Diagnosis information DME control module

U0300 Programming

Diagnostic conditions

- Diagnostics runs continuously

The data/programming version does not match the vehicle equipment.
► Program the **DME control unit** using the correct data record.

U0302

Diagnostic information - CAN

Fault entry in the specified control unit

NOTE
Internal function test completed.

Diagnostic conditions
The control unit initially tests internal function sequences after wake-up. If they are OK, all diagnosable outputs are then tested and any faults are stored.
Wake-up of the control unit by:

- Event-controlled CAN message
- Wake-up signal via wake-up line
- Key contact (terminal S)
- Ignition on

Possible fault causes

- Incorrect control unit coding
- The peripheral equipment connected to the specified control unit is faulty
- Control unit faulty (in most cases, faulty coding is the cause and not the control unit)

Fault effects

- The stated control unit sends only substitute values via the CAN
- Other control units detect these substitute values and set this fault code

U0318

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

Diagnostic information - DME (DFI) control unit

Ambient temperature via CAN

Diagnostic conditions
- Ignition on > 5 second(s)

Possible fault causes
- ♦ Wrong gateway control unit (See ⓘ)
- ♦ Message via CAN faulty or missing

Fault setting condition(s)
- No time information from the gateway control unit (0.5 ... 5 seconds).

and
- There is also no other time information available via satellite (e.g. no reception in garage).

Fault effects
- ♦ Substitute value from model
- ♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

ⓘ INFORMATION

- **This only affects model year 2010 vehicles**

The 2 digits in the 10th + 11th places of the 11-digit part number are relevant:
- 970.618.115.**04** or **.05** ⇒ Wrong gateway control unit
- 970.618.115.**11** (or higher) ⇒ Correct gateway control unit

P000A00

Diagnosis information DME control module

P000A00 Bank 1 intake camshaft adjustment too slow

Diagnostic conditions

- No camshaft adjuster output stage fault
- No rpm or phase sender fault
- Time after engine start > 3 sec.
- With engine running

Fault setting condition(s)

- The fault is set if the camshaft adjuster cannot follow the defined setpoint fast enough or cannot follow it at all due to it being stuck
- Camshaft has adjusted, but (permanently or repeatedly) not in the adjustment time to be observed

Monitored component or system

♦ Bank 1 intake camshaft adjuster

P000B00

Diagnosis information DME control module

P000B00 Bank 1 exhaust camshaft adjustment too slow

Diagnostic conditions

- With engine running

Fault setting condition(s)

- Camshaft adjuster diagnostics: camshaft does not adjust fast enough

Monitored component or system

♦ Bank 1 exhaust camshaft adjuster

Diagnosis information DME control module

P001000 Bank 1 intake camshaft adjustment - open circuit

Diagnostic conditions

- With engine running

Fault setting condition(s)

- Activation voltage higher than diagnostic threshold 4.4...5.6 V
- Output stage diagnostics, line open circuit

Monitored component or system

♦ Bank 1 intake camshaft adjuster output stage

Diagnosis information DME control module

P001100 Bank 1 intake camshaft retardation setpoint not reached

Diagnostic conditions

- No camshaft adjuster output stage fault
- No rpm or phase sender fault
- Time after engine starts >3 sec
- With engine running

Fault setting condition(s)

- The fault is set if the camshaft adjuster cannot follow the defined setpoint fast enough or cannot follow it at all due to it being stuck
- Camshaft stuck (permanently or repeatedly)

Monitored component or system

♦ Bank 1 intake camshaft adjuster

Diagnosis information DME control module

P001400 Bank 1 exhaust camshaft retardation setpoint not reached

Diagnostic conditions

- With engine running

Fault setting condition(s)

- Camshaft adjuster diagnostics: camshaft adjustment does not reach the required position

Monitored component or system

♦ Bank 1 exhaust camshaft adjuster

Diagnosis information DME control module

P001600 Bank 1 camshaft position/crankshaft position sensor - incorrect allocation

Diagnostic conditions

- No fault of the crankshaft sensor
- No fault of the camshaft adjuster
- No other faults present in the camshaft sensor and in the sensor supply voltage
- Engine start
- Switch ignition off and then on again
- With engine running

Fault setting condition(s)

- If the camshaft is moved to the reference position (stop) during the driving cycle, a camshaft-to-crankshaft allocation test is performed
- Edges of the camshaft sensor signal when the camshaft is in reference position (stop) do not match the crankshaft signal (camshaft impermissibly turned out of position)

Monitored component or system

♦ Bank 1 intake camshaft sensor

Fault finding notes

♦ Check camshaft timing (camshaft position) via the Tester
♦ Check chain drive to determine whether the chain is out of place
♦ Check the camshaft adjuster function (check control valves, shaft adjusters, oil pressure)
♦ Check wiring of the camshaft adjusters
♦ Check sensor wiring
♦ Check camshaft sender wheel

Function restrictions

♦ Camshaft adjustment not possible
♦ Loss of power possible
♦ Engine rough running and even "engine stall" possible if the chain is out of position by several teeth

Diagnosis information DME control module

P001700 Bank 1 camshaft position/crankshaft position sensor - incorrect allocation

Diagnostic conditions

- No fault of the crankshaft sensor
- No fault of the camshaft adjuster
- No other faults of the camshaft sensor present
- With engine running

Fault setting condition(s)

- If the camshaft is moved to the reference position (stop) during the driving cycle, a camshaft-to-crankshaft allocation test is performed
- Edges of the camshaft sensor signal when the camshaft is in reference position (stop) do not match the crankshaft signal (camshaft impermissibly turned out of position)

Monitored component or system

♦ Bank 1 exhaust camshaft sensor

Fault finding notes

♦ Check camshaft timing (camshaft position) via the Tester
♦ Check chain drive to determine whether the chain is out of place
♦ Check the camshaft adjuster function (check control valves, shaft adjusters, oil pressure)
♦ Check wiring of the camshaft adjusters
♦ Check sensor wiring
♦ Check camshaft sender wheel

Function restrictions

♦ Camshaft adjustment not possible
♦ Loss of power possible
♦ Engine rough running and even "engine stall" possible if the chain is out of position by several teeth

Diagnosis information DME control module

P003000 Bank 1 sensor 1 - heating circuit open circuit

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater voltage > 4.4...5.6 V

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter

Fault finding notes

♦ Check wiring between the control unit and component for open circuit. Depending on the output stage, the internal diagnostic voltage (between 3 V and 6 V) is measured
♦ Check power supply of the component

Function restrictions

♦ Output stage inactive, failure of the sensor heater

Diagnosis information DME control module

P003100 Bank 1 sensor 1 - heating circuit short circuit to ground

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater voltage > 2.15...3.25 V

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter

Fault finding notes

♦ Check wiring between the control unit and component for short circuit to ground. If this is OK, then pull the component off and clear the fault memory
♦ If the DME control unit detects an open circuit, the fault is in the component
♦ Check power supply on the component

Function restrictions

♦ Output stage inactive, failure of the sensor heater

Diagnosis information DME control module

P003200 Bank 1 sensor 1 - heating circuit short circuit to B+

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater current > 3 A

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter

Fault finding notes

♦ Check wiring between the control unit and component for short circuit to B+. If this is OK, then pull the component off and clear the fault memory
♦ If the DME control unit detects an open circuit, the fault is in the component

Function restrictions

♦ Output stage inactive, failure of the sensor heater

P003600

Diagnosis information DME control module

P003600 Bank 1 sensor 2 - heating circuit open circuit

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater voltage > 4.4...5.6 V

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter

Fault finding notes

♦ Check wiring between the control unit and component for open circuit. The internal diagnostic voltage (between 3 V and 6 V) is measured
♦ Check component for continuity
♦ Check power supply of the component

Function restrictions

♦ Output stage inactive, failure of the sensor heater

Diagnosis information DME control module

P003700 Bank 1 sensor 2 - heating circuit short circuit to ground

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater voltage > 2.15...3.25 V

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter

Fault finding notes

♦ Check wiring between the control unit and component for short circuit to ground. If this is OK, then pull the component off and clear the fault memory
♦ If an open circuit or electrical fault is detected upon unplugging, the fault is in the component
♦ Check power supply on the component

Function restrictions

♦ Output stage inactive, failure of the sensor heater

Diagnosis information DME control module

P003800 Bank 1 sensor 2 - heating circuit short circuit to B+

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater current > 3 A

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter

Fault finding notes

♦ Check wiring between the control unit and component for short circuit to B+. If this is OK, then pull the component off and clear the fault memory
♦ If an open circuit or electrical fault is detected upon unplugging, the fault is in the component
♦ Check power supply on the component

Function restrictions

♦ Output stage inactive, failure of the sensor heater

Diagnosis information DME control module

P004000 Bank 1 sensor 1/bank 2 sensor 1 interchanged

Diagnostic conditions

- Oxygen sensor heating completed
- Diagnostics runs continuously

Fault setting condition(s)

- The lambda controllers of the two banks run in the opposite direction: bank 1 at rich limit and bank 2 at lean limit or bank 1 at lean limit and bank 2 at rich limit
- Observation of the controller outputs of the pre-catalytic converters of the two banks

Monitored component or system

♦ Oxygen sensors ahead of the catalytic converter

Fault finding notes

♦ Oxygen sensors ahead of the catalytic converters interchanged

Function restrictions

♦ Rough-running engine

Diagnosis information DME control module

P005000 Bank 2 sensor 1 - heating circuit electrical fault

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater voltage > 4.4...5.6 V

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter 2

Fault finding notes

♦ Check wiring between the control unit and component for open circuit. Depending on the output stage, the internal diagnostic voltage (between 3 V and 6 V) is measured
♦ Check power supply of the component

Function restrictions

♦ Output stage inactive, failure of the sensor heater

Diagnosis information DME control module

P005100 Bank 2 sensor 1 - heating circuit short circuit to ground

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater voltage > 2.15...3.25 V

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter 2

Fault finding notes

♦ Check wiring between the control unit and component for short circuit to ground. If this is OK, then pull the component off and clear the fault memory
♦ If the DME control unit detects an open circuit, the fault is in the component
♦ Check power supply on the component

Function restrictions

♦ Output stage inactive, failure of the sensor heater

Diagnosis information DME control module

P005200 Bank 2 sensor 1 - heating circuit short circuit to B+

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater current > 3 A

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter 2

Fault finding notes

♦ Check wiring between the control unit and component for short circuit to B+. If this is OK, then pull the component off and clear the fault memory
♦ If the DME control unit detects an open circuit, the fault is in the component

Function restrictions

♦ Output stage inactive, failure of the sensor heater

Diagnosis information DME control module

P005600 Bank 2 sensor 2 - heating circuit electrical fault

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater voltage > 4.4...5.6 V

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter 2

Fault finding notes

♦ Check wiring between the control unit and component for open circuit. The internal diagnostic voltage (between 3 V and 6 V) is measured
♦ Check component for continuity
♦ Check power supply of the component

Function restrictions

♦ Output stage inactive, failure of the sensor heater

Diagnosis information DME control module

P005700 Bank 2 sensor 2 - heating circuit short circuit to ground

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater voltage > 2.15...3.25 V

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter 2

Fault finding notes

♦ Check wiring between the control unit and component for short circuit to ground. If this is OK, then pull the component off and clear the fault memory
♦ If an open circuit or electrical fault is detected upon unplugging, the fault is in the component
♦ Check power supply on the component

Function restrictions

♦ Output stage inactive, failure of the sensor heater

Diagnosis information DME control module

P005800 Bank 2 sensor 2 - heating circuit short circuit to B+

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater current > 3 A

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter 2

Fault finding notes

♦ Check wiring between the control unit and component for short circuit to B+. If this is OK, then pull the component off and clear the fault memory
♦ If an open circuit or electrical fault is detected upon unplugging, the fault is in the component
♦ Check power supply on the component

Function restrictions

♦ Output stage inactive, failure of the sensor heater

Diagnosis information DME control module

P006800 Intake manifold pressure/mass air flow to throttle valve angle, deviation

Diagnostic conditions

- With engine running
- Lambda closed-loop control circuit closed
- Tank vent closed
- Diagnostics runs continuously

Monitored component or system

♦ Mass air flow sensor MAF 6

P007000

Diagnosis information DME control module

P007000 Outside-temperature sensor - electrical fault

Monitored component or system

♦ Ambient temperature sensor

Fault finding notes

♦ See air conditioner fault memory

P007100

Diagnosis information DME control module

P007100 Outside temperature sensor - implausible signal

Diagnostic conditions

- Cold start detected
- No block heater operation detected
- No solar irradiation detected

Fault setting condition(s)

- Temperature cross-check after engine start in the conditioned vehicle state
- Comparison of intake-air temperature, engine temperature and ambient temperature

Monitored component or system

♦ Ambient temperature sensor

Fault finding notes

♦ See air conditioner fault memory

P007200

Diagnosis information DME control module

P007200 Outside-temperature sensor - signal too low

Monitored component or system

♦ Ambient-temperature sensor

Fault finding notes

♦ See air conditioner fault memory

Diagnostic information - DME V6 DFI

Fuel high pressure too low
● From MY 2015 =>

Diagnostic conditions
● Battery voltage 10 V ... 16 V
● Engine start detected > 5 sec.
● Engine temperature -10 °C ... + 100 °C (14 … 212 °F)
● Driving with different load and engine speed ranges

Possible fault causes
♦ Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
♦ Pressure-relief valve in high-pressure circuit faulty
♦ Quantity control valve faulty (in fuel high-pressure pump)
♦ Fuel high-pressure pump faulty

Fault setting conditions
● When the engine is starting under the diagnostic conditions specified above, the plausibility of the value of the fuel high-pressure sensor is checked.
● When the engine is running at idle speed and in the near idle speed range, a suspected fault is set if the actual value of the fuel high-pressure control system differs from the setpoint value.
● The plausibility of the fuel high-pressure sensor **AND also** the value of the fuel/air mixture adaptation is now evaluated:
⇒ If the fuel high-pressure sensor shows plausible values **AND** if this adaptation value is close to 0, the fault code P008700 or P008800 will be entered.
⇒ If the fuel high-pressure sensor shows implausible values **AND** if the adaptation value is significantly different, the fault code P12A100 or P12A200 will be entered.
ⓘ A significant deviation in the fuel adaptation value does not necessarily result in a fault entry for mixture adaptation because another fault limit is decisive for this.

Diagnostic information - DME V6 DFI

Fuel high pressure too high
● From MY 2015 =>

Diagnostic conditions
● Battery voltage 10 V ... 16 V
● Engine start detected > 5 sec.
● Engine temperature -10 °C ... + 100 °C (14 … 212 °F)
● Driving with different load and engine speed ranges

Possible fault causes
♦ Pressure-relief valve in high-pressure circuit faulty
♦ Quantity control valve faulty (in fuel high-pressure pump)
♦ Fuel high-pressure pump faulty

Fault setting conditions
● When the engine is starting under the diagnostic conditions specified above, the plausibility of the value of the fuel high-pressure sensor is checked.
● When the engine is running at idle speed and in the near idle speed range, a suspected fault is set if the actual value of the fuel high-pressure control system differs from the setpoint value.
● The plausibility of the fuel high-pressure sensor **AND also** the value of the fuel/air mixture adaptation is now evaluated:
⇒ If the fuel high-pressure sensor shows plausible values **AND** if this adaptation value is close to 0, the fault code P008700 or P008800 will be entered.
⇒ If the fuel high-pressure sensor shows implausible values **AND** if the adaptation value is significantly different, the fault code P12A100 or P12A200 will be entered.
ⓘ A significant deviation in the fuel adaptation value does not necessarily result in a fault entry for mixture adaptation because another fault limit is decisive for this.

P008A00

Diagnosis information DME control module

P008A00 Fuel low pressure system - pressure too low

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- The measured fuel low pressure deviates significantly from the setpoint pressure

Monitored component or system

♦ Fuel low pressure system

Fault finding notes

♦ Check fuel lines (tightness)
♦ Check fuel filter (soiled/clogged)
♦ Check pressure retaining valve
♦ Checking pressure limiting valve
♦ Check activation of electric fuel pump (low pressure)
♦ Check low pressure sensor (in the high pressure pump)
♦ Check electric fuel pump (low pressure) (pressure, delivery quantity)

P008B00

Diagnosis information DME control module

P008B00 Fuel low pressure system - pressure too high

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- The measured fuel low pressure deviates significantly from the setpoint pressure

Monitored component or system

♦ Fuel low pressure system

Fault finding notes

♦ Check fuel lines (tightness)
♦ Check fuel filter (soiled/clogged)
♦ Check pressure retaining valve
♦ Check pressure limiting valve
♦ Check activation of electric fuel pump (low pressure)
♦ Check low pressure sensor (in the high pressure pump)
♦ Check electric fuel pump (low pressure) (pressure, delivery quantity)

Diagnosis information DME control module

P010000 Mass air flow sensor - supply voltage

Diagnostic conditions

- Ignition on
- Engine turning
- Vehicle electrical system voltage greater than 11 V
- Diagnostics runs several times per driving cycle

Fault setting condition(s)

- The hot-film mass air flow sensor transmits the measured air mass to the control unit in the form of a frequency signal. The control unit evaluates the period as a measured value for the mass air flow

Monitored component or system

♦ Hot-film mass air flow sensor (MAF)

Fault finding notes

♦ Check power supply of the hot-film mass air flow sensor
♦ Line test
♦ Contact test
♦ Replace sensor
♦ In designs with two hot-film mass air flow sensors, interchange these sensors. If the fault moves over too, then replace the sensor. If the fault stays in the same place, then the plug, line or DME control unit is faulty

Diagnosis information DME control module

P010100 Mass air flow sensor - implausible signal

Diagnostic conditions

- With engine running
- Diagnostics runs several times per driving cycle
- Drive with low and high engine load (diagnostics runs continuously)
- Drive with the most constant driving conditions possible for mixture adaptation procedure (diagnostics runs continuously)

Fault setting condition(s)

- Mass air flow > 1,100 kg/h
- Comparison with theoretically possible mass air flow upper limit
- Mass air flow < -10 kg/h
- Comparison with theoretically possible mass air flow lower limit
- Monitoring of the mass air flow for plausibility depending on the throttle valve position, taking all essential component tolerances into account

Monitored component or system

♦ Hot-film mass air flow sensor (MAF 6)

Fault finding notes

♦ Check hoses between the throttle valve and the hot-film mass air flow sensor
♦ Check hot-film mass air flow sensor (for drift)
♦ Check throttle valve for drift and soiling

Diagnosis information DME control module

P010200 Mass air flow sensor signal too low

Diagnostic conditions

- Ignition on
- Engine turning
- Vehicle electrical system voltage greater than 11 V
- Diagnostics runs several times per driving cycle

Fault setting condition(s)

- The hot-film mass air flow sensor transmits the measured air mass to the control unit in the form of a frequency signal. The control unit evaluates the period as a measured value for the mass air flow
- The period of the hot-film mass air flow sensor signal corresponds to a temperature correction factor and is monitored against a lower limit
- The fault is triggered if there is a short circuit to B+ or ground or a line open circuit
- The fault can also be caused by the signal drifting away to low values if the electronic components in the hot-film mass air flow sensor are faulty

Monitored component or system

♦ Hot-film mass air flow sensor (MAF)

Fault finding notes

♦ Line test
♦ Contact test
♦ Replace sensor
♦ In designs with two hot-film mass air flow sensors, interchange these sensors. If the fault moves over too, then replace the sensor. If the fault stays in the same place, then the plug, line or DME control unit is faulty
♦ Unplug the DME control unit and simulate a DME control unit to the hot-film mass air flow sensor by connecting a resistance circuit to the hot-film mass air flow sensor pins, ensure the power supply of the hot-film mass air flow sensor, measure hot-film mass air flow sensor signal
♦ Replace DME control unit

Diagnosis information DME control module

P010300 Mass air flow sensor signal too high

Diagnostic conditions

- Ignition on
- Engine turning
- Vehicle electrical system voltage greater than 11 V
- Diagnostics runs several times per driving cycle

Fault setting condition(s)

- The hot-film mass air flow sensor transmits the measured air mass to the control unit in the form of a frequency signal. The control unit evaluates the period as a measured value for the mass air flow
- The period of the hot-film mass air flow sensor signal corresponds to a temperature correction factor and is monitored against an upper limit
- If the electronic components in the hot-film mass air flow sensor are faulty, this can cause a drift to long periods

Monitored component or system

♦ Hot-film mass air flow sensor (MAF)

Fault finding notes

♦ Line test
♦ Contact test
♦ Replace sensor
♦ In designs with two hot-film mass air flow sensors, interchange these sensors. If the fault moves over too, then replace the sensor. If the fault stays in the same place, then the plug, line or DME control unit is faulty
♦ Unplug the DME control unit and simulate a DME control unit to the hot-film mass air flow sensor by connecting a resistance circuit to the hot-film mass air flow sensor pins, ensure the power supply of the hot-film mass air flow sensor, measure hot-film mass air flow sensor signal
♦ Replace DME control unit

Diagnosis information DME control module

P011100 Intake air temperature sender - implausible signal

Diagnostic conditions

- Cold start detected
- No block heater operation detected
- No solar irradiation detected

Fault setting condition(s)

- Temperature cross-check after engine start in the conditioned vehicle state
- Comparison of intake-air temperature, engine temperature and ambient temperature

Monitored component or system

♦ Intake air temperature sensor

Diagnosis information DME control module

P011200 Intake air temperature sender - signal too low

Diagnostic conditions

- Diagnostics runs several times

Fault setting condition(s)

- Intake air temperature > 129.8 °C (265.6 °F)

Monitored component or system

♦ Intake air temperature sensor

Diagnosis information DME control module

P011300 Intake air temperature sender - signal too high

Diagnostic conditions

- Time after engine starts > 240 sec
- Engine idling
- Injection suppression not active
- Diagnostics runs several times

Monitored component or system

♦ Intake air temperature sensor

Diagnosis information DME control module

P011600 Coolant temperature sender - implausible signal

Diagnostic conditions

- Time after engine starts > 3 sec
- Diagnostics runs once per driving cycle
- Cold start detected
- No block heater operation detected
- No solar irradiation detected

Fault setting condition(s)

- If no perceptible temperature change is recorded after driving states with low and high cooling power, it is assumed that the sensor is "stuck"
- Temperature cross-check after engine start in the conditioned vehicle state
- Comparison of intake-air temperature, engine temperature and ambient temperature

Monitored component or system

♦ Engine cooling system temperature sensor

Fault finding notes

♦ Engine temperature sensor probably faulty

Function restrictions

♦ Engine temperature too low or too high

Diagnosis information DME control module

P011700 Coolant temperature sender - signal too low

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Measured engine temperature > 137.3 °C (279.1 °F)
- Voltage drop at the NTC sensor is assigned to a corresponding temperature
- Fault detection when a maximum temperature threshold is exceeded

Monitored component or system

♦ Engine cooling system temperature sensor

Fault finding notes

♦ Measure voltage via sensor
♦ Fault case: if the voltage is near 0 V, the sensor or wiring is faulty

Function restrictions

♦ Engine temperature too high

Diagnosis information DME control module

P011800 Coolant temperature sender - signal too high

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Measured engine temperature < -44.3 °C (-47.7 °F)
- Voltage drop at the NTC sensor is assigned to a corresponding temperature
- Fault detection when a minimum temperature threshold is exceeded

Monitored component or system

♦ Engine cooling system temperature sensor

Fault finding notes

♦ Measure voltage via sensor
♦ Fault case: if the voltage is near 5 V, the sensor or wiring is faulty

Function restrictions

♦ Engine temperature too low

Diagnosis information DME control module

P012100 Throttle valve potentiometer - implausible signal

Diagnostic conditions

- Engine speed > 480 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- The angles of throttle valve potentiometers 1 and 2 deviate by more than 6.3% from each other
- The angle of throttle valve potentiometer 1 and the calculated throttle valve angle deviate by more than 9.0% from each other

Monitored component or system

♦ Throttle valve sensor 1

Diagnosis information DME control module

P012200 Throttle valve potentiometer - signal too low

Diagnostic conditions

- Ignition on
- Run-on
- Diagnostics runs continuously

Fault setting condition(s)

- Throttle valve potentiometer voltage of sensor 1 < 0.176 V

Monitored component or system

♦ Throttle valve sensor 1

Diagnosis information DME control module

P012300 Throttle valve potentiometer - signal too high

Diagnostic conditions

- Ignition on
- Run-on
- Diagnostics runs continuously

Fault setting condition(s)

- Throttle valve potentiometer voltage of sensor 1 > 4.629 V

Monitored component or system

♦ Throttle valve sensor 1

Diagnosis information DME control module

P013000 Bank 1 sensor 1 - electrical fault in circuit

Diagnostic conditions

- Oxygen sensor 4.9/4.2
- Exhaust temperature > 249.998 °C (481.996 °F)
- Heater control active
- Diagnostics runs continuously

Fault setting condition(s)

- Ceramic element temperature < 640.022 °C (1,184.040 °F)
- Internal resistance > 950 Ohm
- Heater fault
- Line open circuit
- A fault entry is made as soon as the ceramic element temperature is implausibly low, the internal resistance of the Nernst cell is implausibly high or a heater fault or a line open circuit is present
- This diagnostic test represents a quick test in order to deactivate lambda control as quickly as possible in the event of a fault. The exact fault cause is stored as the second fault memory entry

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter

Fault finding notes

♦ See description of the measure based on the parallel heater fault or line open circuit fault memory entry

P013100

Diagnosis information DME control module

P013100 Bank 1 sensor 1 - voltage too low

Diagnostic conditions

- Oxygen sensor 4.9/4.2
- Heater control active
- Diagnostics runs continuously

Fault setting condition(s)

- Virtual ground < 2 V
- Nernst voltage < 1.75 V
- Comparison line < 0.9 V
- Collective fault: short circuit of the virtual ground to ground, short circuit of the Nernst voltage to ground or short circuit of the comparison line to ground

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter

Fault finding notes

♦ Test of the measuring resistor: Important: The ignition must be off for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "pump current" and "trim resistance". R=60-65 Ohm.
If the measuring resistor is faulty, the oxygen sensor is replaced
♦ Test of the power supply: Important: The ignition must be on for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "virtual ground" and "K ground". U=2-3 V. If there is no voltage, the line must be checked for open circuit and replaced if necessary.
♦ Test of the lines "pump voltage", "virtual ground", "trim resistance" and "Nernst voltage" for open circuit and short circuits
♦ If open circuits or short circuits are present, the lines must be repaired
♦ If the fault occurs nevertheless, the DME control unit must be checked

P013200

Diagnosis information DME control module

P013200 Bank 1 sensor 1 - voltage too high

Diagnostic conditions

- Oxygen sensor 4.9/4.2
- Heater control active
- Diagnostics runs continuously

Fault setting condition(s)

- Virtual ground > 3 V
- Nernst voltage > 4 V
- Comparison line > 6 V
- Collective fault: short circuit of the virtual ground to

B+, short circuit of the Nernst voltage to B+ or short circuit of the comparison line to B+

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter

Fault finding notes

♦ Test of the measuring resistor: Important: The ignition must be off for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "pump current" and "trim resistance". R=60-65 Ohm.
If the measuring resistor is faulty, the oxygen sensor is replaced
♦ Test of the power supply: Important: The ignition must be on for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "virtual ground" and "K ground". U=2-3 V. If there is no voltage, the line must be checked for open circuit and replaced if necessary.
♦ Test of the lines "pump voltage", "virtual ground", "trim resistance" and "Nernst voltage" for open circuit and short circuits
♦ If open circuits or short circuits are present, the lines must be repaired
♦ If the fault occurs nevertheless, the DME control unit must be checked

Diagnosis information DME control module

P013300 Bank 1 sensor 1 - signal too slow

Monitored component or system

- Oxygen sensor ahead of catalytic converter
- Dynamic response

Fault finding notes

- Short circuit to B+/ground/mutual short circuit or open circuit in the lines
- Different air flow to the oxygen sensor behind the catalytic converter in case of:
  - **catalytic converter** damaged
  - modified or non-genuine components
- **oxygen sensor ahead of catalytic converter**, bank 1, faulty (aged)

Diagnosis information DME control module

P005000 Bank 2 sensor 1 - heating circuit electrical fault

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater voltage > 4.4...5.6 V

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter 2

Fault finding notes

♦ Check wiring between the control unit and component for open circuit. Depending on the output stage, the internal diagnostic voltage (between 3 V and 6 V) is measured
♦ Check power supply of the component

Function restrictions

♦ Output stage inactive, failure of the sensor heater

Diagnosis information DME control module

P013700 Bank 1 sensor 2 - voltage too low

Diagnostic conditions

● Diagnostics runs continuously

Fault setting condition(s)

● At start with cold sensor: The sensor voltage is below the minimum voltage (0.04 V)
● In warm operation: The sensor voltage is below a minimum voltage (0.04 V) and no reaction to closed-loop enrichment

Monitored component or system

♦ Bank 1 oxygen sensor 2

Fault finding notes

♦ Test of the power supply: Important: The heating must be on for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "signal plus" and "signal ground". U=0.4-0.5 V. If there is no voltage, the line must be checked for open circuit and replaced if necessary.
♦ Check of the lines "signal plus" and "signal ground" for open circuit and short circuits
♦ If open circuits or short circuits are present, the lines must be repaired
♦ If the fault occurs nevertheless, the DME control unit must be checked

P013800

Diagnosis information DME control module

P013800 Bank 1 sensor 2 - voltage too high

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- The sensor voltage is above the maximum voltage (1.08 V)

Monitored component or system

♦ Bank 1 oxygen sensor 2

Fault finding notes

♦ Test of the power supply: Important: The heating must be on for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "signal plus" and "signal ground". U=0.4-0.5 V. If there is no voltage, the line must be checked for open circuit and replaced if necessary.
♦ Check of the lines "signal plus" and "signal ground" for open circuit and short circuits
♦ If open circuits or short circuits are present, the lines must be repaired
♦ If the fault occurs nevertheless, the DME control unit must be checked

Diagnosis information DME control module

P013900 Bank 1 sensor 2 - signal too slow

Diagnostic conditions

- Engine at operating temperature
- Time since engine start > 10 sec
- 60 seconds driving with slight acceleration at 25...130 km/h (16... 81 mph), engine speed < 3,000 rpm, lambda control ahead of catalytic converter active, lambda control behind catalytic converter active, overrun shutoff by accelerator pedal release

Fault setting condition(s)

- Excessive time offset during edge changes between the lean and rich cycle or between the rich and lean cycle

Monitored component or system

♦ Bank 1 oxygen sensor 2

Fault finding notes

♦ Changed flow to the oxygen sensor behind the catalytic converter if the catalytic converter is damaged or if modified or non-genuine components are installed

Diagnosis information DME control module

P013900 Bank 1 sensor 2 - signal too slow

Diagnostic conditions

- Engine at operating temperature
- Time since engine start > 10 sec
- 60 seconds driving with slight acceleration at 25...130 km/h (16... 81 mph), engine speed < 3,000 rpm, lambda control ahead of catalytic converter active, lambda control behind catalytic converter active, overrun shutoff by accelerator pedal release

Fault setting condition(s)

- Excessive time offset during edge changes between the lean and rich cycle or between the rich and lean cycle

Monitored component or system

♦ Bank 1 oxygen sensor 2

Fault finding notes

♦ Changed flow to the oxygen sensor behind the catalytic converter if the catalytic converter is damaged or if modified or non-genuine components are installed

Diagnosis information DME control module

P013900 Bank 1 sensor 2 - signal too slow

Diagnostic conditions

- Engine at operating temperature
- Time since engine start > 10 sec
- 60 seconds driving with slight acceleration at 25...130 km/h (16... 81 mph), engine speed < 3,000 rpm, lambda control ahead of catalytic converter active, lambda control behind catalytic converter active, overrun shutoff by accelerator pedal release

Fault setting condition(s)

- Excessive time offset during edge changes between the lean and rich cycle or between the rich and lean cycle

Monitored component or system

♦ Bank 1 oxygen sensor 2

Fault finding notes

♦ Changed flow to the oxygen sensor behind the catalytic converter if the catalytic converter is damaged or if modified or non-genuine components are installed

Diagnosis information DME control module

P015900 Bank 2 sensor 2 - signal too slow

Diagnostic conditions

- Engine at operating temperature
- Time since engine start > 10 sec
- 60 seconds driving with slight acceleration at 25...130 km/h (16... 81 mph), engine speed < 3,000 rpm, lambda control ahead of catalytic converter active, lambda control behind catalytic converter active, overrun shutoff by accelerator pedal release

Fault setting condition(s)

- Excessive time offset during edge changes between the lean and rich cycle or between the rich and lean cycle

Monitored component or system

♦ Bank 2 oxygen sensor 2

Fault finding notes

♦ Changed flow to the oxygen sensor behind the catalytic converter if the catalytic converter is damaged or if modified or non-genuine components are installed

Diagnosis information DME control module

P015900 Bank 2 sensor 2 - signal too slow

Diagnostic conditions

- Engine at operating temperature
- Time since engine start > 10 sec
- 60 seconds driving with slight acceleration at 25...130 km/h (16... 81 mph), engine speed < 3,000 rpm, lambda control ahead of catalytic converter active, lambda control behind catalytic converter active, overrun shutoff by accelerator pedal release

Fault setting condition(s)

- Excessive time offset during edge changes between the lean and rich cycle or between the rich and lean cycle

Monitored component or system

♦ Bank 2 oxygen sensor 2

Fault finding notes

♦ Changed flow to the oxygen sensor behind the catalytic converter if the catalytic converter is damaged or if modified or non-genuine components are installed

Diagnosis information DME control module

P013900 Bank 1 sensor 2 - signal too slow

Diagnostic conditions

- Engine at operating temperature
- Time since engine start > 10 sec
- 60 seconds driving with slight acceleration at 25...130 km/h (16... 81 mph), engine speed < 3,000 rpm, lambda control ahead of catalytic converter active, lambda control behind catalytic converter active, overrun shutoff by accelerator pedal release

P015100

Diagnosis information DME control module

P015100 Bank 2 sensor 1 - voltage too low

Diagnostic conditions

- Oxygen sensor 4.9/4.2
- Heater control active
- Diagnostics runs continuously

Fault setting condition(s)

- Virtual ground < 2 V
- Nernst voltage < 1.75 V
- Comparison line < 0.9 V
- Collective fault: short circuit of the virtual ground to ground, short circuit of the Nernst voltage to ground or short circuit of the comparison line to ground

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter, bank 2

Fault finding notes

♦ Test of the measuring resistor: Important: The ignition must be off for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "pump current" and "trim resistance". R=60-65 Ohm.
If the measuring resistor is faulty, the oxygen sensor is replaced
♦ Test of the power supply: Important: The ignition must be on for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "virtual ground" and "K ground". U=2-3 V. If there is no voltage, the line must be checked for open circuit and replaced if necessary.
♦ Test of the lines "pump voltage", "virtual ground", "trim resistance" and "Nernst voltage" for open circuit and short circuits
♦ If open circuits or short circuits are present, the lines must be repaired
♦ If the fault occurs nevertheless, the DME control unit must be checked

P015200

Diagnosis information DME control module

P015200 Bank 2 sensor 1 - voltage too high

Diagnostic conditions

- Oxygen sensor 4.9/4.2
- Heater control active
- Diagnostics runs continuously

Fault setting condition(s)

- Virtual ground > 3 V
- Nernst voltage > 4 V
- Comparison line > 6 V
- Collective fault: short circuit of the virtual ground to

B+, short circuit of the Nernst voltage to B+ or short circuit of the comparison line to B+

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter, bank 2

Fault finding notes

♦ Test of the measuring resistor: Important: The ignition must be off for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "pump current" and "trim resistance". R=60-65 Ohm.
If the measuring resistor is faulty, the oxygen sensor is replaced
♦ Test of the power supply: Important: The ignition must be on for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "virtual ground" and "K ground". U=2-3 V. If there is no voltage, the line must be checked for open circuit and replaced if necessary.
♦ Test of the lines "pump voltage", "virtual ground", "trim resistance" and "Nernst voltage" for open circuit and short circuits
♦ If open circuits or short circuits are present, the lines must be repaired
♦ If the fault occurs nevertheless, the DME control unit must be checked

Diagnosis information DME control module

P015300 Bank 2 sensor 1 - signal too slow

Monitored component or system

♦ Bank 2 oxygen sensor 1

Fault finding notes

♦ Short circuit to B+/ground/mutual short circuit or open circuit in the lines
♦ Different air flow to the oxygen sensor behind the catalytic converter in case of:
  ♦ **catalytic converter** damaged
  ♦ modified or non-genuine components
♦ **oxygen sensor ahead of catalytic converter**, bank 2, faulty (aged)

Diagnosis information DME control module

P005600 Bank 2 sensor 2 - heating circuit electrical fault

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- Heater voltage > 4.4...5.6 V

Monitored component or system

♦ Oxygen sensor heater ahead of catalytic converter 2

Fault finding notes

♦ Check wiring between the control unit and component for open circuit. The internal diagnostic voltage (between 3 V and 6 V) is measured
♦ Check component for continuity
♦ Check power supply of the component

Function restrictions

♦ Output stage inactive, failure of the sensor heater

P015700

Diagnosis information DME control module

P015700 Bank 2 sensor 2 - voltage too low

Diagnostic conditions

● Diagnostics runs continuously

Fault setting condition(s)

● At start with cold sensor: The sensor voltage is below the minimum voltage (0.04 V)
● In warm operation: The sensor voltage is below a minimum voltage (0.04 V) and no reaction to closed-loop enrichment

Monitored component or system

♦ Bank 2 oxygen sensor 2

Fault finding notes

♦ Test of the power supply: Important: The heating must be on for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "signal plus" and "signal ground". U=0.4-0.5 V. If there is no voltage, the line must be checked for open circuit and replaced if necessary.
♦ Check of the lines "signal plus" and "signal ground" for open circuit and short circuits
♦ If open circuits or short circuits are present, the lines must be repaired
♦ If the fault occurs nevertheless, the DME control unit must be checked

P015800

Diagnosis information DME control module

P015800 Bank 2 sensor 2 - voltage too high

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- The sensor voltage is above the maximum voltage (1.08 V)

Monitored component or system

♦ Bank 2 oxygen sensor 2

Fault finding notes

♦ Test of the power supply: Important: The heating must be on for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "signal plus" and "signal ground". U=0.4-0.5 V. If there is no voltage, the line must be checked for open circuit and replaced if necessary.
♦ Check of the lines "signal plus" and "signal ground" for open circuit and short circuits
♦ If open circuits or short circuits are present, the lines must be repaired
♦ If the fault occurs nevertheless, the DME control unit must be checked

Diagnosis information DME control module

P015900 Bank 2 sensor 2 - signal too slow

Diagnostic conditions

- Engine at operating temperature
- Time since engine start > 10 sec
- 60 seconds driving with slight acceleration at 25...130 km/h (16... 81 mph), engine speed < 3,000 rpm, lambda control ahead of catalytic converter active, lambda control behind catalytic converter active, overrun shutoff by accelerator pedal release

Fault setting condition(s)

- Excessive time offset during edge changes between the lean and rich cycle or between the rich and lean cycle

Monitored component or system

♦ Bank 2 oxygen sensor 2

Fault finding notes

♦ Changed flow to the oxygen sensor behind the catalytic converter if the catalytic converter is damaged or if modified or non-genuine components are installed

Diagnosis information DME control module

P016000 Bank 2 sensor 2 - no activity

Diagnostic conditions

● Diagnostics runs continuously

Fault setting condition(s)

● The sensor voltage is in the voltage range or the exhaust gas temperature is higher than the temperature threshold and the internal resistance is higher than the internal-resistance threshold

Monitored component or system

♦ Bank 2 oxygen sensor 2

Fault finding notes

♦ Test of the power supply: Important: The heating must be on for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "signal plus" and "signal ground". U=0.4-0.5 V. If there is no voltage, the line must be checked for open circuit and replaced if necessary.
♦ Check of the lines "signal plus" and "signal ground" for open circuit and short circuits
♦ If open circuits or short circuits are present, the lines must be repaired
♦ If the fault occurs nevertheless, the DME control unit must be checked

P016900

Diagnosis information DME control module

P109300 Bank 1 fuel metering system 2 - malfunction

Diagnostic conditions

- Engine speed > 1,200 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Error in the plausibility check of the predicted air flow (torque monitoring function)
- Error in the plausibility check of the mixture correction factors
- The lambda setpoint does not match the current operating mode
- Error in the plausibility check between injection time and fuel mass
- Error in the plausibility check of the relative fuel mass

Monitored component or system

♦ DME control unit

Fault finding notes

♦ Processing of all faults relating to the air and fuel system (see fault memory). If there are no more faults, the DME control unit is faulty
♦ The fault might lie in the fuel metering system or intake system, otherwise the DME control unit must be replaced

Function restrictions

♦ A reset can be performed when the fault occurs once
♦ If the fault is still present, the injection quantity will be limited (no more injections will be permitted above 1,500 rpm)

P017000

Diagnosis information DME control module

P017000 Bank 1 fuel metering system - malfunction

Monitored component or system

♦ Mixture adaptation (short trip)

P017100

Diagnosis information DME control module

P017100 Bank 1 fuel metering system - system too lean

Fault setting condition(s)

- System too lean
- Adaptive value > 21%

Monitored component or system

♦ Mixture adaptation (short trip)

P017200

Diagnosis information DME control module

P017200 Bank 1 fuel metering system - system too rich

Fault setting condition(s)

- System too rich
- Adaptive value <- 21%

Monitored component or system

♦ Mixture adaptation (short trip)

P017300

Diagnosis information DME control module

P017300 Bank 1 fuel metering system - malfunction

Monitored component or system

♦ Mixture adaptation (short trip)

P017400

Diagnosis information DME control module

P017400 Bank 2 fuel metering system - system too lean

Fault setting condition(s)

- System too lean
- Adaptive value > 21%

Monitored component or system

♦ Mixture adaptation (short trip)

P017500

Diagnosis information DME control module

P017500 Bank 2 fuel metering system - system too rich

Fault setting condition(s)

- System too rich
- Adaptive value <- 21%

Monitored component or system

♦ Mixture adaptation (short trip)

Diagnosis information DME control module

P017B00 Cylinder head temperature sender - implausible signal

Diagnostic conditions

● Cold start detected
● Engine was shut off while hot
● Vehicle start with conditioned vehicle
● Diagnostics runs once per driving cycle with conditioned vehicle
● Enabling of "master cross-check" via ambient air temperature signal
● No electrical faults in the engine temperature sensor, no component faults justifying blockage, engine running and no block heater operation

Fault setting condition(s)

● The purpose of the high-stuck check is to detect a stuck sensor in the control range
● Each check is performed once after a correspondingly long engine-off time
● Subsequent temperature cross-check after engine start in the conditioned vehicle state (long off time)
● Comparison of the cylinder head temperature with the engine temperature that has already undergone a plausibility check (checked against intake air temperature and ambient air temperature)
● After a cold start, the measured cylinder head temperature undergoes a plausibility check compared to a modeled cylinder head reference temperature
● If no perceptible temperature change is recorded after driving states with low and high cooling power, it is assumed that the sensor is stuck

