Ambient temperature < 0 °C (32 °F)
- Engine start detected
- Vehicle voltage > 12 V

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Positive crankcase ventilation heating tube faulty

Diagnostic information - DME (DFI) control unit

Positive crankcase ventilation driver

ⓘ INFORMATION

♦ Diagnosis only takes place when the component has been activated.
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

Diagnostic conditions

- Ambient temperature < 0 °C (32 °F)
- Engine start detected
- Vehicle voltage > 12 V

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Positive crankcase ventilation heating tube faulty

P1182

Diagnostic information - DME (DFI) control unit

Positive crankcase ventilation driver

ⓘ INFORMATION

♦ Diagnosis only takes place when the component has been activated.
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

Diagnostic conditions

- Ambient temperature < 0 °C (32 °F)
- Engine start detected
- Vehicle voltage > 12 V

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Positive crankcase ventilation heating tube faulty

P1183

Diagnostic information - DME (DFI) control unit

Intake manifold pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running
- None of the following faults stored: P0234, P1638, P1639, P0107, P0108, P2228, P2229

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Ground supply faulty
- Intake manifold pressure sensor faulty

- **Turbo only**
  - Only if fault P1189 or P1190 (boost pressure sensor) is entered at the same time:
- Leak in vacuum hose at boost pressure control cycle valve or wastegate
- Boost pressure control cycle valve leaking
- Wastegate leaking

Fault setting condition(s)
- The actual value exceeds the defined upper or lower limit (H065)

Fault effects
- Substitute value from model

P1184

Diagnostic information - DME (DFI) control unit

Intake manifold pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running
- None of the following faults stored: P0234, P1638, P1639, P0107, P0108, P2228, P2229

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Ground supply faulty
- ♦ Intake manifold pressure sensor faulty

- **Turbo only**
  - Only if fault P1189 or P1190 (boost pressure sensor) is entered at the same time:
- ♦ Leak in vacuum hose at boost pressure control cycle valve or wastegate
- ♦ Boost pressure control cycle valve leaking
- ♦ Wastegate leaking

Fault setting condition(s)
- The actual value exceeds the defined upper or lower limit (H065)

Fault effects
- ♦ Substitute value from model

Diagnostic information - DME (DFI) control unit

Ambient pressure sensor implausible

Diagnostic conditions
- Ignition on > 10 second(s)
- then: Acceleration with wide-open throttle for as long as possible, immediately followed by an overrun phase lasting as long as possible
- None of the following faults stored: P1638, P1639, P0107, P0108, P2228, P2229, P1183, P1184, P1187, P1188, P1189, P1190

Possible fault causes
- Fault P0069 also entered:
  - ♦ Intake manifold pressure sensor fault

- No fault P0069 entered:
  - ♦ DME (DFI) control unit faulty

Fault effects
- ♦ Substitute value from model

P1187

Diagnostic information - DME (DFI) control unit

Ambient pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running
- None of the following faults stored: P1638, P1639, P0107, P0108, P2228, P2229

Possible fault causes
♦ DME (DFI) control unit faulty

Fault setting condition(s)
- The actual value exceeds the defined upper or lower limit.
  > *A060-Ambient pressure from DME (measured)* <

Fault effects
♦ Substitute value from model

P1188

Diagnostic information - DME (DFI) control unit

Ambient pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running
- None of the following faults stored: P1638, P1639, P0107, P0108, P2228, P2229

Possible fault causes
♦ DME (DFI) control unit faulty

Fault setting condition(s)
- The actual value exceeds the defined upper or lower limit.
  > *A060-Ambient pressure from DME (measured)* <

Fault effects
♦ Substitute value from model

P1189

Diagnostic information - DME (DFI) control unit

Boost pressure sensor (pressure sensor ahead of throttle valve): electrical fault

Diagnostic conditions
- Ignition on or engine running
- None of the following faults stored: P0234, P1638, P1639, P0107, P0108, P2228, P2229

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Ground supply faulty
- ♦ Boost pressure sensor faulty

- **Only if fault P1183 or P1184** (intake manifold pressure sensor) **is entered at the same time**:
  - ♦ Leak in vacuum hose at boost pressure control cycle valve or wastegate
  - ♦ Boost pressure control cycle valve leaking
  - ♦ Wastegate leaking

Fault setting condition(s)
The actual value exceeds the defined upper or lower limit (H210).

Fault effects
- ♦ Substitute value from model

P1190

Diagnostic information - DME (DFI) control unit

Boost pressure sensor (pressure sensor ahead of throttle valve): electrical fault

Diagnostic conditions
- Ignition on or engine running
- None of the following faults stored: P0234, P1638, P1639, P0107, P0108, P2228, P2229

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Ground supply faulty
- Boost pressure sensor faulty

- **Only if fault P1183 or P1184** (intake manifold pressure sensor) **is entered at the same time**:
  - Leak in vacuum hose at boost pressure control cycle valve or wastegate
  - Boost pressure control cycle valve leaking
  - Wastegate leaking

Fault setting condition(s)
The actual value exceeds the defined upper or lower limit (H210).

Fault effects
- Substitute value from model

P1265

Diagnostic information - DME (DFI) control unit

Crash signal

Diagnostic conditions
- Ignition on

Possible fault causes
♦ Short circuit to B+/ground or open circuit in the wiring for the signal line (airbag triggering unit)

P1280

Diagnostic information - DME (DFI) control unit

Fuel pump control unit

Diagnostic conditions
- Switch on ignition or engine start (electric fuel pump activated)

Possible fault causes
♦ Fuel pump control unit implausible

Fault effects
♦ The control unit attempts to bring the fuel pump to the setpoint value.

P1281

Diagnostic information - DME (DFI) control unit

Fuel pump control unit: overtemperature

Diagnostic conditions
- Switch on ignition or engine start (electric fuel pump activated)

Possible fault causes
- Overloading of fuel pump control unit

Fault effects
- The control unit attempts to bring the fuel pump to the setpoint value.

P1282

Diagnostic information - DME (DFI) control unit

Electric fuel pump: sluggish

Diagnostic conditions
- Switch on ignition or engine start (electric fuel pump activated)

Possible fault causes
- Foreign body in electric fuel pump
- Fuel line blocked
- Electric fuel pump faulty

Fault setting condition(s)
- Current draw max. 30% > setpoint value

Fault effects
- The control unit attempts to bring the fuel pump to the setpoint value.

P1283

Diagnostic information - DME (DFI) control unit

Electric fuel pump: blocked

Diagnostic conditions
- Switch on ignition or engine start (electric fuel pump activated)

Possible fault causes
- Foreign body in electric fuel pump
- Electric fuel pump faulty

Fault setting condition(s)
- Current draw at least 30% > setpoint value

Fault effects
- The control unit attempts to bring the fuel pump to the setpoint value.

P1284

Diagnostic information - DME (DFI) control unit

Electric fuel pump: electrical fault

Diagnostic conditions
- Switch on ignition or engine start (electric fuel pump activated)

Possible fault causes
- ♦ Short circuit in lines for fuel pump control unit ⇒ Electric fuel pump
- ♦ Electric fuel pump faulty

Fault effects
- ♦ Electric fuel pump switched off
- ♦ Electric fuel pump activated and tested after 50 ... 150 millisecond(s)

P1285

Diagnostic information - DME (DFI) control unit

Electric fuel pump: electrical fault

Diagnostic conditions
- Switch on ignition or engine start (electric fuel pump activated)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Open circuit in lines for fuel pump control unit ⇒ Electric fuel pump
- ♦ Open circuit in ground line for electric fuel pump
- ♦ Electric fuel pump faulty

Fault effects
- ♦ Electric fuel pump switched off
- ♦ Electric fuel pump activated and tested after 50 ... 150 millisecond(s)

P1286

Diagnostic information - DME (DFI) control unit

Speed deviation

Diagnostic conditions
- Switch on ignition or engine start (electric fuel pump activated)

Possible fault causes
- Supply voltage for fuel pump control unit too low
- Loose contact or corrosion on connectors or lines
- Leak in fuel line
- Fuel line blocked
- Foreign body in electric fuel pump
- Electric fuel pump sluggish

Fault setting condition(s)
- Speed of electric fuel pump deviates from setpoint speed, at:
  - Supply voltage for fuel pump control unit < 12.5 V
  - Fuel counter-pressure too high
  - Fuel counter-pressure too low
  - Electric fuel pump sluggish

Fault effects
- The control unit attempts to bring the fuel pump to the setpoint value.

P1287

Diagnostic information - DME (DFI) control unit

Electric fuel pump: brief failure

Diagnostic conditions
- Switch on ignition or engine start (electric fuel pump activated)

Possible fault causes
♦ Loose contact or corrosion on connectors or lines

Fault setting condition(s)
- Electric fuel pump failed briefly while driving

Fault effects
♦ The control unit attempts to bring the fuel pump to the setpoint value.

P12A1

Diagnostic information - DME (DFI) control unit

Fuel high-pressure sensor implausible

ⓘ INFORMATION

♦ Faults in the fuel high-pressure injection system area are frequently caused by defects in the pre-delivery circuit (fuel low pressure).
♦ Therefore, the pre-delivery circuit must be checked first in case of problems in the area of the fuel high-pressure injection system.

Diagnostic conditions
- Time since engine start > 250 second(s)
- Engine temperature - 10 ... +100 °C (14 … 212 °F)
- Engine speed 450 .... 4,000 rpm
- Lambda control active

Possible fault causes
♦ Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
♦ Fuel high-pressure system leaking
♦ Fuel high-pressure sensor faulty
♦ Fuel high-pressure pump faulty

Fault setting condition(s)
Long-term deviation in fuel high-pressure actual value - setpoint value
(The setpoint value is calculated using several variables, e.g. lambda control, quantity control valve, ...).

P12A2

Diagnostic information - DME (DFI) control unit

Fuel high-pressure sensor implausible

ⓘ INFORMATION

♦ Faults in the fuel high-pressure injection system area are frequently caused by defects in the pre-delivery circuit (fuel low pressure).
♦ Therefore, the pre-delivery circuit must be checked first in case of problems in the area of the fuel high-pressure injection system.

Diagnostic conditions
- Time since engine start > 250 second(s)
- Engine temperature - 10 ... +100 °C (14 … 212 °F)
- Engine speed 450 .... 4,000 rpm
- Lambda control active

Possible fault causes
♦ Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
♦ Fuel high-pressure system leaking
♦ Fuel high-pressure sensor faulty
♦ Fuel high-pressure pump faulty

Fault setting condition(s)
Long-term deviation in fuel high-pressure actual value - setpoint value
(The setpoint value is calculated using several variables, e.g. lambda control, quantity control valve, ...).

P1324

Diagnostic information - DME (DFI) control unit

Bank 2 intake camshaft timing

Diagnostic conditions
- Time since engine start > 10 second(s)

Possible fault causes
- ♦ Timing wrong (chain jump)
- ♦ Camshaft sensor loose
- ♦ Timing set incorrectly (after repairs)
- ♦ Hall sender rotor (camshaft) wrong or damaged

Fault setting condition(s)
Current timing <> stored timing (last engine run)

P1340

Diagnostic information - DME (DFI) control unit

Bank 1 intake camshaft timing

Diagnostic conditions
- Time since engine start > 10 second(s)

Possible fault causes
- ♦ Timing wrong (chain jump)
- ♦ Camshaft sensor loose
- ♦ Timing set incorrectly (after repairs)
- ♦ Hall sender rotor (camshaft) wrong or damaged

Fault setting condition(s)
Current timing <> stored timing (last engine run)

P1346

Diagnostic information - DME (DFI) control unit

Valve lift control, bank 1
- All V8 Turbo
- Cayenne V8S

Diagnostic conditions
- Valve lift system short test (if available)

or
- Driving with slight acceleration (See ⓘ), with:
  - Large lift (actual value A220 = 1):
    - Time since engine start > 5 minute(s)
    - Engine speed 1,250 ... 2,200 rpm (actual value A020)
    - Mass air flow 300 … 600 mg/stroke (actual value A050)

- then driving with slight acceleration, with:
  - Small lift (actual value A220 = 0):
    - Time since engine start > 5 minute(s)
    - Engine speed 1,250 ... 2,200 rpm (actual value A020)
    - Mass air flow 180 … 350 mg/stroke (actual value A050)

Possible fault causes
♦ Engine oil pressure too high or too low
♦ Loose contact or corrosion on connectors or lines (power supply for solenoid valve for hydraulic valve lift control)

Fault setting condition(s)
Based on the oscillation behavior of the camshafts, the diagnostic function detects that all the valves have either not switched to the other lift or have not switched quickly enough during valve lift switchover.