Monitored component or system

♦ Coolant temperature sensor

Fault finding notes

♦ Test of the temperature sensor with cold engine
♦ Check of the cylinder head temperature compared to the coolant temperature. Ideally, compare the measured values after the engine cooling phase (e.g. 2 hours)
♦ A fault exists if the cylinder head temperature value is 30 °C (54 °F) less than the coolant temperature
♦ If the connectors and wiring are OK, replace the sensor

Function restrictions

♦ Engine temperature too high
♦ Measured cylinder head temperature too high
♦ Measured cylinder head temperature too low

Diagnosis information DME control module

P017C00 Cylinder head temperature sender - short circuit to ground

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- The temperature sensor for thermal management input signal falls below the minimum value

Fault finding notes

- ♦ Check for short circuit to ground
- ♦ Check sensor, electrical wiring and the plug
- ♦ If the fault is a sensor fault, a fault will be entered when the sensor is unplugged

Diagnosis information DME control module

P017D00 Cylinder head temperature sender - short circuit to B+

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- The temperature sensor for thermal management input signal exceeds the maximum value

Fault finding notes

- ♦ Check for short circuit to B+/open line
- ♦ Check sensor, electrical wiring and the plug

Diagnosis information DME control module

P019000 Fuel pressure sender - electrical fault in circuit

Diagnostic conditions

● Diagnostics runs continuously

Fault setting condition(s)

● Sensor voltage > 4.8 V
● Monitoring of the electric signal from the pressure sensor for the high pressure/rail pressure fuel system
● The sensor voltage is read into the DME control unit via an AD channel; the voltage value is monitored for minimum and maximum limits

Monitored component or system

♦ Fuel high pressure sensor

Fault finding notes

♦ Check wiring, sensor and the DME control unit

Function restrictions

♦ Possibly power reduction/limp-home mode (with low pressure)

Diagnosis information DME control module

P019100 Fuel pressure sender - implausible signal

Diagnostic conditions

- Diagnostics runs continuously
- With engine running

Fault setting condition(s)

- By means of an upper and a lower pressure limit, it is possible to define a signal range in which the sensor provides plausible, variable values, but they cannot be identified as plausible because they lie outside the working range
- Voltage difference of the high pressure sensor < 0.0049 V (difference is formed over 4 injections)

Monitored component or system

♦ Fuel high pressure sensor

Fault finding notes

♦ High pressure sensor faulty (no electrical fault)
♦ Possibly faulty plug on sensor
♦ Check measured values

Function restrictions

♦ Engine shudders, possibly until it stalls at idle
♦ Acute lack of power
♦ Possibly breakdown

Diagnosis information DME control module

P019200 Fuel pressure sender - short circuit to ground

Diagnostic conditions

● Diagnostics runs continuously

Fault setting condition(s)

● Sensor voltage < 0.2 V
● Monitoring of the electric signal from the pressure sensor for the high pressure/rail pressure fuel system
● The sensor voltage is read into the DME control unit via an AD channel
● The voltage value is monitored for minimum and maximum limits

Monitored component or system

♦ Fuel high pressure sensor

Fault finding notes

♦ Check wiring, sensor and the DME control unit

Function restrictions

♦ Possibly power reduction/limp-home mode (with low pressure)

P019600

Diagnosis information DME control module

P019600 Oil temperature sender - implausible signal

Diagnostic conditions

- Ignition on

Monitored component or system

♦ Oil temperature signal

Fault finding notes

♦ Sensor faulty

P019700

Diagnosis information DME control module

P019700 Oil temperature sender - signal too low

Fault setting condition(s)

- Short circuit to B+

Monitored component or system

♦ Oil level/oil temperature sender

Fault finding notes

♦ Sensor or wiring faulty

P019800

Diagnosis information DME control module

P019800 Oil temperature sender - signal too high

Fault setting condition(s)

- Short circuit to ground

Monitored component or system

♦ Oil level/oil temperature sender

Fault finding notes

♦ Sensor or wiring faulty

Diagnosis information DME control module

P020100 Cylinder 1 fuel injector - electrical fault in circuit

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side-sensing) > 0.45 A...0.85 A and < 2.05 A...2.55 A
- Current (high-side-sensing) < 2.4 A...3.4 A
- The fault is set in case of a booster timeout or open load of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 1

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P020200 Cylinder 2 fuel injector - electrical fault in circuit

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side-sensing) > 0.45 A...0.85 A and < 2.05 A...2.55 A
- Current (high-side-sensing) < 2.4 A...3.4 A
- The fault is set in case of a booster timeout or open load of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 2

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P020300 Cylinder 3 fuel injector - electrical fault in circuit

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side-sensing) > 0.45 A...0.85 A and < 2.05 A...2.55 A
- Current (high-side-sensing) < 2.4 A...3.4 A
- The fault is set in case of a booster timeout or open load of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 3

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P020400 Cylinder 4 fuel injector - electrical fault in circuit

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side-sensing) > 0.45 A...0.85 A and < 2.05 A...2.55 A
- Current (high-side-sensing) < 2.4 A...3.4 A
- The fault is set in case of a booster timeout or open load of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 4

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P020500 Cylinder 5 fuel injector - electrical fault in circuit

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side-sensing) > 0.45 A...0.85 A and < 2.05 A...2.55 A
- Current (high-side-sensing) < 2.4 A...3.4 A
- The fault is set in case of a booster timeout or open load of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 5

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P020600 Cylinder 6 fuel injector - electrical fault in circuit

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side-sensing) > 0.45 A...0.85 A and < 2.05 A...2.55 A
- Current (high-side-sensing) < 2.4 A...3.4 A
- The fault is set in case of a booster timeout or open load of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 6

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P021900 Maximum engine speed exceeded

Fault setting condition(s)

● Engine ran at a speed exceeding the governed speed (7,100 rpm)
● The cause is probably a shifting mistake in case of a manual transmission; this is impossible in case of automatic transmissions in the field

Monitored component or system

♦ The engine is monitored for overspeed

Fault finding notes

♦ Possible cause in case of mechanical damage

Diagnosis information DME control module

P022100 Angle sender 2 for throttle valve drive - implausible signal

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- The angles of throttle valve potentiometers 1 and 2 deviate by more than 6.3% from each other
- The angle of throttle valve potentiometer 2 and the calculated throttle valve angle deviate by more than 9.0% from each other

Monitored component or system

♦ Throttle valve sensor 2

Fault finding notes

♦ Electrical test of the sensor line, power supply, ground, plug
♦ A power supply of 5 V with respect to sensor ground (in the plug) must be measured on the wiring harness of the throttle valve adjuster when the ignition is on (throttle valve unplugged)

Function restrictions

♦ Limp-home mode (engine speed and torque limitation) maximum 110 km/h (68 mph)

Diagnosis information DME control module

P022200 Angle sender 2 for throttle valve drive - signal too low

Diagnostic conditions

- Ignition on, run-on
- Diagnostics runs continuously

Fault setting condition(s)

- Throttle valve potentiometer voltage of throttle valve 1 sensor 2 < 0.156 V

Monitored component or system

♦ Throttle valve sensor 2

Fault finding notes

♦ Electrical test of the sensor line, power supply, ground, plug
♦ A power supply of 5 V with respect to sensor ground (in the plug) must be measured on the wiring harness of the throttle valve adjuster when the ignition is on (throttle valve unplugged)

Function restrictions

♦ Limp-home mode (engine speed and torque limitation) maximum 110 km/h (68 mph)

Diagnosis information DME control module

P022300 Angle sender 2 for throttle valve drive - signal too high

Diagnostic conditions

- Ignition on, run-on
- Diagnostics runs continuously

Fault setting condition(s)

- Throttle valve potentiometer voltage of throttle valve 1 sensor 2 > 4.883 V

Monitored component or system

♦ Throttle valve sensor 2

Fault finding notes

♦ Electrical test of the sensor line, power supply, ground, plug
♦ A power supply of 5 V with respect to sensor ground (in the plug) must be measured on the wiring harness of the throttle valve adjuster when the ignition is on (throttle valve unplugged)

Function restrictions

♦ Limp-home mode (engine speed and torque limitation) maximum 110 km/h (68 mph)

P025A00

Diagnosis information DME control module

P025A00 Fuel pump module activation - electrical fault/open circuit

ⓘ Guided Fault Finding available.

Diagnostic conditions

- Ignition on
- If the low-side transistor is not conducting
- Diagnostics runs continuously

Fault setting condition(s)

- Voltage between 1.5 V and 2.5 V
- Direct current measurement in the output-stage driver (DME control unit); the output stage is switched off and a status is sent when the threshold is reached

Monitored component or system

♦ Control unit: fuel supply

Fault finding notes

♦ Check electrical connection to the fuel pump unit for open circuit.
♦ Unplug the fuel pump unit and connect signal line to ground
♦ If a short circuit to ground is detected, the fuel pump unit is faulty. Otherwise, the DME control unit is faulty

Function restrictions

♦ Engine failure

P025C00

Diagnosis information DME control module

P025C00 Fuel pump module activation - short circuit to ground

ⓘ Guided Fault Finding available.

Diagnostic conditions

- Ignition on
- If the low-side transistor is not conducting
- Diagnostics runs continuously

Fault setting condition(s)

- Voltage < 1.5 V
- Direct current measurement in the output-stage driver (DME control unit); the output stage is switched off and a status is sent when the threshold is reached

Monitored component or system

♦ Control unit: fuel supply

Fault finding notes

♦ Check electrical connection to the fuel pump unit for short circuit to ground
♦ Unplug the fuel pump unit
♦ If an open line is detected, the fuel pump unit is faulty. Otherwise, the DME control unit is faulty

Function restrictions

♦ Engine failure

P025D00

Diagnosis information DME control module

P025D00 Fuel pump module activation - short circuit to B+

ⓘ Guided Fault Finding available.

Diagnostic conditions

- Ignition on
- If the low-side transistor is conducting
- Diagnostics runs continuously

Fault setting condition(s)

- Current > 1.5 A
- Direct current measurement in the output-stage driver (DME control unit); the output stage is switched off and a status is sent when the threshold is reached

Monitored component or system

♦ Control unit: fuel supply

Fault finding notes

♦ Check electrical connection to the fuel pump unit for short circuit to B+
♦ Unplug the fuel pump unit
♦ If an open line is detected, the fuel pump unit is faulty. Otherwise, the DME control unit is faulty

Function restrictions

♦ Engine failure

Diagnosis information DME control module

P026100 Cylinder 1 fuel injector - short circuit to ground

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) < 2.05 A...2.55 A
- Current (high-side sensing) > 2.4 A...3.4 A
- The fault is set in case of short circuit to ground of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 1

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P026200 Cylinder 1 fuel injector - short circuit to B+

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) > 14.3 A...19.3 A
- The fault is set in case of short circuit to B+ of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 1

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P026400 Cylinder 2 fuel injector - short circuit to ground

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) < 2.05 A...2.55 A
- Current (high-side sensing) > 2.4 A...3.4 A
- The fault is set in case of short circuit to ground of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 2

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P026500 Cylinder 2 fuel injector - short circuit to B+

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) > 14.3 A...19.3 A
- The fault is set in case of short circuit to B+ of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 2

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P026700 Cylinder 3 fuel injector - short circuit to ground

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) < 2.05 A...2.55 A
- Current (high-side sensing) > 2.4 A...3.4 A
- The fault is set in case of short circuit to ground of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 3

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P026800 Cylinder 3 fuel injector - short circuit to B+

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) > 14.3 A...19.3 A
- The fault is set in case of short circuit to B+ of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 3

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P027000 Cylinder 4 fuel injector - short circuit to ground

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) < 2.05 A...2.55 A
- Current (high-side sensing) > 2.4 A...3.4 A
- The fault is set in case of short circuit to ground of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 4

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P027100 Cylinder 4 fuel injector - short circuit to B+

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) > 14.3 A...19.3 A
- The fault is set in case of short circuit to B+ of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 4

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P027300 Cylinder 5 fuel injector - short circuit to ground

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) < 2.05 A...2.55 A
- Current (high-side sensing) > 2.4 A...3.4 A
- The fault is set in case of short circuit to ground of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 5

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

P027400

Diagnosis information DME control module

P027400 Cylinder 5 fuel injector - short circuit to B+

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) > 14.3 A...19.3 A
- The fault is set in case of short circuit to B+ of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 5

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

P027600

Diagnosis information DME control module

P027600 Cylinder 6 fuel injector - short circuit to ground

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) < 2.05 A...2.55 A
- Current (high-side sensing) > 2.4 A...3.4 A
- The fault is set in case of short circuit to ground of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 6

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P027700 Cylinder 6 fuel injector - short circuit to B+

Diagnostic conditions

- Three engine revolutions took place
- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Current (low-side sensing) > 14.3 A...19.3 A
- The fault is set in case of short circuit to B+ of the high pressure fuel injector

Monitored component or system

♦ High pressure fuel injector, low side, cylinder 6

Fault finding notes

♦ Check injector resistance
♦ Check wiring

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

P030600 Cylinder 6

ⓘ Guided Fault Finding available.

Diagnostic conditions

- With engine running
- Engine speed between 400 and 6,500 rpm
- Engine torque >= 0 Nm/ftlb.
- Intake-air temperature > -48°C (-54 °F)
- Engine start temperature > -30 °C (-22 °F)
- Fuel shutoff not active
- Bad-road detection not active
- Internal CAN without fault
- Diagnostics runs continuously

Fault setting condition(s)

- Misfiring rate > 2% per 1,000 revolutions

Monitored component or system

♦ Misfire detection, cylinder X - misfiring detected

Fault finding notes

♦ Loose contact or corrosion on connectors or lines
♦ Power or ground supply faulty

♦ Spark plug(s) Oily due to oil entrainment in the cylinder
♦ Spark plug(s) incorrect
♦ Spark plug(s) Mechanical fault or Electrical fault
♦ **Ignition coil** Faulty
♦ Power or ground supply faulty

♦ Fuel quality incorrect
♦ Fuel tank empty
♦ Water in the Fuel tank
♦ Fuel line soiled / Blocked

♦ **Electric fuel pump** Mechanical fault
♦ **Fuel high-pressure pump** Mechanical fault

♦ **Injection valve** Faulty or Borderline
(opens too late / not long enough / not enough or leaks)
♦ **Oxygen sensor(s)** Faulty

♦ **Exhaust system** Narrowed / Blocked

♦ **Catalytic converter** Faulty

♦ **Intake distributor** leaks
♦ Foreign bodies in the **Intake distributor**
♦ Fault **Camshaft adjustment**
♦ Timing incorrect - **Exhaust camshaft**
♦ Valve lifter Faulty
(Intake valve has not switched to the other lift or has not switched quickly enough)
♦ Mechanical fault Valve drive
♦ Compression too low
(e.g. Cylinder lining damaged, Valve-seat ring Faulty ...)

Function restrictions

♦ Loss of power
♦ MIL on

Diagnosis information DME control module

P032100 Engine speed sender - implausible signal

Diagnostic conditions

● The intelligent speed sender is permanently supplied with power
● After synchronization via a safe run-out position and reaching the first reference mark (gap on sender wheel)
● No camshaft sender fault present
● No fault in the sensor supply voltage
● Engine stalling detection not active
● Engine start
● Switch ignition off and then on again
● Diagnostics runs continuously
● With engine running

Fault setting condition(s)

● After synchronization via a safe run-out position, a correction is of the angle basis is made at the first reference mark (gap on sender wheel). If a certain amount is exceeded in this process, the fault is set
● Disturbed signal from intelligent speed sender detected
● Incorrect shutoff position of the intelligent speed sender detected
● Several edges implausible with respect to each other in time
● Incorrect number of crankshaft gaps and/or crankshaft teeth detected

Monitored component or system

♦ Crankshaft sensor

Fault finding notes

♦ Check of the sensor for correct installation (distance from sensor to sender wheel, fit)
♦ Check sensor power supply (only with active sensor)
♦ Check sensor signal with engine running (oscilloscope)
♦ Check the wiring for short circuit to B+, short circuit to ground and line open circuit
♦ Check sender wheel
♦ Replace sensor

Function restrictions

♦ Possibly torque limitation through switch-off of the high-pressure pump

Diagnosis information DME control module

P032200 Engine speed sender - no signal

Diagnostic conditions

- No camshaft sender fault present
- No fault in the sensor supply voltage
- Engine stalling detection not active
- Engine start
- Switch ignition off and then on again
- Diagnostics runs continuously
- With engine running

Fault setting condition(s)

- No edge change of the crankshaft signal detected with camshaft signal present and engine turning

Monitored component or system

♦ Crankshaft sensor

Fault finding notes

♦ Check of the sensor for correct installation (distance from sensor to sender wheel, fit)
♦ Check sensor power supply (only with active sensor)
♦ Check sensor signal with engine running (oscilloscope)
♦ Check of the wiring
♦ Check sender wheel

Function restrictions

♦ Possibly torque limitation through switch-off of the high-pressure pump

Diagnosis information DME control module

P032700 Knock sensor 1 - signal too low

Diagnostic conditions

● Engine speed > 1,000 rpm
● Cyclical, except if fault or fault healing is suspected, in which case only this line is tested until the suspicion is no longer present
● Performed once per 100-ms grid

Fault setting condition(s)

● Knocking signal < -0.7 V
● Short circuit to ground
● Voltage too low

Monitored component or system

♦ Knock sensor 1

Fault finding notes

♦ Check of the sensor, the line, the connections for correct seating of the sensor

Diagnosis information DME control module

P032800 Knock sensor 1 - signal too high

Diagnostic conditions

● Engine speed > 1,000 rpm
● Cyclical, except if fault or fault healing is suspected, in which case only this line is tested until the suspicion is no longer present
● Performed once per 100-ms grid

Fault setting condition(s)

● Knocking signal > 1.0 V
● Short circuit to B+
● Voltage too high

Monitored component or system

♦ Knock sensor 1

Fault finding notes

♦ Check of the sensor, the line, the connections for correct seating of the sensor

Diagnosis information DME control module

P033200 Knock sensor 2 - signal too low

Diagnostic conditions

● Engine speed > 1,000 rpm
● Cyclical, except if fault or fault healing is suspected, in which case only this line is tested until the suspicion is no longer present
● Performed once per 100-ms grid

Fault setting condition(s)

● Knocking signal < -0.7 V
● Short circuit to ground
● Voltage too low

Monitored component or system

♦ Knock sensor 2

Fault finding notes

♦ Check of the sensor, the line, the connections for correct seating of the sensor

Diagnosis information DME control module

P033300 Knock sensor 2, signal too high

Diagnostic conditions

● Engine speed > 1,000 rpm
● Cyclical, except if fault or fault healing is suspected, in which case only this line is tested until the suspicion is no longer present
● Performed once per 100-ms grid

Fault setting condition(s)

● Knocking signal > 1.0 V
● Short circuit to B+
● Voltage too high

Monitored component or system

♦ Knock sensor 2

Fault finding notes

♦ Check of the sensor, the line, the connections for correct seating of the sensor

Diagnosis information DME control module

P034100 Camshaft position sensor - implausible signal

Diagnostic conditions

- No crankshaft sensor fault present
- No fault in the sensor supply voltage
- Switch ignition off and then on again
- Diagnostics at each start
- With engine running

Fault setting condition(s)

- The number of newly detected camshaft edges is evaluated once per camshaft revolution
- The camshaft signal is monitored for the number of edges actually present, their spacing and the signal level between the edges
- Number of edge changes, the signal level between the edges and the angular spacing of the camshaft sender edges deviate too far from the setpoints

Monitored component or system

♦ Bank 1 intake camshaft sensor

Fault finding notes

♦ Check of the sensor for correct installation (distance from sensor to sender wheel, fit)
♦ Check sensor power supply
♦ Check sensor signal with engine running (oscilloscope)
♦ Check of the wiring
♦ Check sender wheel

Function restrictions

♦ Camshaft adjustment is no longer permissible; camshaft moves to reference position

Diagnosis information DME control module

P034200 Camshaft position sensor - signal too low

Diagnostic conditions

- No crankshaft sensor fault present
- With engine running

Fault setting condition(s)

- No sensor edge change detected while engine is running
- Sensor signal is continuously at Low level

Monitored component or system

♦ Bank 1 intake camshaft sensor

Fault finding notes

♦ Check of the sensor for correct installation (distance from sensor to sender wheel, fit)
♦ Check sensor power supply
♦ Check sensor signal with engine running (oscilloscope)
♦ Check of the wiring
♦ Check sender wheel

Function restrictions

♦ Camshaft adjustment is no longer permissible; camshaft moves to reference position

Diagnosis information DME control module

P034300 Camshaft position sensor - signal too high

Diagnostic conditions

- No crankshaft sensor fault present
- With engine running

Fault setting condition(s)

- No sensor edge change detected while engine is running
- Sensor signal continuously at High level

Monitored component or system

♦ Bank 1 intake camshaft sensor

Fault finding notes

♦ Check of the sensor for correct installation (distance from sensor to sender wheel, fit)
♦ Check sensor power supply
♦ Check sensor signal with engine running (oscilloscope)
♦ Check of the wiring
♦ Check sender wheel

Function restrictions

♦ Camshaft adjustment is no longer permissible; camshaft moves to reference position

Diagnosis information DME control module

P035100 Cylinder 1 ignition control - malfunction

Diagnostic conditions

- Engine speed > 80 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage > 5.2 V...6.0 V
- In case of idling, an internal register is set after a filtering time
- A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

Diagnosis information DME control module

P035200 Cylinder 2 ignition control - malfunction

Diagnostic conditions

- Engine speed > 80 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage > 5.2 V...6.0 V
- In case of idling, an internal register is set after a filtering time
- A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

Diagnosis information DME control module

P035300 Cylinder 3 ignition control - malfunction

Diagnostic conditions

- Engine speed > 80 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage > 5.2 V...6.0 V
- In case of idling, an internal register is set after a filtering time
- A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

Diagnosis information DME control module

P035400 Cylinder 4 ignition control - malfunction

Diagnostic conditions

- Engine speed > 80 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage > 5.2 V...6.0 V
- In case of idling, an internal register is set after a filtering time
- A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

P035500

Diagnosis information DME control module

P035500 Cylinder 5 ignition control - malfunction

Diagnostic conditions

- Engine speed > 680 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage > 5.2 V...6.0 V
- Monitoring of ignition coil activation for line open circuit

Monitored component or system

♦ Ignition coils

Fault finding notes

♦ Perform line check
♦ Check resistance of the ignition coil

Function restrictions

♦ Breakdown possible

P035600

Diagnosis information DME control module

P035600 Cylinder 6 ignition control - malfunction

Diagnostic conditions

- Engine speed > 680 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage > 5.2 V...6.0 V
- Monitoring of ignition coil activation for line open circuit

Monitored component or system

♦ Ignition coils

Fault finding notes

♦ Perform line check
♦ Check resistance of the ignition coil

Function restrictions

♦ Breakdown possible

Diagnosis information DME control module

P036600 Camshaft position sensor - implausible signal

Diagnostic conditions

- No crankshaft sensor fault present
- With engine running

Fault setting condition(s)

- The number of newly detected camshaft edges is evaluated once per camshaft revolution
- Not enough camshaft sender edge changes matching the crankshaft signal detected

Monitored component or system

♦ Bank 1 exhaust camshaft sensor

Fault finding notes

♦ Check of the sensor for correct installation (distance from sensor to sender wheel, fit)
♦ Check sensor power supply
♦ Check sensor signal with engine running (oscilloscope)
♦ Check of the wiring
♦ Check sender wheel

Function restrictions

♦ Camshaft adjustment is no longer permissible; camshaft moves to reference position

Diagnosis information DME control module

P036700 Camshaft position sensor - signal too low

Diagnostic conditions

- No crankshaft sensor fault present
- With engine running

Fault setting condition(s)

- No sensor edge change detected while engine is running
- Sensor signal is continuously at Low level

Monitored component or system

♦ Bank 1 exhaust camshaft sensor

Fault finding notes

♦ Check of the sensor for correct installation (distance from sensor to sender wheel, fit)
♦ Check sensor power supply
♦ Check sensor signal with engine running (oscilloscope)
♦ Check of the wiring
♦ Check sender wheel

Function restrictions

♦ Camshaft adjustment is no longer permissible; camshaft moves to reference position

Diagnosis information DME control module

P036800 Camshaft position sensor - signal too high

Diagnostic conditions

- No crankshaft sensor fault present
- With engine running

Fault setting condition(s)

- No sensor edge change detected while engine is running
- Sensor signal continuously at High level

Monitored component or system

♦ Bank 1 exhaust camshaft sensor

Fault finding notes

♦ Check of the sensor for correct installation (distance from sensor to sender wheel, fit)
♦ Check sensor power supply
♦ Check sensor signal with engine running (oscilloscope)
♦ Check of the wiring
♦ Check sender wheel

Function restrictions

♦ Camshaft adjustment is no longer permissible; camshaft moves to reference position

Diagnosis information DME control module

P042000 Bank 1 catalytic converter system - inadequate effect

Diagnostic conditions

- Exhaust gas mass flow < 25 kg/h...70 kg/h
- Modeled catalytic converter temperature in the range 549.998 °C...849.998 °C (1,021.996 °F 1,561.996 °F)
- Mass air flow in the range 15.0%...68.3%
- Engine speed in the range 1,000 rpm...3,000 rpm
- Number of tests: 4
- Rapid adaptation stabilized
- Oxygen sensor ahead of catalytic converter ready; no fault
- Oxygen sensor behind catalytic converter ready; no fault
- Secondary-air system not active
- No misfiring
- Diagnostics runs once per driving cycle

Fault setting condition(s)

- Catalytic converter diagnostics through determination of the oxygen storage capacity

Monitored component or system

♦ Bank 1 catalytic converter

Fault finding notes

♦ The fault of the conversion loss in the catalytic converter cannot be checked in the workshop
♦ Poor fuel quality or misfiring could have caused the fault

Function restrictions

♦ The driver cannot perceive the reduction in the catalytic converter effect

Diagnosis information DME control module

P043000 Bank 2 catalytic converter system - inadequate effect

Diagnostic conditions

- Exhaust gas mass flow < 25 kg/h...70 kg/h
- Modeled catalytic converter temperature in the range 549.998 °C...849.998 °C (1,021.996 °F 1,561.996 °F)
- Mass air flow in the range 15.0%...68.3%
- Engine speed in the range 1,000 rpm...3,000 rpm
- Number of tests: 4
- Rapid adaptation stabilized
- Oxygen sensor ahead of catalytic converter ready; no fault
- Oxygen sensor behind catalytic converter ready; no fault
- Secondary-air system not active
- No misfiring
- Diagnostics runs once per driving cycle

Fault setting condition(s)

- Catalytic converter diagnostics through determination of the oxygen storage capacity

Monitored component or system

♦ Bank 2 catalytic converter

Fault finding notes

♦ The fault of the conversion loss in the catalytic converter cannot be checked in the workshop
♦ Poor fuel quality or misfiring could have caused the fault

Function restrictions

♦ The driver cannot perceive the reduction in the catalytic converter effect

Diagnosis information DME control module

P044100 Tank vent system - incorrect throughput

Diagnostic conditions

- Time after engine starts > 60 sec
- Engine idling
- Engine temperature > 60 °C (140 °F)
- Intake air temperature > 3.8 °C (38.8 °F)
- Elevation above sea level < 2,700 m (8,858 ft.)
- Lambda control present
- No downhill driving
- Tank system tested as tight
- No misfiring
- Diagnostics runs once per driving cycle

Fault setting condition(s)

- Tank vent valve stuck open or closed
- Tank vent valve purge rate < 20.0%
- After a successful 0.5-mm tightness test on the tank system, the tank pressure is increased slightly in another fixed pumping phase and the tank vent valve is then actively opened. The fall time of the reed contact is evaluated. If the fall time lies between two thresholds, the tank system is evaluated as OK. If the contact falls very late (3rd threshold), the tank vent valve is evaluated as not OK. If the reed contact falls very quickly or if the fall times lie in a gray area between OK and not OK, the diagnostic run is not evaluated. Alternatively, the test takes place via the conventional tank vent valve diagnostics by means of deviation of the lambda controller

Monitored component or system

♦ Tank vent valve

Fault finding notes

♦ If the tank vent valve drive link test is not OK, then replace the tank vent valve
♦ If the tank vent valve drive link test is OK, then perform short trip tank vent valve test
♦ Check lines from the carbon canister to the tank vent valve and from the tank vent valve to the intake manifold for leaks, kinks, joined connections and clogging
♦ Replace tank vent valve

Function restrictions

♦ The tank vent valve does not open

♦ The carbon canister is not flushed
♦ Fuel vapors can emerge at the fresh air filter in the rear left wheel housing
♦ MIL on

Diagnosis information DME control module

P044200 Tank vent system - fine leak detected

Diagnostic conditions

- No downhill driving
- Vehicle speed > 7.5 km/h (4.7 mph) (once)
- Engine temperature 3.8 °C...140.3 °C (38.8 °F...284.5 °F)
- Engine temperature at start 3.8 °C...120.0 °C (38.8 °F...248.0 °F)
- Intake air/ambient temperature 3.8 °C ...95.3 °C (38.8 °F...203.5 °F)
- Intake manifold vacuum -2,560.0 hPa
- Tank vent closed

Fault setting condition(s)

- The leakage diagnostic pump applies approx. 20 mbar overpressure on the tank system according to the principle of a diaphragm pump. The leakage diagnostic pump is operated by means of vacuum. The position of the pump diaphragm is monitored via a reed contact. The reed contact is interrupted when the diaphragm is raised. Either vacuum is being applied to the pump or overpressure has already built up in the tank system. Two brief component check phases are followed by a pumping phase in which the tank is pumped up by means of periodic enabling of vacuum activation. If adequate overpressure has been built up or the end of the pumping phase has been reached, this may be followed by a measuring phase. Here, the time that elapses after a single diaphragm stroke until the reed contact is closed again is evaluated. The tank vent valve is forcibly closed during diagnostics after engine start.
- The detected leakage in the fuel system corresponds to a diameter > 2 mm.

Monitored component or system

♦ Tank system/leakage

Fault finding notes

♦ Check the tank cap for correct closing and intact seals
♦ Check tank vent valve
♦ Check plug on the leakage diagnostic pump for correct seating
♦ Pressure-test the tank
♦ Check vacuum supply of the leakage diagnostic pump
♦ As a last option, replace the leakage diagnostic pump

Function restrictions

♦ More pronounced fuel odor
♦ MIL on

ⓘ INFORMATION

The system includes:
- ♦ mechanical **Vacuum pump**
- ♦ **Leakage diagnosis pump**
- ♦ **Intake pipe switchover** (if present)
- ♦ **Exhaust flap** (if present)

Diagnosis information DME control module

P044400 Tank vent valve - open circuit

Diagnostic conditions

- Engine speed > 0.00 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- The output stage of the tank vent valve detects a load decrease; the internal voltage is measured at the output > 4.8 V...5.3 V
- Tank vent valve output stage line drop-off (low side switch)

Monitored component or system

♦ Tank vent valve

Fault finding notes

♦ Check wiring between the DME control unit and component for open circuit. Depending on the output stage, the internal diagnostic voltage (between 3 V and 6 V) is measured
♦ Check voltage supply
♦ Check tank vent valve

Function restrictions

♦ Output stage inactive, failure of the tank vent valve

P045500

Diagnosis information DME control module

P045500 Tank vent system - major leak detected

Diagnostic conditions

- No downhill driving
- Vehicle speed > 7.5 km/h (4.7 mph) (once)
- Engine temperature 3.8 °C...140.3 °C (38.8 °F...284.5 °F)
- Engine temperature at start 3.8 °C...120.0 °C (38.8 °F...248.0 °F)
- Intake air/ambient temperature 3.8 °C ...95.3 °C (38.8 °F...203.5 °F)
- Intake manifold vacuum -2,560.0 hPa
- Tank vent closed

Fault setting condition(s)

- The leakage diagnostic pump applies approx. 20 mbar overpressure on the tank system according to the principle of a diaphragm pump. The leakage diagnostic pump is operated by means of vacuum. The position of the pump diaphragm is monitored via a reed contact. The reed contact is interrupted when the diaphragm is raised. Either vacuum is being applied to the pump or overpressure has already built up in the tank system. Two brief component check phases are followed by a pumping phase in which the tank is pumped up by means of periodic enabling of vacuum activation. If adequate overpressure has been built up or the end of the pumping phase has been reached, this may be followed by a measuring phase. Here, the time that elapses after a single diaphragm stroke until the reed contact is closed again is evaluated. The tank vent valve is forcibly closed during diagnostics after engine start.
- The detected leakage in the fuel system corresponds to a diameter of approx. 1 - 2 mm.

Monitored component or system

♦ Tank system/leakage

Fault finding notes

♦ Check the tank cap for correct closing and intact seals
♦ Check tank vent valve
♦ Check plug on the leakage diagnostic pump for correct seating
♦ Pressure-test the tank
♦ Check vacuum supply of the leakage diagnostic pump
♦ As a last option, replace the leakage diagnostic pump

Function restrictions

♦ More pronounced fuel odor

♦ MIL on

Diagnosis information DME control module

P045700 Tank vent system - leak/tank cap missing

Diagnostic conditions

- No downhill driving
- Vehicle speed > 7.5 km/h (4.7 mph) (once)
- Engine temperature 3.8 °C...140.3 °C (38.8 °F...284.5 °F)
- Engine temperature at start 3.8 °C...120.0 °C (38.8 °F...248.0 °F)
- Intake air/ambient temperature 3.8 °C ...95.3 °C (38.8 °F...203.5 °F)
- Intake manifold vacuum -2,560.0 hPa
- Tank vent closed
- Diagnostics runs once per driving cycle

Fault setting condition(s)

- The leakage diagnostic pump applies approx. 20 mbar overpressure on the tank system according to the principle of a diaphragm pump. The leakage diagnostic pump is operated by means of vacuum. The position of the pump diaphragm is monitored via a reed contact. The reed contact is interrupted when the diaphragm is raised. Either vacuum is being applied to the pump or overpressure has already built up in the tank system. Two brief component check phases are followed by a pumping phase in which the tank is pumped up by means of periodic enabling of vacuum activation. If adequate overpressure has been built up or the end of the pumping phase has been reached, this may be followed by a measuring phase. Here, the time that elapses after a single diaphragm stroke until the reed contact is closed again is evaluated. The tank vent valve is forcibly closed during diagnostics after engine start.

Monitored component or system

♦ Tank system major leak

Fault finding notes

♦ A major leak was detected after a refueling operation; the customer may have forgotten to close the tank cap
♦ Check tank cap
♦ If the fault is simultaneously entered with other faults of the tank vent system, e.g. P0441, P0442, P0455, P0456 or P2403 or P2404, it can be ignored

Function restrictions

♦ Tank cap warning light illuminates

Diagnosis information DME control module

P045800 Tank vent valve - short circuit to ground

Diagnostic conditions

- Engine speed > 0.00 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- The output stage of the tank vent valve detects a short circuit to ground; the diagnostic voltage is measured at the output < 0 V...3.25 V
- Tank vent valve output stage short circuit to ground (low side switch)

Monitored component or system

♦ Tank vent valve

Fault finding notes

♦ Check wiring between the DME control unit and component for short circuit to ground. If this is OK, then pull the component off and clear the fault memory
♦ If the DME control unit detects an open circuit, the fault is in the component
♦ Check power supply on the component

Function restrictions

♦ Output stage inactive, failure of the tank vent valve

P045900

Diagnosis information DME control module

P045900 Tank vent valve - short circuit to B+

Diagnostic conditions

- Engine speed > 0.00 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- The output stage of the tank vent valve detects a short circuit to B+
- Signal current > 2.2 A...4.0 A
- Tank vent valve output stage short circuit to ground (low side switch)

Monitored component or system

♦ Tank vent valve

Fault finding notes

♦ Check wiring between the DME control unit and component for short circuit to B+. If this is OK, then pull the component off and clear the fault memory
♦ If the DME control unit detects an open circuit, the fault is in the component

Function restrictions

♦ Output stage inactive, failure of the tank vent valve

Diagnosis information DME control module

P046100 Fuel level signal - implausible signal

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Tank filling level sum error
- Electrical fault (via CAN) or implausible signal

Monitored component or system

♦ Fuel level sender

Fault finding notes

♦ Fault finding via instrument cluster

Diagnosis information DME control module

P048000 Radiator fan control 1 - electrical fault

Diagnostic conditions

- Switch ignition on; fault is entered immediately
- Effect: last revs are maintained; limp-home mode occurs after 10 s

Fault setting condition(s)

- Open circuit in signal line to fan control unit 1

Monitored component or system

♦ Activation line to the first fan output stage

Fault finding notes

♦ Line from DME control unit to fan control unit 1 is interrupted
♦ Continuity test from DME control unit to the radiator fan output stage
♦ In case of open circuit, it is possible to measure battery positive voltage at the fan control unit and ground at the DME control unit

Function restrictions

♦ Emergency operation of the fan means that the requirements for charging balance, acoustics and closed-circuit current are not met
♦ An empty battery is the possible result

Diagnosis information DME control module

P0501 Vehicle speed signal 1 - implausible signal

Diagnostic conditions

- Engine running
- Diagnostics runs continuously in the brake control unit

Fault setting condition(s)

- The individual wheel speed signals of the respective wheel speed sensors are compared with each other in the PSM control unit

Monitored component or system

♦ Vehicle speed sensor

Fault finding notes

♦ Check brake control unit fault memory

Function restrictions

♦ ACC/cruise control is switched off

Diagnosis information DME control module

P0501 Vehicle speed signal 1 - implausible signal

Diagnostic conditions

- Engine running
- Diagnostics runs continuously in the brake control unit

Fault setting condition(s)

- The individual wheel speed signals of the respective wheel speed sensors are compared with each other in the PSM control unit

Monitored component or system

♦ Vehicle speed sensor

Fault finding notes

♦ Check brake control unit fault memory

Function restrictions

♦ ACC/cruise control is switched off

P050600

Diagnosis information DME control module

P050600 Idle control speed below setpoint

Diagnostic conditions

- Vehicle speed = 0 km/h / mph
- Vehicle speed signal OK
- Engine temperature > 20.3 °C (68.5 °F)
- Intake air temperature > -48.0 °C (-54.4 °F)
- No throttle potentiometer fault (banks 1+2)
- No safety fuel shutoff
- Emergency air driving not active
- No rpm sender limp-home mode
- Diagnostics runs continuously

Fault setting condition(s)

- Idle speed deviation > 100.0 rpm

Monitored component or system

♦ Idle control

P050700

Diagnosis information DME control module

P050700 Idle control speed above setpoint

Diagnostic conditions

- Vehicle speed = 0 km/h / mph
- Vehicle speed signal OK
- Engine temperature > 20.3 °C (68.5 °F)
- Intake air temperature > -48.0 °C (-54.4 °F)
- No throttle potentiometer fault (banks 1+2)
- No safety fuel shutoff
- Emergency air driving not active
- No rpm sender limp-home mode
- Diagnostics runs continuously

Fault setting condition(s)

- Idle speed deviation < -100.0 rpm

Monitored component or system

♦ Idle control

Diagnosis information DME control module

P050A00 Idle speed control - malfunction during cold start

Diagnostic conditions

- Vehicle speed = 0 km/h / mph
- Vehicle speed signal OK
- No throttle potentiometer fault (banks 1+2)
- No safety fuel shutoff
- Emergency air driving not active
- No rpm sender limp-home mode
- Catalytic converter heating active
- Diagnostics running continuously (during catalytic converter heating)

Fault setting condition(s)

- Speed deviation with respect to setpoint speed < -200.0 rpm or > 200.0 rpm
- Integrator of idle speed control is at minimum limit or maximum limit
- Idle speed monitoring
- Maximum threshold or minimum threshold exceeded

Monitored component or system

♦ Idle speed control (overspeed or underspeed)

Fault finding notes

♦ Possible leakage in the air tract (the fault was simulated via a throttle valve with a large segment cut off, so that the engine receives too much air even with the throttle valve closed)
♦ Possible clogging in the air tract (the fault was simulated via a plate (clog) with a 2-mm hole in the air tract, so that the engine receives too little air despite the throttle valve being fully open)

Function restrictions

♦ Higher revs in the instrument cluster
♦ Noise due to higher engine speed
♦ Rough-running engine

Diagnosis information DME control module

P050B00 Ignition timing adjustment - malfunction during cold start

Diagnostic conditions

- Diagnostics runs only during catalytic converter heating

Fault setting condition(s)

- Monitoring of ignition angle for advancing (via engine efficiency) during idling

Monitored component or system

♦ Ignition angle

Fault finding notes

♦ Inform the product support department (possibly fuel quality)

Diagnosis information DME control module

P052A00 Bank 1 intake camshaft adjustment - setpoint not reached during cold start

Diagnostic conditions

- Camshaft adjustment enable issued
- Catalytic converter heating active
- Diagnostics runs once per driving cycle (only during catalytic converter heating)

Fault setting condition(s)

- The camshaft does not track the setpoint but instead is statically stuck

Monitored component or system

♦ Magnetic camshaft adjusting valve, oil pressure of controlled camshaft adjuster, intake camshaft, bank 1

P053A00

Diagnosis information DME control module

P053A00 Positive crankcase ventilation heater - open circuit

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Monitoring of the electrical components for line open circuit

Monitored component or system

♦ Crankcase heater output stage

Fault finding notes

♦ Line check and resistance check of the component

Function restrictions

♦ Possibly breakdown

P053B00

Diagnosis information DME control module

P053B00 Positive crankcase ventilation heater - short circuit to ground

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Monitoring of the electrical components for short circuit to ground

Monitored component or system

♦ Crankcase heater output stage

Fault finding notes

♦ Line check and resistance check of the component

Function restrictions

♦ Possibly breakdown

Diagnosis information DME control module

P053C00 Positive crankcase ventilation heater - short circuit to B+

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics
- Monitoring of the electrical components for short circuit to B+

Monitored component or system

♦ Crankcase heater output stage

Fault finding notes

♦ Line check and resistance check of the component

Function restrictions

♦ Possibly breakdown

P053F00

Diagnosis information DME control module

P053F00 Fuel pressure during cold start - pressure too low

Diagnostic conditions

- Engine start longer than debouncing time (5 sec)
- Catalytic converter heating active
- Diagnostics running only during catalytic converter heating

Fault setting condition(s)

- The control-difference signal is smoothed via a low-pass filter with a time constant and compared with two threshold values

Monitored component or system

♦ Fuel rail/system pressure during catalytic converter heating

Fault finding notes

♦ High-pressure sensor faulty
♦ Metering valve faulty
♦ Low-pressure system faulty
♦ Leaks in the rail
♦ Pressure limiting valve faulty

Function restrictions

♦ Misfiring detected (less power)
♦ Engine stalls

Diagnosis information DME control module

P054A00 Bank 1 exhaust camshaft adjustment - setpoint not reached during cold start

Diagnostic conditions

- Camshaft adjustment enable issued
- Catalytic converter heating active
- Diagnostics runs once per driving cycle (only during catalytic converter heating)

Fault setting condition(s)

- The camshaft does not track the setpoint but instead is statically stuck

Monitored component or system

♦ Magnetic camshaft adjusting valve, oil pressure of controlled camshaft adjuster, exhaust camshaft, bank 1

Diagnosis information DME control module

P055500 Brake booster pressure sender - electrical fault

Diagnostic conditions

- Diagnostics running continuously from ignition on

Fault setting condition(s)

- Brake booster vacuum sensor overvoltage or an open signal line detected

Monitored component or system

♦ Pressure sensor for brake booster

Fault finding notes

♦ Unplug pressure sensor and jumper signal line to ground
♦ If the raw sensor voltage in the measured-value block is approx. 0 V, the sensor is faulty. If the raw sensor voltage in the measured value block > 0 V, check the line to the DME control unit
♦ If the line to the DME control unit is OK, the DME control unit is faulty

Function restrictions

♦ Start/stop may not be available
♦ On vehicles with electrical vacuum pump, it is activated as long as the fault as present. The electrical vacuum pump could be damaged as a result

P055600

Diagnosis information DME control module

P055600 Brake booster pressure sender - implausible signal

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- This detects a brake booster vacuum that is too high, too low or implausible

Monitored component or system

♦ Pressure sensor for brake booster

Fault finding notes

♦ Check whether vacuum is physically OK (leakage, etc.)
♦ Check wiring harness
♦ Replace sensor
♦ Check DME control unit for correct program/data version
♦ Replace DME control unit

Function restrictions

♦ Start/stop may not be available
♦ On vehicles with electrical vacuum pump, it is activated as long as the fault as present. The electrical vacuum pump could be damaged as a result

Diagnosis information DME control module

P055700 Brake booster pressure sender - short circuit to ground

Diagnostic conditions

- Diagnostics running continuously from ignition on

Fault setting condition(s)

- This detects insufficient voltage of the brake booster vacuum sensor

Monitored component or system

♦ Pressure sensor for brake booster

Fault finding notes

♦ Unplug pressure sensor
♦ If the raw sensor voltage in the measured value block is the reference voltage (5 V), the sensor is faulty. If not, check the line to the DME control unit
♦ If the line to the DME control unit is OK, the DME control unit is faulty

Function restrictions

♦ Start/stop may not be available
♦ On vehicles with electrical vacuum pump, it is activated as long as the fault as present. The electrical vacuum pump could be damaged as a result

P056000

Diagnosis information DME control module

P056000 Power supply - implausible signal

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Battery positive voltage signal implausible

Monitored component or system

♦ Battery positive voltage

Fault finding notes

♦ Check terminal 87 behind main relay for battery positive voltage
♦ Check of the line, fuse and main relay

Function restrictions

♦ Engine off

Diagnosis information DME control module

P056200 Power supply - voltage too low

Diagnostic conditions

● Diagnostics runs continuously

Fault setting condition(s)

● Battery positive voltage below minimum value (vehicle electrical system)
● If the battery positive voltage < 9.04 V (but not below the absolute minimum limit below which fault memory entries are no longer possible)

Monitored component or system

♦ Battery positive voltage

Fault finding notes

♦ Check terminal 87 behind main relay for battery positive voltage
♦ Check of the line, fuse and main relay

Function restrictions

♦ Engine off

P056300

Diagnosis information DME control module

P056300 Power supply - voltage too high

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Battery positive voltage above maximum value (vehicle electrical system)
- If the battery positive voltage > 16.01 V

Monitored component or system

♦ Battery positive voltage

Fault finding notes

♦ Check terminal 87 behind main relay for battery positive voltage
♦ Check of the line, fuse and main relay (main relay possibly stuck)

Diagnosis information DME control module

P056800 Cruise control switch - implausible signal

Diagnostic conditions

- DME control unit coded for cruise control/adaptive cruise control (ACC)
- Corresponding operating lever installed
- Cruise control selected
- Release of diagnostic function from ignition on
- Diagnostics running continuously from ignition on

Fault setting condition(s)

- CAN signal of the cruise control/adaptive cruise control (ACC) main switch differs from the hardware line of the main switch
- Fault of the cruise control/adaptive cruise control (ACC) main switch

Monitored component or system

♦ Cruise control/adaptive cruise control (ACC) operating lever

Fault finding notes

♦ Is the cruise control operating lever installed correctly (check coding)?
♦ Is the hardware line to the DME control unit connected correctly in addition to the CAN connection?
♦ Check component line

Function restrictions

♦ No cruise control/adaptive cruise control (ACC) operation possible in the current ignition cycle

Diagnosis information DME control module

P057100 Brake light switch - implausible signal

Diagnostic conditions

- No component fault on brake pedal sensor
- Ignition on
- Frequency count saved over driving cycle
- Diagnostics runs continuously

Fault setting condition(s)

- Plausibility check, brake pedal sensor short circuit to ground

Monitored component or system

♦ Brake light sensor

Fault finding notes

♦ Check plug connection for open circuit (corrosion, soiling, pin out of place)
♦ Check line for short circuit to ground
♦ Check signal line for open circuit
♦ Check power supply of the brake light sensor
♦ No fault found; replace the brake light sensor
♦ If the fault memory entry is entered again after replacement of the brake light sensor, the DME control unit must be replaced

Function restrictions

♦ Rejection of adaptive cruise control (ACC) /cruise control

Diagnostic information - DME control unit

P05A000 Radiator shutter, servo motor turns freely/mechanically blocked

Diagnostic conditions
- Allow the radiator shutter to move to both learned limit stops (e.g. via drive link)

Possible fault causes
- Radiator shutter was turned manually while the ignition was off
- Radiator shutter iced up
- Radiator shutter dirty
- Radiator shutter, vanes scrape/stick (incorrectly installed, positioned)
- Radiator shutter, mechanism broken
- Servo motor faulty

Fault setting conditions
- Increased current draw during movement
- No increased current draw when the learned limit stops are reached

Fault effects
- New initialization
- When the fault is active, the DME control unit sends the OPEN request to the radiator shutter servo motor

P05A200

Diagnostic information - DME control unit

P05A200 Radiator shutter - open circuit
P05A400 Radiator shutter - short circuit in signal line
P05A500 Radiator shutter - short circuit in signal line

Diagnostic conditions
- Ignition on

Possible fault causes

- Short circuit to B+/ground/between lines or open circuit in the signal line
- Loose contact or corrosion on connectors or lines
- Servo motor faulty

Fault setting conditions
- Static signal on the servo motor signal line ◄► DME control unit

Fault effects
- If it still functions, the servo motor opens the shutter as far as possible

Diagnostic information - DME control unit

P05A300 Radiator shutter, signal implausible

Diagnostic conditions
- Ignition on

Possible fault causes
- Implausible request from DME control unit, e.g. during reprogramming
- Servo motor signal line ◄► Open circuit in DME control unit
- Servo motor power supply or ground supply faulty
- Servo motor faulty

Fault setting conditions
- No signal on the servo motor signal line ◄► DME control unit

Fault effects
- If it still functions, the servo motor opens the shutter as far as possible

Diagnostic information - DME control unit

P05A200 Radiator shutter - open circuit
P05A400 Radiator shutter - short circuit in signal line
P05A500 Radiator shutter - short circuit in signal line

Diagnostic conditions
- Ignition on

Possible fault causes

- Short circuit to B+/ground/between lines or open circuit in the signal line
- Loose contact or corrosion on connectors or lines
- Servo motor faulty

Fault setting conditions
- Static signal on the servo motor signal line ◄► DME control unit

Fault effects
- If it still functions, the servo motor opens the shutter as far as possible

P05A500

Diagnostic information - DME control unit

P05A200 Radiator shutter - open circuit
P05A400 Radiator shutter - short circuit in signal line
P05A500 Radiator shutter - short circuit in signal line

Diagnostic conditions
- Ignition on

Possible fault causes

- ♦ Short circuit to B+/ground/between lines or open circuit in the signal line
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Servo motor faulty

Fault setting conditions
- Static signal on the servo motor signal line ◄► DME control unit

Fault effects
- ♦ If it still functions, the servo motor opens the shutter as far as possible

Diagnostic information - DME control unit

P05C000 Radiator shutter unit, overtemperature

Diagnostic conditions
- Allow the radiator shutter to move to both learned limit stops (e.g. via drive link)

Possible fault causes
- Ambient temperature too high
- Servo motor overloaded
- Servo motor faulty

Fault setting conditions
- Temperature in servo motor too high

Fault effects
- New initialization
- When the fault is active, the DME control unit sends the OPEN request to the radiator shutter servo motor

Diagnosis information DME control module

P060600 Control unit faulty

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- The DME control unit detects an internal fault

Monitored component or system

♦ DME control unit

Fault finding notes

♦ Replace DME control unit

Function restrictions

♦ Functional restrictions depend on which components are served by which output stage

Diagnosis information DME control module

P060700 Control unit faulty

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- The DME control unit detects an internal fault

Monitored component or system

♦ DME control unit

Fault finding notes

♦ Replace DME control unit

Function restrictions

♦ Functional restrictions depend on which components are served by which output stage

Diagnosis information DME control module

P060A00 Control unit - internal processor monitoring

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Monitoring of the applied addresses

Monitored component or system

♦ Control unit

Function restrictions

♦ No function of the OBD radar

Diagnosis information DME control module

P061500 Starter relay activation - open circuit

Diagnostic conditions

● Output stage de-energized

Fault setting condition(s)

● Output stages are assessed taking the fault detection possibilities into account. A short circuit to B+ can be detected with an activated output stage. A fallen-off cable and short circuit to ground can be detected with a deactivated output stage. The fault/OK messages are read according to these states
● Starter control IC reports a fallen-off cable of the starter relay control system

Monitored component or system

♦ Starter relay monitoring by starter control IC

Fault finding notes

♦ Check relay wiring

Function restrictions

♦ Starting not possible

Diagnosis information DME control module

P061600 Starter relay activation - short circuit to ground

Diagnostic conditions

● Output stage de-energized

Fault setting condition(s)

● The information about the fault status of the output stages is assessed taking the fault detection possibilities into account. A short circuit to B+ can be detected with an activated output stage. A fallen-off cable and short circuit to ground can be detected with a deactivated output stage. The fault/OK messages are read according to these states
● Starter control IC reports a short circuit to ground of the starter relay control system

Monitored component or system

♦ Starter relay monitoring by starter control IC

Fault finding notes

♦ Check relay wiring

Function restrictions

♦ Starting not possible

Diagnosis information DME control module

P061700 Starter relay activation - short circuit to B+

Diagnostic conditions

● Output stage energized

Fault setting condition(s)

● The information about the fault status of the output stages is assessed taking the fault detection possibilities into account. A short circuit to B+ can be detected with an activated output stage. A fallen-off cable and short circuit to ground can be detected with a deactivated output stage. The fault/OK messages are read according to these states
● Starter control IC reports a short circuit to B+ of the starter relay control system

Monitored component or system

♦ Starter relay monitoring by starter control IC

Fault finding notes

♦ Check relay wiring

Function restrictions

♦ Starting not possible

P062B00

Diagnosis information DME control module

P062B00 Control unit faulty

Diagnostic conditions

- Ignition on
- Diagnostics runs several times per driving cycle

Fault setting condition(s)

- The fault setting condition is monitored by output stage diagnostics

Monitored component or system

♦ Fuel injector communication

Fault finding notes

♦ Control unit faulty

Function restrictions

♦ The resulting driving behavior is jerky and there is a lack of power

Diagnosis information DME control module

P063400 Control unit - temperature switch-off

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- The output stage for fan control unit 1 in the DME control unit has detected an overtemperature. The temperature exceeds an applied threshold
- Direct temperature measurement in the output stage driver: when the threshold (150 °C/302 ° F) is reached, the output stage is switched off and a status is reported
- The output stage reports the overtemperature fault

Monitored component or system

- Activation line to the first fan output stage
- DME control unit pre-delivery pump output stage
- Generator
- Main water pump valve
- Auxiliary water pump
- Water pump supply shutoff valve

Fault finding notes

- Switch engine off, switch ignition off and allow DME control unit to cool down
- Internal fault of the DME control unit; replace the DME control unit

Function restrictions

- Emergency operation of the fan means that the requirements for charging balance, acoustics and closed-circuit current are not met
- An empty battery is a possible result
- Output stage inactive, resulting failure of the pre-delivery pump and engine failure
- Restricted power of the passenger compartment heating

Diagnostic information - DME control unit

P064100 Sender reference voltage A - open circuit

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- Direct voltage-measurement monitoring in the chip of the output stage. A status is reported when a minimum or maximum threshold is reached

Monitored component or system

♦ Sender reference voltage 5 V

Fault finding notes

♦ Check the electrical connection of the components connected to the shared power supply
♦ Check components
♦ Control unit:
  ♦ Connector [A], contact 26
  or
  ♦ Connector [A], contact 28
  or
  ♦ Connector [B], contact 63
  or
  ♦ Connector [B], contact 80

Function restrictions

♦ Limp-home mode

Diagnostic information - DME control unit

P065100 Sender reference voltage B - open circuit

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- Direct voltage-measurement monitoring in the chip of the output stage. A status is reported when a minimum or maximum threshold is reached

Monitored component or system

♦ Sender reference voltage 5 V

Fault finding notes

♦ Check the electrical connection of the components connected to the shared power supply
♦ Check components
♦ Control unit:
  ♦ Connector [A], contact 37
  or
  ♦ Connector [B], contact 19
  or
  ♦ Connector [B], contact 58

Function restrictions

♦ Limp-home mode

Diagnosis information DME control module

P066000 Register intake pipe switchover - electrical fault

Diagnostic conditions

- Engine speed > 40.0 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- The output stage of the intake pipe switchover detects a load decrease. The internal voltage is measured at the output > 4.8 V...5.3 V depending on the output stage module
- Monitoring of electrical activation components (line, components, output stage) for short circuits and open low-side switch line

Monitored component or system

♦ Intake pipe switchover

Fault finding notes

♦ Check wiring between the control unit and component for open circuit. Depending on the output stage, the internal diagnostic voltage (between 3 V and 6 V) is measured
♦ Check voltage supply
♦ Check component for continuity

Function restrictions

♦ Output stage inactive, failure of intake pipe switchover, valve closed, more power possible

Diagnosis information DME control module

P066100 Register intake pipe switchover - short circuit to ground

Diagnostic conditions

- Engine speed > 40.0 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- The output stage of the intake pipe switchover detects a short circuit to ground; the diagnostic voltage < 0 V...3.25 V is measured at the output
- Monitoring of electrical activation components (line, components, output stage) for short circuits and open low-side switch line

Monitored component or system

♦ Intake pipe switchover

Fault finding notes

♦ Check wiring between the control unit and component for short circuit to ground. If this is OK, then pull the component off and clear the fault memory
♦ If the DME control unit detects an open circuit, the fault is in the component
♦ Check power supply on the component

Function restrictions

♦ Output stage inactive, failure of intake pipe switchover, valve open, more torque possible

Diagnosis information DME control module

P066200 Register intake pipe switchover - short circuit to B+

Diagnostic conditions

- Intake pipe switchover activated
- Engine speed > 40.0 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- The output stage of the intake pipe switchover detects a short circuit to B+; signal current > 2.2 A...4.0 A
- Monitoring of electrical activation components (line, components, output stage) for short circuits and open low-side switch line

Monitored component or system

♦ Intake pipe switchover

Fault finding notes

♦ Check wiring between the control unit and component for short circuit to B+. If this is OK, then pull the component off and clear the fault memory
♦ If the DME control unit detects an open circuit, the fault is in the component

Function restrictions

♦ Output stage inactive, failure of intake pipe switchover, valve closed, more power possible

Diagnosis information DME control module

P068600 Main relay - short circuit to ground

Diagnostic conditions

- Main relay not activated
- Diagnostics runs several times

Fault setting condition(s)

- Signal voltage in the range 2.6 V...3.7 V
- Short circuit to ground of the main relay

Monitored component or system

♦ Main relay

P068A00

Diagnosis information DME control module

P068A00 Main relay opens too early

Diagnostic conditions

- Ignition on
- Diagnostics runs once per driving cycle

Fault setting condition(s)

- Open circuit of terminal 87 to the engine control unit

Monitored component or system

♦ Open circuit of terminal 87 to the engine control unit

Fault finding notes

♦ Check electrical connection to the main relay or replace main relay

Function restrictions

♦ DME control unit off

Diagnosis information DME control module

P068B00 Main relay opens too late

Diagnostic conditions

- Started driving cycle
- Diagnostics runs continuously

Fault setting condition(s)

- Sticking main relay

Monitored component or system

♦ Main relay

Fault finding notes

♦ Check electrical connection to the main relay or replace main relay

Function restrictions

♦ Battery discharge possible because the DME control unit does not switch off

Diagnosis information DME control module

P069100 Radiator fan control 1 - short circuit to ground

Diagnostic conditions

- Switch ignition on; fault is entered immediately
- Effect: last revs are maintained; limp-home mode occurs after 10 sec

Fault setting condition(s)

- Control line to fan control unit 1 has a short circuit to ground

Monitored component or system

♦ Activation line to the first fan output stage

Fault finding notes

♦ Check of the control line and plug to determine whether they are short circuited to ground
♦ In a voltage measurement on the control line, the measuring instrument indicates a value close to 0 V
♦ A current measurement on the control line with a clamp-on ammeter displays, if OK, a square-wave signal

Function restrictions

♦ Emergency operation of the fan means that the requirements for charging balance, acoustics and closed-circuit current are not met
♦ An empty battery is the possible result

Diagnosis information DME control module

P069200 Radiator fan control 1 - short circuit to B+

Diagnostic conditions

- Switch ignition on; fault is entered immediately
- Effect: last revs are maintained; limp-home mode occurs after 10 sec

Fault setting condition(s)

- Control line to fan control unit 1 has a short circuit to battery positive voltage

Monitored component or system

♦ Activation line to the first fan output stage

Fault finding notes

♦ Check of the control line and plug to determine whether they are short circuited to battery positive voltage
♦ In a voltage measurement on the control line, the measuring instrument indicates a value close to battery positive voltage
♦ A valid pulse/duty ratio lies between 10% and 90%
♦ A current measurement on the control line with a clamp-on ammeter displays, if OK, a square-wave signal

Function restrictions

♦ Emergency operation of the fan means that the requirements for charging balance, acoustics and closed-circuit current are not met
♦ An empty battery is the possible result

Diagnostic information - DME control unit

P069700 Sender reference voltage C - open circuit

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- Direct voltage-measurement monitoring in the chip of the output stage. A status is reported when a minimum or maximum threshold is reached

Monitored component or system

♦ Sender reference voltage 5 V

Fault finding notes

♦ Check the electrical connection of the components connected to the shared power supply
♦ Check components
♦ Control unit:
  ♦ Connector [A], contact 50
  or
  ♦ Connector [B], contact 36

Function restrictions

♦ In the most unfavorable case: engine off

P06D100

Diagnosis information DME control module

P06D100 Control unit faulty

Diagnostic conditions

● Initialization is performed at the start of the driving cycle when the ignition is switched on

Fault setting condition(s)

● If the ignition driver cannot be initialized within a certain number of attempts, an initialization error is triggered
● The initialization sends all parameters required for operation to the ignition driver
● Initialization takes place with the aid of an automatic state function in three steps : 1. Initialization procedure 2. Verification 3. Completion

Monitored component or system

♦ Ignition coil component driver

Fault finding notes

♦ Internal fault in the DME control unit

Function restrictions

♦ Breakdown

Diagnosis information DME control module

P070400 Clutch switch module, interlock switch

Diagnostic conditions

- Vehicle speed > 35 km/h (22 mph)
- Engine speed > 1,000 rpm
- No parking brake fault

Fault setting condition(s)

- > 50 gear changes without clutch actuation being detected

Monitored component or system

♦ Clutch switch module, interlock switch

Fault finding notes

♦ Check wiring of clutch switch
♦ Check clutch switch

Function restrictions

♦ No cruise control operation

Diagnosis information DME control module

P071600 Sender 1 for transmission input speed - implausible signal

Diagnostic conditions

- Transmission CAN message active
- Diagnostics runs continuously

Fault setting condition(s)

- Fault value on "transmission input speed" signal received by transmission control unit via CAN

Monitored component or system

♦ Transmission input speed (turbine speed) CAN signal from transmission

Fault finding notes

♦ Read out fault memory of the transmission control unit

Diagnosis information DME control module

P085000 Start inhibit P/N signal - short circuit to B+/open circuit

Diagnostic conditions

- Diagnostics runs continuously during ignition on

Fault setting condition(s)

- P or N CAN signal from transmission control unit is present; hardware signal is neither P nor N

Monitored component or system

♦ P/N hardware signal is compared with the CAN message from the transmission

Fault finding notes

♦ Suspect list: P/N switch, wiring, CAN communication, transmission control unit

Function restrictions

♦ Automatic transmission vehicle cannot be started

Diagnosis information DME control module

P085100 Start inhibit P/N signal - short circuit to ground

Diagnostic conditions

- Diagnostics runs continuously during ignition on

Fault setting condition(s)

- Neither P nor N CAN signal from transmission control unit; hardware signal P or N

Monitored component or system

♦ P/N hardware signal is compared with the CAN message from the transmission

Fault finding notes

♦ Suspect list: P/N switch, wiring of the switch, CAN communication, transmission control unit

Function restrictions

♦ Automatic transmission vehicle cannot be started

P091900

Diagnosis information DME control module

P091900 Selector lever fault

Diagnostic conditions

- Diagnostics runs continuously
- The transmission CAN message must be activated

Fault setting condition(s)

- Fault value for "selector lever position" signal received by the transmission control unit via CAN

Monitored component or system

♦ Selector lever position CAN signal from transmission

Fault finding notes

♦ Read out fault memory of the transmission control unit

Function restrictions

♦ Possibly switch-off of the cruise control/adaptive cruise control (ACC)

P105700

Diagnosis information DME control module

P105700 Bank 1 exhaust camshaft adjustment - open circuit

Diagnostic conditions

- With engine running

Fault setting condition(s)

- Activation voltage higher than diagnostic threshold 4.4...5.6 V
- Output stage diagnostics, line open circuit

Monitored component or system

♦ Bank 1 exhaust camshaft adjuster output stage

P109300

Diagnosis information DME control module

P109300 Bank 1 fuel metering system 2 - malfunction

Diagnostic conditions

- Engine speed > 1,200 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Error in the plausibility check of the predicted air flow (torque monitoring function)
- Error in the plausibility check of the mixture correction factors
- The lambda setpoint does not match the current operating mode
- Error in the plausibility check between injection time and fuel mass
- Error in the plausibility check of the relative fuel mass

Monitored component or system

♦ DME control unit

Fault finding notes

♦ Processing of all faults relating to the air and fuel system (see fault memory). If there are no more faults, the DME control unit is faulty
♦ The fault might lie in the fuel metering system or intake system, otherwise the DME control unit must be replaced

Function restrictions

♦ A reset can be performed when the fault occurs once
♦ If the fault is still present, the injection quantity will be limited (no more injections will be permitted above 1,500 rpm)

P111400

Diagnosis information DME control module

P111400 Bank 1 sensor 2 - internal resistance too high

Diagnostic conditions

- Filtered exhaust gas temperature 299.991 °C…819.998 °C (571.984 °F ...1,507.996 °F)
- Switch-off time > 630 sec
- Intake air temperature > -48 °C (-54 °F)
- Overrun mode not active
- Diagnostics runs once per driving cycle

Fault setting condition(s)

- The internal resistance is compared with its setpoint (728.0...16,632.0 Ohm). If the resistance is higher, the fault is set after debouncing

Monitored component or system

♦ Bank 1 oxygen sensor 2 heating

Fault finding notes

♦ Test of the power supply: Important: The ignition must be on for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "heating voltage" and "ground". U>10 V. If there is no voltage, the line must be checked for open circuit and replaced if necessary
♦ Check of the lines "heater voltage" and "heater ground" for open circuit and short circuits
♦ If open circuits or short circuits are present, the lines must be repaired
♦ If the fault occurs nevertheless, the DME control unit must be checked

P114000

Diagnosis information DME control module

P114000 Bank 2 sensor 2 - internal resistance too high

Diagnostic conditions

- Filtered exhaust gas temperature 299.991 °C…819.998 °C (571.984 °F ...1,507.996 °F)
- Switch-off time > 630 sec
- Intake air temperature > -48 °C (-54 °F)
- Overrun mode not active
- Diagnostics runs once per driving cycle

Fault setting condition(s)

- The internal resistance is compared with its setpoint (728.0...16,632.0 Ohm). If the resistance is higher, the fault is set after debouncing

Monitored component or system

♦ Bank 2 oxygen sensor 2 heating

Fault finding notes

♦ Test of the power supply: Important: The ignition must be on for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "heating voltage" and "ground". U>10 V. If there is no voltage, the line must be checked for open circuit and replaced if necessary
♦ Check of the lines "heater voltage" and "heater ground" for open circuit and short circuits
♦ If open circuits or short circuits are present, the lines must be repaired
♦ If the fault occurs nevertheless, the DME control unit must be checked

P119A00

Diagnosis information DME control module

P119A00 Fuel pressure sender - malfunction

Diagnostic conditions

- Diagnostics runs continuously

Monitored component or system

♦ Fuel pressure sensor

Fault finding notes

♦ High-pressure sensor faulty

Function restrictions

♦ Acute lack of power; vehicle possibly stalls at idle
♦ Engine off

Diagnosis information DME control module

P125000 Fuel level too low

Fault setting condition(s)

- Set along with another fault entry, if Reserve lamp of the tank is active

Monitored component or system

♦ Tank-empty information (this is set only together with another fault memory entry)

Diagnostic information - DME V6 DFI

Fuel high pressure implausible
● From MY 2015 =>

Diagnostic conditions
● Battery voltage 10 V ... 16 V
● Engine off for > 4 hours
● Engine temperature < 50 °C (122 °F)
● Intake air temperature deviates from engine temperature by less than 12 °C (53 °F)
● Engine start followed by idling
● No fault codes P0193 or P0192

Possible fault causes
♦ Deviating fuel/air mixture
OR
♦ Fluctuating fuel high pressure
► **Check**:
♦ Secondary air (intake manifold, vacuum system, oil separator, tank vent valve, ...)
♦ Mass air flow sensor (MAF)
♦ Fuel high-pressure sensor (comparison of actual value **B070** using pressure gauge)
♦ Fuel low-pressure circuit (delivery quantity/pressure)
♦ Pressure-relief valve (fuel high-pressure rail)
♦ Fuel high-pressure pump (comparison of setpoint and actual pressure)
♦ Fuel injectors (coked/blocked)
♦ Intake and exhaust valves (significant coking)
♦ Camshaft timing

Fault setting conditions
● When the engine is starting under the diagnostic conditions specified above, the plausibility of the value of the fuel high-pressure sensor is checked.
● When the engine is running at idle speed and in the near idle speed range, a suspected fault is set if the actual value of the fuel high-pressure control system differs from the setpoint value.
● The plausibility of the fuel high-pressure sensor **AND also** the value of the fuel/air mixture adaptation is now evaluated:
⇒ If the fuel high-pressure sensor shows plausible values **AND** if this adaptation value is close to 0, the fault code P008700 or P008800 will be entered.
⇒ If the fuel high-pressure sensor shows implausible values **AND** if the adaptation value is significantly different, the fault code P12A100 or P12A200 will be entered.
ⓘ A significant deviation in the fuel adaptation value does not necessarily result in a fault entry for mixture adaptation because another fault limit is decisive for this.

Diagnostic information - DME V6 DFI

Fuel high pressure implausible
● From MY 2015 =>

Diagnostic conditions
● Battery voltage 10 V ... 16 V
● Engine off for > 4 hours
● Engine temperature < 50 °C (122 °F)
● Intake air temperature deviates from engine temperature by less than 12 °C (53 °F)
● Engine start followed by idling
● No fault codes P0193 or P0192

Possible fault causes
♦ Deviating fuel/air mixture
OR
♦ Fluctuating fuel high pressure
► **Check**:
♦ Secondary air (intake manifold, vacuum system, oil separator, tank vent valve, ...)
♦ Mass air flow sensor (MAF)
♦ Fuel high-pressure sensor (comparison of actual value **B070** using pressure gauge)
♦ Fuel low-pressure circuit (delivery quantity/pressure)
♦ Pressure-relief valve (fuel high-pressure rail)
♦ Fuel high-pressure pump (comparison of setpoint and actual pressure)
♦ Fuel injectors (coked/blocked)
♦ Intake and exhaust valves (significant coking)
♦ Camshaft timing

Fault setting conditions
● When the engine is starting under the diagnostic conditions specified above, the plausibility of the value of the fuel high-pressure sensor is checked.
● When the engine is running at idle speed and in the near idle speed range, a suspected fault is set if the actual value of the fuel high-pressure control system differs from the setpoint value.
● The plausibility of the fuel high-pressure sensor **AND also** the value of the fuel/air mixture adaptation is now evaluated:
⇒ If the fuel high-pressure sensor shows plausible values **AND** if this adaptation value is close to 0, the fault code P008700 or P008800 will be entered.
⇒ If the fuel high-pressure sensor shows implausible values **AND** if the adaptation value is significantly different, the fault code P12A100 or P12A200 will be entered.
ⓘ A significant deviation in the fuel adaptation value does not necessarily result in a fault entry for mixture adaptation because another fault limit is decisive for this.

Diagnosis information DME control module

P130A00 Cylinder shutoff

Fault setting condition(s)

- Misfiring rate damaging to catalytic converter

Monitored component or system

♦ Misfire detection, misfiring detected

Fault finding notes

♦ Fault occurs after misfiring faults

Function restrictions

♦ MIL on
♦ Power restriction
♦ Poor throttle response at high speeds
♦ Breakdown

Diagnosis information DME control module

P133500 Engine torque monitoring 2 - control limit exceeded

Fault setting condition(s)

● A fault in the torque comparison is entered if the filtered permissible torque plus offset is higher than the actual torque

Monitored component or system

♦ DME control unit

Fault finding notes

♦ DME control unit must be replaced

Function restrictions

♦ Engine speed limitation to 1,500 rpm

P133600

Diagnosis information DME control module

P133600 Engine torque monitoring 2 - control limit exceeded

Fault setting condition(s)

- Level 1 torque monitoring limits continuously (longer than 600 sec)

Monitored component or system

♦ DME control unit

Fault finding notes

♦ DME control unit must be replaced

Function restrictions

♦ Incorrect torque in DME control unit is limited
♦ Possibly increased idle speed
♦ Vehicle follows driver's command, possibly with post-acceleration

P138600

Diagnosis information DME control module

P138600 Control unit faulty

Diagnostic conditions

- Ignition on
- Engine speed > 80 rpm
- Diagnostics runs continuously

Monitored component or system

♦ Knock control/signal evaluation

Diagnosis information DME control module

P138700 Control unit faulty

Diagnostic conditions

- Ignition on
- Diagnostics runs several times/continuously
- Pressure sensor ahead of throttle valve ready, no fault

Fault setting condition(s)

- Electrical maximum fault: signal voltage > 4.8779 V
- Electrical minimum fault: signal voltage < 0.2002 V
- Check of whether the ambient pressure lies within a range that can be approached by a vehicle
- The signal is plausible if it has changed only slightly since the last driving cycle. Comparison is made with the ambient pressure limit model

Monitored component or system

♦ Ambient pressure sensor, electrical

Fault finding notes

♦ Replace DME control unit (ambient pressure sensor is installed in the control unit)

P138800

Diagnosis information DME control module

P138800 Control unit faulty

Diagnostic conditions

● Diagnostics runs every 10 ms

Fault setting condition(s)

● Test fault occurred during monitoring of the analog-to-digital converter
● Error in the plausibility check of the accelerator pedal voltage
● The difference between the rpm value calculated in level 2 and the level 1 value exceeds a maximum permissible threshold
● The engine speed exceeds a maximum threshold in case of a level 1 injection quantity limit
● Error in the plausibility check of the ignition angle voltage

Monitored component or system

♦ DME control unit

Fault finding notes

♦ DME control unit must be replaced

Function restrictions

♦ Severe juddering if it is attempted to set engine speeds higher than 1,500 rpm using the accelerator pedal potentiometer
♦ Engine speed limitation to 1,500 rpm

Diagnosis information DME control module

P13EA00 Ignition timing adjustment - malfunction during cold start over idle speed

Diagnostic conditions

- Diagnostics runs only during catalytic converter heating

Fault setting condition(s)

- Monitoring of ignition angle for advancing (via engine efficiency) during partial load

Monitored component or system

♦ Ignition angle

Fault finding notes

♦ Inform the product support department (possibly fuel quality)

Diagnosis information DME control module

P150300 Load signal from generator terminal DF - implausible signal

Monitored component or system

♦ Generator

Fault finding notes

♦ Check electrical line to generator
♦ Check the generator

Diagnosis information DME control module

P150A00 Ignition-off time period signal - implausible

Diagnostic conditions

- Ignition on
- Diagnostics runs once per driving cycle

Fault setting condition(s)

- Plausibility check of the Off time, which is calculated from the standstill time information from the instrument cluster, compared with the run-on counter of the control unit.

Monitored component or system

♦ Off-time counter in the instrument cluster

Fault finding notes

♦ Check data bus
♦ Clear fault memory and observe
♦ Off-time counter in the instrument cluster faulty

Function restrictions

♦ Off-time wrong
♦ In the event of a fault, a change is made to the substitute-value model. Function restrictions of the receiving functions can occur as a result
♦ Possibly poor starting behavior

P154500

Diagnosis information DME control module

P154500 Throttle valve control - malfunction

Diagnostic conditions

- No throttle valve fault active
- No output stage fault
- Diagnostics runs continuously

Fault setting condition(s)

- Difference between measured and calculated throttle valve angles > 4.0009%...50.0008%
- Pulse/duty ratio > 80% and no output stage fault present

Monitored component or system

♦ Throttle valve adjusting unit, control range

Diagnosis information DME control module

P155800 Throttle valve drive - electrical fault in circuit

Diagnostic conditions

- Ignition on and run-on during adaptation
- Diagnostics runs during adaptation

Fault setting condition(s)

- The fault is present if closing of the throttle valve over the reference point takes longer than 0.56 sec

Monitored component or system

♦ Throttle valve adjuster spring test; throttle valve does not open
♦ Throttle valve adjuster output stage, basic test after ignition on

P155900

Diagnosis information DME control module

P155900 Throttle valve control unit - basic setting fault

Diagnostic conditions

- Adaptation
- Diagnostics runs during adaptation

Monitored component or system

♦ Throttle valve adjuster fault during test of the emergency-air position

Diagnosis information DME control module

P156400 Throttle valve control unit - undervoltage at basic setting

Diagnostic conditions

- Ignition on or run-on before and during adaptation
- Adaptation

Fault setting condition(s)

♦ Battery positive voltage < 10.0 V

Monitored component or system

♦ Throttle valve adjuster - adaptation cancellation due to environmental condition

P156500

Diagnosis information DME control module

P156500 Throttle valve control unit - lower limit not reached

Diagnostic conditions

- Adaptation active
- Diagnostics runs several times

Monitored component or system

♦ Throttle valve adjuster, basic setting

P157000

Diagnosis information DME control module

P157000 DME control unit blocked

Diagnostic conditions

- Ignition on or engine speed threshold exceeded
- Diagnostics once after ignition on

Fault setting condition(s)

- Check of the immobilizer communication
- Wrong application

Monitored component or system

♦ Immobilizer in DME control unit, P-class

Fault finding notes

♦ Check CAN communication in the vehicle
♦ Check gateway if present
♦ Check front-end electronics
♦ Check immobilizer vehicle system adaptation
♦ Read out of the "DME control unit immobilizer overall status"
♦ Check data record for P-class

Function restrictions

♦ No engine start

P157900

Diagnosis information DME control module

P157900 Throttle valve control unit - adaptation not started

Diagnostic conditions

- Ignition on or run-on before and during adaptation
- Adaptation

Monitored component or system

♦ Throttle valve adjuster - adaptation cancellation due to environmental condition

P159D00

Diagnosis information DME control module

P159D00 Oil level/temperature sender - implausible signal

Fault setting condition(s)

- Oil temperature/time implausible

Monitored component or system

♦ Oil level/oil temperature sender

Diagnosis information DME control module

P15A000 Sender for transmission neutral position - electrical fault

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- Neutral gear sensor input signal exceeds the permissible maximum value

Monitored component or system

♦ Neutral gear sensor

Fault finding notes

♦ Unplug the neutral gear sensor and measure reference voltage at the signal line
♦ Connect signal line to ground. If the raw sensor voltage is 0 V, the sensor is faulty. If not, then check the sensor line to the DME control unit
♦ If the line to the DME control unit is OK, the DME control unit is faulty

Function restrictions

♦ Start/Stop no longer functions

Diagnosis information DME control module

P15A100 Sender for transmission neutral position - implausible signal

Diagnostic conditions

- With neutral gear engaged
- A gear is engaged and the vehicle is in load/overrun mode
- A gear is detected when a High level is produced at the neutral gear sensor (1-3-5)
- A gear is detected when a Low level is produced at the neutral gear sensor (2-4-6)
- Diagnostics runs continuously

Fault setting condition(s)

- The engine is idling, the clutch pedal is not depressed, but if the neutral gear sensor does not detect neutral gear, the fault path becomes active
- A neutral gear is detected and the neutral gear sensor voltage does not lie in the window of the calculated shift angles. The shift angle is calculated from the voltages of the "even" and "odd" engaged gears
- The absolute neutral gear voltage lies outside the defined window
- The neutral gear raw detection detects a neutral gear when a gear that is securely engaged is detected and load/overrun mode is present
- The valid range for the sensor voltage is left in case of securely engaged even or odd gear

Monitored component or system

♦ Neutral gear sensor

Fault finding notes

♦ Delete neutral gear sensor learning values (basic setting or adaptation) and teach neutral gear sensor with test drive
♦ Check raw voltages of the neutral gear sensor for gears with Low and High levels
♦ If the voltages are not OK, then subject the lines to an electrical test
♦ If the lines are OK, the sensor is mechanically faulty
♦ When everything is OK, perform a final function check of the start/stop system

Function restrictions

♦ Start/Stop no longer functions

Diagnosis information DME control module

P15A200 Sender for transmission neutral position - short circuit to ground

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- Neutral gear sensor input signal falls below the permissible minimum value

Monitored component or system

♦ Neutral gear sensor

Fault finding notes

♦ Unplug neutral gear sensor
♦ If the raw sensor voltage is close to the reference voltage, the sensor is faulty. If it is close to 0 V, then check the line to the DME control unit
♦ If the line to the DME control unit is OK, the DME control unit is faulty

Function restrictions

♦ Start/Stop no longer functions

Diagnosis information DME control module

P160300 Control unit faulty

Fault setting condition(s)

● Incorrect question/answer communication between monitoring module and function processor
● Control unit, component or incoming line fault leading to transmission of incorrect answers to the monitoring module

Monitored component or system

♦ DME control unit

Fault finding notes

♦ DME control unit must be replaced

Function restrictions

♦ Restart no longer possible

Diagnosis information DME control module

P160400 Control unit faulty

Diagnostic conditions

● Ignition on

Fault setting condition(s)

● The starter module provides fault information that refers to a "central communication error", a "central SPI error" or a "central overtemperature flag"

Monitored component or system

♦ DME control unit, internal output stage module

Fault finding notes

♦ Component fault, DME control unit must be replaced

Function restrictions

♦ The component fault prevents the engine from starting

Diagnosis information DME control module

P160900 Crash shutoff was triggered

Fault setting condition(s)

- Crash intensity is greater than/equal to 4

Monitored component or system

♦ Crash signal from airbag control unit

Fault finding notes

♦ Via airbag control unit drive link test

P160A00

Diagnosis information DME control module

P160A00 Control unit faulty

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- Control unit internal diagnostics
- Control unit reset

Monitored component or system

♦ DME control unit

Fault finding notes

♦ DME control unit must be replaced
♦ Flash DME control unit again

Function restrictions

♦ Engine does not start or only with difficulty
♦ Fault is not entered and is thus also not noticed

Diagnosis information DME control module

P161200 DME control unit coded incorrectly

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously
- Only in the initialization phase

Fault setting condition(s)

- DME control unit to airbag control unit coding variants do not match
- If neither the coding word in the EEPROM nor the value of the associated first initialization value represents a valid coding word

Monitored component or system

♦ DME control unit

Fault finding notes

♦ Check DME control unit for correct coding (code airbag)
♦ Read out fault memory and coding word and re-code the DME control unit. OK if the coding is accepted. Otherwise replace the DME control unit

Diagnostic information - DME control unit

P162400 Fault lamp on request active due to fault in transmission control unit

Diagnostic conditions
- Transmission control unit ready for operation

Fault setting condition(s)
- Activation of the fault lamp is required due to exhaust-related fault in the transmission

Monitored component or system
♦ Transmission

P163D00

Diagnosis information DME control module

P163D00 Indicator light for driving program - electrical fault in circuit

Monitored component or system

♦ Driving program switch

Diagnosis information DME control module

P163E00 Control unit faulty

Diagnostic conditions

- Diagnostics runs once per driving cycle

Fault setting condition(s)

- CAN controller RAM monitoring

Monitored component or system

♦ CAN communication: CAN controller

Fault finding notes

♦ Replace DME control unit

Function restrictions

♦ DME control unit faulty

Diagnosis information DME control module

P164000 Control unit faulty

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- If deletion cannot be performed or was not performed successfully
- If at least three blocks cannot be read
- If a block cannot be written after more than three attempts

Monitored component or system

♦ DME control unit

Fault finding notes

♦ DME control unit must be replaced

Function restrictions

♦ DME control unit performs a reset

P164600

Diagnosis information DME control module

P164600 Please read out fault memory of the all-wheel drive electronics

Fault setting condition(s)

- Monitoring of distributor limitation torque

Monitored component or system

♦ Distributor limitation torque signal

Fault finding notes

♦ Check drive data bus and all-wheel drive control unit

Diagnosis information DME control module

P164700 Check coding/variants of the control units in the drive train

Diagnostic conditions

● Release of diagnostic function takes place from ignition on

Fault setting condition(s)

● The DME control unit is not coded for a cruise control or adaptive cruise control (ACC) although the corresponding operating lever is installed

Monitored component or system

♦ Steering column switch module, DME control unit

Fault finding notes

♦ Check whether the DME control unit is correctly coded with regard to cruise control/adaptive cruise control

Function restrictions

♦ No cruise control/adaptive cruise control (ACC) operation possible in the current ignition cycle

P164C00

Diagnosis information DME control module

P164C00 Oil pressure switch for reduced oil pressure - implausible signal

Diagnostic conditions

- Ignition on
- Engine off

Fault setting condition(s)