ⓘ INFORMATION

A drive with the aforementioned conditions can be performed as follows, for example:
- Engine at operating temperature
- Level route
- Driving in 5th gear (manual)
- Vehicle rolls at approx. 50 km/h or 30 mph (approx. 1,000 rpm)
- This is followed by steady acceleration up to 2200 rpm, with:
  - Acceleration not too high (mass air flow < 600 mg/stroke - actual value A050)

and
  - Acceleration not too low (large lift - actual value A220 = 1)

P1347

Diagnostic information - DME (DFI) control unit

Valve lift control, bank 2
- All V8 Turbo
- Cayenne V8S

Diagnostic conditions
- Valve lift system short test (if available)

or
- Driving with slight acceleration (See ⓘ), with:
  - Large lift (actual value A220 = 1):
    - Time since engine start > 5 minute(s)
    - Engine speed 1,250 ... 2,200 rpm (actual value A020)
    - Mass air flow 300 … 600 mg/stroke (actual value A050)

- then driving with slight acceleration, with:
  - Small lift (actual value A220 = 0):
    - Time since engine start > 5 minute(s)
    - Engine speed 1,250 ... 2,200 rpm (actual value A020)
    - Mass air flow 180 … 350 mg/stroke (actual value A050)

Possible fault causes
♦ Engine oil pressure too high or too low
♦ Loose contact or corrosion on connectors or lines (power supply for solenoid valve for hydraulic valve lift control)

Fault setting condition(s)
Based on the oscillation behavior of the camshafts, the diagnostic function detects that all the valves have either not switched to the other lift or have not switched quickly enough during valve lift switchover.

ⓘ INFORMATION

A drive with the aforementioned conditions can be performed as follows, for example:
- Engine at operating temperature
- Level route
- Driving in 5th gear (manual)
- Vehicle rolls at approx. 50 km/h or 30 mph (approx. 1,000 rpm)
- This is followed by steady acceleration up to 2200 rpm, with:
  - Acceleration not too high (mass air flow < 600 mg/stroke - actual value A050)

and
  - Acceleration not too low (large lift - actual value A220 = 1)

P1359

Diagnostic information - DME (DFI) control unit

Valve lift control, cylinder 1 - large lift

Diagnostic conditions
- Short test for valve lift of individual cylinders (if available)

or
- Driving in partial-load range
  - > 5 minute(s)
  - Engine speed 1,250 … 3,000 rpm
  - Mass air flow 180 … 500 mg/stroke

- then idling
  - Air conditioning [OFF]
  - > 2 minute(s)
  - Engine speed 500 … 1,000 rpm
  - Mass air flow 90 … 250 mg/stroke

Possible fault causes
- Fuel injector faulty or borderline
  (opens too late/not long enough/not enough or leaking)
- Bar ignition module faulty
- Leak in intake-air distributor
- Insufficient compression
  (e.g. cylinder liner damaged, valve seat ring faulty, ...)
- Valve lifter faulty
  (Intake valve has not switched to the other lift or has not switched quickly enough)

Fault setting condition(s)
- The diagnostic function detects uneven running for the specified cylinder.
- Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.
- Uneven running is interpreted as a misfire or valve lift fault, depending on type.

Diagnostic information - DME (DFI) control unit

Valve lift control, cylinder 6 - large lift

Diagnostic conditions
- Short test for valve lift of individual cylinders (if available)

or
- Driving in partial-load range
  - > 5 minute(s)
  - Engine speed 1,250 … 3,000 rpm
  - Mass air flow 180 … 500 mg/stroke

- then idling
  - Air conditioning [OFF]
  - > 2 minute(s)
  - Engine speed 500 … 1,000 rpm
  - Mass air flow 90 … 250 mg/stroke

Possible fault causes
- Fuel injector faulty or borderline
  (opens too late/not long enough/not enough or leaking)
- Bar ignition module faulty
- Leak in intake-air distributor
- Insufficient compression
  (e.g. cylinder liner damaged, valve seat ring faulty, ...)
- Valve lifter faulty
  (Intake valve has not switched to the other lift or has not switched quickly enough)

Fault setting condition(s)
- The diagnostic function detects uneven running for the specified cylinder.
- Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.
- Uneven running is interpreted as a misfire or valve lift fault, depending on type.

Diagnostic information - DME (DFI) control unit

Valve lift control, cylinder 2 - large lift

Diagnostic conditions
- Short test for valve lift of individual cylinders (if available)

or
- Driving in partial-load range
  - > 5 minute(s)
  - Engine speed 1,250 … 3,000 rpm
  - Mass air flow 180 … 500 mg/stroke

- then idling
  - Air conditioning [OFF]
  - > 2 minute(s)
  - Engine speed 500 … 1,000 rpm
  - Mass air flow 90 … 250 mg/stroke

Possible fault causes
- Fuel injector faulty or borderline
  (opens too late/not long enough/not enough or leaking)
- Bar ignition module faulty
- Leak in intake-air distributor
- Insufficient compression
  (e.g. cylinder liner damaged, valve seat ring faulty, ...)
- Valve lifter faulty
  (Intake valve has not switched to the other lift or has not switched quickly enough)

Fault setting condition(s)
- The diagnostic function detects uneven running for the specified cylinder.
- Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.
- Uneven running is interpreted as a misfire or valve lift fault, depending on type.

Diagnostic information - DME (DFI) control unit

Valve lift control, cylinder 4 - large lift

Diagnostic conditions
- Short test for valve lift of individual cylinders (if available)

or
- Driving in partial-load range
  - > 5 minute(s)
  - Engine speed 1,250 … 3,000 rpm
  - Mass air flow 180 … 500 mg/stroke

- then idling
  - Air conditioning [OFF]
  - > 2 minute(s)
  - Engine speed 500 … 1,000 rpm
  - Mass air flow 90 … 250 mg/stroke

Possible fault causes
- Fuel injector faulty or borderline
  (opens too late/not long enough/not enough or leaking)
- Bar ignition module faulty
- Leak in intake-air distributor
- Insufficient compression
  (e.g. cylinder liner damaged, valve seat ring faulty, ...)
- Valve lifter faulty
  (Intake valve has not switched to the other lift or has not switched quickly enough)

Fault setting condition(s)
- The diagnostic function detects uneven running for the specified cylinder.
- Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.
- Uneven running is interpreted as a misfire or valve lift fault, depending on type.

Diagnostic information - DME (DFI) control unit

Valve lift control, cylinder 3 - large lift

Diagnostic conditions
- Short test for valve lift of individual cylinders (if available)

or
- Driving in partial-load range
  - > 5 minute(s)
  - Engine speed 1,250 … 3,000 rpm
  - Mass air flow 180 … 500 mg/stroke

- then idling
  - Air conditioning [OFF]
  - > 2 minute(s)
  - Engine speed 500 … 1,000 rpm
  - Mass air flow 90 … 250 mg/stroke

Possible fault causes
- Fuel injector faulty or borderline
  (opens too late/not long enough/not enough or leaking)
- Bar ignition module faulty
- Leak in intake-air distributor
- Insufficient compression
  (e.g. cylinder liner damaged, valve seat ring faulty, ...)
- Valve lifter faulty
  (Intake valve has not switched to the other lift or has not switched quickly enough)

Fault setting condition(s)
- The diagnostic function detects uneven running for the specified cylinder.
- Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.
- Uneven running is interpreted as a misfire or valve lift fault, depending on type.

Diagnostic information - DME (DFI) control unit

Valve lift control, cylinder 5 - large lift

Diagnostic conditions
- Short test for valve lift of individual cylinders (if available)

or
- Driving in partial-load range
  - > 5 minute(s)
  - Engine speed 1,250 … 3,000 rpm
  - Mass air flow 180 … 500 mg/stroke

- then idling
  - Air conditioning [OFF]
  - > 2 minute(s)
  - Engine speed 500 … 1,000 rpm
  - Mass air flow 90 … 250 mg/stroke

Possible fault causes
- Fuel injector faulty or borderline
  (opens too late/not long enough/not enough or leaking)
- Bar ignition module faulty
- Leak in intake-air distributor
- Insufficient compression
  (e.g. cylinder liner damaged, valve seat ring faulty, ...)
- Valve lifter faulty
  (Intake valve has not switched to the other lift or has not switched quickly enough)

Fault setting condition(s)
- The diagnostic function detects uneven running for the specified cylinder.
- Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.
- Uneven running is interpreted as a misfire or valve lift fault, depending on type.

P1372

Diagnostic information - DME (DFI) control unit

Valve lift control, bank 1
- Not V6 Turbo

Diagnostic conditions
- Perform a short test

or
- Engine oil temperature < 111 °C (232 °F) (actual value T030)
- Air conditioning [OFF]

- Small lift:
  - Engine speed 1,200 .... 3,000 rpm (actual value A020)
  - Mass air flow (actual value A050)
    - > 300 … > 175 mg/stroke (depending on: engine speed)
    - < 600 mg/stroke
  - Intake camshaft adjustment > 11° (actual value N060)

- Large lift:
  - Engine speed 1,500 .... 5,000 rpm (actual value A020)
  - Mass air flow (actual value A050)
    - > 800 … > 325 mg/stroke (depending on: engine speed)

Possible fault causes
♦ Oil supply too low
⇒ (e.g. dirty (oil circuit), scavenging restrictor faulty (cylinder head), ...)
♦ Large differences in exhaust backpressure between banks (e.g. due to constricted or blocked passage of an exhaust branch).
♦ Wrong timing, one bank (intake camshaft or exhaust camshaft)
♦ Solenoid valve for hydraulic valve lift control faulty
⇒ (mechanical fault or electrical fault in circuit)

Fault setting condition(s)
Based on the lambda controllers, the diagnostic function detects that all the valves on this bank have either not switched to the other lift or have not switched quickly enough during valve lift switchover.

P1373

Diagnostic information - DME (DFI) control unit

Valve lift control, bank 2
- Not V6 Turbo

Diagnostic conditions
- Perform a short test

or
- Engine oil temperature < 111 °C (232 °F) (actual value T030)
- Air conditioning [OFF]

- Small lift:
  - Engine speed 1,200 .... 3,000 rpm (actual value A020)
  - Mass air flow (actual value A050)
    - > 300 … > 175 mg/stroke (depending on: engine speed)
    - < 600 mg/stroke
  - Intake camshaft adjustment > 11° (actual value N060)

- Large lift:
  - Engine speed 1,500 .... 5,000 rpm (actual value A020)
  - Mass air flow (actual value A050)
    - > 800 … > 325 mg/stroke (depending on: engine speed)

Possible fault causes
♦ Oil supply too low
⇒ (e.g. dirty (oil circuit), scavenging restrictor faulty (cylinder head), ...)
♦ Large differences in exhaust backpressure between banks (e.g. due to constricted or blocked passage of an exhaust branch).
♦ Wrong timing, one bank (intake camshaft or exhaust camshaft)
♦ Solenoid valve for hydraulic valve lift control faulty
⇒ (mechanical fault or electrical fault in circuit)

Fault setting condition(s)
Based on the lambda controllers, the diagnostic function detects that all the valves on this bank have either not switched to the other lift or have not switched quickly enough during valve lift switchover.

P1375

Diagnostic information - DME (DFI) control unit

Valve lift control, cylinder 7 - large lift

Diagnostic conditions

- Short test for valve lift of individual cylinders (if available)

or

- Driving in partial-load range
  - > 5 minute(s)
  - Engine speed 1,250 … 3,000 rpm
  - Mass air flow 180 … 500 mg/stroke

- then idling
  - Air conditioning [OFF]
  - > 2 minute(s)
  - Engine speed 500 … 1,000 rpm
  - Mass air flow 90 … 250 mg/stroke

Possible fault causes

♦ Fuel injector faulty or borderline
(opens too late/not long enough/not enough or leaking)
♦ Bar ignition module faulty
♦ Leak in intake-air distributor
♦ Insufficient compression
(e.g. cylinder liner damaged, valve seat ring faulty, ...)
♦ Valve lifter faulty
(Intake valve has not switched to the other lift or has not switched quickly enough)

Fault setting condition(s)

- The diagnostic function detects uneven running for the specified cylinder.
- Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.
- Uneven running is interpreted as a misfire or valve lift fault, depending on type.

P1376

Diagnostic information - DME (DFI) control unit

Valve lift control, cylinder 8 - large lift

Diagnostic conditions
- Short test for valve lift of individual cylinders (if available)

or
- Driving in partial-load range
  - > 5 minute(s)
  - Engine speed 1,250 … 3,000 rpm
  - Mass air flow 180 … 500 mg/stroke

- then idling
  - Air conditioning [OFF]
  - > 2 minute(s)
  - Engine speed 500 … 1,000 rpm
  - Mass air flow 90 … 250 mg/stroke

Possible fault causes
- Fuel injector faulty or borderline
  (opens too late/not long enough/not enough or leaking)
- Bar ignition module faulty
- Leak in intake-air distributor
- Insufficient compression
  (e.g. cylinder liner damaged, valve seat ring faulty, ...)
- Valve lifter faulty
  (Intake valve has not switched to the other lift or has not switched quickly enough)

Fault setting condition(s)
- The diagnostic function detects uneven running for the specified cylinder.
- Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.
- Uneven running is interpreted as a misfire or valve lift fault, depending on type.