- Oil low pressure switch closed
- Low pressure level switch implausible

Monitored component or system

♦ Oil pressure switch for low pressure detection

Fault finding notes

♦ Check of the electrical wiring and the functionality of the oil pressure switch

P164D00

Diagnosis information DME control module

P164D00 Oil pressure switch for reduced oil pressure - malfunction

Diagnostic conditions

- With engine running

Fault setting condition(s)

- Low pressure level not reached

Monitored component or system

♦ Oil pressure switch for low pressure detection

Fault finding notes

♦ Check whether there is sufficient oil/oil pressure to operate the switch
♦ Check of the electrical wiring, plug and the functionality of the oil pressure switch

Diagnosis information DME control module

P167E00 Start/stop restart - max. start time exceeded

Diagnostic conditions

● Diagnostics runs continuously

Fault setting condition(s)

● A bad start is detected if a start/stop restart is requested, but the activation of the starter did not lead to starting after a time of 3 sec has elapsed

Monitored component or system

♦ Engine start

Fault finding notes

♦ Read out fault memory of the DME control unit and front-end electronics control unit

Function restrictions

♦ Blockage of start/stop function

P168200

Diagnosis information DME control module

P168200 Drive data bus - implausible message from PSM control unit

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- Engine drag torque control intervention functions only over an applicable speed threshold, default value : 10 km/h (6 mph)
- The positive torque intervention by the PSM is monitored via an integration function in the engine control unit. Torque values minus losses, driver's torque request or application constant (the largest value in each case) are included

Monitored component or system

♦ PSM messages

Fault finding notes

♦ See PSM fault memory

Function restrictions

♦ No engine drag torque control intervention

Diagnosis information DME control module

P169800 Steering-column electronics, please read out the fault memory

Diagnostic conditions

- Diagnostics runs continuously, according to the configured time grid

Fault setting condition(s)

- Fault of the steering-angle control unit detected

Monitored component or system

♦ Steering angle CAN signal

Fault finding notes

♦ Read out fault memory of the corresponding sender control unit

Function restrictions

♦ Idling possibly somewhat less stable

Diagnosis information DME control module

P169A00 Loading mode active

Fault setting condition(s)

● The following conditions must be met at the same time: Current operating state: control unit run-on; vehicle speed less than 5 km/h (3 mph); engine speed is 0 rpm; vehicle has travelled no more than 100 km (62 miles) since being put into operation; production mode is locally deactivated
● The control unit run-on mode is active for a certain time period after the state has been changed from ignition on to ignition off. The transport mode can be activated/deactivated only when the DME control unit is in run-on mode. Furthermore, all fault setting conditions must be met. Transport mode remains activated/deactivated beyond the ignition change. Transport mode is deactivated by a locally active production mode

Monitored component or system

♦ DME control unit

Fault finding notes

♦ Transport mode set

Function restrictions

♦ MIL/warning message in instrument cluster "engine control fault" on
♦ Rev limitation, speed limitation, torque limitation
♦ Suppression of catalytic converter heating

Diagnosis information DME control module

P172300 Start inhibit signal - open circuit

Diagnostic conditions

● Engine start

Fault setting condition(s)

● Starting attempts with a half-depressed clutch increment a fault counter, and the fault is set when a certain threshold is reached
● Clutch switch actuated, interlock switch not actuated, terminal 50 active

Monitored component or system

♦ Interlock switch

Fault finding notes

♦ Interlock switch or wiring faulty
♦ Test via DME control unit actual values
♦ Customer misbehavior (carpet)

Function restrictions

♦ Engine cannot be started

Diagnosis information DME control module

P172400 Start inhibit signal - short circuit to ground

Diagnostic conditions

- Diagnostics running continuously during ignition on

Fault setting condition(s)

- Clutch switch not actuated, interlock switch actuated
- Cruise control switch not actuated

Monitored component or system

♦ Interlock switch, clutch switch

Fault finding notes

♦ Interlock switch or clutch switch faulty
♦ Test via DME control unit actual values

Function restrictions

♦ No automatic start possible

P172900

Diagnosis information DME control module

P172900 Start inhibit signal - short circuit to B+

Diagnostic conditions

● A test pulse is produced if there is no fault in the clutch or interlock switch signal, the engine speed is higher than the threshold (approx. 800 rpm), the vehicle speed is higher than the threshold (approx. 5 km/h / 3 mph) and the clutch pedal is not depressed
● Diagnostics runs once per driving cycle

Fault setting condition(s)

● If there is no fault in the clutch or interlock switch signal, the output stage for expanded drive train-open release is activated but no P/N interlock hardware signal is present
● The output stage of the expanded drive train-open release has switched a Low level, but a High level is detected at the P/N interlock input

Monitored component or system

♦ Expanded drive train-open release

Fault finding notes

♦ Engine can be started manually: Check line from DME control unit to DME control unit (bridge between 2 pins: expanded drive train-open release to interlock switch input) according to the wiring diagram
♦ Engine cannot be started manually: Remove plug on the clutch master cylinder, read out actual values and bridge the interlock signal line to ground . If the DME control unit and line are OK, the sensor is faulty. If not, then check the line. If the line is OK, then the DME control unit is faulty

Function restrictions

♦ Start/stop no longer functions
♦ Possibly normal engine starting no longer possible

Diagnosis information DME control module

P188A00 Coolant shutoff valve - electrical fault

Diagnostic conditions

● Diagnostics runs continuously

Fault setting condition(s)

● The output stage reports the load reduction fault; short circuit to battery positive voltage/ground
● Monitoring of the electrical components for line open circuit and short circuit to B+/ground

Monitored component or system

♦ Water pump supply shutoff valve

Fault finding notes

♦ Line test

Function restrictions

♦ Restricted power of the passenger compartment heating

Diagnosis information DME control module

P191B00 Radiator fan control unit - implausible signal

Diagnostic conditions

● Diagnostics runs only when the DME control unit has been flashed again or coded
● The learning values are then deleted, and the request is re-sent after a terminal 87 reset (end of control unit run-on)

Fault setting condition(s)

● Plausibility check of the sent short-circuit times in the DME control unit
● Communication error with fan output stage 1

Monitored component or system

♦ Radiator fan on first output stage

Fault finding notes

♦ A faulty fan control unit might not be able to report back any variant when requested to do so. An incorrect or old fan module might not be able to report back any variant. The signal for flashing was sent during variant feedback, but flashing is cancelled for inexplicable reasons

Function restrictions

♦ No function restrictions, only the acoustics and control quality are impaired

P193600

Diagnosis information DME control module

P193600 Generator switch-off - open circuit/short circuit to ground

Monitored component or system

♦ Generator

Fault finding notes

♦ See gateway fault memory

P193700

Diagnosis information DME control module

P193700 Generator switch-off - short circuit to B+

Monitored component or system

♦ Generator

Fault finding notes

♦ See gateway fault memory

Diagnosis information DME control module

P194400 Control unit 1 for radiator fans - overtemperature

Diagnostic conditions

● Switch ignition on and wait 6 min., then fault entry. Effect: fan decreases power or switches off. Procedure: drive link test, test according to specification. Signal every 2 sec., for 1 sec. to ground
● The fan must be activated with 10% pulse/duty ratio for at least 6 min.

Fault setting condition(s)

● The radiator fan output stage reduces the power from 110 °C (230 °F) and switches off above 130 °C (266 °F). When the temperature falls below 125 °C (257 °F) again, then heat-loss-reduced operation is in effect

Monitored component or system

♦ Radiator fan output stage 1

Fault finding notes

♦ Drive link test
♦ Visual inspection of whether the fan module is in the original condition

Function restrictions

♦ No or reduced fan power of the two possible fans on the first output stage
♦ The system can overheat in extreme situations (towing a trailer, hot countries, top speed). Symptoms are A/C rejection and "Hot" light

Diagnosis information DME control module

P194600 Control unit 1 for radiator fans - faulty/power supply

Diagnostic conditions

● Switch ignition on and wait 6 min., then fault entry. Effect: electronics fault or power supply interrupted. Procedure: Signal every 2 sec., for 4 sec. to ground
● The fan must be activated with 10% pulse/duty ratio for at least 6 min.

Fault setting condition(s)

● Electronics fault or power supply to the fan control unit interrupted

Monitored component or system

♦ Radiator fan output stage 1

Fault finding notes

♦ Drive link test
♦ Check power supply fuse
♦ Check of the supply line from the power supply to the fan
♦ Fan control unit faulty

Function restrictions

♦ No or reduced fan power of the two possible fans on the first output stage
♦ The system can overheat in extreme situations (towing a trailer, hot countries, top speed). Symptoms are A/C rejection and "Hot" light

Diagnosis information DME control module

P194600 Control unit 1 for radiator fans - faulty/power supply

Diagnostic conditions

● Switch ignition on and wait 6 min., then fault entry. Effect: electronics fault or power supply interrupted. Procedure: Signal every 2 sec., for 4 sec. to ground
● The fan must be activated with 10% pulse/duty ratio for at least 6 min.

Fault setting condition(s)

● Electronics fault or power supply to the fan control unit interrupted

Monitored component or system

♦ Radiator fan output stage 1

Fault finding notes

♦ Drive link test
♦ Check power supply fuse
♦ Check of the supply line from the power supply to the fan
♦ Fan control unit faulty

Function restrictions

♦ No or reduced fan power of the two possible fans on the first output stage
♦ The system can overheat in extreme situations (towing a trailer, hot countries, top speed). Symptoms are A/C rejection and "Hot" light

Diagnosis information DME control module

P194600 Control unit 1 for radiator fans - faulty/power supply

Diagnostic conditions

● Switch ignition on and wait 6 min., then fault entry. Effect: electronics fault or power supply interrupted. Procedure: Signal every 2 sec., for 4 sec. to ground
● The fan must be activated with 10% pulse/duty ratio for at least 6 min.

Fault setting condition(s)

● Electronics fault or power supply to the fan control unit interrupted

Monitored component or system

♦ Radiator fan output stage 1

Fault finding notes

♦ Drive link test
♦ Check power supply fuse
♦ Check of the supply line from the power supply to the fan
♦ Fan control unit faulty

Function restrictions

♦ No or reduced fan power of the two possible fans on the first output stage
♦ The system can overheat in extreme situations (towing a trailer, hot countries, top speed). Symptoms are A/C rejection and "Hot" light

Diagnosis information DME control module

P195000 Coolant fan - sluggish/stalled

Diagnostic conditions

● Switch the ignition on and either drive the engine warm, or check via a measured value whether the air conditioner demands the correct number of fans. The measured value indicates the activation of the output stages
● The fan must be activated with 15% pulse/duty ratio for at least 6 min.

Fault setting condition(s)

● Soiling by leaves or ice, corrosion-related stalling due to the effects of road salt, accident damage or similar

Monitored component or system

♦ Radiator fan 1 on first output stage

Fault finding notes

♦ Fan output stage 1 drive link diagnostics
♦ The fan should accelerate to maximum speed in approx. 10 sec.

Function restrictions

♦ No fan power of the first fan on the first radiator fan output stage
♦ The system can overheat in extreme situations (towing a trailer, hot countries, top speed). Symptoms are A/C rejection and "Hot" light

Diagnosis information DME control module

P195000 Coolant fan - sluggish/stalled

Diagnostic conditions

● Switch the ignition on and either drive the engine warm, or check via a measured value whether the air conditioner demands the correct number of fans. The measured value indicates the activation of the output stages
● The fan must be activated with 15% pulse/duty ratio for at least 6 min.

Fault setting condition(s)

● Soiling by leaves or ice, corrosion-related stalling due to the effects of road salt, accident damage or similar

Monitored component or system

♦ Radiator fan 1 on first output stage

Fault finding notes

♦ Fan output stage 1 drive link diagnostics
♦ The fan should accelerate to maximum speed in approx. 10 sec.

Function restrictions

♦ No fan power of the first fan on the first radiator fan output stage
♦ The system can overheat in extreme situations (towing a trailer, hot countries, top speed). Symptoms are A/C rejection and "Hot" light

P198700

Diagnostic information - DME control unit

P198700 Brake temperature too high - check PSM control unit fault memory content

Diagnostic conditions
- PSM control unit ready for operation

Fault setting condition(s)
- Brake temperature too high

Monitored component or system
♦ Brake system

Diagnosis information DME control module

P208800 Bank 1 camshaft adjustment - short circuit to ground

Diagnostic conditions

- With engine running

Fault setting condition(s)

- Activation voltage less than diagnostic threshold 2.14...3.26 V

Monitored component or system

♦ Bank 1 intake camshaft adjuster output stage

Diagnosis information DME control module

P208900 Bank 1 camshaft adjustment - short circuit to B+

Diagnostic conditions

- Ignition on
- With engine running

Fault setting condition(s)

- Typically: I > 2.2...4.0 A, depending on which output stage type is used
- Output stage diagnostics, short circuit to B+

Monitored component or system

♦ Actuator for camshaft adjustment (intake, bank 1) output stage

Function restrictions

♦ Power restriction

Diagnosis information DME control module

P209000 Bank 1 exhaust camshaft adjustment - short circuit to ground

Diagnostic conditions

- With engine running

Fault setting condition(s)

- Activation voltage less than diagnostic threshold 2.14...3.26 V

Monitored component or system

♦ Bank 1 exhaust camshaft adjuster output stage

P209100

Diagnosis information DME control module

P209100 Bank 1 exhaust camshaft adjustment - short circuit to B+

Diagnostic conditions

- With engine running

Fault setting condition(s)

- Diagnostic current higher than diagnostic threshold > 3 A
- Output stage diagnostics, short circuit to B+

Monitored component or system

♦ Bank 1 exhaust camshaft adjuster output stage

P209600

Diagnosis information DME control module

P209600 Bank 1 lambda correction behind catalytic converter - lean control limit exceeded

Fault setting condition(s)

- Delta of the sensor offset of setpoint control -3%...-7%

Monitored component or system

♦ Oxygen sensor drift comparison by oxygen sensor

P209700

Diagnosis information DME control module

P209700 Bank 1 lambda correction behind catalytic converter - rich control limit exceeded

Fault setting condition(s)

- Delta of the sensor offset of setpoint control 3%....7%

Monitored component or system

♦ Oxygen sensor drift comparison by oxygen sensor, bank 1

Diagnosis information DME control module

P209800 Bank 2 lambda correction behind catalytic converter - lean control limit exceeded

Fault setting condition(s)

- Delta of the sensor offset of setpoint control -3%...-7%

Monitored component or system

♦ Oxygen sensor drift comparison by oxygen sensor, bank 2

Diagnosis information DME control module

P209900 Bank 2 lambda correction behind catalytic converter - rich control limit exceeded

Fault setting condition(s)

- Delta of the sensor offset of setpoint control 3%....7%

Monitored component or system

♦ Oxygen sensor drift comparison by oxygen sensor, bank 2

Diagnosis information DME control module

P210600 Throttle valve control unit - limited power due to system fault

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- Short circuit in the DV-E output stage : I > 8.0...18.0 A
- DV-E output stage is overheated or carries excessive current: I > 5.5...7.7 A or T > 150 °C/302 °F (current limitation) or T> 175 °C/347 °F (overtemperature shutoff)
- SPI or signal error in the DV-E output stage : Maximum pulse/duty ratio > 80%
- Open-load fault in the DV-E output stage; output voltage 1 > 2 V and output voltage 2 < 0.8 V

Monitored component or system

♦ Throttle valve adjuster output stage

Diagnosis information DME control module

P211900 Throttle valve control unit - fault during adaptation

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- The lower limit is outside the normal adaptation range (potentiometer 1 < 0.12 V or potentiometer 2 > 4.84 V)

Monitored component or system

♦ Throttle valve adjuster basic setting/adjuster test on adaptation

Fault finding notes

♦ Electrical test of the plug connections and cables
♦ Throttle valve adjuster faulty

Function restrictions

♦ Engine does not start or can be run only in limp-home mode (fixed engine speed, low torque)

Diagnosis information DME control module

P212200 Accelerator pedal position sender - signal too low

Diagnostic conditions

- No fault in the 5 V supply

Fault setting condition(s)

- Electrical test of the pedal value encoder: signal too low

Monitored component or system

♦ Pedal sensor 1

Fault finding notes

♦ Electrical test of the plug connections and cables for short circuit to ground

Function restrictions

♦ The torque is greatly reduced above 3,000 rpm

Diagnosis information DME control module

P212300 Accelerator pedal position sender - signal too high

Diagnostic conditions

- No fault in the 5 V supply

Fault setting condition(s)

- Electrical test of the pedal value encoder: signal too high

Monitored component or system

♦ Pedal sensor 1

Fault finding notes

♦ Electrical test of the plug connections and cables for short circuit to B+

Function restrictions

♦ The torque is greatly reduced above 3,000 rpm

Diagnosis information DME control module

P212700 Accelerator pedal position sender 2 - signal too low

Diagnostic conditions

- No fault in the 5 V supply

Fault setting condition(s)

- Electrical test of the pedal value encoder: signal too low

Monitored component or system

♦ Pedal sensor 2

Fault finding notes

♦ Electrical test of the plug connections and cables for short circuit to ground

Function restrictions

♦ The torque is greatly reduced above 3,000 rpm

Diagnosis information DME control module

P212300 Accelerator pedal position sender 2 - signal too high

Diagnostic conditions

- No fault in the 5 V supply

Fault setting condition(s)

- Electrical test of the pedal value encoder: signal too high

Monitored component or system

♦ Pedal sensor 2

Fault finding notes

♦ Electrical test of the plug connections and cables for short circuit to B+

Function restrictions

♦ The torque is greatly reduced above 3,000 rpm

Diagnosis information DME control module

P213800 Accelerator pedal position sender 1/2 - implausible signal

Diagnostic conditions

- Diagnostics running continuously from ignition on
- No fault in the 5 V supply
- Control unit run-on

Fault setting condition(s)

- The difference of the two input signals exceeds the permissible maximum
- The two signal voltages of the pedal encoder are tested for synchronism
- The two pedal encoder signal voltages are observed in run-on for pedal encoder drift detection. A fault is present if one signal voltage lies within and one signal voltage lies outside the idle range
- When the idle range of the first channel is left, the voltage value of the second channel is stored. When the first channel exceeds a voltage threshold but the second one does not, a fault is detected
- A fault is also detected when the second channel falls below the voltage threshold before the first channel when reaching the idle range again from above

Monitored component or system

♦ Pedal encoder

Fault finding notes

♦ Electrical test of the plug connections, cables and components
♦ Test of the contact resistance values on sensors 1 and 2
♦ It might be necessary to replace the sensors

Function restrictions

♦ The torque is greatly reduced above 3,000 rpm

Diagnostic information - DME control unit

P214600 Supply for fuel injector(s) A - open circuit

Diagnostic conditions

- Engine speed > 80 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Short circuit of the high-pressure fuel injector (high side) to battery positive voltage/ground
- Winding short circuit of the high-pressure fuel injector (high side)

Monitored component or system

♦ High-pressure fuel injector, high side, cylinder 1/6

Function restrictions

♦ Suppression of the high-pressure fuel injectors with data

Diagnostic information - DME control unit

P214900 Supply for fuel injector(s) B - open circuit

Diagnostic conditions

- Engine speed > 80 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Short circuit of the high-pressure fuel injector (high side) to battery positive voltage/ground
- Winding short circuit of the high-pressure fuel injector (high side)

Monitored component or system

♦ High-pressure fuel injector, high side, cylinder 2

Function restrictions

♦ Suppression of the high-pressure fuel injectors with data

Diagnostic information - DME control unit

P215200 Supply for fuel injector(s) C - electrical fault

Diagnostic conditions

- Engine speed > 80 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Short circuit of the high-pressure fuel injector (high side) to battery positive voltage/ground
- Winding short circuit of the high-pressure fuel injector (high side)

Monitored component or system

♦ High-pressure fuel injector, high side, cylinder 3/4

Function restrictions

♦ Suppression of the high-pressure fuel injectors with data

Diagnostic information - DME control unit

P215500 Supply for fuel injector(s) D - electrical fault

Diagnostic conditions

- Engine speed > 80 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Short circuit of the high-pressure fuel injector (high side) to battery positive voltage/ground
- Winding short circuit of the high-pressure fuel injector (high side)

Monitored component or system

♦ High-pressure fuel injector, high side, cylinder 5

Function restrictions

♦ Suppression of the high-pressure fuel injectors with data

P217700

Diagnosis information DME control module

P217700 Bank 1 fuel metering system - system too lean from idling speed

Fault setting condition(s)

- Multiplicative lambda adaptation value > 1.299988

Monitored component or system

♦ Mixture adaptation

P217800

Diagnosis information DME control module

P217800 Bank 1 fuel metering system - system too rich from idling speed

Fault setting condition(s)

- Multiplicative lambda adaptation value < 0.700012

Monitored component or system

♦ Mixture adaptation

P217900

Diagnosis information DME control module

P217900 Bank 2 fuel metering system - system too lean from idling speed

Fault setting condition(s)

- Multiplicative lambda adaptation value > 1.299988

Monitored component or system

♦ Mixture adaptation

P218000

Diagnosis information DME control module

P218000 Bank 2 fuel metering system - system too rich from idling speed

Fault setting condition(s)

- Multiplicative lambda adaptation value < 0.700012

Monitored component or system

♦ Mixture adaptation

Diagnosis information DME control module

P218100 Fault in cooling system

Diagnostic conditions

● Diagnostics runs once per driving cycle with conditioned vehicle

Fault setting condition(s)

● Supplementary diagnostics in addition to conventional thermostat diagnostics on vehicles with thermal management
● Once a certain engine temperature is reached, the further temperature characteristic is observed. If the engine temperature subsequently falls below a temperature threshold, a faulty cooling system is detected

Monitored component or system

♦ Coolant temperature system, performance capacity

Fault finding notes

♦ Test for heating of the cooling system and engine after cold start
♦ Test of the engine temperature sensor. If the sensor is OK, then replace the thermostat

Function restrictions

♦ When the thermostat is stuck open, the cooling system and engine heat up too slowly after a cold start or the engine temperature remains continuously too low

P218700

Diagnosis information DME control module

P218700 Bank 1 fuel metering system - system too lean at idling speed

Fault setting condition(s)

- Additive lambda adaptation value < -6.0%

Monitored component or system

♦ Mixture adaptation sum error

P218800

Diagnosis information DME control module

P218800 Bank 1 fuel metering system - system too rich at idling speed

Fault setting condition(s)

- Additive lambda adaptation value > 6.0%

Monitored component or system

♦ Mixture adaptation sum error

P218900

Diagnosis information DME control module

P218900 Bank 2 fuel metering system - system too lean at idling speed

Fault setting condition(s)

- Additive lambda adaptation value < -6.0%

Monitored component or system

♦ Mixture adaptation sum error

P219000

Diagnosis information DME control module

P219000 Bank 2 fuel metering system - system too rich at idling speed

Fault setting condition(s)

- Additive lambda adaptation value > 6.0%

Monitored component or system

♦ Mixture adaptation sum error

P219500

Diagnosis information DME control module

P219500 Bank 1 oxygen sensor 1 - signal too lean

Fault setting condition(s)

- Delta of the sensor offset of setpoint control > 7%

Monitored component or system

♦ Oxygen sensor drift comparison by oxygen sensor

P219600

Diagnosis information DME control module

P219600 Bank 1 oxygen sensor 1 - signal too rich

Fault setting condition(s)

- Delta of the sensor offset of setpoint control < -7%

Monitored component or system

♦ Oxygen sensor drift comparison by oxygen sensor

P219700

Diagnosis information DME control module

P219700 Bank 2 oxygen sensor 1 - signal too lean

Fault setting condition(s)

- Delta of the sensor offset of setpoint control > 7%

Monitored component or system

♦ Oxygen sensor drift comparison by oxygen sensor

P219800

Diagnosis information DME control module

P219800 Bank 2 oxygen sensor 1 - signal too rich

Fault setting condition(s)

- Delta of the sensor offset of setpoint control < -7%

Monitored component or system

♦ Oxygen sensor drift comparison by oxygen sensor

P223700

Diagnosis information DME control module

P223700 Bank 1 oxygen sensor 1 - pump current open circuit

Diagnostic conditions

- Heater control active
- Lambda control active
- Diagnostics runs continuously

Fault setting condition(s)

- The sensor voltage is in a voltage band, and the gradient of lambda control factor is higher than the maximum value

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter

Fault finding notes

♦ Test of the measuring resistor: Important: The ignition must be off for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "pump current" and "trim resistance". R=60-65 Ohm.
If the measuring resistor is faulty, the oxygen sensor is replaced
♦ Test of the power supply: Important: The ignition must be on for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "virtual ground" and "K ground". U=2-3 V. If there is no voltage, the line must be checked for open circuit and replaced if necessary.
♦ Test of the lines "pump voltage", "virtual ground", "trim resistance" and "Nernst voltage" for open circuit and short circuits
♦ If open circuits or short circuits are present, the lines must be repaired
♦ If the fault occurs nevertheless, the DME control unit must be checked

P224000

Diagnosis information DME control module

P224000 Bank 2 oxygen sensor 1 - pump current open circuit

Diagnostic conditions

- Heater control active
- Lambda control active
- Diagnostics runs continuously

Fault setting condition(s)

- The sensor voltage is in a voltage band, and the gradient of lambda control factor is higher than the maximum value

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter, bank 2

Fault finding notes

♦ Test of the measuring resistor: Important: The ignition must be off for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "pump current" and "trim resistance". R=60-65 Ohm.
If the measuring resistor is faulty, the oxygen sensor is replaced
♦ Test of the power supply: Important: The ignition must be on for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "virtual ground" and "K ground". U=2-3 V. If there is no voltage, the line must be checked for open circuit and replaced if necessary.
♦ Test of the lines "pump voltage", "virtual ground", "trim resistance" and "Nernst voltage" for open circuit and short circuits
♦ If open circuits or short circuits are present, the lines must be repaired
♦ If the fault occurs nevertheless, the DME control unit must be checked

P224300

Diagnosis information DME control module

P224300 Bank 1 oxygen sensor 1 - reference voltage open circuit

Diagnostic conditions

- Heater control active
- Dew point end reached
- 3-kHz measuring frequency of the internal resistance not active for 2 sec
- Diagnostics runs continuously

Fault setting condition(s)

- The sensor voltage is either greater than the maximum voltage or less than the minimum voltage, and the internal resistance is implausibly high

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter

Fault finding notes

♦ Test of the measuring resistor: Important: The ignition must be off for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "pump current" and "trim resistance". R=60-65 Ohm.
If the measuring resistor is faulty, the oxygen sensor is replaced
♦ Test of the power supply: Important: The ignition must be on for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "virtual ground" and "K ground". U=2-3 V. If there is no voltage, the line must be checked for open circuit and replaced if necessary.

P227000

Diagnosis information DME control module

P227000 Bank 1 oxygen sensor 2 - signal too lean

Diagnostic conditions

- Engine speed > 25 rpm
- Lambda adjustment for diagnostics ended
- P-share of control behind catalytic converter active
- All fuel injectors active
- Diagnostics runs several times in the driving cycle

Fault setting condition(s)

- Oxygen sensor voltage behind catalytic converter < 0.64 V...0.649 V
- Vibration test

Monitored component or system

♦ Bank 1 oxygen sensor 2

P227100

Diagnosis information DME control module

P227100 Bank 1 oxygen sensor 2 - signal too rich

Diagnostic conditions

- Engine speed > 25 rpm
- Lambda adjustment for diagnostics ended
- P-share of control behind catalytic converter active
- All fuel injectors active
- Diagnostics runs several times in the driving cycle

Fault setting condition(s)

- Oxygen sensor voltage behind catalytic converter > 0.64 V...0.649 V
- Vibration test

Monitored component or system

♦ Bank 1 oxygen sensor 2

Diagnosis information DME control module

P227200 Bank 2 oxygen sensor 2 - signal too lean

Diagnostic conditions

- Engine speed > 25 rpm
- Lambda adjustment for diagnostics ended
- P-share of control behind catalytic converter active
- All fuel injectors active
- Diagnostics runs several times in the driving cycle

Fault setting condition(s)

- Oxygen sensor voltage behind catalytic converter < 0.64 V...0.649 V
- Vibration test

Monitored component or system

♦ Bank 2 oxygen sensor 2

Diagnosis information DME control module

P227300 Bank 2 oxygen sensor 2 - signal too rich

Diagnostic conditions

- Engine speed > 25 rpm
- Lambda adjustment for diagnostics ended
- P-share of control behind catalytic converter active
- All fuel injectors active
- Diagnostics runs several times in the driving cycle

Fault setting condition(s)

- Oxygen sensor voltage behind catalytic converter > 0.64 V...0.649 V
- Vibration test

Monitored component or system

♦ Bank 2 oxygen sensor 2

Diagnosis information DME control module

P227900 Leakage air in intake system

Diagnostic conditions

- Vehicle idling
- Engine at operating temperature
- Diagnostics runs continuously, but exclusively for tank ventilation

Fault setting condition(s)

- Monitoring of all lambda deviations (lambda actual value, lambda controller, lambda adaptation) to detect a leak ahead of the throttle valve

Monitored component or system

♦ Positive crankcase ventilation

Fault finding notes

♦ Examine all connections of the positive crankcase ventilation for disconnection or leakage

P229400

Diagnosis information DME control module

P229400 Fuel pressure control valve - open circuit

Diagnostic conditions

- Valve not activated
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage in the range 0.65 V...3.2 V
- Quantity control valve output stage load reduction

Monitored component or system

♦ High pressure quantity control valve

Fault finding notes

♦ Check line connection
♦ Cable break or output stage faulty

P229500

Diagnosis information DME control module

P229500 Fuel pressure control valve - short circuit to ground

Diagnostic conditions

- Valve not activated
- Diagnostics runs continuously

Fault setting condition(s)

- Quantity control valve short circuit to ground, low side

Monitored component or system

♦ High pressure quantity control valve

Fault finding notes

♦ Pull plug off quantity control valve and read out the fault memory again. If there is an additional fault, replace the quantity control valve
♦ Check the line connection between the quantity control valve and DME control unit. If it is OK, then replace the DME control unit

Diagnosis information DME control module

P229600 Fuel pressure control valve - short circuit to B+

Diagnostic conditions

- Valve activated
- Diagnostics runs continuously

Fault setting condition(s)

- Quantity control valve short circuit to battery positive voltage, low side

Monitored component or system

♦ High pressure quantity control valve

Fault finding notes

♦ Pull plug off quantity control valve and read out the fault memory again. If there is an additional fault, replace the quantity control valve
♦ Check the line connection between the quantity control valve and DME control unit. If it is OK, then replace the DME control unit

Diagnosis information DME control module

P230000 Ignition coil 1 activation - short circuit to ground

Diagnostic conditions

- Engine speed > 1,400 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage < 0.5 V...1.0 V
- In case of short circuit to ground, an internal register is set after a filtering time. A monitoring function for the lines to the output stage is integrated. A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

Fault finding notes

♦ Perform line check
♦ Check resistance of the ignition coil

Function restrictions

♦ Breakdown possible

Diagnosis information DME control module

P230100 Ignition coil 1 activation - short circuit to B+

Diagnostic conditions

- Engine speed > 1,400 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal current < 5.0 mA...8.8 mA
- In case of short circuit to battery positive voltage, an internal register is set after a filtering time. A monitoring function for the lines to the output stage is integrated. A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

Fault finding notes

♦ Perform line check
♦ Check resistance of the ignition coil

Function restrictions

♦ Breakdown possible

Diagnosis information DME control module

P230300 Ignition coil 2 activation - short circuit to ground

Diagnostic conditions

- Engine speed > 1,400 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage < 0.5 V...1.0 V
- In case of short circuit to ground, an internal register is set after a filtering time. A monitoring function for the lines to the output stage is integrated. A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

Fault finding notes

♦ Perform line check
♦ Check resistance of the ignition coil

Function restrictions

♦ Breakdown possible

Diagnosis information DME control module

P230400 Ignition coil 2 activation - short circuit to B+

Diagnostic conditions

- Engine speed > 1,400 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal current < 5.0 mA...8.8 mA
- In case of short circuit to battery positive voltage, an internal register is set after a filtering time. A monitoring function for the lines to the output stage is integrated. A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

Fault finding notes

♦ Perform line check
♦ Check resistance of the ignition coil

Function restrictions

♦ Breakdown possible

Diagnosis information DME control module

P230600 Ignition coil 3 activation - short circuit to ground

Diagnostic conditions

- Engine speed > 1,400 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage < 0.5 V...1.0 V
- In case of short circuit to ground, an internal register is set after a filtering time. A monitoring function for the lines to the output stage is integrated. A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

Fault finding notes

♦ Perform line check
♦ Check resistance of the ignition coil

Function restrictions

♦ Breakdown possible

Diagnosis information DME control module

P230700 Ignition coil 3 activation - short circuit to B+

Diagnostic conditions

- Engine speed > 1,400 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal current < 5.0 mA...8.8 mA
- In case of short circuit to battery positive voltage, an internal register is set after a filtering time. A monitoring function for the lines to the output stage is integrated. A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

Fault finding notes

♦ Perform line check
♦ Check resistance of the ignition coil

Function restrictions

♦ Breakdown possible

Diagnosis information DME control module

P230900 Ignition coil 4 activation - short circuit to ground

Diagnostic conditions

- Engine speed > 1,400 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage < 0.5 V...1.0 V
- In case of short circuit to ground, an internal register is set after a filtering time. A monitoring function for the lines to the output stage is integrated. A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

Fault finding notes

♦ Perform line check
♦ Check resistance of the ignition coil

Function restrictions

♦ Breakdown possible

Diagnosis information DME control module

P231000 Ignition coil 4 activation - short circuit to B+

Diagnostic conditions

- Engine speed > 1,400 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal current < 5.0 mA...8.8 mA
- In case of short circuit to battery positive voltage, an internal register is set after a filtering time. A monitoring function for the lines to the output stage is integrated. A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

Fault finding notes

♦ Perform line check
♦ Check resistance of the ignition coil

Function restrictions

♦ Breakdown possible

Diagnosis information DME control module

P231200 Ignition coil 5 activation - short circuit to ground

Diagnostic conditions

- Engine speed > 1,400 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage < 0.5 V...1.0 V
- In case of short circuit to ground, an internal register is set after a filtering time. A monitoring function for the lines to the output stage is integrated. A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

Fault finding notes

♦ Perform line check
♦ Check resistance of the ignition coil

Function restrictions

♦ Breakdown possible

Diagnosis information DME control module

P231300 Ignition coil 5 activation - short circuit to B+

Diagnostic conditions

- Engine speed > 1,400 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal current < 5.0 mA...8.8 mA
- In case of short circuit to battery positive voltage, an internal register is set after a filtering time. A monitoring function for the lines to the output stage is integrated. A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

Fault finding notes

♦ Perform line check
♦ Check resistance of the ignition coil

Function restrictions

♦ Breakdown possible

Diagnosis information DME control module

P231500 Ignition coil 6 activation - short circuit to ground

Diagnostic conditions

- Engine speed > 1,400 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal voltage < 0.5 V...1.0 V
- In case of short circuit to ground, an internal register is set after a filtering time. A monitoring function for the lines to the output stage is integrated. A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

Fault finding notes

♦ Perform line check
♦ Check resistance of the ignition coil

Function restrictions

♦ Breakdown possible

Diagnosis information DME control module

P231600 Ignition coil 6 activation - short circuit to B+

Diagnostic conditions

- Engine speed > 1,400 rpm
- Diagnostics runs continuously

Fault setting condition(s)

- Signal current < 5.0 mA...8.8 mA
- In case of short circuit to battery positive voltage, an internal register is set after a filtering time. A monitoring function for the lines to the output stage is integrated. A detected ignition driver fault is stored separately in a register for each channel and can be read out via an SPI interface

Monitored component or system

♦ Ignition coils

Fault finding notes

♦ Perform line check
♦ Check resistance of the ignition coil

Function restrictions

♦ Breakdown possible

Diagnosis information DME control module

P233600 Cylinder 1 knock control - control limit reached

Fault setting condition(s)

- Knock control runs against limit for > 100 ignitions

Monitored component or system

♦ Cylinder-specific knock control intervention monitoring (cylinder 1)

Diagnosis information DME control module

P233700 Cylinder 2 knock control - control limit reached

Fault setting condition(s)

- Knock control runs against limit for > 100 ignitions

Monitored component or system

♦ Cylinder-specific knock control intervention monitoring (cylinder 2)

P233800

Diagnosis information DME control module

P233800 Cylinder 3 knock control - control limit reached

Fault setting condition(s)

- Knock control runs against limit for > 100 ignitions

Monitored component or system

♦ Cylinder-specific knock control intervention monitoring (cylinder 3)

Diagnosis information DME control module

P233900 Cylinder 4 knock control - control limit reached

Fault setting condition(s)

- Knock control runs against limit for > 100 ignitions

Monitored component or system

♦ Cylinder-specific knock control intervention monitoring (cylinder 4)

Diagnosis information DME control module

P234000 Cylinder 5 knock control - control limit reached

Fault setting condition(s)

- Knock control runs against limit for > 100 ignitions

Monitored component or system

♦ Cylinder-specific knock control intervention monitoring (cylinder 5)

P234100

Diagnosis information DME control module

P234100 Cylinder 6 knock control - control limit reached

Fault setting condition(s)

- Knock control runs against limit for > 100 ignitions

Monitored component or system

♦ Cylinder-specific knock control intervention monitoring (cylinder 6)

Diagnosis information DME control module

P240000 Tank vent system, tank leak diagnostic pump activation - electrical fault/open circuit

Diagnostic conditions

● Ignition on
● The cycle condition is reached when both switching states ON/OFF were active for at least 500 ms

Fault setting condition(s)

● The output stage of the leakage diagnostic pump detects a load decrease; the internal voltage is measured at the output > 4.8 V...5.3 V

Monitored component or system

♦ Leakage diagnostic pump

Fault finding notes

♦ Check wiring between the control unit and component for open circuit. Depending on the output stage, the internal diagnostic voltage (between 3 V and 6 V) is measured
♦ Check power supply on the component
♦ Check leakage diagnostic pump

Function restrictions

♦ Output stage inactive, failure of the leakage diagnostic pump

ⓘ INFORMATION

The system includes:
- ♦ mechanical **Vacuum pump**
- ♦ **Leakage diagnosis pump**
- ♦ **Intake pipe switchover**
- ♦ **Exhaust flap** (if present)

Diagnosis information DME control module

P240100 Tank vent system, tank leak diagnostic pump activation - short circuit to ground

Diagnostic conditions

● Ignition on
● The cycle condition is reached when both switching states ON/OFF were active for at least 500 ms

Fault setting condition(s)

● The output stage of the leakage diagnostic pump detects a short circuit to ground; the diagnostic voltage is measured at the output < 0 V...3.25 V

Monitored component or system

♦ Leakage diagnostic pump

Fault finding notes

♦ Check wiring between the control unit and component for short circuit to ground. If this is OK, then pull the component off and clear the fault memory
♦ If the DME control unit detects an open circuit, the fault is in the component
♦ Check power supply on the component

Function restrictions

♦ Output stage inactive, failure of the leakage diagnostic pump

ⓘ INFORMATION

The system includes:
- ♦ mechanical **Vacuum pump**
- ♦ **Leakage diagnosis pump**
- ♦ **Intake pipe switchover**
- ♦ **Exhaust flap** (if present)

Diagnosis information DME control module

P240200 Tank vent system, tank leak diagnostic pump activation - short circuit to B+

Diagnostic conditions

● Ignition on
● The cycle condition is reached when both switching states ON/OFF were active for at least 500 ms

Fault setting condition(s)

● The output stage of the leakage diagnostic pump detects a short circuit to B+; signal current > 2.2 A...4.0 A

Monitored component or system

♦ Leakage diagnostic pump

Fault finding notes

♦ Check wiring between the control unit and component for short circuit to battery positive voltage. If this is OK, then pull the component off and clear the fault memory
♦ If the DME control unit detects an open circuit, the fault is in the component

Function restrictions

♦ Output stage inactive, failure of the leakage diagnostic pump

ⓘ INFORMATION

The system includes:
- ♦ mechanical **Vacuum pump**
- ♦ **Leakage diagnosis pump**
- ♦ **Intake pipe switchover**
- ♦ **Exhaust flap** (if present)

P240300

Diagnosis information DME control module

P240300 Tank vent system, tank leak diagnostic pump sensor - electrical fault/open circuit

Diagnostic conditions

- Vehicle speed > 7.5 km/h (4.7 mph) (once)
- Vehicle speed > 0.0 km/h / mph
- Control unit run-on phase ended
- Diagnostics runs once per driving cycle

Fault setting condition(s)

- The state of the reed contact is monitored before the start of leakage diagnostics. If it is open after engine start, an initial purge is requested because the tank system might still be pressurized. If the reed contact is still open after a purge quantity of 49.8 g over the tank vent valve and the tank vent valve is tested as OK, the component fault is set. This is a purely passive test; the actual diagnostics does not become active. Another check is performed at the start of leakage diagnostics. A so-called closed check is performed here. It sets the fault if the reed contact is open after 0.5 sec

Monitored component or system

♦ Leakage diagnostic pump

Fault finding notes

♦ Vacuum system leaking (see ⓘ)
♦ Vacuum pump faulty
♦ Depressurize the tank by opening the tank cap before the workshop test
♦ Reed contact in the leakage diagnostic pump faulty
♦ Loose contact of the electrical connections of the leakage diagnostics pump
♦ Replace the leakage diagnostics pump

Function restrictions

♦ MIL lights up

ⓘ INFORMATION

The system includes:

- mechanical **Vacuum pump**
- **Leakage diagnosis pump**
- **Intake pipe switchover** (if present)
- **Exhaust flap** (if present)

Diagnosis information DME control module

P240400 Tank vent system, tank leak diagnostic pump sensor - implausible signal

Diagnostic conditions

- Vehicle speed > 7.5 km/h (4.7 mph) (once)
- Vehicle speed > 0.0 km/h / mph
- Control unit run-on phase ended
- Tank vent closed
- Diagnostics runs once per driving cycle

Fault setting condition(s)

- It is checked whether the reed contact opens when the leakage diagnostics pump is activated (close to open check). After an activation pulse, it is waited for 0.4 sec to determine whether the reed contact opens. If this does not happen, the cto check is repeated 30 times. If the contact is then still closed and no fault reservations occurred, the fault is set

Monitored component or system

♦ Leakage diagnostic pump

Fault finding notes

♦ Vacuum system leaking (see ⓘ)
♦ Vacuum pump faulty
♦ Check plug on the leakage diagnostic pump for correct seating
♦ Check vacuum supply of the leakage diagnostic pump
♦ As a last option, replace the leakage diagnostic pump

Function restrictions

♦ MIL lights up

ⓘ INFORMATION

The system includes:
- ♦ mechanical **Vacuum pump**
- ♦ **Leakage diagnosis pump**
- ♦ **Intake pipe switchover** (if present)
- ♦ **Exhaust flap** (if present)

Diagnosis information DME control module

P241400 Bank 1 sensor 1 - voltage too low/leakage air

Fault setting condition(s)