P1380

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

Diagnostic information - DME (DFI) control unit

Bank 1 misfire after cold start

Diagnostic conditions
- Cold start (catalytic converter heating measure)
- Idle speed up to the red range on the tachometer
- No overrun phase(s)
- None of the following faults stored: P0335, P0336, P0371, P0373

Possible fault causes

♦ Affected by block heater

♦ Loose contact or corrosion on connectors or lines
♦ Power supply or ground supply faulty

♦ Spark plug(s) oily due to oil entrainment in the cylinder
♦ Wrong spark plug(s)
♦ Mechanical or electrical fault in spark plug(s)
♦ Bar ignition module faulty
♦ Power supply or ground supply faulty

♦ Wrong fuel quality
♦ Fuel tank empty
♦ Water in fuel tank
♦ Fuel line dirty/blocked
♦ Mechanical fault in electric fuel pump
♦ Mechanical fault in fuel high-pressure pump

♦ Fuel injector faulty or borderline
(opens too late/not long enough/not enough or leaking)
♦ Oxygen sensor(s) faulty

♦ Exhaust system constricted/blocked
♦ Catalytic converter faulty

♦ Leak in intake-air distributor
♦ Foreign bodies in intake-air distributor
♦ Camshaft adjustment fault
♦ Wrong timing - exhaust camshaft
♦ Valve lift control fault
♦ Valve lifter faulty
(Intake valve has not switched to the other lift or has not switched quickly enough)
♦ Mechanical fault in valve drive
♦ Insufficient compression
(e.g. cylinder liner damaged, valve seat ring faulty, ...)

Fault setting condition(s)

● The diagnostic function detects uneven running for the specified cylinder.

● Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.

● Uneven running is interpreted as a misfire or valve lift fault, depending on type.

Diagnostic information - DME (DFI) control unit

Bank 2 misfire after cold start

Diagnostic conditions
- Cold start (catalytic converter heating measure)
- Idle speed up to the red range on the tachometer
- No overrun phase(s)
- None of the following faults stored: P0335, P0336, P0371, P0373

Possible fault causes

♦ Affected by block heater

♦ Loose contact or corrosion on connectors or lines
♦ Power supply or ground supply faulty

♦ Spark plug(s) oily due to oil entrainment in the cylinder
♦ Wrong spark plug(s)
♦ Mechanical or electrical fault in spark plug(s)
♦ Bar ignition module faulty
♦ Power supply or ground supply faulty

♦ Wrong fuel quality
♦ Fuel tank empty
♦ Water in fuel tank
♦ Fuel line dirty/blocked
♦ Mechanical fault in electric fuel pump
♦ Mechanical fault in fuel high-pressure pump

♦ Fuel injector faulty or borderline
(opens too late/not long enough/not enough or leaking)
♦ Oxygen sensor(s) faulty

♦ Exhaust system constricted/blocked
♦ Catalytic converter faulty

♦ Leak in intake-air distributor
♦ Foreign bodies in intake-air distributor
♦ Camshaft adjustment fault
♦ Wrong timing - exhaust camshaft
♦ Valve lift control fault
♦ Valve lifter faulty
(Intake valve has not switched to the other lift or has not switched quickly enough)
♦ Mechanical fault in valve drive
♦ Insufficient compression
(e.g. cylinder liner damaged, valve seat ring faulty, ...)

Fault setting condition(s)

● The diagnostic function detects uneven running for the specified cylinder.

● Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.

● Uneven running is interpreted as a misfire or valve lift fault, depending on type.

Diagnostic information - DME (DFI) control unit

Ignition timing angle after cold start

Diagnostic conditions
- Cold start
- then driving

Possible fault causes
ⓘ This fault entry is used for information purposes only; the actual cause of the fault is in another area.
♦ Significant engine running problems force the engine control system to leave the permitted ignition timing range in order to keep the engine running.

P1460

Diagnostic information - DME (DFI) control unit

Radiator fan: overtemperature

⚠WARNING
Exposed running fan blades!
Danger of limbs being severed!
Risk of serious injury due to ejected foreign bodies!
♦ **ALWAYS** keep hair or clothing out of the rotating range of the fan.
♦ DO NOT reach into the rotating fan.
♦ **DO NOT** place tools or other items in the rotating range of the fan.
♦ Perform work on the fan only with the ignition switched off.
♦ Secure the ignition to prevent it from being switched on accidentally by other persons.

NOTE
Sensitive electronics!
Risk of irreparable damage to electronic components!
♦ **DO NOT** carry out electrical tests.
♦ **DO NOT** connect external power sources.

ⓘ INFORMATION
♦ The control unit is activated by the DME control unit via a signal line.
♦ In the opposite direction, the control unit can report faults to the DME control unit.

Diagnostic conditions
● Radiator fan activated > 5 minute(s)

Possible fault causes
♦ Radiator air intake covered (car cover)
♦ Radiator fan control unit faulty

Fault setting condition(s)
● Overtemperature in radiator fan control unit

Fault effects
● 1st threshold exceeded:
  ♦ Radiator fan speed = 1,800 rpm (lowest power loss)
● 2nd threshold exceeded:
  ♦ Radiator fan switched off

P1461

Diagnostic information - DME (DFI) control unit

Radiator fan: electrical fault

⚠WARNING
Exposed running fan blades!
Danger of limbs being severed!
Risk of serious injury due to ejected foreign bodies!
♦ **ALWAYS** keep hair or clothing out of the rotating range of the fan.
♦ DO NOT reach into the rotating fan.
♦ **DO NOT** place tools or other items in the rotating range of the fan.
♦ Perform work on the fan only with the ignition switched off.
♦ Secure the ignition to prevent it from being switched on accidentally by other persons.

NOTE
Sensitive electronics!
Risk of irreparable damage to electronic components!
♦ **DO NOT** carry out electrical tests.
♦ **DO NOT** connect external power sources.

ⓘ INFORMATION
♦ The control unit is activated by the DME control unit via a signal line.
♦ In the opposite direction, the control unit can report faults to the DME control unit.

Diagnostic conditions
● Radiator fan activated > 5 minute(s)

Possible fault causes
♦ Radiator fan faulty
♦ Radiator fan control unit faulty

Fault effects
♦ Radiator fan switched off

P1462

Diagnostic information - DME (DFI) control unit

Radiator fan: internal power supply

⚠WARNING

Exposed running fan blades!
Danger of limbs being severed!
Risk of serious injury due to ejected foreign bodies!

- **ALWAYS** keep hair or clothing out of the rotating range of the fan.
- DO NOT reach into the rotating fan.
- **DO NOT** place tools or other items in the rotating range of the fan.
- Perform work on the fan only with the ignition switched off.
- Secure the ignition to prevent it from being switched on accidentally by other persons.

NOTE

Sensitive electronics!
Risk of irreparable damage to electronic components!

- **DO NOT** carry out electrical tests.
- **DO NOT** connect external power sources.

ⓘ INFORMATION

- The control unit is activated by the DME control unit via a signal line.
- In the opposite direction, the control unit can report faults to the DME control unit.

Diagnostic conditions

- Radiator fan activated > 5 minute(s)

Possible fault causes

- Radiator fan faulty
- Radiator fan control unit faulty

P1466

Diagnostic information - DME (DFI) control unit

Radiator fan: mechanical fault

⚠WARNING

Exposed running fan blades!
Danger of limbs being severed!
Risk of serious injury due to ejected foreign bodies!

- ♦ **ALWAYS** keep hair or clothing out of the rotating range of the fan.
- ♦ DO NOT reach into the rotating fan.
- ♦ **DO NOT** place tools or other items in the rotating range of the fan.
- ♦ Perform work on the fan only with the ignition switched off.
- ♦ Secure the ignition to prevent it from being switched on accidentally by other persons.

NOTE

Sensitive electronics!
Risk of irreparable damage to electronic components!

- ♦ **DO NOT** carry out electrical tests.
- ♦ **DO NOT** connect external power sources.

ⓘ INFORMATION

- ♦ The control unit is activated by the DME control unit via a signal line.
- ♦ In the opposite direction, the control unit can report faults to the DME control unit.

Diagnostic conditions

- ● Radiator fan activated > 5 minute(s)

Possible fault causes

- ♦ Radiator fan sluggish or blocked
- ♦ Radiator fan faulty

Fault setting condition(s)

- ● Radiator fan current draw too high

Fault effects

- ● Sluggish:
  - ♦ Radiator fan speed reduced to 0 rpm
- ● Blocked:
  - ♦ Engine shakes loose

P1502

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit

Diagnostic conditions
- Vehicle standstill
- Coolant temperature 5 ... 100 °C (41 … 212 °F)
- Intake air temperature 5 ... 40 °C (41 … 104 °F)
- Accelerator pedal not pressed (0%)
- Ignition off
- then switch on ignition > 60 second(s) with engine off

Possible fault causes
- ♦ Adaptation was not performed (successfully).
- ♦ Throttle valve adjusting unit faulty

P1506

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit

Diagnostic conditions
- Vehicle standstill
- Coolant temperature 5 ... 100 °C (41 … 212 °F)
- Intake air temperature 5 ... 40 °C (41 … 104 °F)
- Accelerator pedal not pressed (0%)
- Ignition off
- then switch on ignition > 60 second(s) with engine off

Possible fault causes
- ♦ Adaptation was not performed (successfully).
- ♦ Throttle valve adjusting unit faulty

P1507

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit

Diagnostic conditions
- Vehicle standstill
- Coolant temperature 5 ... 100 °C (41 … 212 °F)
- Intake air temperature 5 ... 40 °C (41 … 104 °F)
- Accelerator pedal not pressed (0%)
- Ignition off
- then switch on ignition > 60 second(s) with engine off

Possible fault causes
- ♦ Adaptation was not performed (successfully).
- ♦ Throttle valve adjusting unit faulty

P1508

Diagnostic information - DME (DFI) control unit

Control unit function monitoring

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill

Possible fault causes
- Power supply or ground supply faulty ⇒ See P1559
- DME (DFI) control unit software error ▶ Re-program

ⓘ INFORMATION
- All calculations for functions in the control unit are monitored by a higher-level unit.
- A fault is entered if monitoring detects implausible calculations.

P1509

Diagnostic information - DME (DFI) control unit

Control unit function monitoring

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill

Possible fault causes
- ♦ Power supply or ground supply faulty ⇒ See P1559
- ♦ DME (DFI) control unit software error ▶ Re-program

ⓘ INFORMATION
- ♦ All calculations for functions in the control unit are monitored by a higher-level unit.
- ♦ A fault is entered if monitoring detects implausible calculations.

P1517

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit - adaptation aborted due to environmental condition

Diagnostic conditions

- Vehicle standstill
- Coolant temperature 5 ... 100 °C (41 … 212 °F)
- Intake air temperature 5 ... 40 °C (41 … 104 °F)
- Accelerator pedal not pressed (0%)
- Ignition off
- then switch on ignition > 60 second(s) with engine off

Possible fault causes

♦ Adaptation aborted due to environmental condition

Fault setting condition(s)

One or more of the stated conditions were not met (see ⓘ)

Fault effects

♦ Engine **cannot** be started

ⓘ INFORMATION

Forced adaptation can be performed using the PIWIS Tester.

Diagnostic information - DME (DFI) control unit

Ambient temperature via CAN
- Panamera up to MY D
- Panamera GTS from MY E
- Cayenne up to MY E

Diagnostic conditions
- Ignition on > 5 second(s)

Possible fault causes
♦ Wrong gateway control unit (See ⓘ)
♦ Message via CAN faulty or missing

Fault setting condition(s)
- No time information from the gateway control unit (0.5 ... 5 second(s))

and
- There is also no other time information available via satellite (e.g. no reception in garage)

Fault effects
♦ Substitute value from model
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

ⓘ INFORMATION
- **This affects only the following vehicles:**

♦ **Model year 2010**

The 2 digits in the 10th + 11th places of the 11-digit part number are relevant:
- 970.618.115.**04** ⇒ Wrong gateway control unit
- 970.618.115.**05** (or higher) ⇒ Correct gateway control unit

Diagnostic information - DME (DFI) control unit

Switch-off time fault

Diagnostic conditions
- Engine running
- then switch off ignition
- immediately afterwards: ignition on > 10 minute(s), with:
  - Instrument cluster ready for operation

Possible fault causes
- ♦ Wrong gateway control unit (See ⓘ **1**)
- ♦ Wrong software version in DME (DFI) control unit
- ♦ Wrong software version in gateway control unit
- ♦ Wrong software version in instrument cluster
- ♦ Fault in CAN drive or CAN comfort area
- ♦ Instrument cluster failed or faulty

Fault setting condition(s)
- No or implausible time pulse from the gateway control unit (via instrument cluster) within 60 seconds with:
  - Ignition on

ⓘ INFORMATION 1
- **This affects only the following vehicles:**

♦ **Model year 2010**

The 2 digits in the 10th + 11th places of the 11-digit part number are relevant:
- 970.618.115.**04** ⇒ Wrong gateway control unit
- 970.618.115.**05** (or higher) ⇒ Correct gateway control unit

ⓘ INFORMATION 2
1. The DME control unit receives time information from the instrument cluster at regular intervals (approx. 4 sec.) when the ignition is on.

2. For Panamera up to MY 2013:
The switch-off time A145_Time since engine stop (manual via ignition lock) is calculated in the gateway using its own function from the time signals from the instrument cluster.

3. For Panamera from MY 2014:
The switch-off time A145_Time since engine stop (manual via ignition lock) comes from the instrument cluster. The gateway routes this to the DME control unit.

P1531

Diagnostic information - DME (DFI) control unit

Switch-off time fault

Diagnostic conditions
- Engine running
- then switch off ignition
- immediately afterwards: ignition on > 10 minute(s), with:
  - Instrument cluster ready for operation

Possible fault causes
- ♦ Wrong gateway control unit (See ⓘ **1**)
- ♦ Wrong software version in DME (DFI) control unit
- ♦ Wrong software version in gateway control unit
- ♦ Wrong software version in instrument cluster
- ♦ Fault in CAN drive or CAN comfort area
- ♦ Instrument cluster failed or faulty

Fault setting condition(s)
- No or implausible time pulse from the gateway control unit (via instrument cluster) within 60 seconds with:
  - Ignition on

ⓘ INFORMATION 1
- **This affects only the following vehicles:**

♦ **Model year 2010**

The 2 digits in the 10th + 11th places of the 11-digit part number are relevant:
- 970.618.115.**04** ⇒ Wrong gateway control unit

The switch-off time A145_Time since engine stop (manual via ignition lock) is calculated in the gateway using its own function from the time signals from the instrument cluster.

3. For Panamera from MY 2014:
The switch-off time A145_Time since engine stop (manual via ignition lock) comes from the instrument cluster. The gateway routes this to the DME control unit.

P1536

Diagnostic information - DME (DFI) control unit

Oil pump activation

ⓘ INFORMATION

♦ The measured oil pressure is compared with the setpoint oil pressure.
♦ The setpoint oil pressure depends, among other things, on the ambient conditions (temperatures, off time, etc.), operating point of the engine …
♦ A fault is detected if the PWM signal is outside a defined range for > 30 seconds.

Diagnostic conditions
● Engine running

Possible fault causes
♦ Dynamic driving style when oil level is near minimum (oil foaming)
♦ Engine oil pressure too low (oil level, oil quality, oil thinning, dirt in oil circuit, oil circuit faulty - increased leakage inside the engine)
♦ Engine oil pressure too high (oil quality, oil thickening, dirt in oil circuit, oil circuit faulty)
♦ Oil pressure sensor faulty (incorrect trimming)
♦ Oil pressure control valve faulty
♦ Oil pump faulty

P1537

Diagnostic information - DME (DFI) control unit

Oil pump activation

ⓘ INFORMATION

♦ The measured oil pressure is compared with the setpoint oil pressure.
♦ The setpoint oil pressure depends, among other things, on the ambient conditions (temperatures, off time, etc.), operating point of the engine …
♦ A fault is detected if the PWM signal is outside a defined range for > 30 seconds.

Diagnostic conditions
● Engine running

Possible fault causes
♦ Dynamic driving style when oil level is near minimum (oil foaming)
♦ Engine oil pressure too low (oil level, oil quality, oil thinning, dirt in oil circuit, oil circuit faulty - increased leakage inside the engine)
♦ Engine oil pressure too high (oil quality, oil thickening, dirt in oil circuit, oil circuit faulty)
♦ Oil pressure sensor faulty (incorrect trimming)
♦ Oil pressure control valve faulty
♦ Oil pump faulty

P1538

Diagnostic information - DME (DFI) control unit

Oil pump activation

ⓘ INFORMATION

♦ The oil pressure control valve is controlled via a PWM signal.
♦ The PWM signal depends, among other things, on the ambient conditions (temperatures, off time, etc), operating point of the engine (rpm, load, oil temperature), measured oil pressure (at the oil pressure sensor) …
♦ A fault is detected if the PWM signal is outside a defined range for > 8 seconds.

Diagnostic conditions
● Engine running

Possible fault causes
♦ Engine oil pressure too low (oil level, oil quality, oil thinning, dirt in oil circuit, oil circuit faulty)
♦ Engine oil pressure too high (oil quality, oil thickening, dirt in oil circuit, oil circuit faulty)
♦ Oil pressure sensor faulty
♦ Oil pressure control valve faulty
♦ Oil pump faulty

P1539

Diagnostic information - DME (DFI) control unit

Oil pump activation

ⓘ INFORMATION

♦ The oil pressure control valve is controlled via a PWM signal.
♦ The PWM signal depends, among other things, on the ambient conditions (temperatures, off time, etc), operating point of the engine (rpm, load, oil temperature), measured oil pressure (at the oil pressure sensor) …
♦ A fault is detected if the PWM signal is outside a defined range for > 8 seconds.

Diagnostic conditions
● Engine running

Possible fault causes
♦ Engine oil pressure too low (oil level, oil quality, oil thinning, dirt in oil circuit, oil circuit faulty)
♦ Engine oil pressure too high (oil quality, oil thickening, dirt in oil circuit, oil circuit faulty)
♦ Oil pressure sensor faulty
♦ Oil pressure control valve faulty
♦ Oil pump faulty

P1540

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit

Diagnostic conditions
- Vehicle standstill
- Coolant temperature 5 ... 100 °C (41 … 212 °F)
- Intake air temperature 5 ... 40 °C (41 … 104 °F)
- Accelerator pedal not pressed (0%)
- Ignition off
- then switch on ignition > 60 second(s) with engine off

Possible fault causes
- ♦ Adaptation was not performed (successfully).
- ♦ Throttle valve adjusting unit faulty

P1541

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit

Diagnostic conditions
- Vehicle standstill
- Coolant temperature 5 ... 100 °C (41 … 212 °F)
- Intake air temperature 5 ... 40 °C (41 … 104 °F)
- Accelerator pedal not pressed (0%)
- Ignition off
- then switch on ignition > 60 second(s) with engine off

Possible fault causes
- ♦ Adaptation was not performed (successfully).
- ♦ Throttle valve adjusting unit faulty

P1542

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit - start test

Diagnostic conditions
- **Throttle valve adjusting unit** adapted
- Switch on ignition , then
  - Switch off ignition for > 1 **min.**
    - Switch on ignition

Possible fault causes
♦ Throttle valve adjusting unit faulty

Fault setting condition(s)
The start test was faulty twice in a row (See ⓘ).

ⓘ INFORMATION
Start test: When the ignition is switched on , the throttle valve is opened by a certain value, and must then close on its own.

P1543

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit - start test

Diagnostic conditions
- **Throttle valve adjusting unit** adapted
- Switch on ignition , then
  - Switch off ignition for > 1 **min.**
    - Switch on ignition

Possible fault causes
♦ Throttle valve adjusting unit faulty

Fault setting condition(s)
The start test was faulty twice in a row (See ⓘ).

ⓘ INFORMATION
Start test: When the ignition is switched on , the throttle valve is opened by a certain value, and must then close on its own.

P1544

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit stuck

Diagnostic conditions
- Throttle valve adjusting unit adapted
- Vehicle standstill
- No gear engaged or selector-lever position P or N
- Intake air temperature > 5 °C (41 °F)
- Idle speed
- then short acceleration
- then engine speed > 2,200 rpm

Possible fault causes
- Throttle valve adjusting unit frozen
- Throttle valve adjusting unit faulty

P1550

Diagnostic information - DME (DFI) control unit

Control unit function monitoring

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill

Possible fault causes
- ♦ Power supply or ground supply faulty ⇒ See P1559
- ♦ DME (DFI) control unit software error ▶ Re-program

ⓘ INFORMATION
- ♦ All calculations for functions in the control unit are monitored by a higher-level unit.
- ♦ A fault is entered if monitoring detects implausible calculations.

P1552

Diagnostic information - DME (DFI) control unit

Control unit function monitoring

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill

Possible fault causes
- ♦ Power supply or ground supply faulty ⇒ See P1559
- ♦ DME (DFI) control unit software error ▶ Re-program

ⓘ INFORMATION
- ♦ All calculations for functions in the control unit are monitored by a higher-level unit.
- ♦ A fault is entered if monitoring detects implausible calculations.

Diagnostic information - DME (DFI) control unit

Control unit function monitoring, wake-up

ⓘ INFORMATION

♦ The entered fault code P1553 or P1555 is merely an indication that the DME control unit performed a reboot in its internal monitoring unit.
♦ This normally remains unnoticed by the driver.
♦ If a **customer complaint** stating that manual engine starting (**starting with the key**) was refused, was aborted or took too long, the DME control unit is faulty.
♦ If **no such customer complaint** exists, the **DME control unit is OK!**

Diagnostic conditions
● Vehicle voltage > 11 V
● Switch the ignition on and then start the engine

Possible fault causes
● If a customer complaint stating that manual engine starting (starting with the key) was refused, was aborted or took too long, the DME control unit is faulty.
● If **no such customer complaint** exists, the **DME control unit is OK!** ► Erase fault memory.

Fault effects
♦ None if this is only a once-off occurrence.
or
♦ Starting with the key was refused or aborted or took too long.

Diagnostic information - DME (DFI) control unit

Control unit function monitoring, wake-up

ⓘ INFORMATION

♦ The entered fault code P1553 or P1555 is merely an indication that the DME control unit performed a reboot in its internal monitoring unit.

● Vehicle voltage > 11 V
● Switch the ignition on and then start the engine

Possible fault causes
● If a customer complaint stating that manual engine starting (starting with the key) was refused, was aborted or took too long, the DME control unit is faulty.
● If **no such customer complaint** exists, the **DME control unit is OK!** ► Erase fault memory.

Fault effects
♦ None if this is only a once-off occurrence.
or
♦ Starting with the key was refused or aborted or took too long.

P1556

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

P1557

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

P1558

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

P1559

Diagnostic information - DME (DFI) control unit

Control unit restart during operation (warm reset)

Diagnostic conditions
- Engine start

Possible fault causes
♦ Vehicle electrical system voltage < 6 V during starting process (e.g. battery discharged or faulty), e.g. due to contact resistance in the lines to the DME control unit.
♦ Excessive difference in internal monitoring processes in the control unit, e.g. in case of reversal of the engine's direction of rotation due to inadvertent shifting into reverse gear when the vehicle is driving forward.

Fault setting condition(s)
This fault is entered if the DME control unit performs a restart during operation (soft reboot/warm reset).

P1561

Diagnostic information - DME (DFI) control unit

Vehicle speed PSM

Diagnostic conditions
- Driving with:
  - Engine temperature > 30 °C (86 °F)
  - Overrun phase(s) > 1.5 second(s)
  - Engine speed 1.408 .... 3,000 rpm
- None of the following faults stored: U0129, P0503

Possible fault causes
♦ Fault in PSM area

Fault setting condition(s)
- Vehicle speed < 3 km/h or 1 mph (measured value), with:
  - Diagnostic conditions

P1563

Diagnostic information - DME (DFI) control unit

Cruise control coding

Diagnostic conditions
- Ignition on

Possible fault causes
- Vehicle data incorrect
  (See PIWIS Tester II ▶ Additional menu [F7] ▶ Maintenance of vehicle data)
- Vehicle equipment wrong
- DME (DFI) control unit coded incorrectly - The data record does not match the vehicle.
- Steering wheel electronics control unit coded incorrectly

P1565

Diagnostic information - DME (DFI) control unit

Adaptive cruise control (ACC) implausible

Diagnostic conditions
- Driving

Possible fault causes
- ♦ Fault in adaptive cruise control (ACC) area

Fault setting condition(s)
- Simultaneous detection of
  - ♦ Request: Acceleration - adaptive cruise control (ACC)

  and
  - ♦ Input signal: Brake light switch

Diagnostic information - DME (DFI) control unit

Internal power supply (R/C)

Diagnostic conditions
- Vehicle voltage > 11 V
- Engine compartment and engine cold
- Engine running, then:
  - Switch off ignition
  - Switch on ignition after approx. 1 minute

Possible fault causes
- ♦ Power supply to the DME (DFI) control unit was interrupted (See ⓘ)
- ♦ R/C component in the DME (DFI) control unit faulty

ⓘ INFORMATION
This fault can be entered if the power supply to the DME (DFI) control unit is interrupted within the first 45 seconds after switching ignition off (discharge time of the R/C) and is then restored again immediately afterwards and the ignition is switched on.
- After the ignition is switched off (terminal 15), the DME control unit switches to control unit run-on mode.
- The run-on period depends on many underlying conditions (e.g. engine temperature for fan operation).

The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.

Diagnostic information - DME (DFI) control unit

Control unit run-on not ended correctly

ⓘ INFORMATION

♦ The entered P-code 1572 merely indicates that the DME control unit did not have enough time to end all sequences properly between the time when the ignition was switched off and the power supply was interrupted (See ⓘ).
♦ **The control unit itself is OK.**

Diagnostic conditions
- Vehicle voltage > 11 V
- Engine compartment and engine cold
- Engine running, then:
  - Switch off ignition
  - Switch on ignition after approx. 1 minute

Possible fault causes
♦ Supply voltage too low when starting engine
♦ DME (DFI) control unit re-programmed
♦ During control unit operation (engine on, ignition on or control unit run-on):
  ♦ Connector B unlocked or unplugged from DME (DFI) control unit
  ♦ Power supply to DME (DFI) control unit interrupted
♦ Power supply to DME (DFI) control unit faulty

Fault setting condition(s)
- Control unit run-on was not ended properly (See ⓘ).