- Signal voltage > 2.5 V...3.2 V

Monitored component or system

♦ Oxygen sensor in air

Diagnosis information DME control module

P241500 Bank 2 sensor 1 - voltage too low/leakage air

Fault setting condition(s)

- Signal voltage > 2.5 V...3.2 V

Monitored component or system

♦ Oxygen sensor in air

Diagnosis information DME control module

P253300 Ignition starting switch circuit - short circuit to ground/open circuit

Diagnostic conditions

● During starting process

Fault setting condition(s)

● If valid terminal 50 CAN information is present, it is used to check the cable information
● Comparison of terminal 50 component signal with terminal 50 CAN signal from the front end electronics control unit

Monitored component or system

♦ Terminal 50 component signal

Fault finding notes

♦ Check of the electrical line to the front-end electronics control unit
♦ Check front-end electronics control unit fault memory

Function restrictions

♦ Manual start with delay (delay due to CAN delay)

Diagnosis information DME control module

P253500 Ignition starting switch circuit - short circuit to B+

Diagnostic conditions

● During starting process

Fault setting condition(s)

● If valid terminal 50 CAN information is present, it is used to check the cable information
● Comparison of terminal 50 component signal with terminal 50 CAN signal from the front end electronics control unit, signal continuously high

Monitored component or system

♦ Terminal 50 component signal

Fault finding notes

♦ Check of the electrical line to the front-end electronics control unit
♦ Check front-end electronics control unit fault memory

Function restrictions

♦ Manual start with delay (delay due to CAN delay)

Diagnosis information DME control module

P253900 Fuel low pressure sender - open circuit

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Analog value measurement detects that a maximum value was exceeded (4.7998 V)
- Monitoring of the electrical signals of the pressure sensor for the demand-controlled fuel system (low pressure) for minimum and maximum limits
- The sensor voltage is read into the DME control unit via an analog/digital channel

Monitored component or system

♦ Fuel low-pressure sensor

Diagnosis information DME control module

P254100 Fuel low pressure sender - short circuit to ground

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Analog value measurement detects that a value fell below the minimum value (0.2002 V)
- Monitoring of the electrical signals of the pressure sensor for the demand-controlled fuel system (low pressure) for minimum and maximum limits
- The sensor voltage is read into the DME control unit via an analog/digital channel

Monitored component or system

♦ Fuel low-pressure sensor

Diagnosis information DME control module

P260000 Coolant pump - open circuit

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- The output stage reports the load decrease fault
- Monitoring of the electrical components for line open circuit

Monitored component or system

♦ Main water pump valve

Fault finding notes

♦ Check component
♦ Line test

Diagnosis information DME control module

P260200 Coolant pump - short circuit to ground

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- The output stage reports the short circuit to ground fault
- Monitoring of the electrical components for short circuit to ground

Monitored component or system

♦ Main water pump valve

Fault finding notes

♦ Check valve internal resistance
♦ Line test

Function restrictions

♦ Restrictions in this sequence: no interior heating, start/stop ban, deactivation of auxiliary units
♦ Breakdown possible
♦ The driver is informed via the instrument cluster

Diagnosis information DME control module

P260300 Coolant pump - short circuit to B+

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- The output stage reports the short circuit to battery positive voltage fault
- Monitoring of the electrical components for short circuit to B+

Monitored component or system

♦ Main water pump valve

Fault finding notes

♦ Check valve internal resistance
♦ Line test

Diagnosis information DME control module

P261A00 Coolant pump 2 - open circuit

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- The output stage reports the load decrease fault
- Monitoring of the electrical components for line open circuit

Monitored component or system

♦ Auxiliary water pump

Fault finding notes

♦ Line test

Diagnosis information DME control module

P261C00 Coolant pump 2 - short circuit to ground

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- The output stage reports the short circuit to ground fault
- Monitoring of the electrical components for short circuit to ground

Monitored component or system

♦ Auxiliary water pump

Fault finding notes

♦ Line test

Function restrictions

♦ Restrictions in this sequence: no interior heating, start/stop ban, deactivation of auxiliary units
♦ Breakdown possible

P261D00

Diagnosis information DME control module

P261D00 Coolant pump 2 - short circuit to B+

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- The output stage reports the short circuit to battery positive voltage fault
- Monitoring of the electrical components for short circuit to B+

Monitored component or system

♦ Auxiliary water pump

Fault finding notes

♦ Line test

P262600

Diagnosis information DME control module

P262600 Bank 1 linear oxygen sensor/comparison line pump current - open circuit

Diagnostic conditions

- Dew point end reached
- Heater control active
- Overrun mode active
- Exhaust temperature from model < 849.998 °C (1,561.996 °F)
- Diagnostics runs continuously

Fault setting condition(s)

- Offset-corrected sensor voltage > 4.81006 V
- In overrun mode, the sensor voltage is higher than the maximum voltage

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter

Fault finding notes

♦ Test of the measuring resistor: Important: The ignition must be off for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "pump current" and "trim resistance". R=60-65 Ohm.
If the measuring resistor is faulty, the oxygen sensor is replaced
♦ Test of the power supply: Important: The ignition must be on for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "virtual ground" and "K ground". U=2-3 V. If there is no voltage, the line must be checked for open circuit and replaced if necessary.
♦ Test of the lines "pump voltage", "virtual ground", "trim resistance" and "Nernst voltage" for open circuit and short circuits
♦ If open circuits or short circuits are present, the lines must be repaired
♦ If the fault occurs nevertheless, the DME control unit must be checked

P262900

Diagnosis information DME control module

P262900 Bank 2 linear oxygen sensor/comparison line pump current - open circuit

Diagnostic conditions

- Dew point end reached
- Heater control active
- Overrun mode active
- Exhaust temperature from model < 849.998 °C (1,561.996 °F)
- Diagnostics runs continuously

Fault setting condition(s)

- Offset-corrected sensor voltage > 4.81006 V
- In overrun mode, the sensor voltage is higher than the maximum voltage

Monitored component or system

♦ Oxygen sensor ahead of catalytic converter, bank 2

Fault finding notes

♦ Test of the measuring resistor: Important: The ignition must be off for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "pump current" and "trim resistance". R=60-65 Ohm.
If the measuring resistor is faulty, the oxygen sensor is replaced
♦ Test of the power supply: Important: The ignition must be on for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "virtual ground" and "K ground". U=2-3 V. If there is no voltage, the line must be checked for open circuit and replaced if necessary.
♦ Test of the lines "pump voltage", "virtual ground", "trim resistance" and "Nernst voltage" for open circuit and short circuits
♦ If open circuits or short circuits are present, the lines must be repaired
♦ If the fault occurs nevertheless, the DME control unit must be checked

Diagnosis information DME control module

P304000 Transmission ratio implausible

Diagnostic conditions

- Monitoring of the drive train plausibility check is activated
- Diagnostics runs continuously

Fault setting condition(s)

- The drive train transmission ratio received by the CAN exceeds the maximum permissible value of 13.64
- The drive train transmission ratio received by the CAN falls below the minimum permissible value of 2.38
- The drive train transmission ration received by the CAN does not correspond to the back-computed rpm ratio, even though the torque converter lockup clutch is closed

Monitored component or system

♦ CAN drive train transmission ratio

Diagnosis information DME control module

P304300 Fuel pump - mechanical fault

Diagnostic conditions

- Ignition on
- Activation of the fuel pump electronics/electronic fuel pump
- Diagnostics runs continuously

Fault setting condition(s)

- Stalled pump rotor
- Detection via rpm measurement (no commutation, but current is flowing. Suspicion: stalled rotor)

Monitored component or system

♦ Fuel pump electronics

Fault finding notes

♦ Check of the three phases between the fuel pump electronics and the electronic fuel pump
♦ Check of the fuel pump (mechanical fault must be present)

Function restrictions

♦ Fuel pump stationary

Diagnosis information DME control module

P304400 Fuel pump - short circuit

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- Short circuits (to B+ and ground between the fuel pump electronics and fuel pump and short circuits between the phase lines)

Monitored component or system

♦ Fuel pump electronics

Fault finding notes

♦ Remove plug on the tank and erase the fault memory. If the fuel pump electronics now detects an open line, the fuel pump is faulty. Otherwise, check the line between the fuel pump electronics and the fuel pump. If the lines are OK, then replace the fuel pump electronics

Function restrictions

♦ Fuel pump might be stationary

Diagnosis information DME control module

P304500 Fuel pump electronics faulty

Diagnostic conditions

- If the DME control unit is awake, e.g. due to door contact wake-up
- Diagnostics runs continuously (test takes place in every grid of the process)

Fault setting condition(s)

- EEPROM/NV-RAM error; fuel pump electronics reports internal fault via ground clocking on the signal line to the DME control unit

Monitored component or system

♦ Fuel pump electronics

Fault finding notes

♦ Replace fuel pump electronics

Function restrictions

♦ Speed limitation of the fuel pump
♦ Possibly torque restriction

Diagnosis information DME control module

P304600 Starter relay 1 - electrical fault in circuit (relay stuck/does not switch)

Diagnostic conditions

● End of starter activation

Fault setting condition(s)

● In order to permit diagnostics of both relays, a different output stage is switched off first at each start. The switch-off sequence for the output stages is interchanged at the end of each starter activation. This makes it possible to determine which relay sticks closed.

Monitored component or system

♦ Starter relay 1

Fault finding notes

♦ Replace the relay. If the relay fault moves as well, replace the relay
♦ If both relays are entered, a short circuit to B+ of the feedback line should be tested first

Function restrictions

♦ Only manual start possible

Diagnosis information DME control module

P304700 Starter relay 2 activation - short circuit to B+

Diagnostic conditions

● Output stages are assessed taking the fault detection possibilities into account. A short circuit to B+ can be detected with an activated output stage. A fallen-off cable and short circuit to ground can be detected with a deactivated output stage. The fault/OK messages are read according to these states
● Output stage energized

Fault setting condition(s)

● Short circuit to B+ of starter relay activation 2

Monitored component or system

♦ Starter relay monitoring

Fault finding notes

♦ Check relay wiring

Function restrictions

♦ Starting not possible

Diagnosis information DME control module

P304800 Starter relay 2 activation - short circuit to ground

Diagnostic conditions

● Output stages are assessed taking the fault detection possibilities into account. A short circuit to B+ can be detected with an activated output stage. A fallen-off cable and short circuit to ground can be detected with a deactivated output stage. The fault/OK messages are read according to these states
● Output stage de-energized

Fault setting condition(s)

● Short circuit to ground of starter relay activation 2

Monitored component or system

♦ Starter relay monitoring

Fault finding notes

♦ Check relay wiring

Function restrictions

♦ Starting not possible

Diagnosis information DME control module

P304900 Starter relay 2 activation - open circuit

Diagnostic conditions

● Output stages are assessed taking the fault detection possibilities into account. A short circuit to B+ can be detected with an activated output stage. A fallen-off cable and short circuit to ground can be detected with a deactivated output stage. The fault/OK messages are read according to these states
● Output stage de-energized

Fault setting condition(s)

● Cable fell off starter relay activation 2

Monitored component or system

♦ Starter relay monitoring

Fault finding notes

♦ Check relay wiring

Function restrictions

♦ Starting not possible

Diagnosis information DME control module

P305000 Starter relay 2 - electrical fault in circuit (relay stuck/does not switch)

Diagnostic conditions

● End of starter activation

Fault setting condition(s)

● In order to permit diagnostics of both relays, a different output stage is switched off first at each start. The switch-off sequence for the output stages is interchanged at the end of each starter activation. This makes it possible to determine which relay sticks closed.
● Relay 2 sticks and is always closed

Monitored component or system

♦ Starter relay 2

Fault finding notes

♦ Replace the relay. If the relay fault moves as well, replace the relay
♦ If both relays are entered, a short circuit to B+ of the feedback line should be tested first

Function restrictions

♦ Only manual start possible

Diagnosis information DME control module

P305200 Starter activation feedback terminal 50 - short circuit to B+

Diagnostic conditions

- Not during starting process

Fault setting condition(s)

- When both starter relays are activated, the feedback line must report a "high" level

Monitored component or system

♦ Feedback line terminal 50R

Fault finding notes

♦ Check of the lines
♦ Check of whether starter is activated
♦ Check the starter relay
♦ Check starter

Function restrictions

♦ Possibly no engine start

Diagnosis information DME control module

P305300 Starter activation feedback terminal 50 - short circuit to ground/open circuit

Diagnostic conditions

- Only during starting process

Fault setting condition(s)

- When both starter relays are activated, the feedback line must report a "high" level

Monitored component or system

♦ Feedback line terminal 50R

Fault finding notes

♦ Check of the lines
♦ Check of whether starter is activated
♦ Check the starter relay
♦ Check starter

Function restrictions

♦ Possibly no engine start

P305400

Diagnosis information DME control module

P305400 Starter does not turn/mechanically blocked/electrical fault

Diagnostic conditions

● Starting process

Fault setting condition(s)

● With active feedback signal and no speed, the starter is faulty or the engine is mechanically blocked

Monitored component or system

♦ Starter/motor blocked

Fault finding notes

♦ Line test on terminal 50 to the starter
♦ Voltage dip during starting process
♦ Motor mechanically blocked
♦ Starter faulty

Function restrictions

♦ Engine cannot be started

Diagnosis information DME control module

P307300 Fuel pump - electrical fault in circuit

Diagnostic conditions

- Ignition on
- Activation of the fuel pump electronics/fuel pump
- Diagnostics runs continuously

Fault setting condition(s)

- Interruption in phase line

Monitored component or system

♦ Fuel pump electronics

Fault finding notes

♦ Check plug connections and lines between the fuel pump electronics and fuel pump for continuity.
♦ The fuel pump can be measured (continuity between all phases on the pump). If OK, then replace the fuel pump electronics

Function restrictions

♦ Fuel pump might be stationary

P307800

Diagnosis information DME control module

P307800 Throttle valve control unit - air throughput at idle too low

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Offset standardized mass air flow through throttle valve < -8.0 kg/h

Monitored component or system

♦ Throttle adjuster

Diagnosis information DME control module

P308800 Starter relay - electrical fault in circuit

Diagnostic conditions

● Activation of the starter output stages during the starting process

Fault setting condition(s)

● It is tested whether the motor turns and a feedback signal from terminal 50R is present after activation of the two starter relays. After brief detection of engine speed/camshaft movement during starter output stage activation, a faulty starter can be assumed.
● Relays are activated, but do not close. Consequently the motor does not turn and there is no feedback signal

Monitored component or system

♦ Starter relay

Fault finding notes

♦ Check of the relay wiring, terminal 50R and starter wiring
♦ Check of the relays

Function restrictions

♦ Vehicle does not start because the relays do not close

Diagnosis information DME control module

P308D00 Fuel pump - too slow

Diagnostic conditions

- Ignition on
- Activation of the fuel pump electronics/fuel pump
- Diagnostics runs continuously (test takes place in every grid of the process)

Fault setting condition(s)

- Overcurrent
- Current measurement via measuring shunt
- Total current from all three phases
- Speed deviation

Monitored component or system

♦ Fuel pump electronics

Fault finding notes

♦ Check of the fuel system, e.g. fuel filter, sluggish pump (flow measurement), kinked fuel line

Function restrictions

♦ Speed limitation of the fuel pump
♦ Possibly torque restriction

Diagnosis information DME control module

P308E00 Fuel pump electronics - overtemperature

Diagnostic conditions

- Ignition on
- Activation of the fuel pump electronics/fuel pump
- Diagnostics runs continuously

Fault setting condition(s)

- Overtemperature in fuel pump electronics output stage (load circuit); the temperature is measured by means of NTC thermistors on the PCB next to the output stage outputs
- When the fuel pump electronics detect a fault, it reports this back to the DME control unit by connecting the signal line to ground at defined times corresponding to the fault. The length of the ground clocking corresponds to the respective fault.

Monitored component or system

♦ Fuel pump electronics

Fault finding notes

♦ Check for sluggish pump (flow measurement). If OK, then replace the fuel pump electronics

Function restrictions

♦ Fuel pump stationary
♦ Speed limitation of the fuel pump
♦ Possibly torque restriction

Diagnosis information DME control module

P309600 Control unit faulty

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- The evaluation IC reports "low supply voltage" (< 9.0 V)
- The evaluation IC reports a communication error

Monitored component or system

♦ Control unit: Evaluation IC for oxygen sensor

Fault finding notes

♦ Replace DME control unit

Function restrictions

♦ No detection of electrical faults on the signal lines possible, and lambda control is therefore no longer possible

Diagnosis information DME control module

P309700 Control unit faulty

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- The evaluation IC reports "low supply voltage" (< 9.0 V)
- The evaluation IC reports a communication error

Monitored component or system

♦ Control unit: Evaluation IC for oxygen sensor

Fault finding notes

♦ Replace DME control unit

Function restrictions

♦ No detection of electrical faults on the signal lines possible, and lambda control is therefore no longer possible

P310B00

Diagnosis information DME control module

P310B00 Fuel low pressure control - fuel pressure out of tolerance

Diagnostic conditions

- With engine running
- Diagnostics runs continuously

Fault setting condition(s)

- The measured fuel low pressure deviates significantly from the setpoint pressure

Monitored component or system

♦ Fuel low pressure system

Fault finding notes

♦ Check fuel lines (tightness)
♦ Check fuel filter (soiled/clogged)
♦ Check pressure retaining valve
♦ Check pressure limiting valve
♦ Check activation of electric fuel pump (low pressure)
♦ Check low pressure sensor (in the high pressure pump)
♦ Check electric fuel pump (low pressure) (pressure, delivery quantity)

P325500

Diagnosis information DME control module

P325500 Bank 1 oxygen sensor ahead of catalytic converter, heating circuit - control at upper limit

Diagnostic conditions

- Dew point end reached
- Heater control active for 50.0 sec
- Heater control not active for 50.0 sec
- Exhaust gas temperature at the sensor > 299.991 °C (571.984 °F)
- Diagnostics runs continuously

Fault setting condition(s)

- If the setpoint temperature of the sensor ceramic element (684.998 °C/1,264.996 °F) is not reached during control operation of the heater, the pulse/duty ratio converges to 100%. The fault is set if this state is present for 60.0 sec.

Monitored component or system

♦ Oxygen sensor heating ahead of catalytic converter

Fault finding notes

♦ Check of the heater resistance: Important: Oxygen sensor at room temperature (20-25 °C/68-77 °F)! Unplug the oxygen sensor and measure the resistance at the contacts on the plug between "heater contact (-)" and "heater (battery positive voltage)". R=2.4-4.0 Ohm. If the heater resistor is incorrect, the oxygen sensor is replaced
♦ Test of the power supply: Important: The ignition must be on for this purpose! Unplug the oxygen sensor and measure at the contacts on the coupling between "heating (battery positive voltage)" and "K ground". U=10 V. If there is no voltage, the line must be checked for open circuit and replaced if necessary
♦ Check of the lines "heater contact (-)" and "heating (battery positive voltage)" for open circuit and short circuits
♦ If open circuits or short circuits are present, the lines must be repaired
♦ If the fault occurs nevertheless, the DME control unit must be checked

P325600

Diagnosis information DME control module

P325500 Bank 1 oxygen sensor ahead of catalytic converter, heating circuit - control at upper limit

Diagnostic conditions

- Dew point end reached
- Heater control active for 50.0 sec
- Heater control not active for 50.0 sec
- Exhaust gas temperature at the sensor > 299.991 °C (571.984 °F)
- Diagnostics runs continuously

P326600

Diagnosis information DME control module

P326600 Bank 1 sensor 1 - internal resistance implausible

Diagnostic conditions

● Only during the starting phase : Dew point end reached, heater control active, minimum off time > 180.0 sec, time after activation of heater control = 40.0 sec
● Diagnostics runs once per driving cycle

Fault setting condition(s)

● The ceramic element temperature is less than the minimum temperature (719.991 ° C/1,327.984)

Monitored component or system

♦ Oxygen sensor heating ahead of catalytic converter

Fault finding notes

♦ Check of the heater resistance: Important: Oxygen sensor at room temperature (20-25 °C/68-77 °F)! Unplug the oxygen sensor and measure the resistance at the contacts on the plug between "heater contact (-)" and "heater (battery positive voltage)". R=2.4-4.0 Ohm. Diagnosis information DME control module

U000100 Drive data bus faulty

Diagnostic conditions

- Ignition on

Fault setting condition(s)

- Bus-off monitoring; the fault entry is made after 250 ms continuous bus off

Monitored component or system

♦ CAN communication: Drive CAN

Fault finding notes

♦ Check electrical connections of the CAN line

Function restrictions

♦ Various restrictions possible: engine does not start, torque restriction, transmission limp-home mode

Diagnosis information DME control module

U000200 Drive data bus - no communication

Diagnostic conditions

- Ignition on

Fault setting condition(s)

- Timeout monitoring: no message receipt on drive CAN

Monitored component or system

♦ CAN communication: Drive CAN

Fault finding notes

♦ Check drive data bus

Function restrictions

♦ All messages sent on the drive CAN are no longer evaluated

U010100

Diagnosis information DME control module

Uxxxx00 Communication with control unit XY

Diagnostic conditions

● Ignition on

Fault setting condition(s)

● Timeout monitoring: No message receipt of at least one of the CAN identifiers applied for the adaptive cruise control (ACC).

Monitored component or system

♦ CAN communication with the specified control unit

Fault finding notes

♦ Check DME control unit coding
♦ Check the power supply of the specified control unit
♦ Check CAN for the specified control unit
♦ Check specified control unit

Function restrictions

♦ All messages of the specified control unit are no longer evaluated.
♦ The specified control unit can no longer be addressed by all other control units

Diagnosis information DME control module

Diagnosis information DME control module

U030200 Transmission control unit - check data record

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- DME control unit is coded for manual transmission, but nevertheless still receives transmission messages

Monitored component or system

♦ CAN communication: transmission messages

Fault finding notes

♦ This fault is entered if the DME control unit in an automatic vehicle is incorrectly coded for a manual transmission

Diagnosis information DME control module

U032300 Check fault memory content/coding of air conditioner control unit

Diagnostic conditions

- Ignition on

Monitored component or system

♦ CAN communication: ambient temperature

Diagnosis information DME control module

Uxxxx00 Check XY control unit fault memory content

Diagnostic conditions

● Ignition on

Fault setting condition(s)

● Monitoring for stopped message counter: The same message count is received several times in sequence, the message counter received in the XY message always includes the same value for an applicable number of messages.
● Monitoring of the data length code: An incorrect message length was detected several times; the received XY message is shorter than the applied length
● Monitoring of the checksum: Incorrect checksum received several times in sequence; the checksum received in the XY message does not agree with the checksum calculated by the DME control unit for an applicable number of messages.
● Timeout monitoring: No message receipt. The identifier applied for the XY message is not received

Monitored component or system

♦ CAN communication with control unit message of the specified XY control unit

Fault finding notes

♦ Check XY control unit fault memory content

Function restrictions

♦ Control unit XY message is no longer evaluated

Diagnosis information DME control module

Uxxxx00 Check XY control unit fault memory content

Diagnostic conditions

● Ignition on

Fault setting condition(s)

● Monitoring for stopped message counter: The same message count is received several times in sequence, the message counter received in the XY message always includes the same value for an applicable number of messages.
● Monitoring of the data length code: An incorrect message length was detected several times; the received XY message is shorter than the applied length
● Monitoring of the checksum: Incorrect checksum received several times in sequence; the checksum received in the XY message does not agree with the checksum calculated by the DME control unit for an applicable number of messages.
● Timeout monitoring: No message receipt. The identifier applied for the XY message is not received

Monitored component or system

♦ CAN communication with control unit message of the specified XY control unit

Fault finding notes

♦ Check XY control unit fault memory content

Function restrictions

♦ Control unit XY message is no longer evaluated

Diagnosis information DME control module

U041500 Check PSM control unit fault memory content

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- The fault is set if the brake pressure is invalid (CAN bit) and the fault identification of the brake pressure (CAN signal) is set at the same time. In other words, the fault is set if the signal quality of the brake pressure is "bad" and the transmitted brake pressure is "FFhex"
- Vehicle speed sensor value range test. The maximum fault is detected when the vehicle speed exceeds the maximum value. Diagnostics is not performed if there is a fault in the vehicle speed sensor (component or CAN signal not valid)
- Monitoring for stopped message counter: The same message count is received 5 times in sequence, the message counter received in the PSM message always includes the same value for an applicable number of messages (4)
- Monitoring of the data length code: An incorrect message length was detected 3 times; the received PSM message is shorter than the applied length (8)
- Monitoring of the checksum: Incorrect checksum received 3 times in sequence; the checksum received in the PSM message does not agree with the checksum calculated by the DME control unit for an applicable number of messages (3)
- Monitoring of the speed signal

Monitored component or system

- PSM control unit
- PSM speed signal
- CAN communication: PSM messages

Fault finding notes

- Check drive data bus and PSM control unit
- Read out PSM control unit fault memory

Function restrictions

- Start/stop is deactivated
- Adaptive cruise control (ACC)/cruise control is switched off
- Torque limitation

Diagnosis information DME control module

U041600 PSM control unit - implausible signal

Diagnostic conditions

- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- Brake booster vacuum value from PSM control unit: Message remains at the initialization value or sends fault value

Monitored component or system

♦ Pressure sensor for brake booster

Fault finding notes

♦ Read out PSM control unit fault memory.

Function restrictions

♦ Start/stop not available
♦ On vehicles with electrical vacuum pump, it is activated as long as the fault as present. The electrical vacuum pump could be damaged as a result

U041700

Diagnosis information DME control module

Uxxxx00 Check XY control unit fault memory content

Diagnostic conditions

● Ignition on

Fault setting condition(s)

● Monitoring for stopped message counter: The same message count is received several times in sequence, the message counter received in the XY message always includes the same value for an applicable number of messages.
● Monitoring of the data length code: An incorrect message length was detected several times; the received XY message is shorter than the applied length
● Monitoring of the checksum: Incorrect checksum received several times in sequence; the checksum received in the XY message does not agree with the checksum calculated by the DME control unit for an applicable number of messages.
● Timeout monitoring: No message receipt. The identifier applied for the XY message is not received

Monitored component or system

♦ CAN communication with control unit message of the specified XY control unit

Fault finding notes

♦ Check XY control unit fault memory content

Function restrictions

♦ Control unit XY message is no longer evaluated

Diagnosis information DME control module

Uxxxx00 Check XY control unit fault memory content

Diagnostic conditions

● Ignition on

Diagnostic conditions

● Ignition on

Fault setting condition(s)

● Monitoring for stopped message counter: The same message count is received several times in sequence, the message counter received in the XY message always includes the same value for an applicable number of messages.
● Monitoring of the data length code: An incorrect message length was detected several times; the received XY message is shorter than the applied length
● Monitoring of the checksum: Incorrect checksum received several times in sequence; the checksum received in the XY message does not agree with the checksum calculated by the DME control unit for an applicable number of messages.
● Timeout monitoring: No message receipt. The identifier applied for the XY message is not received

Monitored component or system

♦ CAN communication with control unit message of the specified XY control unit

Fault finding notes

♦ Check XY control unit fault memory content

Function restrictions

♦ Control unit XY message is no longer evaluated

U100300

Diagnosis information DME control module

Uxxxx00 Communication with control unit XY

Diagnostic conditions

● Ignition on

Fault setting condition(s)

● Timeout monitoring: No message receipt of at least one of the CAN identifiers applied for the adaptive cruise control (ACC).

Monitored component or system

♦ CAN communication with the specified control unit

Fault finding notes

♦ Check DME control unit coding
♦ Check the power supply of the specified control unit
♦ Check CAN for the specified control unit
♦ Check specified control unit

Function restrictions

♦ All messages of the specified control unit are no longer evaluated.
♦ The specified control unit can no longer be addressed by all other control units

Diagnosis information DME control module

Uxxxx00 Check XY control unit fault memory content

Diagnostic conditions

● Ignition on

Fault setting condition(s)

● Monitoring for stopped message counter: The same message count is received several times in sequence, the message counter received in the XY message always includes the same value for an applicable number of messages.
● Monitoring of the data length code: An incorrect message length was detected several times; the received XY message is shorter than the applied length
● Monitoring of the checksum: Incorrect checksum received several times in sequence; the checksum received in the XY message does not agree with the checksum calculated by the DME control unit for an applicable number of messages.
● Timeout monitoring: No message receipt. The identifier applied for the XY message is not received

Monitored component or system

♦ CAN communication with control unit message of the specified XY control unit

Fault finding notes

♦ Check XY control unit fault memory content

Function restrictions

♦ Control unit XY message is no longer evaluated

Diagnosis information DME control module

U100800 Check gateway control unit fault memory content

Diagnostic conditions

- Engine on
- Diagnostics runs continuously

Fault setting condition(s)

- Generator power plausibility check; the requested generator power is too high
- Generator load plausibility check; the generator load via CAN is maximum and in the invalid range

Monitored component or system

♦ Interface with front-end electronics control unit ♦ Front-end electronics control unit

Fault finding notes

♦ Poll front-end electronics control unit fault memory

Diagnosis information DME control module

Uxxxx00 Communication with control unit XY

Diagnostic conditions

● Ignition on

Fault setting condition(s)

● Timeout monitoring: No message receipt of at least one of the CAN identifiers applied for the adaptive cruise control (ACC).

Monitored component or system

♦ CAN communication with the specified control unit

Fault finding notes

♦ Check DME control unit coding
♦ Check the power supply of the specified control unit
♦ Check CAN for the specified control unit
♦ Check specified control unit

Function restrictions

♦ All messages of the specified control unit are no longer evaluated.
♦ The specified control unit can no longer be addressed by all other control units

Diagnosis information DME control module

U101000 heck parking brake control unit fault memory content

Diagnostic conditions

- Receipt of message from parking brake control unit

Fault setting condition(s)

- Clutch fault status of the parking brake message

Monitored component or system

♦ Clutch travel sensor

Fault finding notes

♦ Check via parking brake actual values and clutch travel sensor function
♦ Observe parking brake control unit fault memory entries

Diagnosis information DME control module

Uxxxx00 Communication with control unit XY

Diagnostic conditions

● Ignition on

Fault setting condition(s)

● Timeout monitoring: No message receipt of at least one of the CAN identifiers applied for the adaptive cruise control (ACC).

Monitored component or system

♦ CAN communication with the specified control unit

Fault finding notes

♦ Check DME control unit coding
♦ Check the power supply of the specified control unit
♦ Check CAN for the specified control unit
♦ Check specified control unit

Function restrictions

♦ All messages of the specified control unit are no longer evaluated.
♦ The specified control unit can no longer be addressed by all other control units

Diagnosis information DME control module

U101700 Check PSM control unit fault memory content

Diagnostic conditions

- Valid PSM message received
- Ignition on
- Diagnostics runs continuously

Fault setting condition(s)

- PSM control unit reports a sensor fault during brake pressure evaluation
- Transverse acceleration not available via CAN
- Monitoring of individual wheel speed signals

Monitored component or system

♦ PSM control unit
♦ Signal, wheel speeds

Fault finding notes

♦ Brake light switch faulty
♦ Check positioning of brake light switch
♦ Check drive data bus and PSM control unit

Function restrictions

♦ Rejection of adaptive cruise control (ACC) /cruise control

U101900

Diagnosis information DME control module

U101900 Check instrument cluster fault memory content

Diagnostic conditions

- Ignition on

Monitored component or system

♦ CAN communication: Oil level/oil temperature sender

Diagnosis information DME control module

U102500 Check air conditioner control unit fault memory content

Diagnostic conditions

- Ignition on

Fault setting condition(s)

- Monitoring of compressor load
- Monitoring of radiator fan signal

Monitored component or system

♦ Compressor load signal
♦ Radiator fan signal

Fault finding notes

♦ Check electrical connection between DME control unit and A/C compressor, or check the A/C compressor
♦ CAN fault: air conditioner control unit - radiator fan control unit

Function restrictions

♦ Air conditioner does not function
♦ Radiator fans run at 100%

Diagnosis information DME control module

U102600 Check transmiss. control unit fault memory content

Diagnostic conditions

- Receipt of transmission message
- CAN message active
- Diagnostics runs continuously

Fault setting condition(s)

- Clutch fault status of the transmission message
- Transmission continuously signals clutch sensor fault via CAN
- Fault value on "transfer function" signal received from transmission control unit

Monitored component or system

♦ Transmission control unit
♦ CAN clutch signal from transmission control unit
♦ CAN signal transfer function from transmission

Fault finding notes

♦ Check the transmission via actual values
♦ Observe fault memory entries from transmission
♦ If a fault value is received on the "transfer function" signal from the transmission control unit, then read out the transmission control unit fault memory

Function restrictions

♦ Automatic transmission vehicle cannot be started

Diagnosis information DME control module

U110300 Production mode active

Diagnostic conditions

- Diagnostics runs continuously

Fault setting condition(s)

- Production mode set

Monitored component or system

♦ Control unit

Fault finding notes

♦ Perform vehicle handover with Tester

Function restrictions

♦ MIL or warning message in instrument cluster "engine control fault" on
♦ Rpm limitation
♦ Speed limitation
♦ Torque limitation
♦ Suppression of catalytic converter heating

Diagnostic information - DME control unit

U110300 Transport mode active

Diagnostic conditions
- Diagnostics runs continuously

Fault setting condition(s)
- Transport mode set

Monitored component or system
- Control unit

Fault finding notes
- Perform vehicle handover using Tester

Functional restrictions
- MIL on and/or "Fault engine control" warning message in instrument cluster
- Engine speed limitation
- Speed limitation
- Torque limitation
- Suppression of catalytic converter heating

Diagnosis information DME control module

U111200 Function restriction due to implausible message

Diagnostic conditions

● If the DME control unit is coded for cruise control, the corresponding operating lever is installed and cruise control is selected, the diagnostic function is released from ignition on
● If the DME control unit is coded for adaptive cruise control (ACC), the adaptive cruise control (ACC) is in the ACTIVE or OVERRIDE state and the driver performs braking intervention, the diagnostic function is released from ignition on
● If the DME control unit is coded for adaptive cruise control (ACC) and no corresponding CAN faults occur, the diagnostic function is released from terminal 15 on.
● Diagnostics runs continuously from ignition on

Fault setting condition(s)

● The driver brakes and the adaptive cruise control (ACC) remains in the ACTIVE or OVERRIDE state
● The adaptive cruise control ACC/cruise control main switch is "OFF", but an adaptive cruise control (ACC) torque request continues to be sent
● Speed signals in the instrument cluster and the vehicle speed deviate from each other
● Signals of the cruise control operating lever received in the DME control unit indicate an implausible button combination

Monitored component or system

♦ Adaptive cruise control (ACC) control unit
♦ DME control unit
♦ Speed in instrument cluster
♦ Cruise control operating lever

Fault finding notes

♦ Check brake light switch information
♦ Check whether the adaptive cruise control (ACC) control unit receives the brake light switch information
♦ Check whether the adaptive cruise control (ACC) control unit properly receives the plausibility-checked main switch (CAN and component signal)
♦ Check speed signals in/to the instrument cluster
♦ Check measurement of the vehicle speed
♦ Check coding in the instrument cluster
♦ Contact product support
♦ Ensure unambiguous actuation of the cruise control operating lever buttons. Use actual value to check whether plausible button combinations are sent from the cruise control operating lever.

If one button is pressed and two buttons are measured, then update the control unit and then replace the operating unit if necessary. If two buttons are pressed and two buttons are measured, then perform a software setpoint/actual comparison. If the fault is still present or recurs or updating is not possible, then contact the product support department

Function restrictions

♦ No adaptive cruise control (ACC)/cruise control operation possible in the current ignition cycle

Diagnosis information DME control module

U111300 Function restriction due to received fault value

Diagnostic conditions

● If the DME control unit is coded for cruise control, the corresponding operating lever is installed and cruise control is selected, the diagnostic function is released from ignition on
● If a longitudinal acceleration sensor is installed in the vehicle

Fault setting condition(s)

● Instrument cluster sends fault value for speed signal
● Front-end electronics control unit or steering wheel electronics reports a fault of the cruise control operating lever
● Longitudinal acceleration sensor sends a fault value

Monitored component or system

♦ Instrument cluster (dashboard insert)
♦ Adaptive cruise control (ACC)/cruise control operating lever
♦ Longitudinal acceleration sensor

Fault finding notes

♦ Read out instrument cluster fault memory
♦ Function test of the cruise control operating lever
♦ Read out fault memory of the front end electronics and steering wheel electronics
♦ Read out fault memory of PSM or parking brake

Function restrictions

♦ No adaptive cruise control (ACC)/cruise control operation possible in the current ignition cycle
♦ No correct calculation of the road gradient

Diagnosis information DME control module

U140A00 DME control unit - terminal 30 open circuit

Diagnostic conditions

● Control unit run-on phase must be completely ended.

Fault setting condition(s)

● Monitoring of the power supply for the shutoff timer in the control unit via terminal 30 pin (continuous supply) during the de-energized state (main relay dropped out).

Monitored component or system

♦ Control unit: Voltage monitoring, terminal 30 pin (continuous supply)

Fault finding notes

♦ Check voltage at terminal 30 pin (fuse, line open circuit)

Function restrictions

♦ Shutoff time is invalid
♦ Locking of temperature sensor plausibility check during cold starting
♦ Restrictions in the maintenance interval calculation

Cayenne, MY 2015-

Diagnosis information - DME (DFI) V6T + V8

P000A

Diagnostic information - DME (DFI) control unit

Bank 1 intake camshaft adjustment

Diagnostic conditions
- Perform a short test

or:
- **Engine oil temperature** -10 ... +120 °C (14 … 248 °F)
- **Engine speed** 1,200 ... 6,000 rpm
- None of the following faults stored: P0010, P0020, P2088, P2089, P2092, P2093

Possible fault causes
- ♦ Dynamic driving style when oil level is near minimum (oil foaming)
- ♦ Solenoid valve for hydraulic camshaft adjustment faulty
  ⇒ (e.g. mechanical fault or dirt (oil circuit))
- ♦ Engine oil pressure too low
  ⇒ (e.g. oil thinning, oil thickening, wrong oil quality, oil pressure control or oil pump faulty)
- ♦ Camshaft adjustment faulty
- ♦ Intake camshaft stuck

Fault setting condition(s)
- Actual value/setpoint deviation > 10° on intake camshaft

or
- Intake camshaft adjustment slow

P000B

Diagnostic information - DME (DFI) control unit

Bank 1 exhaust camshaft adjustment

Diagnostic conditions
- Perform a short test

or:
- Engine oil temperature -10 ... +120 °C (14 … 248 °F)
- Engine speed 1,200 ... 6,000 rpm
- None of the following faults stored: P0013, P0023, P2090, P2091, P2094, P2095

Possible fault causes
- ♦ Dynamic driving style when oil level is near minimum (oil foaming)
- ♦ Solenoid valve for hydraulic camshaft adjustment faulty
  ⇒ (e.g. mechanical fault or dirt (oil circuit))
- ♦ Engine oil pressure too low
  ⇒ (e.g. oil thinning, oil thickening, wrong oil quality, oil pressure control or oil pump faulty)
- ♦ Camshaft adjustment faulty
- ♦ Exhaust camshaft stuck

Fault setting condition(s)
- Actual value/setpoint deviation > 10° on exhaust camshaft

or
- Exhaust camshaft adjustment slow

Diagnostic information - DME (DFI) control unit

Bank 2 intake camshaft adjustment

Diagnostic conditions
- Perform a short test

or:
- Engine oil temperature -10 ... +120 °C (14 … 248 °F)
- Engine speed 1,200 .... 6,000 rpm
- None of the following faults stored: P0010, P0020, P2088, P2089, P2092, P2093

Possible fault causes
- ♦ Dynamic driving style when oil level is near minimum (oil foaming)
- ♦ Solenoid valve for hydraulic camshaft adjustment faulty
  ⇒ (e.g. mechanical fault or dirt (oil circuit))
- ♦ Engine oil pressure too low
  ⇒ (e.g. oil thinning, oil thickening, wrong oil quality, oil pressure control or oil pump faulty)
- ♦ Camshaft adjustment faulty
- ♦ Intake camshaft stuck

Fault setting condition(s)
- Actual value/setpoint deviation > 10° on intake camshaft

or
- Intake camshaft adjustment slow

Diagnostic information - DME (DFI) control unit

Bank 1 exhaust camshaft adjustment

Diagnostic conditions
- Perform a short test

or:
- Engine oil temperature -10 ... +120 °C (14 … 248 °F)
- Engine speed 1,200 ... 6,000 rpm
- None of the following faults stored: P0013, P0023, P2090, P2091, P2094, P2095

Possible fault causes
- ♦ Dynamic driving style when oil level is near minimum (oil foaming)
- ♦ Solenoid valve for hydraulic camshaft adjustment faulty
  ⇒ (e.g. mechanical fault or dirt (oil circuit))
- ♦ Engine oil pressure too low
  ⇒ (e.g. oil thinning, oil thickening, wrong oil quality, oil pressure control or oil pump faulty)
- ♦ Camshaft adjustment faulty
- ♦ Exhaust camshaft stuck

Fault setting condition(s)
- Actual value/setpoint deviation > 10° on exhaust camshaft

or
- Exhaust camshaft adjustment slow

P0010

Diagnostic information - DME (DFI) control unit

Intake camshaft adjustment output stage, bank 1

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

Diagnostic information - DME (DFI) control unit

Bank 1 intake camshaft adjustment

Diagnostic conditions
- Perform a short test

or:
- **Engine oil temperature** -10 ... +120 °C (14 … 248 °F)
- **Engine speed** 1,200 ... 6,000 rpm
- None of the following faults stored: P0010, P0020, P2088, P2089, P2092, P2093

Possible fault causes
- ♦ Dynamic driving style when oil level is near minimum (oil foaming)
- ♦ Solenoid valve for hydraulic camshaft adjustment faulty
  ⇒ (e.g. mechanical fault or dirt (oil circuit))
- ♦ Engine oil pressure too low
  ⇒ (e.g. oil thinning, oil thickening, wrong oil quality, oil pressure control or oil pump faulty)
- ♦ Camshaft adjustment faulty
- ♦ Intake camshaft stuck

Fault setting condition(s)
- Actual value/setpoint deviation > 10° on intake camshaft

or
- Intake camshaft adjustment slow

P0013

Diagnostic information - DME (DFI) control unit

Bank 1 exhaust camshaft adjustment output stage

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- ♦ Short circuit to B+/ground or open circuit in the line (activation)
- ♦ Short circuit to ground or open circuit in the lines (power supply)
- ♦ Fuse faulty
- ♦ Solenoid valve for hydraulic camshaft adjustment faulty

Diagnostic information - DME (DFI) control unit

Bank 1 exhaust camshaft adjustment

Diagnostic conditions
- Perform a short test

or:
- Engine oil temperature -10 ... +120 °C (14 … 248 °F)
- Engine speed 1,200 ... 6,000 rpm
- None of the following faults stored: P0013, P0023, P2090, P2091, P2094, P2095

Possible fault causes
- ♦ Dynamic driving style when oil level is near minimum (oil foaming)
- ♦ Solenoid valve for hydraulic camshaft adjustment faulty
  ⇒ (e.g. mechanical fault or dirt (oil circuit))
- ♦ Engine oil pressure too low
  ⇒ (e.g. oil thinning, oil thickening, wrong oil quality, oil pressure control or oil pump faulty)
- ♦ Camshaft adjustment faulty
- ♦ Exhaust camshaft stuck

Fault setting condition(s)
- Actual value/setpoint deviation > 10° on exhaust camshaft

or
- Exhaust camshaft adjustment slow

P0016

Diagnostic information - DME (DFI) control unit

Crankshaft position in relation to bank 1 intake camshaft

Diagnostic conditions
- Time since engine start > 10 second(s)

Possible fault causes
- Timing set incorrectly
- Timing chain stretched
- Camshaft adjustment faulty (locking)
- Hall sender rotor (camshaft) wrong or damaged
- Intake camshaft sensor wrong

Fault setting condition(s)
- Adaptation not within the valid value range

Diagnostic information - DME (DFI) control unit

Crankshaft position in relation to bank 1 exhaust camshaft

Diagnostic conditions
- Time since engine start > 10 second(s)

Possible fault causes
- Timing set incorrectly
- Timing chain stretched
- Camshaft adjustment faulty (locking)
- Hall sender rotor (camshaft) wrong or damaged
- Exhaust camshaft sensor wrong

Fault setting condition(s)
Adaptation not within the valid value range

P0018

Diagnostic information - DME (DFI) control unit

Crankshaft position in relation to bank 2 intake camshaft

Diagnostic conditions
- Time since engine start > 10 second(s)

Possible fault causes
- ♦ Timing set incorrectly
- ♦ Timing chain stretched
- ♦ Camshaft adjustment faulty (locking)
- ♦ Hall sender rotor (camshaft) wrong or damaged
- ♦ Intake camshaft sensor wrong

Fault setting condition(s)
- Adaptation not within the valid value range

Diagnostic information - DME (DFI) control unit

Crankshaft position in relation to bank 2 exhaust camshaft

Diagnostic conditions
- Time since engine start > 10 second(s)

Possible fault causes
- Timing set incorrectly
- Timing chain stretched
- Camshaft adjustment faulty (locking)
- Hall sender rotor (camshaft) wrong or damaged
- Exhaust camshaft sensor wrong

Fault setting condition(s)
Adaptation not within the valid value range

P0020

Diagnostic information - DME (DFI) control unit

Intake camshaft adjustment output stage, bank 2

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

Diagnostic information - DME (DFI) control unit

Bank 2 intake camshaft adjustment

Diagnostic conditions
- Perform a short test

or:
- Engine oil temperature -10 ... +120 °C (14 … 248 °F)
- Engine speed 1,200 .... 6,000 rpm
- None of the following faults stored: P0010, P0020, P2088, P2089, P2092, P2093

Possible fault causes
- ♦ Dynamic driving style when oil level is near minimum (oil foaming)
- ♦ Solenoid valve for hydraulic camshaft adjustment faulty
  ⇒ (e.g. mechanical fault or dirt (oil circuit))
- ♦ Engine oil pressure too low
  ⇒ (e.g. oil thinning, oil thickening, wrong oil quality, oil pressure control or oil pump faulty)
- ♦ Camshaft adjustment faulty
- ♦ Intake camshaft stuck

Fault setting condition(s)
- Actual value/setpoint deviation > 10° on intake camshaft

or
- Intake camshaft adjustment slow

P0023

Diagnostic information - DME (DFI) control unit

Bank 2 exhaust camshaft adjustment output stage

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

Diagnostic information - DME (DFI) control unit

Bank 1 exhaust camshaft adjustment

Diagnostic conditions
- Perform a short test

or:
- Engine oil temperature -10 ... +120 °C (14 … 248 °F)
- Engine speed 1,200 ... 6,000 rpm
- None of the following faults stored: P0013, P0023, P2090, P2091, P2094, P2095

Possible fault causes
- ♦ Dynamic driving style when oil level is near minimum (oil foaming)
- ♦ Solenoid valve for hydraulic camshaft adjustment faulty
  ⇒ (e.g. mechanical fault or dirt (oil circuit))
- ♦ Engine oil pressure too low
  ⇒ (e.g. oil thinning, oil thickening, wrong oil quality, oil pressure control or oil pump faulty)
- ♦ Camshaft adjustment faulty
- ♦ Exhaust camshaft stuck

Fault setting condition(s)
- Actual value/setpoint deviation > 10° on exhaust camshaft

or
- Exhaust camshaft adjustment slow

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor upstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

● Engine running > 10 second(s)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor upstream of catalytic converter, bank 1
faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor upstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

● Engine running > 10 second(s)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor upstream of catalytic converter, bank 1
faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor upstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

● Engine running > 10 second(s)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor upstream of catalytic converter, bank 1
faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor downstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 10 second(s)
- Oxygen sensor heater active

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor downstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 10 second(s)
- Oxygen sensor heater active

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor downstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 10 second(s)
- Oxygen sensor heater active

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor(s) upstream of catalytic converter interchanged

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Lambda control active
- Driving with:
  - small valve lift (See Actual value A220)
  - large valve lift (See Actual value A220)

Possible fault causes

♦ Oxygen sensors upstream of catalytic converter bank 1 and bank 2 interchanged

Diagnostic information - DME (DFI) control unit

Oxygen sensor(s) downstream of catalytic converter interchanged

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Steady driving > 20 minute(s) at:
  - approx. 80 km/h (50 mph)
  - in the highest gear
  - Lambda control (behind catalytic converter) active

Possible fault causes

♦ Oxygen sensors downstream of catalytic converter bank 1 and bank 2 interchanged

Diagnostic information - DME (DFI) control unit

Turbocharger governor

Diagnostic conditions
- Full-load acceleration

Possible fault causes
- ♦ Ambient pressure too low (e.g. at high altitude)
- ♦ Boost pressure too high (P0234) at high altitude

Fault setting condition(s)
Turbocharger exceeds speed limits ⇒ approx. 170,000 ... 180,000 rpm (See ⓘ)

Fault effects
- ♦ Reduced engine torque
- ♦ Wastegate open

ⓘ INFORMATION
The turbocharger's speed is calculated from various input variables.