ⓘ INFORMATION

♦ After the ignition is switched off (terminal 15), the DME control unit switches to control unit run-on mode.
♦ The run-on period depends on many underlying conditions (e.g. engine temperature for fan operation).
The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.

P1575

Diagnostic information - DME (DFI) control unit

Accelerator pedal potentiometer implausible

Diagnostic conditions
- Ignition on > 3 second(s)
- then accelerator pedal pressed down fully > 3 second(s)
- then release accelerator pedal fully
- then idling > 10 second(s)

Possible fault causes
- Short circuit to B+/ground/between lines or open circuit in wiring to potentiometer 1 and 2
- Accelerator pedal potentiometer 1 and 2 faulty

Fault setting condition(s)
- Both potentiometers detected as faulty.
- Individual faults are also entered in most cases.

Fault effects
- Engine does not respond to throttle, engine speed 1,000 rpm

P1576

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

P1577

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

P1581

Diagnostic information - DME V8 DFI

Kickdown adaptation

INFORMATION

♦ A fault is detected if an adaptation process is terminated unsuccessfully 20 times.

Diagnostic conditions

- Ignition switched on
- Adaptation requested via Tester
- Accelerator pedal pressed down fully

Possible fault causes

♦ Adaptation requested, but started too late (max. 10 sec.)
♦ Accelerator pedal not kept constantly pressed down fully for at least 1 sec.
♦ Accelerator pedal not pressed down fully
♦ Accelerator pedal module loose

P1582

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

P1583

Diagnostic information - DME (DFI) control unit

Sport mode not available

Diagnostic conditions
- Ignition on

Possible fault causes
- ♦ Premature fault entry (See ⓘ)
- ♦ Sport mode button faulty (See Air-conditioning system regulator)
- ♦ Fault relevant for Sport mode in one of the following systems:
  - ♦ DME (DFI) control unit
  - ♦ PDK control unit
  - ♦ PSM control unit
  - ♦ Leveling system control unit (PASM)
  - ♦ PDCC control unit
  - ♦ Spoiler drive

ⓘ INFORMATION

♦ If there is NO customer complaint about the availability of Sport mode, this information must be ignored.
♦ In most cases, the fault is entered in the fault memory without justification if one of the control units from the Sport mode system (DFI, PDK, PSM, leveling system, PDCC) does NOT report readiness or does this too late during initialization of the air-conditioning system regulator.
♦ The air-conditioning system regulator sends this information to the DME (DFI).

P1600

Diagnostic information - DME (DFI) control unit

Vehicle speed PSM

Diagnostic conditions
- Driving
- None of the following faults stored: U0129

Possible fault causes
- Fault in PSM area

Fault setting condition(s)
- Vehicle speed > 350 km/h or 218 mph (measured value)

P1603

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

P1604

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

P1606

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

P1616

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

P1620

Diagnostic information - DME (DFI) control unit

Crash signal monitoring

Diagnostic conditions
- Engine start

Possible fault causes
- Airbag drive link test
- Engine switch-off following:
  - Accident detection

P1626

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

P1627

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

P1628

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

P1629

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

P1632

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

P1637

Diagnostic information - DME (DFI) control unit

Boost pressure sensor (pressure sensor ahead of throttle valve) implausible

Diagnostic conditions
- Ignition on > 10 second(s)
- then: Acceleration with wide-open throttle for as long as possible, immediately followed by an overrun phase lasting as long as possible
- None of the following faults stored: P1638, P1639, P0107, P0108, P2228, P2229, P1183, P1184, P1187, P1188, P1189, P1190

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Ground supply faulty
- Boost pressure sensor faulty

Fault effects
- Substitute value from model

P1638

Diagnostic information - DME (DFI) control unit

Boost pressure sensor (pressure sensor ahead of throttle valve): electrical fault

Diagnostic conditions
- Ignition on or engine running
- None of the following faults stored: P0234

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Ground supply faulty
- ♦ Boost pressure sensor faulty

- **Only if fault P0107 or P0108** (intake manifold pressure sensor) **is entered at the same time**:
  - ♦ Leak in vacuum hose at boost pressure control cycle valve or wastegate
  - ♦ Boost pressure control cycle valve leaking
  - ♦ Wastegate leaking

Fault effects
- ♦ Substitute value from model

P1639

Diagnostic information - DME (DFI) control unit

Boost pressure sensor (pressure sensor ahead of throttle valve): electrical fault

Diagnostic conditions
- Ignition on or engine running
- None of the following faults stored: P0234

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Ground supply faulty
- ♦ Boost pressure sensor faulty

- **Only if fault P0107 or P0108** (intake manifold pressure sensor) **is entered at the same time**:
  - ♦ Leak in vacuum hose at boost pressure control cycle valve or wastegate
  - ♦ Boost pressure control cycle valve leaking
  - ♦ Wastegate leaking

Fault effects
- ♦ Substitute value from model

P1641

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

P1642

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

P1657

Diagnostic information - DME (DFI) control unit

Diverter solenoid valve

Diagnostic conditions
- Driving with 1 full-load acceleration and 1 overrun phase

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Diverter solenoid valve faulty

P1658

Diagnostic information - DME (DFI) control unit

Diverter solenoid valve

Diagnostic conditions
- Driving with 1 full-load acceleration and 1 overrun phase

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Diverter solenoid valve faulty

P1659

Diagnostic information - DME (DFI) control unit

Diverter solenoid valve

Diagnostic conditions
- Driving with 1 full-load acceleration and 1 overrun phase

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Diverter solenoid valve faulty

P1666

Diagnostic information - DME (DFI) control unit

Diverter solenoid valve

Diagnostic conditions
- Driving with 1 full-load acceleration and 1 overrun phase

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Diverter solenoid valve faulty

P1691

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

P1692

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

P1696

Diagnostic information - DME (DFI) control unit

Generator - electrical fault

Diagnostic conditions
- Engine running

Fault setting condition(s)
- Fault in gateway control unit

P1699

Diagnostic information - DME (DFI) control unit

Generator - no communication

Diagnostic conditions
- Engine running

Fault setting condition(s)
- Fault in gateway control unit

P169A

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

P2088

Diagnostic information - DME (DFI) control unit

Intake camshaft adjustment output stage, bank 1

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

P2089

Diagnostic information - DME (DFI) control unit

Intake camshaft adjustment output stage, bank 1

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

P2090

Diagnostic information - DME (DFI) control unit

Bank 1 exhaust camshaft adjustment output stage

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

P2091

Diagnostic information - DME (DFI) control unit

Bank 1 exhaust camshaft adjustment output stage

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

P2092

Diagnostic information - DME (DFI) control unit

Intake camshaft adjustment output stage, bank 2

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

P2093

Diagnostic information - DME (DFI) control unit

Intake camshaft adjustment output stage, bank 2

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

P2094

Diagnostic information - DME (DFI) control unit

Bank 2 exhaust camshaft adjustment output stage

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

P2095

Diagnostic information - DME (DFI) control unit

Bank 2 exhaust camshaft adjustment output stage

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

P2096

Diagnostic information - DME (DFI) control unit

Lambda correction behind catalytic converter bank 1 - control limit exceeded (too lean)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Steady driving > 20 minute(s) at:
  - approx. 80 km/h (50 mph)
  - in the highest gear
  - Lambda control (behind catalytic converter) active
- None of the following faults stored: P2270, P2271, P0041

Possible fault causes

♦ Leak in exhaust system between oxygen sensor upstream of catalytic converter and oxygen sensor downstream of catalytic converter, bank 1

♦ Camshaft adjustment fault

♦ Valve lift control fault

♦ Mechanical fault in valve drive

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty (aged)

Fault setting condition(s)

♦ Adaptation limit (4%) exceeded

P2097

Diagnostic information - DME (DFI) control unit

Lambda correction behind catalytic converter bank 1 - control limit exceeded (too rich)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Steady driving > 20 minute(s) at:
  - approx. 80 km/h (50 mph)
  - in the highest gear
  - Lambda control (behind catalytic converter) active
- None of the following faults stored: P2270, P2271, P0041

Possible fault causes

♦ Leak in exhaust system between oxygen sensor upstream of catalytic converter and oxygen sensor downstream of catalytic converter, bank 1

♦ Camshaft adjustment fault

♦ Valve lift control fault

♦ Mechanical fault in valve drive

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty (aged)

Fault setting condition(s)

♦ Adaptation limit (4%) exceeded

P2098

Diagnostic information - DME (DFI) control unit

Lambda correction behind catalytic converter bank 2 - control limit exceeded (too lean)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Steady driving > 20 minute(s) at:
  - approx. 80 km/h (50 mph)
  - in the highest gear
  - Lambda control (behind catalytic converter) active
- None of the following faults stored: P2272, P2273, P0041

Possible fault causes

♦ Leak in exhaust system between oxygen sensor upstream of catalytic converter and oxygen sensor downstream of catalytic converter, bank 2

♦ Camshaft adjustment fault

♦ Valve lift control fault

♦ Mechanical fault in valve drive

♦ Oxygen sensor upstream of catalytic converter bank 2 faulty (aged)

Fault setting condition(s)

♦ Adaptation limit (4%) exceeded

P2099

Diagnostic information - DME (DFI) control unit

Lambda correction behind catalytic converter bank 2 - control limit exceeded (too rich)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ Mechanical fault in valve drive

♦ Oxygen sensor upstream of catalytic converter bank 2 faulty (aged)

Fault setting condition(s)

♦ Adaptation limit (4%) exceeded

P2100

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit driver

Diagnostic conditions
- Ignition on

Possible fault causes
- Short circuit between lines (servo motor)
- Throttle valve adjusting unit faulty

Fault effects
The vehicle is in limp-home mode, i.e. the engine is running at 1,200 to 1,800 rpm.

P2101

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit - position deviation/control range

Diagnostic conditions
- Throttle valve adjusting unit adapted
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit between lines (servo motor)
- Throttle valve adjusting unit faulty

Fault effects
The vehicle is in limp-home mode, i.e. the engine is running at 1,200 to 1,800 rpm.

P2103

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit - position deviation/control range

Diagnostic conditions
- Throttle valve adjusting unit adapted
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit between lines (servo motor)
- Throttle valve adjusting unit faulty

Fault effects
The vehicle is in limp-home mode, i.e. the engine is running at 1,200 to 1,800 rpm.

P2121

Diagnostic information - DME (DFI) control unit

Throttle valve potentiometer 1 implausible

Diagnostic conditions
- Engine running
- None of the following faults stored: P2127 or P2128 (throttle valve potentiometer 2)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines (potentiometer)
- ♦ Throttle valve adjusting unit faulty

Fault setting condition(s)
- Throttle valve potentiometer 1 (measured) - mass air flow (calculated)
  ⇒ Deviation too high

Fault effects
The vehicle is in limp-home mode, i.e. the engine is running at 1,200 to 1,800 rpm.

P2122

Diagnostic information - DME (DFI) control unit

Throttle potentiometer 1

Diagnostic conditions
- Ignition on > 5 second(s)
- then engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines (**potentiometer**)
- ♦ **Throttle valve adjusting unit** faulty

Fault effects
- ♦ No acceleration initially + increased idle speed (approx. 800 rpm)
  - ▶ until the accelerator pedal is released fully.
  - ♦ Then acceleration, with
    - ♦ significantly reduced engine torque (max. approx.100 ... 180 Nm)
    - ♦ and limited engine speed (max. approx. 5,000 rpm).
  - ♦ If the accelerator and brake are pressed at the same time, the engine will run at idle speed.

P2123

Diagnostic information - DME (DFI) control unit

Throttle potentiometer 1

Diagnostic conditions
- Ignition on > 5 second(s)
- then engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines (**potentiometer**)
- ♦ **Throttle valve adjusting unit** faulty

Fault effects
- ♦ No acceleration initially + increased idle speed (approx. 800 rpm)
  - ▶ until the accelerator pedal is released fully.
  - ♦ Then acceleration, with
    - ♦ significantly reduced engine torque (max. approx.100 ... 180 Nm)
    - ♦ and limited engine speed (max. approx. 5,000 rpm).
  - ♦ If the accelerator and brake are pressed at the same time, the engine will run at idle speed.

P2126

Diagnostic information - DME (DFI) control unit

Throttle valve potentiometer 2 implausible

Diagnostic conditions
- Engine running
- None of the following faults stored: P2122 or P2123 (throttle valve potentiometer 1)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines (potentiometer)
- ♦ Throttle valve adjusting unit faulty

Fault setting condition(s)
- Throttle valve potentiometer 2 (measured) - mass air flow (calculated)
  ⇒ Deviation too high

Fault effects
The vehicle is in limp-home mode, i.e. the engine is running at 1,200 to 1,800 rpm.

P2127

Diagnostic information - DME (DFI) control unit

Throttle potentiometer 2

Diagnostic conditions
- Ignition on > 5 second(s)
- then engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines (**potentiometer**)
- ♦ **Throttle valve adjusting unit** faulty

Fault effects
- ♦ No acceleration initially + increased idle speed (approx. 800 rpm)
  - ▶ until the accelerator pedal is released fully.
  - ♦ Then acceleration, with
    - ♦ significantly reduced engine torque (max. approx.100 ... 180 Nm)
    - ♦ and limited engine speed (max. approx. 5,000 rpm).
  - ♦ If the accelerator and brake are pressed at the same time, the engine will run at idle speed.

P2128

Diagnostic information - DME (DFI) control unit

Throttle potentiometer 2

Diagnostic conditions
- Ignition on > 5 second(s)
- then engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines (**potentiometer**)
- ♦ **Throttle valve adjusting unit** faulty

Fault effects
- ♦ No acceleration initially + increased idle speed (approx. 800 rpm)
  - ▶ until the accelerator pedal is released fully.
  - ♦ Then acceleration, with
    - ♦ significantly reduced engine torque (max. approx.100 ... 180 Nm)
    - ♦ and limited engine speed (max. approx. 5,000 rpm).
  - ♦ If the accelerator and brake are pressed at the same time, the engine will run at idle speed.

P2138

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit - channel comparison

Diagnostic conditions
- Throttle valve adjusting unit adapted
- Idling and short acceleration
- then driving with different operating conditions

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Throttle valve adjusting unit faulty

Fault setting condition(s)
- The two potentiometer values differ too greatly from each other.
- It is not clear which value is incorrect.

Fault effects
- No throttle response
- Increased idle speed (approx. 1,000 .... 1,600 rpm)
- Electronic throttle emergency mode (see ⓘ)

ⓘ INFORMATION

Electronic throttle emergency mode

During electronic throttle emergency mode, no power is supplied to the throttle valve, which then drops to emergency air position.
- Idle speed increases to approx. 1,000 .... 1,200 rpm.
- If the accelerator pedal is pressed, the engine will run at max. 1,600 rpm (set via ignition, injection, ...). ▶ **Limp home**.
- If the accelerator and brake are pressed at the same time, the engine will run at idle speed.
- If the engine speed exceeds 1,600 rpm, cylinders will be deactivated.
- If cylinder deactivation is not sufficient, the DME control unit performs a reset and fault code **P1559** is stored in the fault memory (the original faults were previously stored as reset-resistant faults in the fault memory).

P2146

Diagnostic information - DME (DFI) control unit

Power supply for fuel injectors

ⓘ INFORMATION

The power supply for the fuel injectors is switched in pairs in the control unit.

- V8 engine:
  - ♦ Cylinder 1 + 6 (P2146)
  - ♦ Cylinder 2 + 8 (P2149)
  - ♦ Cylinder 3 + 5 (P2152)
  - ♦ Cylinder 4 + 7 (P2155)

- V6 engine:
  - ♦ Cylinder 1 + 6 (P2146)
  - ♦ Cylinder 2 + 4 (P2149)
  - ♦ Cylinder 3 + 5 (P2152)

Diagnostic conditions

- Engine running

Possible fault causes

- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines (power supply)
- ♦ Fuel injector faulty

P2149

Diagnostic information - DME (DFI) control unit

Power supply for fuel injectors

ⓘ INFORMATION

The power supply for the fuel injectors is switched in pairs in the control unit.

- V8 engine:
  - ♦ Cylinder 1 + 6 (P2146)
  - ♦ Cylinder 2 + 8 (P2149)
  - ♦ Cylinder 3 + 5 (P2152)
  - ♦ Cylinder 4 + 7 (P2155)

- V6 engine:
  - ♦ Cylinder 1 + 6 (P2146)
  - ♦ Cylinder 2 + 4 (P2149)
  - ♦ Cylinder 3 + 5 (P2152)

Diagnostic conditions

- Engine running

Possible fault causes

- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines (power supply)
- ♦ Fuel injector faulty

P2152

Diagnostic information - DME (DFI) control unit

Power supply for fuel injectors

ⓘ INFORMATION

The power supply for the fuel injectors is switched in pairs in the control unit.

- V8 engine:
  - ♦ Cylinder 1 + 6 (P2146)
  - ♦ Cylinder 2 + 8 (P2149)
  - ♦ Cylinder 3 + 5 (P2152)
  - ♦ Cylinder 4 + 7 (P2155)

- V6 engine:
  - ♦ Cylinder 1 + 6 (P2146)
  - ♦ Cylinder 2 + 4 (P2149)
  - ♦ Cylinder 3 + 5 (P2152)

Diagnostic conditions

- Engine running

Possible fault causes

- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines (power supply)
- ♦ Fuel injector faulty

P2155

Diagnostic information - DME (DFI) control unit

Power supply for fuel injectors

ⓘ INFORMATION

The power supply for the fuel injectors is switched in pairs in the control unit.

- V8 engine:
  - ♦ Cylinder 1 + 6 (P2146)
  - ♦ Cylinder 2 + 8 (P2149)
  - ♦ Cylinder 3 + 5 (P2152)
  - ♦ Cylinder 4 + 7 (P2155)

- V6 engine:
  - ♦ Cylinder 1 + 6 (P2146)
  - ♦ Cylinder 2 + 4 (P2149)
  - ♦ Cylinder 3 + 5 (P2152)

Diagnostic conditions

- Engine running

Possible fault causes

- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines (power supply)
- ♦ Fuel injector faulty

P215A

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

Diagnostic information - DME (DFI) control unit

Thermostat stuck open

Diagnostic conditions

- Thermal management system test (if available)

or

- Drive > 10 minute(s) with:
  - Engine start temperature -10° ... +60 °C (14 … 140 °F)
  - Ambient temperature > -10 °C (14 °F)
  - Average vehicle speed > 35 ... 60 km/h (21 … 37 mph) (depending on outside temperature > +60 °C ... < +20 °C/> 140 °F ... < 68 °F)
  - Max. vehicle speed 100 km/h (62 mph)
  - as few overrun phases as possible (< 100 second(s) in total)
  - Average mass air flow > 25 ... 35 kg/h (depending on outside temperature > +30 °C ... < -10 °C/> 86 °F ... < 14 °F)
  - With heating until engine coolant temperature > 80 °C (176 °F)

Possible fault causes

- ♦ Affected by block heater
- ♦ 3/2-way valve faulty, with:
  - Original auxiliary heater
- ♦ Seal in thermostat housing faulty
- ♦ Thermostat housing faulty
- ♦ Thermostat faulty
- ♦ Engine coolant temperature sensor faulty or loose contact or corrosion on connectors or lines

Fault setting condition(s)

- Engine coolant temperature < setpoint value 80 °C (176 °F) at end of diagnostics (see ⓘ)

ⓘ INFORMATION

- ♦ Diagnostics has ended when the calculated temperature model has reached 80 °C (176 °F).
- ♦ Diagnostics is evaluated only if the aforementioned diagnostic conditions were met.

P2183

Diagnostic information - DME (DFI) control unit

Coolant temperature at radiator outlet implausible
- **NOT** for Panamera V6S up to MY D

Diagnostic conditions
- Thermal management system test (if available)

or
- Engine start, with:
  - Coolant temperature < 70 °C (158 °F)
- None of the following faults stored: P0116, P0117, P0118, P0119, P050C, P3081, P3082

Possible fault causes
- ♦ Engine coolant temperature sensor
- ♦ Radiator air intake covered
- ♦ Radiator outlet coolant temperature sensor faulty

Fault setting condition(s)
Coolant temperature at radiator outlet > 25 °C (77 °F) warmer than engine temperature at engine start

Diagnostic information - DME (DFI) control unit

Radiator outlet coolant temperature sensor: electrical fault

Diagnostic conditions
- Ignition on

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Radiator outlet coolant temperature sensor faulty

Fault setting condition(s)
- Coolant temperature at radiator outlet (measured) < -40 °C (-40 °F) (P2184), with:
  - Ignition on or engine running

  and
  - Intake air temperature > -30 °C (-22 °F)

  or
  - Engine running > 31 minute(s)

or
- Coolant temperature at radiator outlet (measured) > +140 °C (284 °F) (P2185), with:
  - Ignition on or engine running

Diagnostic information - DME (DFI) control unit

Radiator outlet coolant temperature sensor: electrical fault

Diagnostic conditions
- Ignition on

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Radiator outlet coolant temperature sensor faulty

Fault setting condition(s)
- Coolant temperature at radiator outlet (measured) < -40 °C (-40 °F) (P2184), with:
  - Ignition on or engine running
  - and
  - Intake air temperature > -30 °C (-22 °F)
  - or
  - Engine running > 31 minute(s)

or
- Coolant temperature at radiator outlet (measured) > +140 °C (284 °F) (P2185), with:
  - Ignition on or engine running

P2186

Diagnostic information - DME (DFI) control unit

Radiator outlet coolant temperature sensor: loose contact

Diagnostic conditions
- Ignition on
- None of the following faults stored: P2184, P2185

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Radiator outlet coolant temperature sensor faulty

Fault setting condition(s)
Coolant temperature at radiator outlet: actual-value jumps > 3 °C (37 °F)

Fault effects
- Substitute value = last actual value that was detected as OK, with:
  - Actual-value jumps > 9.75 °C (49.5 °F)

P2195

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 1 - signal too lean/too rich

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Engine running > 3 minute(s) with:
  - No overrun phase(s)
  - All oxygen sensor(s) ready for operation
  - Lambda control active
  - Engine speed 640 .... 4,000 rpm
  - Load 15 ... 70%
  - Catalytic converter temperature > 400 °C (752 °F)
  - Mass air flow 10 ... 520 kg/h
- None of the following faults stored: P2270, P2271, P0041

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

Fault setting condition(s)

The oxygen sensor signal deviates by a certain value from the control value (rich/lean mixture) within a certain time. (Significant deviation occurs suddenly)

P2196

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 1 - signal too lean/too rich

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Engine running > 3 minute(s) with:
  - No overrun phase(s)
  - All oxygen sensor(s) ready for operation
  - Lambda control active
  - Engine speed 640 .... 4,000 rpm
  - Load 15 ... 70%
  - Catalytic converter temperature > 400 °C (752 °F)
  - Mass air flow 10 ... 520 kg/h
- None of the following faults stored: P2270, P2271, P0041

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

Fault setting condition(s)

The oxygen sensor signal deviates by a certain value from the control value (rich/lean mixture) within a certain time. (Significant deviation occurs suddenly)

P2197

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 2 - signal too lean/too rich

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 3 minute(s) with:
  - No overrun phase(s)
  - All oxygen sensor(s) ready for operation
  - Lambda control active
  - Engine speed 640 .... 4,000 rpm
  - Load 15 ... 70%
  - Catalytic converter temperature > 400 °C (752 °F)
  - Mass air flow 10 ... 520 kg/h
- None of the following faults stored: P2272, P2273, P0041

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

Fault setting condition(s)

The oxygen sensor signal deviates by a certain value from the control value (rich/lean mixture) within a certain time. (Significant deviation occurs suddenly)

P2198

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 2 - signal too lean/too rich

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 3 minute(s) with:
  - No overrun phase(s)
  - All oxygen sensor(s) ready for operation
  - Lambda control active
  - Engine speed 640 .... 4,000 rpm
  - Load 15 ... 70%
  - Catalytic converter temperature > 400 °C (752 °F)
  - Mass air flow 10 ... 520 kg/h
- None of the following faults stored: P2272, P2273, P0041

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

Fault setting condition(s)

The oxygen sensor signal deviates by a certain value from the control value (rich/lean mixture) within a certain time. (Significant deviation occurs suddenly)

Diagnostic information - DME (DFI) control unit

Ambient pressure sensor implausible

Diagnostic conditions
- Ignition on > 10 second(s)
- then: Acceleration with wide-open throttle for as long as possible, immediately followed by an overrun phase lasting as long as possible
- None of the following faults stored: P1638, P1639, P0107, P0108, P2228, P2229, P1183, P1184, P1187, P1188, P1189, P1190

Possible fault causes
- Fault P0069 also entered:
  - ♦ Intake manifold pressure sensor fault

- No fault P0069 entered:
  - ♦ DME (DFI) control unit faulty

Fault effects
- ♦ Substitute value from model

P2228

Diagnostic information - DME (DFI) control unit

Ambient pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running

Possible fault causes
- DME (DFI) control unit faulty

Fault effects
- Substitute value from model

P2229

Diagnostic information - DME (DFI) control unit

Ambient pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running

Possible fault causes
- DME (DFI) control unit faulty

Fault effects
- Substitute value from model

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 1: open circuit in pumping current (APE)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 10 minute(s) with:
  - Engine at operating temperature
  - at least 1 overrun phase(s) > 6 second(s)
- then idling > 40 second(s)

Possible fault causes

♦ Open circuit in pumping current line (APE - contact 1)

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 2: open circuit in pumping current (APE)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 10 minute(s) with:
  - Engine at operating temperature
  - at least 1 overrun phase(s) > 6 second(s)
- then idling > 40 second(s)

Possible fault causes

♦ Open circuit in pumping current line (APE - contact 1)

♦ Oxygen sensor upstream of catalytic converter bank 2 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 1: open circuit in signal (RE+/IPN)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 10 minute(s) with:
  - Engine at operating temperature
  - at least 1 overrun phase(s) > 6 second(s)
- then idling > 40 second(s)