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor upstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

● Engine running > 10 second(s)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor upstream of catalytic converter, bank 2
faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor upstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

● Engine running > 10 second(s)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor upstream of catalytic converter, bank 2
faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor upstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

● Engine running > 10 second(s)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor upstream of catalytic converter, bank 2
faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater upstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 10 minute(s) with:
  - Engine at operating temperature
  - at least 1 overrun phase(s) > 6 second(s)
- then idling > 40 second(s)

Possible fault causes

♦ Electrical fault in electric circuit (short circuit) for oxygen sensor heater

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor downstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 10 second(s)
- Oxygen sensor heater active

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor downstream of catalytic converter, bank 2 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor downstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 10 second(s)
- Oxygen sensor heater active

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor downstream of catalytic converter, bank 2 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater driver for oxygen sensor downstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 10 second(s)
- Oxygen sensor heater active

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line (power supply or activation)

♦ Oxygen sensor downstream of catalytic converter, bank 2 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater upstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 10 minute(s) with:
  - Engine at operating temperature
  - at least 1 overrun phase(s) > 6 second(s)
- then idling > 40 second(s)

Possible fault causes

♦ Electrical fault in electric circuit (short circuit) for oxygen sensor heater

♦ Oxygen sensor upstream of catalytic converter bank 2 faulty

Diagnostic information - DME (DFI) control unit

Mass air flow implausible

ⓘ INFORMATION

Totals fault

One or more additional faults are entered that more precisely indicate the operating ranges in which the fault occurred.

- Near idle speed range:
  - ♦ P1069 + P1070 + P1071 + P1072 + P1073
- Lower partial-load range :
  - ♦ P1074 + P1075
- Upper partial-load range :
  - ♦ P1076 + P1077

Diagnostic information - DME (DFI) control unit

Ambient temperature via CAN

Diagnostic conditions
- NO fault stored in the DME (DFI) control unit
- Driving > 80 km/h (49 mph) for > 15 minute(s)
- then driving > 1 minute(s) under the following conditions:
  - Coolant temperature 47 ... 108 °C (116 … 226 °F)
  - Engine speed 1,200 ... 4,000 rpm
  - Vehicle speed 40 ... 180 km/h (24 … 111 mph)

Possible fault causes
- ♦ Ambient temperature incorrect (sensor trimming incorrect/faulty)
- ♦ Intake air temperature incorrect (sensor trimming incorrect/faulty)
- Turbo only:
  - ♦ Charge-air cooler blocked, faulty, modified …

Fault setting condition(s)

ⓘ INFORMATION

The temperature model depends mainly on the measured intake air temperature.
- Deviation between ambient temperature via CAN and substitute value from model > 25 °C (77 °F)

Fault effects

♦ Substitute value from model
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

Diagnostic information - DME (DFI) control unit

Ambient temperature via CAN

Diagnostic conditions
- Ignition on > 5 second(s)

Possible fault causes
♦ Outside temperature sensor fault (See Fault memory for air-conditioning system regulator)

Fault setting condition(s)
Outside temperature sensor fault (See Fault memory for **air-conditioning system regulator**)

Fault effects
♦ Substitute value from model
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

Diagnostic information - DME (DFI) control unit

Ambient temperature via CAN

Diagnostic conditions
- Ignition on > 5 second(s)

Possible fault causes
♦ Outside temperature sensor fault (See Fault memory for air-conditioning system regulator)

Fault setting condition(s)
Outside temperature sensor fault (See Fault memory for **air-conditioning system regulator**)

Fault effects
♦ Substitute value from model
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

Diagnostic information - DME (DFI) control unit

Ambient temperature via CAN

Diagnostic conditions
- Ignition on > 5 second(s)

Possible fault causes
♦ Outside temperature sensor fault (See Fault memory for air-conditioning system regulator)

Fault setting condition(s)
Outside temperature sensor fault (See Fault memory for **air-conditioning system regulator**)

Fault effects
♦ Substitute value from model
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

P0076

Diagnostic information - DME (DFI) control unit

Valve lift control driver, bank 1

Diagnostic conditions
- Idle speed > 10 second(s)
- then increase engine speed until the large valve lift has been switched (See Actual value A220)

Possible fault causes
- ♦ Short circuit to B+/ground or open circuit in the line (activation)
- ♦ Short circuit to ground or open circuit in the lines (power supply)
- ♦ Fuse faulty
- ♦ Solenoid valve for hydraulic valve lift control faulty

P0077

Diagnostic information - DME (DFI) control unit

Valve lift control driver, bank 1

Diagnostic conditions
- Idle speed > 10 second(s)
- then increase engine speed until the large valve lift has been switched (See Actual value A220)

Possible fault causes
- ♦ Short circuit to B+/ground or open circuit in the line (activation)
- ♦ Short circuit to ground or open circuit in the lines (power supply)
- ♦ Fuse faulty
- ♦ Solenoid valve for hydraulic valve lift control faulty

P0082

Diagnostic information - DME (DFI) control unit

Valve lift control driver, bank 2

Diagnostic conditions
- Idle speed > 10 second(s)
- then increase engine speed until the large valve lift has been switched (See Actual value A220)

Possible fault causes
- ♦ Short circuit to B+/ground or open circuit in the line (activation)
- ♦ Short circuit to ground or open circuit in the lines (power supply)
- ♦ Fuse faulty
- ♦ Solenoid valve for hydraulic valve lift control faulty

P0083

Diagnostic information - DME (DFI) control unit

Valve lift control driver, bank 2

Diagnostic conditions
- Idle speed > 10 second(s)
- then increase engine speed until the large valve lift has been switched (See Actual value A220)

Possible fault causes
- ♦ Short circuit to B+/ground or open circuit in the line (activation)
- ♦ Short circuit to ground or open circuit in the lines (power supply)
- ♦ Fuse faulty
- ♦ Solenoid valve for hydraulic valve lift control faulty

P0089

Diagnostic information - DME (DFI) control unit

Fuel low pressure implausible

Diagnostic conditions
- Engine running > 2 second(s)
- Engine temperature 60 ... 110 °C (140 ... 230 °F)

Possible fault causes
- ♦ Fuel tank (driven) empty
  - ► See Extended fault memory
  - ⇒ Actual value **40-Fuel Level Input** [**0%**]
- ♦ Fuel filter clogged up
- ♦ Fuel line kinked/trapped
- ♦ Pressure relief valve in fuel delivery unit leaking
- ♦ Fuel delivery unit leaking
- ♦ Electric fuel pump faulty
- ♦ Fuel low-pressure sensor out of adjustment

Fault setting condition(s)
Setpoint-to-actual comparison of fuel pump control unit activation.
♦ If the actual fuel low-pressure value cannot follow the setpoint or cannot follow it quickly enough, a fault entry is made for a deviation of the actual fuel low-pressure value of:
- > 1,200 hPa below the setpoint for > 15 seconds

or
- > 2,400 hPa above the setpoint for > 15 seconds

P008A

Diagnostic information - DME (DFI) control unit

Fuel low-pressure system pressure too low

Diagnostic conditions
- Engine running > 2 second(s)

Possible fault causes
- ♦ Fuel tank (driven) empty
  - ► See Extended fault memory
  - ⇒ Actual value **40-Fuel Level Input** [**0%**]
- ♦ Fuel line detached
- ♦ Electric fuel pump faulty
- ♦ Fuel low-pressure sensor faulty

Fault setting condition(s)
Actual fuel low pressure value below 3,000 hPa minimum pressure for 0.7 seconds.

P008B

Diagnostic information - DME (DFI) control unit

Fuel low-pressure system pressure too high

Diagnostic conditions
- Engine running > 2 second(s)

Possible fault causes
- ♦ Fuel low-pressure sensor faulty
- ♦ Fuel high-pressure pump faulty (supplies high pressure to low-pressure side)

Fault setting condition(s)
Actual fuel low pressure value above 9,000 hPa maximum pressure for 0.7 seconds.
ⓘ The pressure relief valve in the fuel delivery unit opens at approx. 7,000 hPa.

P0090

Diagnostic information - DME (DFI) control unit

Bank 1 quantity control valve output stage

Diagnostic conditions
- Ignition on > 5 second(s)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Quantity control valve faulty (in bank 1 fuel high-pressure pump)

P0091

Diagnostic information - DME (DFI) control unit

Bank 1 quantity control valve output stage

Diagnostic conditions
- Ignition on > 5 second(s)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Quantity control valve faulty (in bank 1 fuel high-pressure pump)

P0092

Diagnostic information - DME (DFI) control unit

Bank 1 quantity control valve output stage

Diagnostic conditions
- Ignition on > 5 second(s)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Quantity control valve faulty (in bank 1 fuel high-pressure pump)

Diagnostic information - DME (DFI) control unit

Intake manifold pressure sensor

ⓘ INFORMATION

Totals fault

♦ One or more additional faults are entered that more precisely indicate where to look for the fault cause.

Diagnostic information - DME (DFI) control unit

Intake manifold pressure sensor implausible

Diagnostic conditions
- Ignition on > 10 second(s)
- then: Acceleration with wide-open throttle for as long as possible, immediately followed by an overrun phase lasting as long as possible
- None of the following faults stored: P1638, P1639, P0107, P0108, P2228, P2229, P1183, P1184, P1187, P1188, P1189, P1190

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Ground supply faulty
- ♦ Intake manifold pressure sensor faulty

- **ONLY** for '**40-Time after Start**' greater than **0** (see Extended fault memory):
  - ♦ Throttle valve adjusting unit soiled

Fault effects
- ♦ Substitute value from model

Diagnostic information - DME (DFI) control unit

Intake manifold pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running
- None of the following faults stored: P0234

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Ground supply faulty
- ♦ Intake manifold pressure sensor faulty

- **Turbo only**
  - Only if fault P1638 or P1639 (boost pressure sensor) is entered at the same time:
- ♦ Leak in vacuum hose at boost pressure control cycle valve or wastegate
- ♦ Boost pressure control cycle valve leaking
- ♦ Wastegate leaking

Fault effects
- ♦ Substitute value from model

Diagnostic information - DME (DFI) control unit

Intake manifold pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running
- None of the following faults stored: P0234

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Ground supply faulty
- ♦ Intake manifold pressure sensor faulty

- **Turbo only**
  - Only if fault P1638 or P1639 (boost pressure sensor) is entered at the same time:
- ♦ Leak in vacuum hose at boost pressure control cycle valve or wastegate
- ♦ Boost pressure control cycle valve leaking
- ♦ Wastegate leaking

Fault effects
- ♦ Substitute value from model

Diagnostic information - DME (DFI) control unit

Intake air temperature implausible

Diagnostic conditions
- Vehicle has NOT been and is NOT standing in the sun.
- Engine off > 9 hour(s)
- Engine coolant temperature cooling > 35 °C (95 °F), with:
  - Engine off
- then cold start, at:
  - Coolant temperature < 37 °C (98.6 °F)
  - Difference between intake air temperature <=> engine coolant temperature < 6 °C (42.8 °F)
- then driving, with:
  - Engine running > 23 minute(s)
  - Distance driven > 7 km (4 mi.)
  - Engine coolant temperature up to > 94 °C (201 °F)

Possible fault causes
- ♦ Intake air temperature sensor faulty (in intake manifold pressure sensor)
- ♦ Resistor installed (instead of intake air temperature sensor)

Fault setting condition(s)
- Change in intake air temperature < 1.5 °C (34.7 °F), at:
  - Diagnostic conditions

Fault effects
- ♦ Substitute coolant temperature value

P0112

Diagnostic information - DME (DFI) control unit

Intake air temperature sensor: electrical fault

Diagnostic conditions
- Engine running > 2 minute(s)
- Mass air flow < 150 kg/h

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Intake air temperature sensor faulty

Fault effects
- ♦ Substitute value from model

P0113

Diagnostic information - DME (DFI) control unit

Intake air temperature sensor: electrical fault

Diagnostic conditions
- Engine running > 2 minute(s)
- Mass air flow < 150 kg/h

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Intake air temperature sensor faulty

Fault effects
- ♦ Substitute value from model

P0114

Diagnostic information - DME (DFI) control unit

Intake air temperature sensor: electrical fault

Diagnostic conditions
- Ignition on > 10 second(s)

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Intake air temperature sensor faulty

Diagnostic information - DME (DFI) control unit

Engine coolant temperature implausibly high

Diagnostic conditions
- Thermal management system test (if available)

or
- Driving with:
  - Engine start temperature > 35 °C (95 °F)
  - Engine speed > 1,300 rpm
  - Vehicle speed > 40 km/h (24 mph)
  - Cooling performance high and low
- Then vehicle standstill, with:
  - Idle speed > 75 second(s)
- None of the following faults stored: P0117, P0118, P0119, P3081, P3082

Possible fault causes
- ♦ Engine coolant temperature sensor faulty
- ♦ Resistor installed (instead of coolant temperature sensor)

Fault setting condition(s)
- Change in engine coolant temperature < setpoint value (See ⓘ)

ⓘ INFORMATION
Change in setpoint value = depending on engine start temperature

Diagnostic information - DME (DFI) control unit

Engine coolant temperature sensor: electrical fault

Diagnostic conditions
- Ignition on

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Engine coolant temperature sensor faulty

Fault setting condition(s)
- Engine coolant temperature (measured) < -40 °C (-40 °F) (P0117), with:
  - Ignition on or engine running
  - and
  - Intake air temperature > -30 °C (-22 °F)
  - or
  - Engine running > 300 second(s)

or
- Engine coolant temperature (measured) > +130 °C (266 °F) (P0118), with:
  - Ignition on or engine running

Diagnostic information - DME (DFI) control unit

Engine coolant temperature sensor: electrical fault

Diagnostic conditions
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Engine coolant temperature sensor faulty

Fault setting condition(s)
- Engine coolant temperature (measured) < -40 °C (-40 °F) (P0117), with:
  - Ignition on or engine running
  - and
  - Intake air temperature > -30 °C (-22 °F)
  - or
  - Engine running > 300 second(s)

or
- Engine coolant temperature (measured) > +130 °C (266 °F) (P0118), with:
  - Ignition on or engine running

Diagnostic information - DME (DFI) control unit

Engine coolant temperature sensor: loose contact

Diagnostic conditions
- Ignition on
- None of the following faults stored: P0117, P0118

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Engine coolant temperature sensor faulty

Fault setting condition(s)
- Engine coolant temperature: Actual-value jumps > 3 °C (37 °F)

Fault effects
- ♦ Substitute value = last actual value that was detected as OK, with:
  - Actual-value jumps > 9.75 °C (49.5 °F)

Diagnostic information - DME (DFI) control unit

Accelerator pedal potentiometer implausible

Diagnostic conditions
- Ignition on > 3 second(s)
- then accelerator pedal pressed down fully > 3 second(s)
- then release accelerator pedal fully
- then idling > 10 second(s)

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in wiring to potentiometer 1 or 2
- ♦ Accelerator pedal potentiometer 1 or 2 faulty

Fault setting condition(s)
- The two potentiometer values differ too greatly from each other.
- It is not clear which value is incorrect.

Fault effects
- ♦ Engine does not respond to throttle, engine speed 1,000 rpm

P0122

Diagnostic information - DME (DFI) control unit

Accelerator pedal potentiometer 1

Diagnostic conditions
- Ignition on > 3 second(s)
- then accelerator pedal pressed down fully > 3 second(s)
- then release accelerator pedal fully
- then idling > 10 second(s)

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in wiring to potentiometer 1
- ♦ Accelerator pedal potentiometer 1 faulty

Fault effects
- ♦ The accelerator pedal angle is calculated from the remaining potentiometer signal.
- ♦ No acceleration initially + increased idle speed (approx. 800 rpm)
  - ▶ until the accelerator pedal is released fully.
  - ♦ Then acceleration, with
    - ♦ significantly reduced engine torque (max. approx.100 ... 180 Nm)
    - ♦ and limited engine speed (max. approx. 5,000 rpm)
  - ♦ If the accelerator and brake are pressed at the same time, the engine will run at idle speed.

P0123

Diagnostic information - DME (DFI) control unit

Accelerator pedal potentiometer 1

Diagnostic conditions
- Ignition on > 3 second(s)
- then accelerator pedal pressed down fully > 3 second(s)
- then release accelerator pedal fully
- then idling > 10 second(s)

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in wiring to potentiometer 1
- ♦ Accelerator pedal potentiometer 1 faulty

Fault effects
- ♦ The accelerator pedal angle is calculated from the remaining potentiometer signal.
- ♦ No acceleration initially + increased idle speed (approx. 800 rpm)
  - ▶ until the accelerator pedal is released fully.
  - ♦ Then acceleration, with
    - ♦ significantly reduced engine torque (max. approx.100 ... 180 Nm)
    - ♦ and limited engine speed (max. approx. 5,000 rpm)
  - ♦ If the accelerator and brake are pressed at the same time, the engine will run at idle speed.

P0128

Diagnostic information - DME (DFI) control unit

Thermostat stuck open

Diagnostic conditions
Preceding diagnostics:
- Driving > 10 minutes, with:
  - Engine start temperature (T072) -10 °C... +60 °C (+14 °F... +140 °C)
  - Ambient temperature (T050) > -10 °C (+14 °F)
  - Average vehicle speed (A100) > 35 ... 60 km/h (22 ... 37 mph)
    (depending on outside temperature > +60 °C ... < +20 °C/> +140 °F ... < +68 °F)
  - Vehicle speed max. 100 km/h (62 mph)
  - As few overrun phases as possible (< 100 second(s) in total)
  - Average mass air flow (H020) > 25 ... 35 kg/h
    (depending on outside temperature > +30 °C ... < -10 °C/> +86 °F ... < +14 °F)
  - With heating until engine coolant temperature > 80 °C/176 °F (T020)
- Preceding diagnostics ended without fault entry, then driving > 2 minutes at vehicle speed > 65 km/h (40 mph) and medium load

or
- System test of thermal management (if available)

Possible fault causes
- ♦ Influence by block heater
- ♦ 3/2-way valve faulty, with :
  - Original auxiliary heater
- ♦ Seal in thermostat housing faulty
- ♦ Thermostat housing faulty
- ♦ Thermostat faulty
- ♦ Engine coolant temperature sensor faulty or loose contact or corrosion on plugs or lines

Fault setting condition(s)
- Engine coolant temperature (T020) < 70 °C/158 °F for longer than 30 seconds

Fault effects
- ♦ Radiator shutter is opened
- ♦ Radiator shutter remains open until the fault has been healed or deleted from the fault memory
- ♦ Fault entry P2181 is also present

ⓘ INFORMATION
- ♦ This additional thermostat diagnostics starts only if the preceding thermostat diagnostics was ended without fault detection.
- ♦ It is required because, depending on the operating conditions, the radiator shutter can prevent reliable detection of a faulty thermostat.

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

● Idling > 3 second(s)

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

● Idling > 3 second(s)

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter bank 1, dynamic response

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Engine running > 2 minute(s) with:
  - Engine at operating temperature
  - All oxygen sensor(s) ready for operation
- then steady driving > 10 minute(s) at:
  - Engine speed < 800 ... 3,200 rpm
  - Mass air flow 120 … 520 mg/stroke
  - No overrun phase(s)

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Different air flow to oxygen sensor downstream of catalytic converter if:

  ♦ Catalytic converter is damaged

  ♦ Components modified or non-genuine components

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty (aged)

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater circuit upstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running, with:
  - **Oxygen sensor heater** downstream of catalytic converter active > 180 second(s)
  - Lambda control active
- None of the following faults stored: P0030, P0031, P0032

Possible fault causes

♦ Contact resistance (power supply or activation)

♦ Shunt (high resistance) in heater circuit ⇒ Signal line

♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 2 minute(s) with:
  - Engine at operating temperature
  - Mass air flow > 10 kg/h
- then idling > 30 second(s)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line

♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 2 minute(s) with:
  - Engine at operating temperature
  - Mass air flow > 10 kg/h
- then idling > 30 second(s)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line

♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Driving with:
  - Engine at operating temperature
  - Overrun phase(s)

Possible fault causes

♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

P013B

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Driving with:
  - Engine at operating temperature
  - Overrun phase(s)

Possible fault causes

♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Driving with:
  - Engine at operating temperature
  - Overrun phase(s)

Possible fault causes

♦ Oxygen sensor downstream of catalytic converter, bank 2 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Driving with:
  - Engine at operating temperature
  - Overrun phase(s)

Possible fault causes

♦ Oxygen sensor downstream of catalytic converter, bank 2 faulty

P013E

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence

or

- Engine temperature > 60 °C (140 °F)
- Time since engine start > 10 second(s)
- Catalytic converter temperature 540 ... 750 °C (1,004 ... 1,382 °F)
- Drive for 60 seconds with slight acceleration at 40 ... 130 km/h (24 … 80 mph)
- Active carbon filter loading < 0.7
- Engine speed < 3,000 rpm
- Lambda control ahead of catalytic converter active
- Lambda control behind catalytic converter active
- None of the following faults stored: Oxygen sensor(s) - electrical fault, intake manifold pressure sensor or throttle adjusting unit

Possible fault causes

♦ Different air flow to oxygen sensor downstream of catalytic converter if:
  ♦ Catalytic converter is damaged
  ♦ Components modified or non-genuine components

Fault setting condition(s)

- Excessive time offset during edge changes between the lean and rich cycle or between the rich and lean cycle.

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 1

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 2 minute(s) with:
  - Engine at operating temperature
  - Mass air flow > 10 kg/h
- then idling > 30 second(s)

Possible fault causes

♦ Loose contact or corrosion on connectors or lines

♦ Short circuit to B+/ground or open circuit in the line

♦ Oxygen sensor downstream of catalytic converter, bank 2 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor heater circuit downstream of catalytic converter, bank 2

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running, with:
  - **Oxygen sensor heater** downstream of catalytic converter active > 180 second(s)
  - Lambda control active
- None of the following faults stored: P0056, P0057, P0058

Possible fault causes

♦ Contact resistance (power supply or activation)

♦ Shunt (high resistance) in heater circuit ⇒ Signal line

♦ Oxygen sensor downstream of catalytic converter, bank 2 faulty

Diagnostic information - DME (DFI) control unit

Lambda control adaptation, bank 1: system too lean

Diagnostic conditions
- Short test

or:
- Lambda control active
- Lambda control adapted
- Engine temperature > 60 °C (140 °F)
- Intake air temperature < 80 °C (176 °F)
- Engine running > 45 second(s), at:
  - Engine speed < 800 rpm
- then drive with different operating conditions in the lower and upper load ranges with valve lift switchover from small lift to large lift (A220).

Possible fault causes
- ♦ Leak in exhaust system (engine ⇒ oxygen sensor upstream of catalytic converter)
- ♦ Exhaust system constricted/blocked
- ♦ Fuel injector faulty (mechanical fault)
- ♦ Timing set incorrectly
- ♦ Fault in areas: fuel high pressure, intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, Intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment

Fault setting condition(s)
The diagnostic function should indicate a deviation of more than 30% (3.5 mg/stroke in the range near idle) of the lambda control adaptation + 30% deviation of the lambda controller for longer than 30 seconds.
(positive deviation ⇒ enrichment)

ⓘ INFORMATION
Opposed adaptation values in connection with misfires indicate that the timing is out of adjustment.

Diagnostic information - DME (DFI) control unit

Lambda control adaptation, bank 1: system too rich

Diagnostic conditions
- Short test

or
- Lambda control active
- Lambda control adapted
- Engine temperature > 60 °C (140 °F)
- Intake air temperature < 80 °C (176 °F)
- Engine running > 45 second(s), at:
  - Engine speed < 800 rpm
- then drive with different operating conditions in the lower and upper load ranges with valve lift switchover from small lift to large lift (A220).

Possible fault causes
- ♦ High fuel content in engine oil.
- ♦ Leak in exhaust system (engine ⇒ oxygen sensor upstream of catalytic converter)
- ♦ Fuel injector faulty (mechanical fault)
- ♦ Timing set incorrectly
- ♦ Fault in areas: fuel high pressure, intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment

Fault setting condition(s)
The diagnostic function should indicate a deviation of more than 30% (3.5 mg/stroke in the range near idle) of the lambda control adaptation + 30% deviation of the lambda controller for longer than 30 seconds.
(negative deviation ⇒ leaning)

ⓘ INFORMATION
Opposed adaptation values in connection with misfires indicate that the timing is out of adjustment.

Diagnostic information - DME (DFI) control unit

Lambda control adaptation, bank 2: system too lean

Diagnostic conditions
- Short test

or
- Lambda control active
- Lambda control adapted
- Engine temperature > 60 °C (140 °F)
- Intake air temperature < 80 °C (176 °F)
- Engine running > 45 second(s), at:
  - Engine speed < 800 rpm
- then drive with different operating conditions in the lower and upper load ranges with valve lift switchover from small lift to large lift (A220).

Possible fault causes
- ♦ Leak in exhaust system (engine ⇒ oxygen sensor upstream of catalytic converter)
- ♦ Exhaust system constricted/blocked
- ♦ Fuel injector faulty (mechanical fault)
- ♦ Timing set incorrectly
- ♦ Fault in areas: fuel high pressure, intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment

Fault setting condition(s)
The diagnostic function should indicate a deviation of more than 30% (3.5 mg/stroke in the range near idle) of the lambda control adaptation + 30% deviation of the lambda controller for longer than 30 seconds.
(positive deviation ⇒ enrichment)

ⓘ INFORMATION

(negative deviation ⇒ leaning)

ⓘ INFORMATION
Opposed adaptation values in connection with misfires indicate that the timing is out of adjustment.

P0190

Diagnostic information - DME (DFI) control unit

Fuel high-pressure sensor

Diagnostic conditions
- Time since engine start > 5 second(s)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Fuel high-pressure sensor faulty

P0192

Diagnostic information - DME (DFI) control unit

Fuel high-pressure sensor

Diagnostic conditions
- Time since engine start > 5 second(s)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Fuel high-pressure sensor faulty

P0195

Diagnostic information - DME (DFI) control unit

Oil temperature stuck (stuck low)

Diagnostic conditions
- Time since engine start > 10 second(s)
- Coolant temperature > 50 °C (122 °F) for > 60 second(s)
- None of the following faults stored: Coolant temperature or oil temperature sensor

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit between lines
- ♦ Oil cooler damaged or blocked
- ♦ Oil temperature sensor faulty

Fault setting condition(s)
- Oil temperature < -10 °C (14 °F), with:
  - Coolant temperature > 50 °C (122 °F) for > 60 second(s)

Diagnostic information - DME (DFI) control unit

Oil temperature sensor

Diagnostic conditions
- Time since engine start > 5 minute(s)
- Coolant temperature -15 ... 110 °C (5 … 230 °F)
- Oil temperature -39 ... 159 °C (-38 … 318 °F)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to ground or open circuit in the lines
- ♦ Oil temperature sensor faulty

Fault setting condition(s)

♦ **P0197:**
- Oil temperature (measured value) < -39 °C (-38 °F), with:
  - Engine running > 300 second(s)

or
- Ignition on or engine running

and
- Coolant temperature > -15 °C (5 °F)

♦ **P0198:**
- Oil temperature (measured value) > 159 °C (318 °F), with:
  - Ignition on or engine running

and
- Coolant temperature < 110 °C (230 °F)

Diagnostic information - DME (DFI) control unit

Oil temperature sensor

Diagnostic conditions
- Time since engine start > 5 minute(s)
- Coolant temperature -15 ... 110 °C (5 … 230 °F)
- Oil temperature -39 ... 159 °C (-38 … 318 °F)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to ground or open circuit in the lines
- ♦ Oil temperature sensor faulty

Fault setting condition(s)

♦ **P0197:**
- Oil temperature (measured value) < -39 °C (-38 °F), with:
  - Engine running > 300 second(s)

or
- Ignition on or engine running

and
- Coolant temperature > -15 °C (5 °F)

♦ **P0198:**
- Oil temperature (measured value) > 159 °C (318 °F), with:

Accelerator pedal potentiometer 2

Diagnostic conditions
- Ignition on > 3 second(s)
- then accelerator pedal pressed down fully > 3 second(s)
- then release accelerator pedal fully
- then idling > 10 second(s)

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in wiring to potentiometer 2
- ♦ Accelerator pedal potentiometer 2 faulty

Fault effects
- ♦ The accelerator pedal angle is calculated from the remaining potentiometer signal.
- ♦ No acceleration initially + increased idle speed (approx. 800 rpm)
  - ▶ until the accelerator pedal is released fully.
  - ♦ Then acceleration, with
    - ♦ significantly reduced engine torque (max. approx.100 ... 180 Nm)
    - ♦ and limited engine speed (max. approx. 5,000 rpm)
  - ♦ If the accelerator and brake are pressed at the same time, the engine will run at idle speed.

Diagnostic information - DME (DFI) control unit

Accelerator pedal potentiometer 2

Diagnostic conditions
- Ignition on > 3 second(s)
- then accelerator pedal pressed down fully > 3 second(s)
- then release accelerator pedal fully
- then idling > 10 second(s)

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in wiring to potentiometer 2
- ♦ Accelerator pedal potentiometer 2 faulty

Fault effects
- ♦ The accelerator pedal angle is calculated from the remaining potentiometer signal.
- ♦ No acceleration initially + increased idle speed (approx. 800 rpm)
  - ▶ until the accelerator pedal is released fully.
  - ♦ Then acceleration, with
    - ♦ significantly reduced engine torque (max. approx.100 ... 180 Nm)
    - ♦ and limited engine speed (max. approx. 5,000 rpm)
  - ♦ If the accelerator and brake are pressed at the same time, the engine will run at idle speed.

P0234

Diagnostic information - DME (DFI) control unit

Boost pressure control limit exceeded

Diagnostic conditions
- 3 full-load accelerations:
  - in 3rd gear (no gearshift)
  - Engine speed between 1,500 rpm and max. engine speed

Possible fault causes
- ♦ Insufficient vacuum supply due to leak in vacuum system or faulty vacuum pump (see ⓘ)
- ♦ Leak in vacuum hose at boost pressure control cycle valve or wastegate
- ♦ Boost pressure control cycle valve faulty (mechanical fault or leak)
- ♦ Wastegate faulty (mechanical fault or leak)

Fault setting condition(s)
- Boost pressure (measured) > setpoint value (depending on operating condition)
- Deviation of boost pressure (measured) with respect to ambient pressure too high > 2 second(s)

ⓘ INFORMATION
The vacuum system includes:
- ♦ Mechanical vacuum pump
- ♦ Main load circuit:
  - ♦ Brake booster
- ♦ Auxiliary load circuit:
  - ♦ Boost pressure control cycle valve
  - ♦ Diverter solenoid valve
  - ♦ Exhaust flap (if fitted)
  - ♦ Acoustic simulator (V6 Turbo only)
  - ♦ Tank leakage diagnosis pump (USA, Canada and South Korea only)

P0235

Diagnostic information - DME (DFI) control unit

Pressure sensor ahead of throttle valve

ⓘ INFORMATION

Totals fault

♦ One or more additional faults are entered that more precisely indicate where to look for the fault cause.

Diagnostic information - DME (DFI) control unit

Boost pressure sensor (pressure sensor ahead of throttle valve) implausible

Diagnostic conditions
- Ignition on > 10 second(s)
- then: Acceleration with wide-open throttle for as long as possible, immediately followed by an overrun phase lasting as long as possible
- None of the following faults stored: P1638, P1639, P0107, P0108, P2228, P2229, P1183, P1184, P1187, P1188, P1189, P1190

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Ground supply faulty
- Boost pressure sensor faulty

Fault effects
- Substitute value from model

Diagnostic information - DME (DFI) control unit

Boost pressure sensor (pressure sensor ahead of throttle valve): electrical fault

Diagnostic conditions
- Ignition on or engine running
- None of the following faults stored: P0234

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Ground supply faulty
- ♦ Boost pressure sensor faulty

- **Only if fault P0107 or P0108** (intake manifold pressure sensor) **is entered at the same time**:
  - ♦ Leak in vacuum hose at boost pressure control cycle valve or wastegate
  - ♦ Boost pressure control cycle valve leaking
  - ♦ Wastegate leaking

Fault effects
- ♦ Substitute value from model

Diagnostic information - DME (DFI) control unit

Boost pressure sensor (pressure sensor ahead of throttle valve): electrical fault

Diagnostic conditions
- Ignition on or engine running
- None of the following faults stored: P0234

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Ground supply faulty
- ♦ Boost pressure sensor faulty

- **Only if fault P0107 or P0108** (intake manifold pressure sensor) **is entered at the same time**:
  - ♦ Leak in vacuum hose at boost pressure control cycle valve or wastegate
  - ♦ Boost pressure control cycle valve leaking
  - ♦ Wastegate leaking

Fault effects
- ♦ Substitute value from model

Diagnostic information - DME (DFI) control unit

Boost pressure control cycle valve driver

Diagnostic conditions
- Engine running
- Boost pressure control cycle valve activated

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+ or open circuit in the lines (power supply or boost pressure control cycle valve activation)
- Boost pressure control cycle valve faulty

Fault effects
- Only basic boost pressure is built up

P0245

Diagnostic information - DME (DFI) control unit

Boost pressure control cycle valve driver

Diagnostic conditions
- Time since engine start > 10 second(s)

Possible fault causes
- Short circuit to ground (boost pressure control cycle valve activation)

Fault effects
- Only basic boost pressure is built up

Diagnostic information - DME (DFI) control unit

Boost pressure control cycle valve driver

Diagnostic conditions
- Engine running
- Boost pressure control cycle valve activated

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+ or open circuit in the lines (power supply or boost pressure control cycle valve activation)
- Boost pressure control cycle valve faulty

Fault effects
- Only basic boost pressure is built up

P025A

Diagnostic information - DME (DFI) control unit

Fuel pump control unit: activation

Diagnostic conditions
- Engine start (electric fuel pump activated)

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Open circuit in control line for DME (DFI) control unit ⇒ Fuel pump control unit
- Faulty power supply or ground supply for fuel pump control unit
- Fuel pump control unit faulty

P025C

Fuel injector, cylinder 8

Diagnostic conditions
- Engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Cylinder 8 fuel injector faulty

P0298

Diagnostic information - DME (DFI) control unit

Oil temperature implausibly high

Diagnostic conditions
- Time since ignition off > 8 hours, then:
  - Drive > 25 km/h (16 mph) > 45 s within the first 6 minutes after engine start
  - NO drop in temperatures (e.g. due to drive from a garage into a cooler environment)

Possible fault causes
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Engine oil temperature sensor faulty

Fault setting condition(s)
- The temperature measured by the engine oil temperature sensor (T030) deviates too much from the mean value of the engine, engine oil, intake air and ambient air (T160) temperatures. (See ⓘ)

Fault effects
♦ Substitute value from model

ⓘ INFORMATION

Step 1
♦ When the engine is started after the ignition has been switched off for more than 8 hours, the engine coolant, engine oil, intake air and ambient air temperatures are compared with each other.
♦ They may deviate from the calculated mean value (T160) by only a certain amount (depending on the switch-off time).
♦ A suspected fault is set if the deviation is too large. However, the fault must still be confirmed in the second step.

Step 2
♦ Within the first six minutes after ignition on, a check is performed to determine whether the following conditions were met:
- Drive > 25 km/h (16 mph) for longer than 45 seconds in total
- None of the four temperatures decreased too much (e.g. due to drive from a garage into a cooler environment)

♦ If all conditions were met, the fault is entered in the fault memory.
♦ If one of the conditions was NOT met, the diagnostic result is rejected and NO fault is entered in the fault memory.
♦ If the vehicle is NOT driven within 6 minutes after starting and the aforementioned conditions are met, the suspected fault is rejected and NO fault is entered in the fault memory.

P0299

Diagnostic information - DME (DFI) control unit

Boost pressure control deviation

Diagnostic conditions
- 3 full-load accelerations:
  - in 3rd gear (no gearshift)
  - Engine speed between 1,500 rpm and max. engine speed
- then steady driving

Possible fault causes
- ♦ Insufficient vacuum supply due to leak in vacuum system or faulty vacuum pump (see ⓘ)
- ♦ Leak between turbocharger (on pressure side) and intake valve (engine)
- ♦ Leak between diverter solenoid valve and turbocharger or engine
- ♦ Vacuum hose leaking at boost pressure control cycle valve or diverter solenoid valve
- ♦ Diverter solenoid valve not installed or installed incorrectly
- ♦ Diverter solenoid valve leaking or stuck
- ♦ Diverter valve not installed or installed incorrectly
- ♦ Diverter valve leaking or stuck
- ♦ Boost pressure control cycle valve stuck open electrically or mechanically
- ♦ Wastegate mechanical fault, leaking or stuck open
- ♦ Turbocharger (1 or 2) stiff or stuck

Fault setting condition(s)
- Boost pressure (measured) < setpoint value (depending on operating condition)

ⓘ INFORMATION

The vacuum system includes:
- ♦ Mechanical vacuum pump
- ♦ Main load circuit:
  - ♦ Brake booster
- ♦ Auxiliary load circuit:
  - ♦ Boost pressure control cycle valve
  - ♦ Diverter solenoid valve
  - ♦ Exhaust flap (if fitted)
  - ♦ Acoustic simulator (V6 Turbo only)
  - ♦ Tank leakage diagnosis pump (USA, Canada and South Korea only)

Diagnostic information - DME (DFI) control unit

Cylinder 1 injection quantity adaptation

Diagnostic conditions
● Engine running

Possible fault causes
♦ Cylinder 1 fuel injector faulty

Fault setting condition(s)
● Adaptation limits reached - 40% in ballistic range, 20% in full-stroke range - for longer than 2 ... 20 seconds (depending on engine speed).
OR
● The closing time cannot be calculated because the injector does not send a clear signal.