Possible fault causes

♦ Open circuit in signal line (RE+/IPN - contact 6/contact 2)

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 2: open circuit in signal (RE+/IPN)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 10 minute(s) with:
  - Engine at operating temperature
  - at least 1 overrun phase(s) > 6 second(s)
- then idling > 40 second(s)

Possible fault causes

♦ Open circuit in line (RE+/IPN - contact 6/contact 2)

♦ Oxygen sensor upstream of catalytic converter bank 2 faulty

P2257

Diagnostic information - DME (DFI) control unit

Secondary-air pump relay driver

Diagnostic conditions
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in lines for secondary-air pump relay activation
- Secondary-air pump relay faulty

P2258

Diagnostic information - DME (DFI) control unit

Secondary-air pump relay driver

Diagnostic conditions
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in lines for secondary-air pump relay activation
- Secondary-air pump relay faulty

P2263

Diagnostic information - DME (DFI) control unit

Basic boost pressure too low

Diagnostic conditions
- 3 full-load accelerations:
  - in 3rd gear (no gearshift)
  - Engine speed between 1,500 rpm and max. engine speed
- then steady driving

Possible fault causes
- ♦ Insufficient vacuum supply due to leak in vacuum system or faulty vacuum pump (see ⓘ)
- ♦ Leak between turbocharger (on pressure side) and intake valve (engine)
- ♦ Vacuum hose leaking at boost pressure control cycle valve or diverter solenoid valve
- ♦ Diverter solenoid valve not installed or installed incorrectly
- ♦ Diverter solenoid valve leaking or stuck
- ♦ Diverter valve not installed or installed incorrectly
- ♦ Diverter valve leaking or stuck
- ♦ Boost pressure control cycle valve stuck open electrically or mechanically
- ♦ Wastegate mechanical fault, leaking or stuck open
- ♦ Turbocharger (1 or 2) stiff or stuck

Fault setting condition(s)
- Boost pressure (calculated) < setpoint value (depending on operating condition)

ⓘ INFORMATION
The vacuum system includes:
- ♦ Mechanical vacuum pump
- ♦ Main load circuit:
  - ♦ Brake booster
- ♦ Auxiliary load circuit:
  - ♦ Boost pressure control cycle valve
  - ♦ Diverter solenoid valve
  - ♦ Exhaust flap (if fitted)
  - ♦ Acoustic simulator (V6 Turbo only)
  - ♦ Tank leakage diagnosis pump (USA, Canada and South Korea only)

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 1 - signal too lean/too rich

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Steady driving > 20 minute(s) at:
  - approx. 80 km/h (50 mph)
  - in the highest gear
  - Lambda control (behind catalytic converter) active

Possible fault causes

♦ Leak in exhaust system between oxygen sensor upstream of catalytic converter and oxygen sensor downstream of catalytic converter, bank 1

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

Fault setting condition(s)

♦ The oxygen sensor signal deviates by a certain value from the control value (rich/lean mixture) within a certain time.

P2271

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 1 - signal too lean/too rich

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Steady driving > 20 minute(s) at:
  - approx. 80 km/h (50 mph)
  - in the highest gear
  - Lambda control (behind catalytic converter) active

Possible fault causes

♦ Leak in exhaust system between oxygen sensor upstream of catalytic converter and oxygen sensor downstream of catalytic converter, bank 1

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

Fault setting condition(s)

♦ The oxygen sensor signal deviates by a certain value from the control value (rich/lean mixture) within a certain time.

P2272

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 2 - signal too lean/too rich

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Steady driving > 20 minute(s) at:
  - approx. 80 km/h (50 mph)
  - in the highest gear
  - Lambda control (behind catalytic converter) active

Possible fault causes

♦ Leak in exhaust system between oxygen sensor upstream of catalytic converter and oxygen sensor downstream of catalytic converter, bank 2

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Oxygen sensor downstream of catalytic converter, bank 2 faulty

Fault setting condition(s)

♦ The oxygen sensor signal deviates by a certain value from the control value (rich/lean mixture) within a certain time.

P2273

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 2 - signal too lean/too rich

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Steady driving > 20 minute(s) at:
  - approx. 80 km/h (50 mph)
  - in the highest gear
  - Lambda control (behind catalytic converter) active

Possible fault causes

♦ Leak in exhaust system between oxygen sensor upstream of catalytic converter and oxygen sensor downstream of catalytic converter, bank 2

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Oxygen sensor downstream of catalytic converter, bank 2 faulty

Fault setting condition(s)

♦ The oxygen sensor signal deviates by a certain value from the control value (rich/lean mixture) within a certain time.

P2294

Diagnostic information - DME (DFI) control unit

Bank 2 quantity control valve output stage

Diagnostic conditions
- Ignition on > 5 second(s)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Quantity control valve faulty (in bank 2 fuel high-pressure pump)

P2295

Diagnostic information - DME (DFI) control unit

Bank 2 quantity control valve output stage

Diagnostic conditions
- Ignition on > 5 second(s)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Quantity control valve faulty (in bank 2 fuel high-pressure pump)

P2296

Diagnostic information - DME (DFI) control unit

Bank 2 quantity control valve output stage

Diagnostic conditions
- Ignition on > 5 second(s)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Quantity control valve faulty (in bank 2 fuel high-pressure pump)

P2297

Diagnostic information - DME (DFI) control unit

Implausible signal for oxygen sensor ahead of bank 1 catalytic converter (during overrun shutoff)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor ahead of the catalytic converter with the sensor behind the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Driving with:
  - Exhaust temperature > 200 °C (392 °F)
  - Overrun phase(s) > 8 second(s)

Possible fault causes

♦ Unintentional fuel supply, e.g. due to:
  ♦ dripping fuel injector
  ♦ high fuel content in engine oil
  ♦ large quantity of evaporating engine oil

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Oxygen sensor ahead of bank 1 catalytic converter faulty (aged)

P2298

Diagnostic information - DME (DFI) control unit

Implausible signal for oxygen sensor ahead of bank 1 catalytic converter (during overrun shutoff)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor ahead of the catalytic converter with the sensor behind the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Driving with:
  - Exhaust temperature > 200 °C (392 °F)
  - Overrun phase(s) > 8 second(s)

Possible fault causes

♦ Unintentional fuel supply, e.g. due to:
  ♦ dripping fuel injector
  ♦ high fuel content in engine oil
  ♦ large quantity of evaporating engine oil

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Oxygen sensor ahead of bank 2 catalytic converter faulty (aged)

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 1

⚠WARNING

High voltage !

Risk of death or serious injury due to high voltage or high current!

♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE

Sensitive electronics!

Risk of irreparable damage to electronic components!

♦ **DO NOT** carry out electrical tests.

♦ **DO NOT** connect external power sources.

♦ Check ground supply.

Diagnostic conditions

- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+ or open circuit in the lines (ground supply)

♦ Short circuit to ground or open circuit in the lines (power supply)

♦ Short circuit to B+/ground or open circuit in the line (activation)

♦ Bar ignition module on cylinder 1 faulty

P2301

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 1

⚠WARNING

High voltage !

Risk of death or serious injury due to high voltage or high current!

♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE

Sensitive electronics!

Risk of irreparable damage to electronic components!

♦ **DO NOT** carry out electrical tests.

♦ **DO NOT** connect external power sources.

♦ Check ground supply.

Diagnostic conditions

- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+ or open circuit in the lines (ground supply)

♦ Short circuit to ground or open circuit in the lines (power supply)

♦ Short circuit to B+/ground or open circuit in the line (activation)

♦ Bar ignition module on cylinder 1 faulty

P2302

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 1 - SoftShutDown

⚠WARNING
High voltage!
Risk of death or serious injury due to high voltage or high current!
♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE
Sensitive electronics!
Risk of irreparable damage to electronic components!
♦ **DO NOT** carry out electrical tests.

  - ♦ Bar ignition module on cylinder 2 faulty

- P2305 + P0352 or P2303 or P2304:
  - ♦ Loose contact or corrosion on connectors or lines
  - ♦ Short circuit to B+ or open circuit in the lines (ground supply)
  - ♦ Short circuit to ground or open circuit in the lines (power supply)
  - ♦ Short circuit to B+/ground or open circuit in the line (activation)
  - ♦ Bar ignition module on cylinder 2 faulty

P2306

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 3

⚠WARNING

High voltage !

Risk of death or serious injury due to high voltage or high current!

♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE

Sensitive electronics!

Risk of irreparable damage to electronic components!

♦ **DO NOT** carry out electrical tests.

♦ **DO NOT** connect external power sources.

♦ Check ground supply.

Diagnostic conditions

- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+ or open circuit in the lines (ground supply)

♦ Short circuit to ground or open circuit in the lines (power supply)

♦ Short circuit to B+/ground or open circuit in the line (activation)

♦ Bar ignition module on cylinder 3 faulty

P2307

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 3

⚠WARNING

High voltage !

Risk of death or serious injury due to high voltage or high current!

♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE

Sensitive electronics!

Risk of irreparable damage to electronic components!

♦ **DO NOT** carry out electrical tests.

♦ **DO NOT** connect external power sources.

♦ Check ground supply.

Diagnostic conditions

- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+ or open circuit in the lines (ground supply)

♦ Short circuit to ground or open circuit in the lines (power supply)

♦ Short circuit to B+/ground or open circuit in the line (activation)

♦ Bar ignition module on cylinder 3 faulty

P2308

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 3 - SoftShutDown

⚠WARNING
High voltage!
Risk of death or serious injury due to high voltage or high current!
♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE
Sensitive electronics!
Risk of irreparable damage to electronic components!
♦ **DO NOT** carry out electrical tests.
♦ **DO NOT** connect external power sources.
♦ Check ground supply.

Diagnostic conditions
- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)
- None of the following faults stored: P0351, P2300, P2301

Possible fault causes
- Only P2308:
  - ♦ Bar ignition module on cylinder 3 faulty

- P2308 + P0353 or P2306 or P2307:
  - ♦ Loose contact or corrosion on connectors or lines
  - ♦ Short circuit to B+ or open circuit in the lines (ground supply)
  - ♦ Short circuit to ground or open circuit in the lines (power supply)
  - ♦ Short circuit to B+/ground or open circuit in the line (activation)
  - ♦ Bar ignition module on cylinder 3 faulty

P2309

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 4

⚠WARNING

High voltage !

Risk of death or serious injury due to high voltage or high current!

♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE

Sensitive electronics!

Risk of irreparable damage to electronic components!

♦ **DO NOT** carry out electrical tests.

♦ **DO NOT** connect external power sources.

♦ Check ground supply.

Diagnostic conditions

- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+ or open circuit in the lines (ground supply)

♦ Short circuit to ground or open circuit in the lines (power supply)

♦ Short circuit to B+/ground or open circuit in the line (activation)

♦ Bar ignition module on cylinder 4 faulty

Diagnostic information - DME (DFI) control unit

Misfiring during mixture adaptation phase

Diagnostic conditions

- Perform short test >Individual cylinder mixture adaptation<

or

- Driving with engine speed and load conditions that are as constant as possible:
  - 4th ... 7th gear
  - Engine speed 1,090 ... 3,000 rpm
  - Engine load 155 … 544 mg/stroke
  - Active carbon filter load < 0.8

Possible fault causes

♦ Mixture in the specified cylinder is too lean

Fault setting condition(s)

- If, during mixture adaptation of the individual cylinders (see ⓘ), rough running of a cylinder close to misfiring is detected, the function is aborted for the affected bank and a suspected fault is logged.
- The function is repeated up to 2 times in this highway cycle.
- If the function is aborted again in each of the 4 highway cycles over several drives, the fault entry >Misfiring during mixture adaptation phase, cylinder X< (P230A … F) will appear.

ⓘ INFORMATION

♦ For fuel trim adaptation of the individual cylinders, the mixture of one individual cylinder is always "leaned out" by a certain percentage.
♦ The other cylinders of the bank are enriched until the lambda value is balanced again and the mixture control unit no longer has to regulate.
♦ This takes place in sequence for each cylinder a total of 3 times.
♦ The adaptation function now takes the mean value of each cylinder and adapts the injection time by the corresponding percentage, but by no more than 5%.
♦ The diagnostic function evaluates the 3 mixture lean-out cycles and uses this to produce the respective actual value >Injection quantity deviation, cylinder X< **(L500 ... L550)**.
♦ Cylinders that deviate by more than 12% are entered as faulty (P219C ... P21A1):
  ♦ The mixture adaptation value of this bank and the 3 actual values >Injection quantity deviation, cylinder X< of the bank with the faulty cylinder are entered in the fault environments 1 ... 4.
  ♦ Fault type >No signal< means that the mixture is too rich
  ♦ Fault type >Signal implausible< means that the mixture is too lean

Diagnostic information - DME (DFI) control unit

Misfiring during mixture adaptation phase

Diagnostic conditions

- Perform short test >Individual cylinder mixture adaptation<

or

- Driving with engine speed and load conditions that are as constant as possible:
  - 4th ... 7th gear
  - Engine speed 1,090 ... 3,000 rpm
  - Engine load 155 … 544 mg/stroke
  - Active carbon filter load < 0.8

Possible fault causes

♦ Mixture in the specified cylinder is too lean

Fault setting condition(s)

- If, during mixture adaptation of the individual cylinders (see ⓘ), rough running of a cylinder close to misfiring is detected, the function is aborted for the affected bank and a suspected fault is logged.
- The function is repeated up to 2 times in this highway cycle.
- If the function is aborted again in each of the 4 highway cycles over several drives, the fault entry >Misfiring during mixture adaptation phase, cylinder X< (P230A … F) will appear.