ⓘ INFORMATION
♦ Very small fuel injection quantities are relevant in catalytic converter heating, as well as in warm-up at high fuel pressures and triple injection.
♦ Operation of the fuel injector in the range of very small quantities is possible only if injection no longer takes place in the full-stroke range, but instead in the ballistic range. In other words, the injector needle does not open all the way to the stop (full stroke), but instead closes again during the ballistic phase.
♦ In order to ensure a correct injection quantity, the closing time of the fuel injector is adapted. Adaptation is active throughout the operating range, i.e. also during full-stroke operation.
♦ The diagnostic function monitors these closing times.

Diagnostic information - DME (DFI) control unit

Cylinder 1 injection quantity adaptation

Diagnostic conditions
● Engine running

Possible fault causes
♦ Cylinder 1 fuel injector faulty

Fault setting condition(s)
● Adaptation limits reached - 40% in ballistic range, 20% in full-stroke range - for longer than 2 ... 20 seconds (depending on engine speed).
OR
● The closing time cannot be calculated because the injector does not send a clear signal.

ⓘ INFORMATION
♦ Very small fuel injection quantities are relevant in catalytic converter heating, as well as in warm-up at high fuel pressures and triple injection.
♦ Operation of the fuel injector in the range of very small quantities is possible only if injection no longer takes place in the full-stroke range, but instead in the ballistic range. In other words, the injector needle does not open all the way to the stop (full stroke), but instead closes again during the ballistic phase.
♦ In order to ensure a correct injection quantity, the closing time of the fuel injector is adapted. Adaptation is active throughout the operating range, i.e. also during full-stroke operation.
♦ The diagnostic function monitors these closing times.

Diagnostic information - DME (DFI) control unit

Cylinder 2 injection quantity adaptation

Diagnostic conditions
● Engine running

Possible fault causes
♦ Cylinder 2 fuel injector faulty

Fault setting condition(s)
● Adaptation limits reached - 40% in ballistic range, 20% in full-stroke range - for longer than 2 ... 20 seconds (depending on engine speed).
OR
● The closing time cannot be calculated because the injector does not send a clear signal.

Diagnostic information - DME (DFI) control unit

Misfiring

Diagnostic conditions
- Engine temperature > -20 °C (-4 °F)
- Idle speed up to the red range on the tachometer
- No overrun phase(s)
- None of the following faults stored: P0335, P0336, P0371, P0373

Possible fault causes
♦ Affected by block heater

♦ Loose contact or corrosion on connectors or lines
♦ Power supply or ground supply faulty

♦ Spark plug(s) oily due to oil entrainment in the cylinder
♦ Wrong spark plug(s)
♦ Mechanical or electrical fault in spark plug(s)
♦ Bar ignition module faulty
♦ Power supply or ground supply faulty

♦ Wrong fuel quality
♦ Fuel tank empty
♦ Water in fuel tank
♦ Fuel line dirty/blocked
♦ Mechanical fault in electric fuel pump
♦ Mechanical fault in fuel high-pressure pump

♦ Fuel injector faulty or borderline
(opens too late/not long enough/not enough or leaking)
♦ Oxygen sensor(s) faulty

♦ Exhaust system constricted/blocked
♦ Catalytic converter faulty

♦ Leak in intake-air distributor
♦ Foreign bodies in intake-air distributor
♦ Camshaft adjustment fault
♦ Wrong timing - exhaust camshaft
♦ Valve lift control fault
♦ Valve lifter faulty
(Intake valve has not switched to the other lift or has not switched quickly enough)
♦ Mechanical fault in valve drive
♦ Insufficient compression
(e.g. cylinder liner damaged, valve seat ring faulty, ...)

Fault setting condition(s) (see ⓘ)

● The diagnostic function detects uneven running for the specified cylinder.
● Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.
● Uneven running is interpreted as a misfire or valve lift fault, depending on type.

ⓘ INFORMATION

♦ It is possible that only one cylinder (or the cylinders of one bank) has/have exceeded the uneven running threshold for a fault entry.
♦ Other cylinders may be just below the level which would result in a fault entry.
♦ See Actual values M005 ... M080 (Uneven running)

P0301

Diagnostic information - DME (DFI) control unit

Misfiring

Diagnostic conditions
- Engine temperature > -20 °C (-4 °F)
- Idle speed up to the red range on the tachometer
- No overrun phase(s)
- None of the following faults stored: P0335, P0336, P0371, P0373

Possible fault causes
♦ Affected by block heater

♦ Loose contact or corrosion on connectors or lines
♦ Power supply or ground supply faulty

♦ Spark plug(s) oily due to oil entrainment in the cylinder
♦ Wrong spark plug(s)

Fault setting condition(s) (see ⓘ)

● The diagnostic function detects uneven running for the specified cylinder.
● Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.
● Uneven running is interpreted as a misfire or valve lift fault, depending on type.

ⓘ INFORMATION

♦ It is possible that only one cylinder (or the cylinders of one bank) has/have exceeded the uneven running threshold for a fault entry.
♦ Other cylinders may be just below the level which would result in a fault entry.
♦ See Actual values M005 ... M080 (Uneven running)

Diagnostic information - DME (DFI) control unit

Misfiring

Diagnostic conditions
- Engine temperature > -20 °C (-4 °F)
- Idle speed up to the red range on the tachometer
- No overrun phase(s)
- None of the following faults stored: P0335, P0336, P0371, P0373

Possible fault causes
♦ Affected by block heater

♦ Loose contact or corrosion on connectors or lines
♦ Power supply or ground supply faulty

♦ Spark plug(s) oily due to oil entrainment in the cylinder
♦ Wrong spark plug(s)
♦ Mechanical or electrical fault in spark plug(s)
♦ Bar ignition module faulty
♦ Power supply or ground supply faulty

♦ Wrong fuel quality
♦ Fuel tank empty
♦ Water in fuel tank
♦ Fuel line dirty/blocked
♦ Mechanical fault in electric fuel pump
♦ Mechanical fault in fuel high-pressure pump

♦ Fuel injector faulty or borderline
(opens too late/not long enough/not enough or leaking)
♦ Oxygen sensor(s) faulty

♦ Exhaust system constricted/blocked
♦ Catalytic converter faulty

♦ Leak in intake-air distributor
♦ Foreign bodies in intake-air distributor
♦ Camshaft adjustment fault
♦ Wrong timing - exhaust camshaft
♦ Valve lift control fault
♦ Valve lifter faulty
(Intake valve has not switched to the other lift or has not switched quickly enough)
♦ Mechanical fault in valve drive
♦ Insufficient compression
(e.g. cylinder liner damaged, valve seat ring faulty, ...)

Fault setting condition(s) (see ⓘ)

● The diagnostic function detects uneven running for the specified cylinder.
● Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.
● Uneven running is interpreted as a misfire or valve lift fault, depending on type.

ⓘ INFORMATION

♦ It is possible that only one cylinder (or the cylinders of one bank) has/have exceeded the uneven running threshold for a fault entry.
♦ Other cylinders may be just below the level which would result in a fault entry.
♦ See Actual values M005 ... M080 (Uneven running)

P0305

Diagnostic information - DME (DFI) control unit

Misfiring

Diagnostic conditions
- Engine temperature > -20 °C (-4 °F)
- Idle speed up to the red range on the tachometer
- No overrun phase(s)
- None of the following faults stored: P0335, P0336, P0371, P0373

Possible fault causes
♦ Affected by block heater

♦ Loose contact or corrosion on connectors or lines
♦ Power supply or ground supply faulty

♦ Spark plug(s) oily due to oil entrainment in the cylinder
♦ Wrong spark plug(s)
♦ Mechanical or electrical fault in spark plug(s)
♦ Bar ignition module faulty
♦ Power supply or ground supply faulty

♦ Wrong fuel quality
♦ Fuel tank empty
♦ Water in fuel tank
♦ Fuel line dirty/blocked
♦ Mechanical fault in electric fuel pump
♦ Mechanical fault in fuel high-pressure pump

♦ Fuel injector faulty or borderline
(opens too late/not long enough/not enough or leaking)
♦ Oxygen sensor(s) faulty

♦ Exhaust system constricted/blocked
♦ Catalytic converter faulty

♦ Leak in intake-air distributor
♦ Foreign bodies in intake-air distributor
♦ Camshaft adjustment fault
♦ Wrong timing - exhaust camshaft
♦ Valve lift control fault
♦ Valve lifter faulty
(Intake valve has not switched to the other lift or has not switched quickly enough)
♦ Mechanical fault in valve drive
♦ Insufficient compression
(e.g. cylinder liner damaged, valve seat ring faulty, ...)

Fault setting condition(s) (see ⓘ)

● The diagnostic function detects uneven running for the specified cylinder.
● Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.
● Uneven running is interpreted as a misfire or valve lift fault, depending on type.

ⓘ INFORMATION

♦ It is possible that only one cylinder (or the cylinders of one bank) has/have exceeded the uneven running threshold for a fault entry.
♦ Other cylinders may be just below the level which would result in a fault entry.
♦ See Actual values M005 ... M080 (Uneven running)

P0306

Diagnostic information - DME (DFI) control unit

Misfiring

Diagnostic conditions
- Engine temperature > -20 °C (-4 °F)
- Idle speed up to the red range on the tachometer
- No overrun phase(s)
- None of the following faults stored: P0335, P0336, P0371, P0373

Possible fault causes
♦ Affected by block heater

Diagnostic information - DME (DFI) control unit

Knock sensor 1

Diagnostic conditions
- Short test

or
- Engine running, with:
  - Time since engine start > 10 second(s)
  - Engine temperature > 50 °C (122 °F)
  - Engine speed > 1,000 rpm
  - Different load ranges

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground or open circuit in the lines
- Knock sensor 1 loose
- Knock sensor 1 faulty
- Engine oil filling level significantly too high

Fault setting condition(s)
The fault is detected if the knock sensor signal does not change sufficiently, depending on the engine speed and load, and possibly also if it is too quiet (noise is less dynamic than expected).

Fault effects
- If the fault is stored, the ignition timing is retarded for all cylinders affecting this knock sensor in the >knock control active< range.
- Knock control adaptation is idle.

Diagnostic information - DME (DFI) control unit

Knock sensor 1

Diagnostic conditions
- Short test

or
- Engine running, with:
  - Time since engine start > 10 second(s)
  - Engine temperature > 50 °C (122 °F)
  - Engine speed > 1,000 rpm
  - Different load ranges

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Knock sensor 1 loose or stuck
- Knock sensor 1 faulty
- Engine oil filling level significantly too high

Fault setting condition(s)
The fault is detected if the knock sensor signal is too weak (noise is >quieter< than expected), depending on the engine speed and load.

Fault effects
- If the fault is stored, the ignition timing is retarded for all cylinders affecting this knock sensor in the >knock control active< range.
- Knock control adaptation is idle.

Diagnostic information - DME (DFI) control unit

Knock sensor 3

Diagnostic conditions
- Short test

or
- Engine running, with:
  - Time since engine start > 10 second(s)
  - Engine temperature > 50 °C (122 °F)
  - Engine speed > 1,000 rpm
  - Different load ranges

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground or open circuit in the lines
- Knock sensor 3 loose
- Knock sensor 3 faulty
- Engine oil filling level significantly too high

Fault setting condition(s)
The fault is detected if the knock sensor signal does not change sufficiently, depending on the engine speed and load, and possibly also if it is too quiet (noise is less dynamic than expected).

Fault effects
- If the fault is stored, the ignition timing is retarded for all cylinders affecting this knock sensor in the >knock control active< range.
- Knock control adaptation is idle.

Diagnostic information - DME (DFI) control unit

Knock sensor 3

Diagnostic conditions
- Short test

or
- Engine running, with:
  - Time since engine start > 10 second(s)
  - Engine temperature > 50 °C (122 °F)
  - Engine speed > 1,000 rpm
  - Different load ranges

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Knock sensor 3 loose or stuck
- Knock sensor 3 faulty
- Engine oil filling level significantly too high

Fault setting condition(s)
The fault is detected if the knock sensor signal is too weak (noise is >quieter< than expected), depending on the engine speed and load.

Fault effects
- If the fault is stored, the ignition timing is retarded for all cylinders affecting this knock sensor in the >knock control active< range.
- Knock control adaptation is idle.

Diagnostic information - DME (DFI) control unit

Knock sensor 2

Diagnostic conditions
- Short test

or
- Engine running, with:
  - Time since engine start > 10 second(s)
  - Engine temperature > 50 °C (122 °F)
  - Engine speed > 1,000 rpm
  - Different load ranges

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground or open circuit in the lines
- Knock sensor 2 loose
- Knock sensor 2 faulty
- Engine oil filling level significantly too high

Fault setting condition(s)
The fault is detected if the knock sensor signal does not change sufficiently, depending on the engine speed and load, and possibly also if it is too quiet (noise is less dynamic than expected).

Fault effects
- If the fault is stored, the ignition timing is retarded for all cylinders affecting this knock sensor in the >knock control active< range.
- Knock control adaptation is idle.

Diagnostic information - DME (DFI) control unit

Knock sensor 2

Diagnostic conditions
- Short test

or
- Engine running, with:
  - Time since engine start > 10 second(s)
  - Engine temperature > 50 °C (122 °F)
  - Engine speed > 1,000 rpm
  - Different load ranges

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Knock sensor 2 loose or stuck
- Knock sensor 2 faulty
- Engine oil filling level significantly too high

Fault setting condition(s)
The fault is detected if the knock sensor signal is too weak (noise is >quieter< than expected), depending on the engine speed and load.

Fault effects
- If the fault is stored, the ignition timing is retarded for all cylinders affecting this knock sensor in the >knock control active< range.
- Knock control adaptation is idle.

P0335

Diagnostic information - DME (DFI) control unit

Crankshaft sensor

Diagnostic conditions
- Engine running
- PDK only:
  - then automatic engine stop and restart by the Start/Stop system

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Phase sensor wheel faulty (damaged/bent)
- Crankshaft sensor not installed or installed incorrectly
- Crankshaft sensor faulty

Fault setting condition(s)
- Signal not OK (missing or implausible)

Diagnostic information - DME (DFI) control unit

Crankshaft sensor

Diagnostic conditions
- Engine start
- then driving with overrun phase(s)
- PDK only:
  - then automatic engine stop and restart by the Start/Stop system

Possible fault causes
- Starter battery flat at low ambient temperature
- Loose contact or corrosion on connectors or lines
- Phase sensor wheel faulty (damaged/bent)
- Crankshaft sensor loose
- Crankshaft sensor not installed or installed incorrectly
- Crankshaft sensor faulty

Fault setting condition(s)
- The crankshaft sensor detects too many or not enough tooth flanks on the sensor wheel:
  - Engine start
  - Engine running
  - Overrun phase(s)

Diagnostic information - DME (DFI) control unit

Knock sensor 4

Diagnostic conditions
- Short test

or
- Engine running, with:
  - Time since engine start > 10 second(s)
  - Engine temperature > 50 °C (122 °F)
  - Engine speed > 1,000 rpm
  - Different load ranges

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground or open circuit in the lines
- Knock sensor 4 loose
- Knock sensor 4 faulty
- Engine oil filling level significantly too high

Fault setting condition(s)
The fault is detected if the knock sensor signal does not change sufficiently, depending on the engine speed and load, and possibly also if it is too quiet (noise is less dynamic than expected).

Fault effects
- If the fault is stored, the ignition timing is retarded for all cylinders affecting this knock sensor in the >knock control active< range.
- Knock control adaptation is idle.

Diagnostic information - DME (DFI) control unit

Knock sensor 4

Diagnostic conditions
- Short test

or
- Engine running, with:
  - Time since engine start > 10 second(s)
  - Engine temperature > 50 °C (122 °F)
  - Engine speed > 1,000 rpm
  - Different load ranges

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Knock sensor 4 loose or stuck
- Knock sensor 4 faulty
- Engine oil filling level significantly too high

Fault setting condition(s)
The fault is detected if the knock sensor signal is too weak (noise is >quieter< than expected), depending on the engine speed and load.

Fault effects
- If the fault is stored, the ignition timing is retarded for all cylinders affecting this knock sensor in the >knock control active< range.
- Knock control adaptation is idle.

P0341

Diagnostic information - DME (DFI) control unit

Bank 1 intake camshaft sensor

Diagnostic conditions
- Engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Bank 1 intake camshaft sensor faulty
- ♦ Camshaft adjustment faulty (locking) ⇒ only for P0344

P0342

Diagnostic information - DME (DFI) control unit

Bank 1 intake camshaft sensor

Diagnostic conditions
- Engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Bank 1 intake camshaft sensor faulty
- ♦ Camshaft adjustment faulty (locking) ⇒ only for P0344

P0343

Diagnostic information - DME (DFI) control unit

Bank 1 intake camshaft sensor

Diagnostic conditions
- Engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Bank 1 intake camshaft sensor faulty
- ♦ Camshaft adjustment faulty (locking) ⇒ only for P0344

P0344

Diagnostic information - DME (DFI) control unit

Bank 1 intake camshaft sensor

Diagnostic conditions
- Engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines

- ♦ Bank 2 intake camshaft sensor faulty
- ♦ Camshaft adjustment faulty (locking) ⇒ only for P0349

Diagnostic information - DME (DFI) control unit

Power supply, bar ignition module

⚠WARNING
High voltage!
Risk of death or serious injury due to high voltage or high current!
♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE
Sensitive electronics!
Risk of irreparable damage to electronic components!
♦ **DO NOT** carry out electrical tests.
♦ **DO NOT** connect external power sources.
♦ Check ground supply.

Diagnostic conditions
- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)

Possible fault causes
♦ Fuse faulty
♦ Short circuit to ground or open circuit in the lines (power supply)

Fault setting condition(s)
The fault is detected only if there is no voltage present at ALL bar ignition modules at contact 3.

P0351

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 1

⚠WARNING
High voltage !
Risk of death or serious injury due to high voltage or high current!
♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE
Sensitive electronics!
Risk of irreparable damage to electronic components!
♦ **DO NOT** carry out electrical tests.
♦ **DO NOT** connect external power sources.
♦ Check ground supply.

Diagnostic conditions
- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)

Possible fault causes
♦ Loose contact or corrosion on connectors or lines
♦ Short circuit to B+ or open circuit in the lines (ground supply)
♦ Short circuit to ground or open circuit in the lines (power supply)
♦ Short circuit to B+/ground or open circuit in the line (activation)
♦ Bar ignition module on cylinder 1 faulty

P0352

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 2

⚠WARNING
High voltage !
Risk of death or serious injury due to high voltage or high current!
♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE
Sensitive electronics!
Risk of irreparable damage to electronic components!
♦ **DO NOT** carry out electrical tests.
♦ **DO NOT** connect external power sources.
♦ Check ground supply.

Diagnostic conditions
- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)

Possible fault causes
♦ Loose contact or corrosion on connectors or lines
♦ Short circuit to B+ or open circuit in the lines (ground supply)
♦ Short circuit to ground or open circuit in the lines (power supply)
♦ Short circuit to B+/ground or open circuit in the line (activation)
♦ Bar ignition module on cylinder 2 faulty

P0353

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 3

⚠WARNING
High voltage !
Risk of death or serious injury due to high voltage or high current!
♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE
Sensitive electronics!
Risk of irreparable damage to electronic components!
♦ **DO NOT** carry out electrical tests.
♦ **DO NOT** connect external power sources.
♦ Check ground supply.

Diagnostic conditions
- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)

Possible fault causes
♦ Loose contact or corrosion on connectors or lines
♦ Short circuit to B+ or open circuit in the lines (ground supply)
♦ Short circuit to ground or open circuit in the lines (power supply)
♦ Short circuit to B+/ground or open circuit in the line (activation)
♦ Bar ignition module on cylinder 3 faulty

P0354

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 4

⚠WARNING
High voltage !
Risk of death or serious injury due to high voltage or high current!
♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE
Sensitive electronics!
Risk of irreparable damage to electronic components!
♦ **DO NOT** carry out electrical tests.
♦ **DO NOT** connect external power sources.
♦ Check ground supply.

Diagnostic conditions
- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)

Possible fault causes
♦ Loose contact or corrosion on connectors or lines
♦ Short circuit to B+ or open circuit in the lines (ground supply)
♦ Short circuit to ground or open circuit in the lines (power supply)
♦ Short circuit to B+/ground or open circuit in the line (activation)
♦ Bar ignition module on cylinder 4 faulty

P0355

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 5

⚠WARNING
High voltage !
Risk of death or serious injury due to high voltage or high current!
♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE
Sensitive electronics!
Risk of irreparable damage to electronic components!
♦ **DO NOT** carry out electrical tests.
♦ **DO NOT** connect external power sources.
♦ Check ground supply.

Diagnostic conditions
- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)

Possible fault causes
♦ Loose contact or corrosion on connectors or lines
♦ Short circuit to B+ or open circuit in the lines (ground supply)
♦ Short circuit to ground or open circuit in the lines (power supply)
♦ Short circuit to B+/ground or open circuit in the line (activation)
♦ Bar ignition module on cylinder 5 faulty

- Engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Bank 1 exhaust camshaft sensor faulty
- ♦ Camshaft adjustment faulty (locking) ⇒ only for P0369

Diagnostic information - DME (DFI) control unit

Bank 1 exhaust camshaft sensor

Diagnostic conditions
- Engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Bank 1 exhaust camshaft sensor faulty
- ♦ Camshaft adjustment faulty (locking) ⇒ only for P0369

P0370

Diagnostic information - DME (DFI) control unit

Crankshaft sensor

Diagnostic conditions
- Engine start
- then driving with overrun phase(s)
- then automatic engine stop and restart by the Start/Stop system

Possible fault causes
- ♦ Crankshaft sensor faulty

Fault setting condition(s)
- Implausible direction of rotation signal

Diagnostic information - DME (DFI) control unit

Crankshaft sensor

Diagnostic conditions
- Engine running
- PDK only:
  - then automatic engine stop and restart by the Start/Stop system

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Phase sensor wheel faulty (damaged/bent)
- Crankshaft sensor not installed or installed incorrectly
- Crankshaft sensor faulty

Fault setting condition(s)
- Signal not OK (missing or implausible)

Diagnostic information - DME (DFI) control unit

Crankshaft sensor

Diagnostic conditions
- Engine start
- then driving with overrun phase(s)
- PDK only:
  - then automatic engine stop and restart by the Start/Stop system

Possible fault causes
- Starter battery flat at low ambient temperature
- Loose contact or corrosion on connectors or lines
- Phase sensor wheel faulty (damaged/bent)
- Crankshaft sensor loose
- Crankshaft sensor not installed or installed incorrectly
- Crankshaft sensor faulty

Fault setting condition(s)
- The crankshaft sensor detects too many or not enough tooth flanks on the sensor wheel:
  - Engine start
  - Engine running
  - Overrun phase(s)

P0391

Diagnostic information - DME (DFI) control unit

Bank 2 exhaust camshaft sensor

Diagnostic conditions
- Engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Bank 2 exhaust camshaft sensor faulty
- ♦ Camshaft adjustment faulty (locking) ⇒ Only for P0394

Diagnostic information - DME (DFI) control unit

Bank 2 exhaust camshaft sensor

Diagnostic conditions
- Engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Bank 2 exhaust camshaft sensor faulty
- ♦ Camshaft adjustment faulty (locking) ⇒ Only for P0394

P0393

Diagnostic information - DME (DFI) control unit

Bank 2 exhaust camshaft sensor

Diagnostic conditions
- Engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Bank 2 exhaust camshaft sensor faulty
- ♦ Camshaft adjustment faulty (locking) ⇒ Only for P0394

Diagnostic information - DME (DFI) control unit

Bank 2 exhaust camshaft sensor

Diagnostic conditions
- Engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Bank 2 exhaust camshaft sensor faulty
- ♦ Camshaft adjustment faulty (locking) ⇒ Only for P0394

Diagnostic information - DME (DFI) control unit

Secondary-air system, bank 1 and bank 2

Diagnostic conditions
- Perform all short tests from top to bottom, up to and including secondary air.

or
- The diagnostic function starts under the following conditions:
  - Engine running, with:
    - Ambient temperature > 5 °C (41 °F)
    - Engine start temperature 5 ... 40 °C (41 … 90 °F)
    - Secondary-air injection active
  - None of the following faults stored: Oxygen sensor upstream of catalytic converter, engine coolant temperature sensor, camshaft adjustment, ambient pressure, ambient temperature
- Diagnostics is interrupted for as long as the following conditions exist:
  - Engine speed > 3,500 rpm
  - Mass air flow > 750 mg/stroke
  - Overrun phase(s)

ⓘ INFORMATION
♦ The diagnostic function ends with the end of secondary-air injection.
♦ A certain number of measurements must have taken place within diagnostics, between operational readiness of the oxygen sensors and the end of secondary-air injection.
♦ If this is not the case, diagnostics is ended without a result.

Possible fault causes
♦ Air intake duct (secondary pump) constricted/blocked
♦ Short circuit to B+/ground or open circuit in the secondary-air pump relay line (working current circuit)
♦ Secondary-air pump relay faulty
♦ Leak in secondary-air injection lines
♦ Secondary-air valve stuck/frozen
♦ Air intake duct (engine) constricted/coked
♦ Fuel/air mixture preparation not adapted
♦ Secondary air at oxygen sensor upstream of catalytic converter
♦ Catalytic converter faulty (broken)

Fault setting condition(s)
- Actual value <> setpoint lambda control deviation
  - The diagnostic function checks whether deviation of the lambda controllers is as expected upon activation.

P0418

Diagnostic information - DME (DFI) control unit

Secondary-air pump relay driver

Diagnostic conditions
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in lines for secondary-air pump relay activation
- Secondary-air pump relay faulty

Diagnostic information - DME (DFI) control unit

Primary catalytic converter, bank 1 - inadequate effect

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

Diagnostic conditions

- Perform the following short tests in sequence:
  1. All oxygen sensor short tests
  2. Tank vent valve short test
  3. Partial-load fuel supply short test
  4. Idle fuel supply short test
  5. Catalytic converter conversion short test

or:

- Engine temperature > 60 °C (140 °F)
- Time since engine start > 10 second(s)
- Catalytic converter temperature 540 ... 750 °C (1,004 ... 1,382 °F)
- Drive for 60 seconds with slight acceleration at 40 ... 130 km/h (24 ... 80 mph)
- Active carbon filter loading < 0.7
- Engine speed < 3,000 rpm
- Secondary-air injection not active (EU5 only)
- Lambda control ahead of catalytic converter active
- Lambda control behind catalytic converter active
- None of the following faults stored: Oxygen sensor(s) - electrical fault, intake manifold pressure sensor or throttle adjusting unit

Possible fault causes

- If an oxygen sensor fault is entered:
  - ♦ corresponding fault cause
    - ► Correct oxygen sensor fault according to instructions
      - ► then perform short test as described above

♦ Leak in exhaust system between engine and oxygen sensor downstream of catalytic converter
  ⇒ particularly with mass air flow < 400 mg/stroke
♦ Oxygen sensor upstream and downstream of catalytic converter bank 1 interchanged
♦ Oxygen sensor upstream of catalytic converter bank 1 and bank 2 interchanged
♦ Oxygen sensor downstream of catalytic converter bank 1 and bank 2 interchanged
♦ Catalytic converter bank 1 faulty

P0431

Diagnostic information - DME (DFI) control unit

Primary catalytic converter, bank 2 - inadequate effect

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

Diagnostic conditions

- Perform the following short tests in sequence:
  1. All oxygen sensor short tests
  2. Tank vent valve short test
  3. Partial-load fuel supply short test
  4. Idle fuel supply short test
  5. Catalytic converter conversion short test

or:

- Engine temperature > 60 °C (140 °F)
- Time since engine start > 10 second(s)
- Catalytic converter temperature 540 ... 750 °C (1,004 ... 1,382 °F)
- Drive for 60 seconds with slight acceleration at 40 ... 130 km/h (24 … 80 mph)
- Active carbon filter loading < 0.7
- Engine speed < 3,000 rpm
- Secondary-air injection not active (EU5 only)
- Lambda control ahead of catalytic converter active
- Lambda control behind catalytic converter active
- None of the following faults stored: Oxygen sensor(s) - electrical fault, intake manifold pressure sensor or throttle adjusting unit

Possible fault causes

- If an oxygen sensor fault is entered:
  - ♦ corresponding fault cause
    - ► Correct oxygen sensor fault according to instructions
      - ► then perform short test as described above

♦ Leak in exhaust system between engine and oxygen sensor downstream of catalytic converter

⇒ particularly with mass air flow < 400 mg/stroke

♦ Oxygen sensor upstream and downstream of catalytic converter bank 2 interchanged

♦ Oxygen sensor upstream of catalytic converter bank 1 and bank 2 interchanged

♦ Oxygen sensor downstream of catalytic converter bank 1 and bank 2 interchanged

♦ Catalytic converter bank 2 faulty

P0441

Diagnostic information - DME (DFI) control unit

Tank vent system
- **NOT** V6 Turbo

Diagnostic conditions
- Perform tank vent valve short test and tank leak short test

or
- Time since engine start > 2 minute(s)
- Idling > 15 second(s)
- Engine temperature > 40 °C (104 °F)
- Ambient temperature > 4 °C (39 °F)
- Ambient pressure > 730 hPa (= location below approx. 2,400 ... 2,700 m/7,874 ... 8,858 ft.) (A060)
- Vehicle speed = 0 km/h (0 mph)
- Selector-lever position P or N, or no gear engaged
- Steering wheel in center position
- Air conditioning switched off
- All loads switched off
- All oxygen sensor(s) ready for operation
- None of the following faults stored: Oxygen sensor(s), tank vent valve output stage

Possible fault causes
- ♦ Tank vent valve faulty (stuck open or closed)
- ♦ Tank vent valve not installed or installed incorrectly
- ♦ Line between active carbon filter and tank vent valve leaking/trapped/blocked
- ♦ Purge-air line between tank vent valve and intake manifold leaking/trapped/blocked

Diagnostic information - DME (DFI) control unit

Tank system - leak

Diagnostic conditions
- Perform tank leak short test

or:
- Driving > 150 second(s) with:
  - Engine start temperature 5 ... 40 °C (41 … 104 °F)
  - Time since engine start 5 second(s) ... 20 minute(s)
  - Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
  - Height difference < 20 m (66 ft.)
  - Intake air temperature > 5 °C (41 °F)
  - Intake air temperature: fluctuation(s) < 10 °C (50 °F)
  - Vehicle speed 7 ... 120 km/h (5 … 75 mph)
  - Acceleration/deceleration max. -2 m/s² … +2 m/s²
  - High partial-load share

Possible fault causes
- ♦ Tank cap loose/does not close (properly)
- ♦ Tank cap leaking/faulty
- ♦ Vacuum system leaking (See ⓘ 1)
- ♦ Vacuum pump faulty
- ♦ Tank vent valve (TEV) mechanically faulty (does not close (properly))
- ♦ Leakage diagnosis pump - fresh-air side constricted (dust/dirt)
- ♦ Internal (diaphragm) or external leak in leakage diagnosis pump
- ♦ Fuel tank system (with hoses) leaking

Fault setting condition(s)
- Total leakage in fuel tank system (See ⓘ 2):
  - ♦ Diameter approx. 0.5 - 1 mm - micro leak P0456
  - ♦ Diameter approx. 1 - 2 mm - minor leak P0442
  - ♦ Diameter > 2 mm - major leak P0455

ⓘ INFORMATION

1. The vacuum system includes:
- ♦ Mechanical vacuum pump
- ♦ Main load circuit:
  - ♦ Brake booster
- ♦ Auxiliary load circuit:
  - ♦ Variable intake manifold (not Turbo)
  - ♦ Boost pressure control cycle valve (Turbo only)
  - ♦ Diverter solenoid valve (Turbo only)
  - ♦ Exhaust flap (if fitted)
  - ♦ Acoustic simulator (V6 Turbo only)
  - ♦ Tank leakage diagnosis pump (USA, Canada and South Korea only)

2. There may be several small leaks, which correspond in total to the leak determined here.

P0444

Diagnostic information - DME (DFI) control unit

Tank vent valve driver

Diagnostic conditions
- Perform tank vent valve short test

or:
- Time since engine start > 10 second(s)
- Tank vent valve activated

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+ or open circuit in the lines (power supply or tank vent valve activation)
- Tank vent valve faulty

Diagnostic information - DME (DFI) control unit

Tank system - leak

Diagnostic conditions
- Perform tank leak short test

or:
- Driving > 150 second(s) with:
  - Engine start temperature 5 ... 40 °C (41 … 104 °F)
  - Time since engine start 5 second(s) ... 20 minute(s)
  - Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)

P0458

Diagnostic information - DME (DFI) control unit

Tank vent valve driver: below limit value

Diagnostic conditions
- Perform tank vent valve short test

or:
- Time since engine start > 10 second(s)
- Leakage diagnosis pump not activated

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground (tank vent valve activation)
- Tank vent valve faulty

P0459

Diagnostic information - DME (DFI) control unit

Tank vent valve driver

Diagnostic conditions
- Perform tank vent valve short test

or:
- Time since engine start > 10 second(s)
- Tank vent valve activated

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+ or open circuit in the lines (power supply or tank vent valve activation)
- Tank vent valve faulty

P0480

Diagnostic information - DME (DFI) control unit

Radiator fan control unit driver

⚠WARNING

Exposed running fan blades!
Danger of limbs being severed!
Risk of serious injury due to ejected foreign bodies!

♦ **ALWAYS** keep hair or clothing out of the rotating range of the fan.
♦ DO NOT reach into the rotating fan.
♦ **DO NOT** place tools or other items in the rotating range of the fan.
♦ Perform work on the fan only with the ignition switched off.
♦ Secure the ignition to prevent it from being switched on accidentally by other persons.

NOTE

Sensitive electronics!
Risk of irreparable damage to electronic components!

♦ **DO NOT** carry out electrical tests.
♦ **DO NOT** connect external power sources.

Diagnostic conditions

● Ignition on

Possible fault causes

♦ Short circuit to ground or open circuit in lines (power supply to radiator fan control unit terminal 30)
♦ Short circuit to B+/ground or open circuit in the line (radiator fan control unit activation)
♦ Radiator fan control unit faulty

Diagnostic information - DME (DFI) control unit

Bank 1 secondary-air system

Diagnostic conditions

- Perform all short tests from top to bottom, up to and including secondary air.

or

- The diagnostic function starts under the following conditions:
  - Engine running, with:
    - Ambient temperature > 5 °C (41 °F)
    - Engine start temperature 5 ... 32 °C (41 … 90 °F)
    - Secondary-air injection active
  - None of the following faults stored: Oxygen sensor upstream of catalytic converter, engine coolant temperature sensor, camshaft adjustment, ambient pressure, ambient temperature
- The diagnostic function ends under the following conditions:
  - Oxygen sensor upstream of catalytic converter not ready for operation
  - Total time period (diagnostics) exceeded (depending on: engine start temperature)
- Diagnostics is interrupted for as long as the following conditions exist:
  - Engine speed > 3,500 rpm
  - Mass air flow > 750 mg/stroke
  - Overrun phase(s)

ⓘ INFORMATION

♦ The diagnostic function ends with the end of secondary-air injection.
♦ A certain number of measurements must have taken place within diagnostics, between operational readiness of the oxygen sensors and the end of secondary-air injection.
♦ If this is not the case, diagnostics is ended without a result.

Possible fault causes

♦ Catalytic converter faulty (broken)
♦ Leak in secondary-air injection line
♦ Bank 1 secondary-air valve stuck/frozen
♦ Air intake duct (engine) constricted/coked
♦ Fuel/air mixture preparation not adapted

Fault setting condition(s)

- Actual value <> setpoint lambda control deviation
  - The diagnostic function checks whether deviation of the lambda controllers is as expected upon activation.

Diagnostic information - DME (DFI) control unit

Bank 2 secondary-air system

Diagnostic conditions

- Perform all short tests from top to bottom, up to and including secondary air.

or

- The diagnostic function starts under the following conditions:
  - Engine running, with:
    - Ambient temperature > 5 °C (41 °F)
    - Engine start temperature 5 ... 32 °C (41 ... 90 °F)
    - Secondary-air injection active
  - None of the following faults stored: oxygen sensor ahead of catalytic converter, engine coolant temperature sensor, camshaft adjustment, ambient pressure, ambient temperature
- The diagnostic function ends under the following conditions:
  - Oxygen sensor ahead of catalytic converter not ready for operation
  - Total time period (diagnostics) exceeded (depending on: engine start temperature)
- Diagnostics is interrupted for as long as the following conditions exist:
  - Engine speed > 3,500 rpm
  - Mass air flow > 750 mg/stroke
  - Overrun phase(s)

ⓘ INFORMATION

♦ The diagnostic function ends with the end of secondary-air injection.
♦ A certain number of measurements must have taken place within diagnostics, between operational readiness of the oxygen sensors and the end of secondary-air injection.
♦ If this is not the case, diagnostics is ended without a result.

Possible fault causes

♦ Catalytic converter faulty (broken)
♦ Leak in secondary-air injection line
♦ Bank 2 secondary-air valve stuck/frozen
♦ Air intake duct (engine) constricted/coked
♦ Fuel-air mixture preparation not adapted

Fault setting condition(s)

- Actual value <> setpoint lambda control deviation
  - The diagnostic function checks whether deviation of the lambda controllers is as expected upon activation.

P0501

Diagnostic information - DME (DFI) control unit

Vehicle speed PSM

Diagnostic conditions
- Driving with:
  - Brake pedal not pressed
- None of the following faults stored: U0129, P0503

Possible fault causes
- ♦ Fault in PSM area

Fault setting condition(s)
- Delay implausible, too long (measured value), with:
  - Brake pedal not pressed

Diagnostic information - DME (DFI) control unit

Vehicle speed PSM

Diagnostic conditions
- Driving with:
  - Engine temperature > 30 °C (86 °F)
  - Overrun phase(s) > 1.5 second(s)
  - Engine speed 1.408 .... 3,000 rpm
- None of the following faults stored: U0129, P0503

Possible fault causes
♦ Fault in PSM area

Fault setting condition(s)
- Vehicle speed < 3 km/h or 1 mph (measured value), with:
  - Diagnostic conditions

P0503

Diagnostic information - DME (DFI) control unit

Vehicle speed PSM

Diagnostic conditions
- Driving
- None of the following faults stored: U0129

Possible fault causes
- Fault in PSM area

Fault setting condition(s)
- Vehicle speed > 350 km/h or 218 mph (measured value)

Diagnostic information - DME (DFI) control unit

Idle speed control at stop, lower limit value

Diagnostic conditions
- Engine temperature > 60 °C (140 °F)
- Idling > 20 second(s)
- Vehicle standstill
- Engine without load (A/C system off, steering straight ahead)
- Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
  ⇒ See actual value A060-Ambient pressure from DME (measured)
- None of the following functions active: Tank ventilation, Secondary air injection
- None of the following faults stored: Speed, throttle potentiometer, engine temperature, intake air temperature, tank vent valve, tank ventilation system

Possible fault causes
- Fuel quality insufficient
- Air cleaner blocked/frozen
- Air guide ahead of throttle valve blocked
- Ancillary units sluggish
- Exhaust system blocked

Fault setting condition(s)
Idle speed deviation > 20 second(s)

Diagnostic information - DME (DFI) control unit

Idle speed control at stop, upper limit value

Diagnostic conditions
- Engine temperature > 60 °C (140 °F)
- Idling > 20 second(s)
- Vehicle standstill
- Engine without load (A/C system off, steering straight ahead)
- Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
  ⇒ See actual value A060-Ambient pressure from DME (measured)
- None of the following functions active: Tank ventilation, Secondary air injection
- None of the following faults stored: Speed, throttle potentiometer, engine temperature, intake air temperature, tank vent valve, tank ventilation system

Possible fault causes
- ♦ Intake manifold leaking
- ♦ Positive crankcase ventilation leaking
- ♦ Throttle valve adjusting unit faulty

Fault setting condition(s)
Idle speed deviation > 20 second(s)

P050A

Diagnostic information - DME (DFI) control unit

Idle speed control after cold start at stop, upper limit value

Diagnostic conditions
- Engine temperature -10 °C (14 °F)
- Cold start (catalytic converter heating measure)
- Idling > 20 second(s)
- Vehicle standstill
- Engine without load (A/C system off, steering straight ahead)
- Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
  ⇒ See actual value A060-Ambient pressure from DME (measured)
- None of the following functions active: Tank ventilation, Secondary air injection
- None of the following faults stored: Speed, throttle potentiometer, engine temperature, intake air temperature, tank vent valve, tank ventilation system

Possible fault causes
- ♦ Intake manifold leaking
- ♦ Positive crankcase ventilation leaking
- ♦ Throttle valve adjusting unit faulty

Fault setting condition(s)
- Idle speed deviation > 20 second(s) during cold start

P050B

Diagnostic information - DME (DFI) control unit

Ignition timing angle after cold start

Diagnostic conditions
- Cold start
- then driving

Possible fault causes
ⓘ This fault entry is used for information purposes only; the actual cause of the fault is in another area.
♦ Significant engine running problems force the engine control system to leave the permitted ignition timing range in order to keep the engine running.