Leakage diagnosis pump driver

Diagnostic conditions

- Perform tank vent valve and tank leak short tests

or:

- Time since engine start > 10 second(s)
- Leakage diagnosis pump activated
- No fault entered for: P1556, P1557, P1558

Possible fault causes

- Vacuum system leaking (See ⓘ)
- Vacuum pump faulty
- Short circuit to B+ or open circuit in the lines (power supply or leakage diagnosis pump activation)
- Leakage diagnosis pump faulty

ⓘ INFORMATION

The vacuum system includes:

- Mechanical vacuum pump
- Main load circuit:
  - Brake booster
- Auxiliary load circuit:
  - Variable intake manifold (not Turbo)
  - Boost pressure control cycle valve (Turbo only)
  - Diverter solenoid valve (Turbo only)
  - Exhaust flap (if fitted)
  - Acoustic simulator (V6 Turbo only)
  - Tank leakage diagnosis pump (USA, Canada and South Korea only)

Diagnostic information - DME (DFI) control unit

Leakage diagnosis pump driver: below limit value

Diagnostic conditions
- Perform tank vent valve and tank leak short tests

or:
- Time since engine start > 10 second(s)
- Leakage diagnosis pump not activated
- No fault entered for: P1556, P1557, P1558

Possible fault causes
- Vacuum system leaking (See ⓘ)
- Vacuum pump faulty
- Short circuit to ground (leakage diagnosis pump activation)
- Leakage diagnosis pump faulty

ⓘ INFORMATION
The vacuum system includes:

Reed switch for leakage diagnosis pump

Diagnostic conditions

- Perform tank leak short test

or

- Driving > 150 second(s) with:
  - Engine start temperature 5 ... 50 °C (41 … 122 °F)
  - Time since engine start 5 second(s) ... 20 minute(s)
  - Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
    ⇒ See actual value > A060-Ambient pressure from DME (measured) <
  - Height difference < 20 m (66 ft.)
  - Intake air temperature > 5 °C (41 °F)
  - Intake air temperature: fluctuation(s) < 10 °C (50 °F)
  - Vehicle speed 0 ... 120 km/h (0 … 75 mph)
  - Acceleration/deceleration max. -2 m/s² … +2 m/s²
  - High partial-load share

Possible fault causes

- Vacuum system leaking (See ⓘ)
- Vacuum pump faulty
- Open circuit/short circuit to B+ (signal line)
- Leakage diagnosis pump faulty (reed switch)

Fault setting condition(s)

- Reed switch signal missing

ⓘ INFORMATION

  - Intake air temperature: fluctuation(s) < 10 °C (50 °F)
  - Vehicle speed 0 ... 120 km/h (0 … 75 mph)
  - Acceleration/deceleration max. -2 m/s² … +2 m/s²
  - High partial-load share

Possible fault causes

- Vacuum system leaking (See ⓘ)
- Vacuum pump faulty
- Tank vent valve stuck closed
- Purge-air line between tank vent valve and intake manifold trapped/blocked
- Short circuit to ground (signal line)
- Leakage diagnosis pump faulty (reed switch)

Fault setting condition(s)

- Reed switch signal permanently present

ⓘ INFORMATION

The vacuum system includes:

- Mechanical vacuum pump
- Main load circuit:
  - Brake booster
- Auxiliary load circuit:
  - Variable intake manifold (not Turbo)

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 1 - sensor in air

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Lambda control active
- Driving > 10 second(s) with:
  - No overrun phase(s)
- No fault entered for: oxygen sensor(s) or mixture preparation

Possible fault causes

♦ Fuel injector mechanical fault/blocked
(e.g. due to chip in the fuel rail)

♦ Oxygen sensor upstream of catalytic converter bank 1 not installed (only electrically connected)

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

P2415

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 2 - sensor in air

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Lambda control active
- Driving > 10 second(s) with:
  - No overrun phase(s)
- No fault entered for: oxygen sensor(s) or mixture preparation

Possible fault causes

♦ Fuel injector mechanical fault/blocked
(e.g. due to chip in the fuel rail)

♦ Oxygen sensor upstream of catalytic converter bank 2 not installed (only electrically connected)

♦ Oxygen sensor upstream of catalytic converter bank 2 faulty

Diagnostic information - DME (DFI) control unit

Oil level sensor

Diagnostic conditions
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground or open circuit in the lines
- Oil level sensor faulty

P250D

Diagnostic information - DME (DFI) control unit

Oil level sensor

Diagnostic conditions
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground or open circuit in the lines
- Oil level sensor faulty

P2539

Diagnostic information - DME (DFI) control unit

Fuel low-pressure sensor: electrical fault

Diagnostic conditions
- Ignition on

or
- Engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Fuel low-pressure sensor faulty

P2541

Diagnostic information - DME (DFI) control unit

Fuel low-pressure sensor: electrical fault

Diagnostic conditions
- Ignition on

or
- Engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Fuel low-pressure sensor faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 1: open circuit in compensating current (RT)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 10 minute(s) with:
  - Engine at operating temperature
  - Exhaust temperature > 200 °C (392 °F)
  - at least 1 overrun phase(s) > 6 second(s)
- then idling > 40 second(s)

Possible fault causes

♦ Open circuit in compensating current line (RT - contact 5)

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

P2629

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 2: open circuit in compensating current (RT)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 10 minute(s) with:
  - Engine at operating temperature
  - Exhaust temperature > 200 °C (392 °F)
  - at least 1 overrun phase(s) > 6 second(s)
- then idling > 40 second(s)

Possible fault causes

♦ Open circuit in line (RT - contact 5)

♦ Oxygen sensor upstream of catalytic converter bank 2 faulty

P2A00

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 1 - electrical fault

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 30 second(s), at:
  - Exhaust temperature > 100 °C (212 °F)
  - Oxygen sensor upstream of catalytic converter ready for operation
  - No overrun phase(s)

Possible fault causes

♦ Fault in oxygen sensor upstream of catalytic converter, bank 1 area

Fault setting condition(s)

♦ Temperature implausible (oxygen sensor upstream of catalytic converter)

Fault effects

♦ Since oxygen sensing is interrupted the moment a fault is detected, the DME (DFI) control unit stores this fault as information.

♦ Further faults are entered

ⓘ The vehicle must be driven in the same driving cycle (without ignition reset) for this purpose.

P2A01

Diagnostic information - DME (DFI) control unit

Mixture behind catalytic converter, bank 1 - signal too lean/too rich

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 90 seconds with:
  - No overrun phases
  - All **oxygen sensors** ready for operation

Possible fault causes

♦ Mixture preparation fault

♦ Exhaust line fault

♦ Exhaust gas measurement fault

Fault setting condition(s)

The oxygen sensor signal deviates by a certain value from the control value (rich/lean mixture) within a certain time.

Fault effects

♦ Since oxygen sensing is interrupted the moment a fault is detected, the DME (DFI) control unit stores this fault as information.

♦ Further faults are entered

ⓘ The vehicle must be driven in the same driving cycle (without ignition reset) for this purpose.

P2A03

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 2 - electrical fault

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 30 second(s), at:
  - Exhaust temperature > 100 °C (212 °F)
  - Oxygen sensor upstream of catalytic converter ready for operation
  - No overrun phase(s)

Possible fault causes

♦ Fault in oxygen sensor upstream of catalytic converter, bank 2 area

Fault setting condition(s)

♦ Temperature implausible (oxygen sensor upstream of catalytic converter)

Fault effects

♦ Since oxygen sensing is interrupted the moment a fault is detected, the DME (DFI) control unit stores this fault as information.

♦ Further faults are entered

ⓘ The vehicle must be driven in the same driving cycle (without ignition reset) for this purpose.

P2A04

Diagnostic information - DME (DFI) control unit

Mixture behind catalytic converter, bank 2 - signal too lean/too rich

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 90 seconds with:
  - No overrun phases
  - All **oxygen sensors** ready for operation

Possible fault causes

♦ Mixture preparation fault

♦ Exhaust line fault

♦ Exhaust gas measurement fault

Fault setting condition(s)

The oxygen sensor signal deviates by a certain value from the control value (rich/lean mixture) within a certain time.

Fault effects

♦ Since oxygen sensing is interrupted the moment a fault is detected, the DME (DFI) control unit stores this fault as information.

♦ Further faults are entered

ⓘ The vehicle must be driven in the same driving cycle (without ignition reset) for this purpose.

Diagnostic information - DME (DFI) control unit

Starter relay activation

Diagnostic conditions
- **PDK only**: Brake pressed + selector-lever position P or N
- **Manual transmission only**: Clutch pressed down fully
- Ignition on > 3 second(s)
- then start the engine

Possible fault causes
♦ Open circuit or short circuit to B+/ground in the activation line between the DME control unit and relay
♦ Starter relay faulty

Fault effects
♦ Starter does not turn (if there is an open circuit or short circuit to B+)

P3081

Diagnostic information - DME (DFI) control unit

Engine coolant temperature implausible

Diagnostic conditions
- Thermal management system test (if available)

or
- Intake air temperature at engine start < 70 °C (158 °F) or coolant temperature at engine start < 70 °C (158 °F) (See ⓘ 1)
- Engine running > 3 minute(s) (with no overrun phase(s))
- None of the following faults stored: Coolant temperature sensor or intake air temperature sensor

Possible fault causes
- ♦ Affected by block heater
- ♦ 3/2-way valve faulty, with:
  - Original auxiliary heater
- ♦ Seal in thermostat housing faulty
- ♦ Thermostat housing faulty
- ♦ Thermostat faulty
- ♦ Air in the cooling system

Fault setting condition(s)
- Engine coolant temperature < 70 °C (158 °F), at:
  - End of diagnostics (See ⓘ 2)

Fault effects
- ♦ Engine temperature = temperature model (as substitute value for engine coolant temperature)
- ♦ The fault can be healed only if the thermostat has been tested and found to be OK.

ⓘ INFORMATION

1.

The diagnostic function starts under the following conditions:
- If the system was free of faults before
  - Engine coolant temperature at engine start < 70 °C (158 °F)
- If fault has been previously detected in the system
  - Intake air temperature at engine start < 70 °C (158 °F) (engine temperature substitute value only for engine start)

2.

Diagnostics is ended,
- after engine running > 3 minute(s) (with no overrun phase(s)),

and if:
- the calculated temperature model reaches 70 °C (158 °F) before the measured coolant temperature has reached 70 °C (158 °F) (fault entry),

or
- the measured coolant temperature reaches 70 °C (158 °F) before the calculated temperature model has reached 70 °C (158 °F) (NO fault entry).

Diagnostic information - DME (DFI) control unit

Engine coolant temperature stuck

Diagnostic conditions

- Thermal management system test (if available)

or

- Time since ignition off > 6 hour(s)
- Intake air temperature at engine start < 45 °C (113 °F)
- Intake air temperature at engine start = ambient temperature +/- 20 °C (68 °F)
- Engine running > 30 second(s)

Possible fault causes

- Switch-off time incorrect = gateway control unit faulty (See ⓘ 1)
- 3/2-way valve faulty, with:
  - Original auxiliary heater
- Loose contact or corrosion on connectors or lines
- Engine coolant temperature sensor faulty
- Affected by block heater

Fault setting condition(s)

- Engine start temperature > 35 ... > 65 °C (95 … 149 °F) (See ⓘ 2)

ⓘ INFORMATION

1.

If the engine switch-off time (formed in the gateway control unit) that is output is greater than the actual value, the engine does not appear to have cooled down sufficiently.
This can be checked by switching the vehicle off - with the engine at operating temperature - for longer than 6 hours (ignition off). After this time:

- Switch on ignition and connect the PIWIS Tester.
- Select the following actual values: T020, T030, T040.
- Compare the actual values:
  - The engine temperature (T020) deviates significantly
  ⇒ Check and repair the temperature sensor and wiring.
  - The values are similar
  ⇒ If an auxiliary heater is installed in the vehicle,
    - switch on the auxiliary heater and leave it on for at least 15 minutes, then:
    - Compare the actual values again:
      - The engine temperature (T020) deviates significantly
      ⇒ Replace 3/2-way directional-control valve
      - The values are similar. The calculation of the shut-off time is probably incorrect
      ⇒ Replace gateway control unit.
  ⇒ If no auxiliary heater is installed in the vehicle:
    - the switch-off time calculation is probably incorrect
      ⇒ Replace gateway control unit.

2.

Setpoint value depends on:

- Time since ignition off

and

- Intake air temperature at engine start

Example: Engine start temperature setpoint value: max. 65 °C (149 °F)

- Time since ignition off: 6.1 hour(s)

and

- Intake air temperature at engine start: 44 °C (111 °F)

U0073

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

U0101