P050D

Diagnostic information - DME (DFI) control unit

Idle speed control after cold start at stop, lower limit value

Diagnostic conditions
- Engine temperature -10 °C (14 °F)
- Cold start (catalytic converter heating measure)
- Idling > 20 second(s)
- Vehicle standstill
- Engine without load (A/C system off, steering straight ahead)
- Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
  ⇒ See actual value A060-Ambient pressure from DME (measured)
- None of the following functions active: Tank ventilation, Secondary air injection
- None of the following faults stored: Speed, throttle potentiometer, engine temperature, intake air temperature, tank vent valve, tank ventilation system

Possible fault causes
- Fuel quality insufficient
- Air cleaner blocked/frozen
- Air guide ahead of throttle valve blocked
- Ancillary units sluggish
- Exhaust system blocked

Fault setting condition(s)
Idle speed deviation > 20 second(s) during cold start

P0513

Diagnostic information - DME (DFI) control unit

Immobilizer code incorrect from front-end electronics

Diagnostic conditions
- Ignition on

Possible fault causes
- Immobilizer code incorrect from front-end electronics

Fault effects
- Engine cannot be started

Diagnostic information - DME (DFI) control unit

Oil pressure sensor

Diagnostic conditions
- Idling > 1 minute(s), then:
- Engine speed > 3,010 rpm, then:
- Switch off ignition and remove ignition key > 1 minute(s)

Possible fault causes
- Engine oil pressure too low
  (oil level, oil thinning, dirt in oil circuit, oil circuit faulty)
- Oil pressure sensor faulty (incorrect trimming compared with ambient pressure sensor)

Fault setting condition(s)
- Engine oil pressure > 6.2 bar at engine speed < 1,000 rpm

or
- Engine oil pressure < 1.5 bar at engine speed > 3,008 rpm

or
- Deviation between engine oil pressure and ambient pressure > 0.4 bar in control unit run-on (after ignition off)

Diagnostic information - DME (DFI) control unit

Oil pressure sensor

Diagnostic conditions
- Engine start detected

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground or open circuit in the lines
- Oil pressure sensor faulty

P0523

Diagnostic information - DME (DFI) control unit

Oil pressure sensor

Diagnostic conditions
- Engine start detected

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground or open circuit in the lines
- Oil pressure sensor faulty

Diagnostic information - DME (DFI) control unit

Engine oil pressure too low

ⓘ INFORMATION
Technical Information 29/10 (in repair group 1703) must be observed in case of vehicles that have been stationary for an extended period (> 150 days).

Diagnostic conditions
- Engine running
- None of the following faults stored: P0521, P0522, P0523

Possible fault causes
♦ Engine oil pressure too low (oil level, oil thinning, dirt in oil circuit, oil circuit faulty)

Fault setting condition(s)
- Engine oil pressure < setpoint value for longer than 3 second(s)

Diagnostic information - DME (DFI) control unit

Intake camshaft adjustment, bank 1 after cold start
- **during catalytic converter heating measure**

ⓘ INFORMATION
If only the fault for camshaft adjustment after cold start is entered, particular attention should be paid to causes such as viscous engine oil or components that stick when cold.

ⓘ INFORMATION
♦ The catalytic converter heating measures take place for a limited time under certain conditions (cold start).
♦ These include dual injection, timing retardation, additional camshaft adjustment, ...

Diagnostic conditions
- Cold start with catalytic converter heating measure
- then engine speed 1,200 ... 6,000 rpm
- None of the following faults stored: P0010, P0020, P2088, P2089, P2092, P2093

Possible fault causes
♦ Engine oil pressure too low
⇒ (e.g. oil thickening, wrong oil quality, oil pressure control or oil pump sluggish/stuck)
♦ Solenoid valve for hydraulic camshaft adjustment sluggish/stuck
♦ Camshaft adjustment sluggish/stuck
♦ Intake camshaft sluggish/stuck

Fault setting condition(s)
- Intake camshaft actual value/setpoint value deviation too high

Diagnostic information - DME (DFI) control unit

Intake camshaft adjustment, bank 2 after cold start
- **during catalytic converter heating measure**

ⓘ INFORMATION
If only the fault for camshaft adjustment after cold start is entered, particular attention should be paid to causes such as viscous engine oil or components that stick when cold.

ⓘ INFORMATION
♦ The catalytic converter heating measures take place for a limited time under certain conditions (cold start).

♦ Solenoid valve for hydraulic camshaft adjustment sluggish/stuck
♦ Camshaft adjustment sluggish/stuck
♦ Intake camshaft sluggish/stuck

Fault setting condition(s)
- Intake camshaft actual value/setpoint value deviation too high

P053A

Diagnostic information - DME (DFI) control unit

Positive crankcase ventilation driver

ⓘ INFORMATION

♦ Diagnosis only takes place when the component has been activated.
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

Diagnostic conditions

- Ambient temperature < 0 °C (32 °F)
- Engine start detected
- Vehicle voltage > 12 V

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Positive crankcase ventilation heating tube faulty

P053B

Diagnostic information - DME (DFI) control unit

Positive crankcase ventilation driver

ⓘ INFORMATION

♦ Diagnosis only takes place when the component has been activated.
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

Diagnostic conditions

- Ambient temperature < 0 °C (32 °F)
- Engine start detected
- Vehicle voltage > 12 V

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Positive crankcase ventilation heating tube faulty

Diagnostic information - DME (DFI) control unit

Positive crankcase ventilation driver

ⓘ INFORMATION

♦ Diagnosis only takes place when the component has been activated.
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

Diagnostic conditions

- Ambient temperature < 0 °C (32 °F)
- Engine start detected
- Vehicle voltage > 12 V

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Positive crankcase ventilation heating tube faulty

Diagnostic information - DME (DFI) control unit

Fuel high pressure after cold start

ⓘ INFORMATION

♦ Faults in the fuel high-pressure injection system area are frequently caused by defects in the pre-delivery circuit (fuel low pressure).
♦ Therefore, the pre-delivery circuit must be checked first in case of problems in the area of the fuel high-pressure injection system.

ⓘ INFORMATION

♦ The catalytic converter heating measures take place for a limited time under certain conditions after the engine is started.
♦ These include dual injection, timing retardation, additional camshaft adjustment, ...

Diagnostic conditions
- Engine start (cold start + catalytic converter heating measure)
- Engine temperature > -10 °C (14 °F)
- Engine running > 5 second(s)

Possible fault causes
♦ Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
♦ Quantity control valve faulty (in fuel high-pressure pump)
♦ Fuel high-pressure pump faulty

Fault setting condition(s)
Fuel high pressure deviation > 20% (actual value - setpoint value) during catalytic converter heating measure.

P054A

Diagnostic information - DME (DFI) control unit

Bank 1 exhaust camshaft adjustment after cold start
- **during catalytic converter heating measure**

ⓘ INFORMATION
If only the fault for camshaft adjustment after cold start is entered, particular attention should be paid to causes such as viscous engine oil or components that stick when cold.

ⓘ INFORMATION
♦ The catalytic converter heating measures take place for a limited time under certain conditions after the engine is started.
♦ These include dual injection, timing retardation, additional camshaft adjustment, ...

Diagnostic conditions
- Cold start with catalytic converter heating measure
- then engine speed 1,200 ... 6,000 rpm
- None of the following faults stored: P0013, P0023, P2090, P2091, P2094, P2095

Possible fault causes
♦ Engine oil pressure too low
⇒ (e.g. oil thickening, wrong oil quality, oil pressure control or oil pump sluggish/stuck)
♦ Solenoid valve for hydraulic camshaft adjustment sluggish/stuck
♦ Camshaft adjustment sluggish/stuck
♦ Exhaust camshaft sluggish/stuck

Fault setting condition(s)
- Exhaust camshaft actual value/setpoint value deviation too high

Diagnostic information - DME (DFI) control unit

Bank 1 exhaust camshaft adjustment after cold start

Diagnostic information - DME (DFI) control unit

Cruise control operating stalk

Diagnostic conditions
- Ignition on

Possible fault causes
♦ Fault in steering wheel electronics area

Fault effects
♦ Cruise control does not work

P0571

Diagnostic information - DME (DFI) control unit

Brake light switch

Diagnostic conditions
- Ignition on

Possible fault causes
♦ Fault in PSM control unit area

Fault setting condition(s)
- Brake light switch position implausible

P0597

Diagnostic information - DME (DFI) control unit

Thermostat driver

Diagnostic conditions
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground or open circuit in the lines
- Thermostat faulty

P0598

Diagnostic information - DME (DFI) control unit

Thermostat driver

Diagnostic conditions
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground or open circuit in the lines
- Thermostat faulty

P0599

Diagnostic information - DME (DFI) control unit

Thermostat driver

Diagnostic conditions
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground or open circuit in the lines
- Thermostat faulty

Diagnostic information - DME (DFI) control unit

Radiator shutter: servo motor turns freely

Diagnostic conditions
- Allow the radiator shutter to move to both learned limit stops (e.g. via drive link)

Possible fault causes
- Radiator shutter was turned manually while the ignition was off
- Vanes broken

Fault setting conditions
- No increased current draw when the learned limit stops are reached

Fault effects
- New initialization
- When the fault is active, the DME control unit sends the OPEN request to the radiator shutter servo motor

Diagnostic information - DME (DFI) control unit

Radiator shutter mechanically blocked

Diagnostic conditions
● Allow the radiator shutter to move to both learned limit stops (e.g. via drive link)

Possible fault causes
♦ Actuator iced up
♦ Foreign object stuck between the vanes
♦ Servo motor faulty

Fault setting conditions
● Increased current draw during movement

Fault effects
♦ New initialization
♦ When the fault is active, the DME control unit sends the OPEN request to the radiator shutter servo motor

Diagnostic information - DME (DFI) control unit

Radiator shutter: perform adaptation

Diagnostic conditions
- Allow the radiator shutter to move to both learned limit stops (e.g. via drive link)

Possible fault causes
- ♦ Preceding repair
- ♦ The DME control unit was reprogrammed previously
- ♦ Shutter or drive faulty

Fault setting conditions
- Initialization failed

Fault effects
- ♦ New initialization
- ♦ When the fault is active, the DME control unit sends the OPEN request to the radiator shutter servo motor

Diagnostic information - DME (DFI) control unit

Radiator shutter: signal implausible or missing

Diagnostic conditions
- Ignition on

Possible fault causes
- ♦ Implausible request from DME control unit, e.g. during reprogramming
- ♦ Servo motor signal line ◄► Open circuit in DME control unit
- ♦ Servo motor power supply or ground supply faulty
- ♦ Servo motor faulty

Fault setting conditions
- No signal on the servo motor signal line ◄► DME control unit

Fault effects
- ♦ If it still functions, the servo motor opens the shutter as far as possible

P05A3

Diagnostic information - DME control unit

Radiator shutter, implausible state

Diagnostic conditions
- Initialization ⇒ Allow the radiator shutter to move to both learned limit stops (e.g. via drive link)

Possible fault causes
- ♦ Actuator was replaced, but not yet adapted
- ♦ Actuator must be re-initialized
- ♦ Actuator faulty if adaptation and initialization were not successful

Fault setting conditions
- No ground clocking from servo motor (life detection)

P05A4

Diagnostic information - DME (DFI) control unit

Radiator louver: short circuit in the signal line

Diagnostic conditions
- Ignition on

Possible fault causes
- Servo motor signal line ◄► Short circuit to B+ or ground in DME control unit
- Servo motor faulty

Fault setting conditions
- Static signal on the servo motor signal line ◄► DME control unit

Fault effects
- If it still functions, the servo motor opens the louver as far as possible

P05A5

Diagnostic information - DME (DFI) control unit

Radiator louver: short circuit in the signal line

Diagnostic conditions
- Ignition on

Possible fault causes
- Servo motor signal line ◄► Short circuit to B+ or ground in DME control unit
- Servo motor faulty

Fault setting conditions
- Static signal on the servo motor signal line ◄► DME control unit

Fault effects
- If it still functions, the servo motor opens the louver as far as possible

P05A8

Diagnostic information - DME (DFI) control unit

Radiator shutter: current draw too high

Diagnostic conditions
- Allow the radiator shutter to move to both learned limit stops (e.g. via drive link)

Possible fault causes
- Servo motor faulty

Fault setting conditions
- Current draw too high

Fault effects
- Radiator shutter switched off

Diagnostic information - DME (DFI) control unit

Radiator shutter: servo motor overtemperature

Diagnostic conditions
● Allow the radiator shutter to move to both learned limit stops (e.g. via drive link)

Possible fault causes
♦ Ambient temperature too high
♦ Servo motor overloaded
♦ Servo motor faulty

Fault setting conditions
● Temperature in servo motor too high

Fault effects
♦ New initialization
♦ When the fault is active, the DME control unit sends the OPEN request to the radiator shutter servo motor

P0601

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

P0603

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

P0604

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

P0605

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

P0606

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

Diagnostic information - DME (DFI) control unit

Control unit function monitoring

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill

Possible fault causes
- ♦ Faults that lead to limp-home mode (See ⓘ)
- ♦ DME (DFI) control unit software error
  ► Re-programming (See ⓘ)

ⓘ INFORMATION
- ♦ When a serious fault is detected in the engine control system (control unit or parts such as the throttle valve, etc.), the control unit switches to a limp-home program and simultaneously stores a corresponding fault. The >Reduced engine power< warning message is displayed in the instrument cluster.
- ♦ This fault might not be detected again immediately away after a restart.
- ♦ Fault P0607 is therefore stored as well, and the control unit already switches to the limp-home program during the restart.
- ♦ If one or more **other faults** are entered in addition to fault P0607:
  - ♦ First correct the other faults,
  - ♦ then clear the fault memory and meet the diagnostic conditions (see above).
- ♦ If **only** fault P0607 is stored, there is an error in the software (DME (DFI) control unit).

P0611

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

Diagnostic information - DME (DFI) control unit

Starter relay 1 activation: electrical fault

Diagnostic conditions
- PDK only: brake applied + selector lever position P or N
- Manual transmission only: completely depress clutch
- Ignition on > 3 second(s)
- Then start the engine

Possible fault causes
- ♦ Open circuit in activation line between DME control unit and starter relay 1
- ♦ Short circuit to ground in activation line between DME control unit and starter relay 1
- ♦ Short circuit to B+ in activation line between DME control unit and starter relay 1
- ♦ Starter relay 1 faulty

Fault effects
- In case of short circuit to ground in activation line:
  - ♦ none
- In case of all other fault sources:
  - ♦ Engine cannot be started

Diagnostic information - DME (DFI) control unit

Starter relay 1 activation: electrical fault

Diagnostic conditions
- PDK only: brake applied + selector lever position P or N
- Manual transmission only: completely depress clutch
- Ignition on > 3 second(s)
- Then start the engine

Possible fault causes
- ♦ Open circuit in activation line between DME control unit and starter relay 1
- ♦ Short circuit to ground in activation line between DME control unit and starter relay 1
- ♦ Short circuit to B+ in activation line between DME control unit and starter relay 1
- ♦ Starter relay 1 faulty

Fault effects
- In case of short circuit to ground in activation line:
  - ♦ none
- In case of all other fault sources:
  - ♦ Engine cannot be started

Diagnostic information - DME (DFI) control unit

Starter relay 1 activation: electrical fault

Diagnostic conditions
- PDK only: brake applied + selector lever position P or N
- Manual transmission only: completely depress clutch
- Ignition on > 3 second(s)
- Then start the engine

Possible fault causes
- ♦ Open circuit in activation line between DME control unit and starter relay 1
- ♦ Short circuit to ground in activation line between DME control unit and starter relay 1
- ♦ Short circuit to B+ in activation line between DME control unit and starter relay 1
- ♦ Starter relay 1 faulty

Fault effects
- In case of short circuit to ground in activation line:
  - ♦ none
- In case of all other fault sources:
  - ♦ Engine cannot be started

P0642

Diagnostic information - DME (DFI) control unit

Sensor voltage 1

Diagnostic conditions
- Ignition on > 10 second(s)

Possible fault causes
- Short circuit to B+/ground or open circuit in the line
- Pedal sensor faulty
- Oil pressure sensor faulty
- Fuel high-pressure sensor faulty
- Boost pressure sensor faulty, with:
  - Turbocharger
- Clutch rpm sensor faulty , with:
  - Manual transmission

Fault setting condition(s)
- Deviation in sensor voltage:
  - < 4.7 V (P0642)

  or
  - > 5.3 V (P0643)

at:
- Connector [A], contact 40

  or
- Connector [A], contact 42

  or
- Connector [B], contact 18

P0643

Diagnostic information - DME (DFI) control unit

Sensor voltage 1

Diagnostic conditions
- Ignition on > 10 second(s)

Possible fault causes
- Short circuit to B+/ground or open circuit in the line
- Pedal sensor faulty
- Oil pressure sensor faulty
- Fuel high-pressure sensor faulty
- Boost pressure sensor faulty, with:
  - Turbocharger
- Clutch rpm sensor faulty , with:
  - Manual transmission

Fault setting condition(s)
- Deviation in sensor voltage:
  - < 4.7 V (P0642)

  or
  - > 5.3 V (P0643)

at:
  - Connector [A], contact 40

  or
  - Connector [A], contact 42

  or
  - Connector [B], contact 18

Diagnostic information - DME (DFI) control unit

Sensor voltage 2

Diagnostic conditions
- Ignition on > 10 second(s)

Possible fault causes
- ♦ Short circuit to B+/ground or open circuit in the line
- ♦ Pedal sensor faulty
- ♦ Throttle valve adjusting unit faulty

Fault setting condition(s)
- Deviation in sensor voltage:
  - ♦ < 4.7 V (P0652)

  or
  - ♦ > 5.3 V (P0653)

at:
- ♦ Connector [A], contact 53

  or
- ♦ Connector [B], contact 62

Diagnostic information - DME (DFI) control unit

Sensor voltage 2

Diagnostic conditions
- Ignition on > 10 second(s)

Possible fault causes
- Short circuit to B+/ground or open circuit in the line
- Pedal sensor faulty
- Throttle valve adjusting unit faulty

Fault setting condition(s)
- Deviation in sensor voltage:
  - < 4.7 V (P0652)

  or
  - > 5.3 V (P0653)

at:
  - Connector [A], contact 53

  or
  - Connector [B], contact 62

Diagnostic information - DME (DFI) control unit

Power supply, terminal 15 or 87

Diagnostic conditions
- Ignition on

or
- Engine running

Possible fault causes
- Vehicle electrical system supply voltage too high (e.g. jump-lead starting)
- Vehicle electrical system supply voltage too low
- Contact resistance, loose contact or corrosion on connectors or lines (DME (DFI) control unit)

Fault setting condition(s)
- Deviation of supply voltage at terminal 15 or 87:
  - < 10 V (P0658/P2531)

  or
  - > 16 V (P0659/P2532)

at:
- DME (DFI) control unit - connector [A], contact 34 ⇒ Terminal 15
- DME (DFI) control unit - connector [A], contact 3/5/6 ⇒ Terminal 87

Diagnostic information - DME (DFI) control unit

Power supply, terminal 15 or 87

Diagnostic conditions
- Ignition on

or
- Engine running

Possible fault causes
- Vehicle electrical system supply voltage too high (e.g. jump-lead starting)
- Vehicle electrical system supply voltage too low
- Contact resistance, loose contact or corrosion on connectors or lines (DME (DFI) control unit)

Fault setting condition(s)
- Deviation of supply voltage at terminal 15 or 87:
  - < 10 V (P0658/P2531)

  or
  - > 16 V (P0659/P2532)

at:
- DME (DFI) control unit - connector [A], contact 34 ⇒ Terminal 15
- DME (DFI) control unit - connector [A], contact 3/5/6 ⇒ Terminal 87

Diagnostic information - DME (DFI) control unit

Start delay due to undervoltage

Diagnostic conditions
- DME (DFI) control unit is viable (voltage > 5 V at A34 (terminal15) + ground)
- Ignition is switched on (voltage present at A34)

Possible fault causes
- If the actual value >A010-DME SUPPLY VOLTAGE< in the FreezeFrame of the fault entry P0685 was stored at **<** 8.0 V:
  - ♦ Voltage is too low or voltage will drop when the engine starts (see ⓘ).

- If the actual value >A010-DME SUPPLY VOLTAGE< in the FreezeFrame of the fault entry P0685 was stored at **>** 8.0 V:
  - ♦ Open circuit in power supply for main-relay control circuit
  - ♦ Short circuit to ground or open circuit in the lines between main relay and DME (DFI) control unit (DME (DFI) control unit power supply)
  - ♦ Short circuit to B+ or open circuit in the lines between DME (DFI) control unit and main relay (main relay activation)
  - ♦ Main relay faulty

Fault setting condition(s)
- A check is carried out once to determine whether the voltage at A3/A5/A6 has exceeded a minimum value:
  - ♦ Panamera
    > 6.0 V
  - ♦ Cayenne with program version up to WS5880
    > 6.0 V
  - ♦ Cayenne with program version WS5890 or higher (week 45/10)
    > 5.0 V
- Test duration 0.0 to approx. 0.5 seconds after ignition on, or after control unit reset.

Fault effects
♦ Fuel injection is blocked.

ⓘ INFORMATION
♦ According to specifications, the DME main relay must work only at 8.0 V or higher.
♦ There are also relays that work at a significantly lower voltage.
♦ The entire engine control system can work at 5.0 V or higher.
♦ If the start voltage drops, this can cause the diagnosis to detect the fault >START DELAY DUE TO UNDERVOLTAGE< and fuel injection will be blocked.
♦ The starter relay can also pick up at 3 V.
♦ This means that the starter might still turn, but the engine cannot start.
♦ The various software versions can result in various types of behavior and displays:

I. Possible behavior and displays in the Panamera and Cayenne with program version up to WS5880:

- Start voltage < 5 V:
  - Starter might turn
  - Engine does not start
  - NO DME fault entries because the DME (DFI) control unit is not viable.

- Start voltage < 5 V, but > 5 V … < 6 V before and after the start attempt
 + DME main relay does NOT work:
  - Starter might turn
  - Engine does not start
  - DME fault entry P0685 with FreezeFrame actual value
>A010-DME SUPPLY VOLTAGE< = 0 V
  - NO DME fault entry P0686 because these diagnostic conditions (> 8.0 V at A34) were not met.
  - DME fault entry P1572 because the control unit voltage dropped to < 5 V and as a result, control unit run-on could not be completed.

- Start voltage < 5 V, but > 5 V … < 6 V before and after the start attempt
 + DME main relay is working:
  - Starter might turn
  - Engine does not start
  - DME fault entry P0685 with FreezeFrame actual value
>A010-DME SUPPLY VOLTAGE< > 5 V … < 6 V
  - NO DME fault entry P0686 because these diagnostic conditions (> 8.0 V at A34) were not met.
  - DME fault entry P1572 because the control unit voltage dropped to < 5 V and as a result, control unit run-on could not be completed.

- Start voltage > 5 V … < 6 V
 + DME main relay does NOT work:
  - Starter might turn
  - Engine does not start
  - DME fault entry P0685 with FreezeFrame actual value
>A010-DME SUPPLY VOLTAGE< = 0 V
  - NO DME fault entry P0686 because these diagnostic conditions (> 8.0 V at A34) were not met.

- Start voltage > 5 V … < 6 V
 + DME main relay is working:
  - Starter turns
  - Engine does not start
  - DME fault entry P0685 with FreezeFrame actual value
>A010-DME SUPPLY VOLTAGE< > 5 V … < 6 V
  - NO DME fault entry P0686 because these diagnostic conditions (> 8.0 V at A34) were not met.

- Start voltage > 6V … < 8 V

+ DME main relay does NOT work:
  ♦ Starter turns
  ♦ Engine does not start
  ♦ DME fault entry P0685 with FreezeFrame actual value
>A010-DME SUPPLY VOLTAGE< = 0 V
  ♦ NO DME fault entry P0686 because these diagnostic conditions (> 8.0 V at A34) were not met.

- Start voltage > 6V
+ DME main relay is working:
  ♦ Starter turns
  ♦ Engine starts
  ♦ NO DME fault entries

- Start voltage > 8 V
+ DME main relay does NOT work:
  ♦ Starter turns
  ♦ Engine does not start
  ♦ DME fault entry P0685 with FreezeFrame actual value
>A010-DME SUPPLY VOLTAGE< = 0 V
  ♦ DME fault entry P0686 with FreezeFrame actual value
>A010-DME SUPPLY VOLTAGE< = 0 V

II. Behavior and displays in the E2 with WS5890 or higher:

- Start voltage < 5 V:
  ♦ Starter might turn
  ♦ Engine does not start
  ♦ NO DME fault entries because the DME (DFI) control unit is not viable.

- Start voltage > 5 V … < 8 V
+ DME main relay does NOT work:
  ♦ Starter turns
  ♦ Engine does not start
  ♦ DME fault entry P0685 with FreezeFrame actual value
>A010-DME SUPPLY VOLTAGE< = 0 V
  ♦ NO DME fault entry P0686 because these diagnostic conditions (> 8.0 V at A34) were not met.

- Start voltage > 5 V … < 8 V
+ DME main relay is working:
  ♦ Starter turns
  ♦ Engine starts
  ♦ NO DME fault entries

- Start voltage > 8 V
+ DME main relay does NOT work:
  ♦ Starter turns

- ♦ Engine does not start
- ♦ DME fault entry P0685 with FreezeFrame actual value >A010-DME SUPPLY VOLTAGE< = 0 V
- ♦ DME fault entry P0686 with FreezeFrame actual value >A010-DME SUPPLY VOLTAGE< = 0 V

- Start voltage > 8 V

+ DME main relay is working:

- ♦ Starter turns
- ♦ Engine starts
- ♦ NO DME fault entries

Diagnostic information - DME (DFI) control unit

Main relay off

Diagnostic conditions
- Vehicle voltage > 8.0 V
- Ignition off
- Control unit run-on completed (See ⓘ)
- Then ignition on

Possible fault causes
♦ Main relay faulty (contact stuck)
♦ Short circuit to B+ in line between main relay and DME (DFI) control unit (DME (DFI) control unit power supply)
♦ Short circuit to ground in line between DME (DFI) control unit and main relay (main relay activation)

Fault setting condition(s)
- Power supply for DME (DFI) control unit > 4.0 V at connector [A], contact 3/5/6, with :
- Power supply for DME (DFI) control unit > 0.0 V at connector [A], contact 34 (terminal 15)

ⓘ INFORMATION
♦ After the ignition is switched off (terminal 15), the DME control unit switches to control unit run-on mode.
♦ The run-on period depends on many underlying conditions (e.g. engine temperature for fan operation).
The run-on duration can be 1 minute when the engine is cold and up to 45 minutes when the engine is hot.

P0687

Diagnostic information - DME (DFI) control unit

Main relay ON

Diagnostic conditions
- Vehicle voltage > 8.0 V
- Ignition on

Possible fault causes
♦ Main relay faulty
♦ Open circuit in power supply for main-relay control circuit
♦ Short circuit to ground or open circuit in the lines between main relay and DME (DFI) control unit (DME (DFI) control unit power supply)
♦ Short circuit to B+ or open circuit in the lines between DME (DFI) control unit and main relay (main relay activation)

Fault setting condition(s)
- Power supply for DME (DFI) control unit < 6.0 V at connector [A], contact 3/5/6, with :
  - Power supply for DME (DFI) control unit > 8.0 V at connector [A], contact 34 (terminal 15)

P06E9

Diagnostic information - DME (DFI) control unit

Maximum starting time exceeded

Diagnostic conditions
- Engine start (key start or start/stop start)

Fault setting condition(s)
- Engine start duration > 5 seconds with more than 20 engine starts (key starts or stop/start starts)

Diagnostic information - DME (DFI) control unit

Torque intervention from transmission control unit implausible

Diagnostic conditions
- Drive with gear changes

Possible fault causes
- ♦ Shifting in PDK takes too long

Fault setting condition(s)
- The torque intervention by the PDK control unit takes too long; it is therefore implausible for the DME control unit.

Diagnostic information - DME (DFI) control unit

P/N input signal, open circuit/short circuit to B+

Diagnostic conditions
- Ignition on > 3 second(s)
- then start engine, with:
  - Brake pressed
  - Selector-lever position P or N

Possible fault causes
♦ Open circuit/short circuit to B+ in signal line

Fault setting condition(s)
Deviation in signal for P/N input signal and signal via CAN

Fault effects
♦ Starter does not turn

Diagnostic information - DME (DFI) control unit

P/N input signal, short circuit to ground

Diagnostic conditions
- Ignition on > 3 second(s)
- then start engine, with:
  - Brake pressed
  - Selector-lever position P or N

Possible fault causes
♦ Short circuit to ground in signal line

Fault setting condition(s)
Deviation in signal for P/N input signal and signal via CAN

Fault effects
♦ Engine start possible, with:
  - Selector-lever position R or D or M

Diagnostic information - DME (DFI) control unit

Torque request from PSM implausible

Diagnostic conditions
● Drive with PSM intervention for vehicle stabilization

Possible fault causes
♦ Fault in PSM control unit area

Fault setting condition(s)
● Torque request from PSM is implausibly high compared to driver setpoint torque (via accelerator pedal).

Fault effects
♦ All torque requests from the PSM are ignored for this trip ⇒ PSM interventions restricted.

Diagnostic information - DME (DFI) control unit

Fuel high pressure quantity

ⓘ INFORMATION

♦ Faults in the fuel high-pressure injection system area are frequently caused by defects in the pre-delivery circuit (fuel low pressure).
♦ Therefore, the pre-delivery circuit must be checked first in case of problems in the area of the fuel high-pressure injection system.

Diagnostic conditions
- Engine speed 450 .... 4,000 rpm
- Engine temperature - 10 ... +100 °C (14 … 212 °F)
- Driving with different operating conditions

Possible fault causes
♦ Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
♦ Quantity control valve faulty (in fuel high-pressure pump)
♦ Fuel high-pressure pump faulty

Fault setting condition(s)
Deviation in quantity control actual value (fuel high pressure)

Diagnostic information - DME (DFI) control unit

Fuel pressure/quantity too low at start

ⓘ INFORMATION 1

This fault entry can be caused by various reasons.
♦ If the fault was **NOT entered while the engine was starting**, but while the engine was running normally, a check must be carried out in the **crankshaft sensor** area (**See** ⓘ **2**).
♦ Fault finding in the fuel area must only be carried out if a customer complains that starting times are too long AND if the fault was entered while the engine was starting.
♦ If there is no such customer complaint, however, the only measure to be taken is to clear the fault memory.

Diagnostic conditions
● Engine start
● Engine temperature - 10 ... +100 °C (14 … 212 °F)
● Engine running > 5 second(s)

Possible fault causes
♦ Short-term failure of the engine speed signal as a result of a crankshaft sensor fault with or without a corresponding fault entry
(See ⓘ 2)
♦ Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
(See ⓘ **3**)
♦ Quantity control valve faulty (in fuel high-pressure pump)
♦ Fuel high-pressure pump faulty

Fault setting condition(s)
● The fuel pressure required for carrying out a high-pressure start was not reached or was not reached quickly enough
ⓘ Low-pressure start is enabled; starting takes considerably longer (up to 2 sec.).

ⓘ INFORMATION 2

● If engine speed = 0, a starting setpoint value is set for the fuel high pressure that is higher than the setpoint value at idle speed or at a low load.
● An engine start is detected if the engine speed increases from 0 to > 300 rpm.
● When an engine start is detected, a check determines whether the measured fuel high pressure reaches the setpoint value within a certain number of engine revolutions.
⇒ If the engine's speed signal fails briefly (e.g. 6/1,000 seconds) and is then restored, the following things happen:
1. Engine speed = 0 ▶ Starting setpoint value for the fuel high pressure is set.
2. Engine speed increases to over 300 rpm ▶ Engine start is detected.
3. Comparison of setpoint value and actual value of the fuel high pressure ▶ Fault entry P1023, although there was no actual engine start.
4. Entries in the extended fault memory for P1023 are as follows:
♦ *40_Time after Start* > 5 s
♦ *40_Engine RPM* > 600 rpm

♦ *40_Vehicle Speed* > 0 km/h (0 mph)

ⓘ INFORMATION 3

Faults in the fuel high-pressure injection system area are frequently caused by defects in the pre-delivery circuit (fuel low pressure).
♦ Therefore, the pre-delivery circuit must be checked first in case of problems in the area of the fuel high-pressure injection system.

P1024

Diagnostic information - DME (DFI) control unit

Fuel high pressure too high after engine off

Diagnostic conditions
- Engine temperature - 10 ... +100 °C (14 … 212 °F)
- Engine running > 5 second(s)
- then ignition off > 10 second(s)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines ▶ Fuel high-pressure sensor
- ♦ Quantity control valve faulty (in fuel high-pressure pump)

Fault setting condition(s)
- Fuel high pressure drops too slowly after engine off

Diagnostic information - DME (DFI) control unit

Fuel high pressure adaptation

ⓘ INFORMATION 1

♦ Faults in the fuel high-pressure injection system area are frequently caused by defects in the pre-delivery circuit (fuel low pressure).
♦ Therefore, the pre-delivery circuit must be checked first in case of problems in the area of the fuel high-pressure injection system.

Diagnostic conditions
- Engine speed 450 .... 4,000 rpm
- Engine temperature - 10 ... +100 °C (14 … 212 °F)
- Driving with different operating conditions

Possible fault causes
♦ Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
♦ Fuel high-pressure adaptation required (See ⓘ 2)
♦ Fuel high-pressure pump faulty

ⓘ INFORMATION 2

♦ The old values must be deleted prior to a new adaptation of the fuel high-pressure ranges.
♦ The fuel high-pressure adaptation values can be deleted using >PIWIS Tester II< as follows: >DME< ⇒ >Maintenance/repairs< ⇒ >Delete adaptation values<

P1026

Diagnostic information - DME (DFI) control unit

Fuel high pressure implausible

ⓘ INFORMATION

♦ Faults in the fuel high-pressure injection system area are frequently caused by defects in the pre-delivery circuit (fuel low pressure).
♦ Therefore, the pre-delivery circuit must be checked first in case of problems in the area of the fuel high-pressure injection system.

Diagnostic conditions
- Time since engine start > 5 second(s)
- Engine temperature - 10 ... +100 °C (14 … 212 °F)
- Engine running/driving

Possible fault causes (See Fault setting condition(s))
- Below limit value:
  - ♦ Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
  - ♦ Fuel tank (driven) empty
    - ► See Extended fault memory
    - ⇒ Actual value **40-Fuel Level Input** [**0%**]

- Below limit value or above limit value :
  - ♦ Quantity control valve faulty (in fuel high-pressure pump)
  - ♦ Fuel high-pressure pump faulty

Fault setting condition(s) (See ⓘ)
♦ Below limit value:
- Continuous average fuel high pressure < 10 bar

♦ Above limit value:
- Continuous average fuel high pressure > 135 bar

ⓘ INFORMATION

► See Extended fault memory
⇒ 21-Environmental condition for first fault occurrence /B070-Fuel high pressure actual value
⇒ 21-Environmental condition for first fault occurrence /B060-Fuel high pressure setpoint value

Conversion:
♦ 10,000 hPa = 10 bar = 10,000 mbar
♦ 1,000 kPa = 10 bar = 10,000 mbar
♦ 1 MPa = 10 bar = 10,000 mbar

P1027

Diagnostic information - DME (DFI) control unit

Fuel high pressure fluctuates

Diagnostic conditions
- Engine speed 450 .... 4,000 rpm
- Engine temperature - 10 ... +100 °C (14 … 212 °F)
- Driving with different operating conditions

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines ▶ Fuel high-pressure sensor
- ♦ Quantity control valve sluggish (in fuel high-pressure pump)

Fault setting condition(s)
The fuel high pressure fluctuates by +/- 25 bar from the setpoint fuel pressure.

Diagnostic information - DME (DFI) control unit

Fuel high-pressure sensor stuck

ⓘ INFORMATION

♦ Faults in the fuel high-pressure injection system area are frequently caused by defects in the pre-delivery circuit (fuel low pressure).
♦ Therefore, the pre-delivery circuit must be checked first in case of problems in the area of the fuel high-pressure injection system.

Diagnostic conditions
- Engine running (driving)
- Engine temperature - 10 ... +100 °C (14 … 212 °F)

Possible fault causes
♦ Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
♦ Fuel high-pressure sensor faulty

Fault setting condition(s)
No change in the fuel high-pressure sensor voltage line, with:
- Engine running

Diagnostic information - DME (DFI) control unit

Fuel high-pressure sensor stuck at engine start

ⓘ INFORMATION

♦ Faults in the fuel high-pressure injection system area are frequently caused by defects in the pre-delivery circuit (fuel low pressure).
♦ Therefore, the pre-delivery circuit must be checked first in case of problems in the area of the fuel high-pressure injection system.

Diagnostic conditions
- Engine start
- Engine temperature - 10 ... +100 °C (14 … 212 °F)

Possible fault causes
♦ Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
♦ Fuel high-pressure sensor faulty

Fault setting condition(s)
No change in the **fuel high-pressure sensor** voltage line, at:
- Engine start

P1036

Diagnostic information - DME (DFI) control unit

Fuel high pressure: too low/too high

Diagnostic conditions
- Engine running
- Fuel high-pressure pump operates normally, i.e.:
  - no engine stop
  - no overrun phase

Possible fault causes
- Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
- Loose contact or corrosion on connectors or lines ▶ **Fuel high-pressure sensor**
- **Quantity control valve** sluggish (in **fuel high-pressure pump**)
- **Fuel high-pressure pump** faulty

Fault setting condition(s)
- The actual fuel high-pressure value deviates from the setpoint fuel pressure by more than 20 bar for longer than 5 seconds.
  - Actual value too low ⇒ P1036
  - Actual value too high ⇒ P1037

ⓘ INFORMATION
•V6 Turbo engines ONLY
The >Fuel high-pressure pump< system tests can be used for testing
⇒ See Diagnostics ▶ DME ▶ Maintenance/repairs ▶ System tests
ⓘ See F1 Help there!

P1037

Diagnostic information - DME (DFI) control unit

Fuel high pressure: too low/too high

Diagnostic conditions
- Engine running
- Fuel high-pressure pump operates normally, i.e.:
  - no engine stop
  - no overrun phase

Possible fault causes
- Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
- Loose contact or corrosion on connectors or lines ▶ **Fuel high-pressure sensor**
- **Quantity control valve** sluggish (in **fuel high-pressure pump**)
- **Fuel high-pressure pump** faulty

Fault setting condition(s)
- The actual fuel high-pressure value deviates from the setpoint fuel pressure by more than 20 bar for longer than 5 seconds.
  - Actual value too low ⇒ P1036
  - Actual value too high ⇒ P1037

ⓘ INFORMATION
•V6 Turbo engines ONLY
The >Fuel high-pressure pump< system tests can be used for testing
⇒ See Diagnostics ▶ DME ▶ Maintenance/repairs ▶ System tests
ⓘ See F1 Help there!

Diagnostic information - DME (DFI) control unit

Fuel high-pressure pump: bank 2 adaptation faulty

Diagnostic conditions
● Perform system test >Fuel high-pressure pump, bank 2<

ⓘ INFORMATION
If the system test takes longer than approx. 5 minutes, it will be canceled without a result.
● This is the case if the tested fuel high-pressure pump can no longer build up high pressure, i.e. can no longer pump fuel
(e.g. low-pressure supply blocked, pump tappets broken, pump faulty, ...).

Possible fault causes
♦ Fuel high-pressure pump, bank 2 faulty

Fault setting condition(s)
ⓘ During the >Fuel high-pressure pump, bank 2< system test, the fuel high-pressure pump for bank 1 is adjusted to zero quantity (switched off) and the fuel high-pressure pump for bank 2 is adapted.
● A fault is entered if the result is not within the permissible adaptation range.

Diagnostic information - DME (DFI) control unit

Fuel high-pressure pump: bank 1 adaptation faulty

Diagnostic conditions
● Perform system test >Fuel high-pressure pump, bank 1<

ⓘ INFORMATION
If the system test takes longer than approx. 5 minutes, it will be canceled without a result.
● This is the case if the tested fuel high-pressure pump can no longer build up high pressure, i.e. can no longer pump fuel
(e.g. low-pressure supply blocked, pump tappets broken, pump faulty, ...).

Possible fault causes
♦ Fuel high-pressure pump, bank 1 faulty

Fault setting condition(s)
ⓘ During the >Fuel high-pressure pump, bank 1< system test, the fuel high-pressure pump for bank 2 is adjusted to zero quantity (switched off) and the fuel high-pressure pump for bank 1 is adapted.
● A fault is entered if the result is not within the permissible adaptation range.

P1044

Diagnostic information - DME (DFI) control unit

Acoustic simulator solenoid valve driver

Diagnostic conditions
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground or open circuit in the line (power supply or activation)
- Acoustic simulator solenoid valve faulty

P1045

Diagnostic information - DME (DFI) control unit

Acoustic simulator solenoid valve driver

Diagnostic conditions
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground or open circuit in the line (power supply or activation)
- Acoustic simulator solenoid valve faulty

P1046

Diagnostic information - DME (DFI) control unit

Acoustic simulator solenoid valve driver

Diagnostic conditions
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground or open circuit in the line (power supply or activation)
- Acoustic simulator solenoid valve faulty

Diagnostic information - DME (DFI) control unit

Tank vent pressure sensor implausible

Diagnostic conditions
● Drive with different operating conditions (idling, full-load acceleration, uniform partial-load operation and overrun phases)
then
♦ Switch off engine and wait for control unit run-on (approx. 90 seconds)
then
♦ Switch on ignition
then
♦ Engine start

Possible fault causes
♦ Tank vent pressure sensor faulty
♦ Tank vent valve stuck closed (see P0441)
♦ Both check valves stuck closed or installed backward (see P0441)

Fault setting condition(s)
Diagnostics part 1:
♦ In the area of the tank vent pressure sensor, a vacuum exists between the tank vent valve and the check valves when the engine is switched off.
♦ Immediately after the engine is switched off, the tank vent valve is opened briefly so that ambient pressure exists there.
♦ After the ignition is switched on, the pressure in the tank vent system is compared with the ambient pressure.
♦ The fault is set if the two pressure values differ by too much from each other.
♦ A deviation of the ambient pressure due to weather changes between the time when the engine is switched off and the time when the ignition is switched on again is taken into account.
♦ Diagnostics is rejected if the differences in the ambient pressure are too high.

Diagnostics part 2:
♦ When the engine is started, the pressure in the tank vent system must decrease by a certain amount due to the vacuum in the intake manifold.
♦ If this does not happen, a check is performed to determine whether the pressure in the tank vent system now decreases when the boost pressure is sufficient.
♦ The fault is set if the pressure does not change sufficiently in both cases.

P1051

Diagnostic information - DME (DFI) control unit

Tank vent system

ⓘ **For more information, see Guided Fault Finding**

Diagnostic conditions (see also ⓘ)
- Tank vent valve short test - upper partial-load range

then
- Tank vent valve short test - lower partial-load range

or:
- **Time since engine start** > 2 minute(s)
- Idling > 15 second(s)
- **Engine temperature** > 40 °C (104 °F)
- **Ambient temperature** > 4 °C (39 °F)
- Ambient pressure > 730 hPa (= location below approx. 2,400 ... 2,700 m/7,874 ... 8,858 ft.) **(A060)**
- All **oxygen sensor(s)** ready for operation
- None of the following faults stored: **Oxygen sensor(s)**, tank vent valve output stage
- Vehicle speed > 15 **km/h** (9 **mph**)
- The carbon canister is adequately flushed via the tank vent valve (see ⓘ).

Possible fault causes
- ♦ Tank vent valve faulty (stuck open or closed)
- ♦ Tank vent valve not installed or installed incorrectly
- ♦ Line between carbon canister and tank vent valve leaking/trapped/blocked
- ♦ **Purge-air line** between tank vent valve and **intake manifold** leaking/trapped/blocked
- ♦ Purge-air line between tank vent valve and turbocharger (Venturi pump) leaking/trapped/blocked
- ♦ Check valve between tank vent valve and intake manifold faulty or installed backward
- ♦ Check valve between tank vent valve and turbocharger (Venturi pump) faulty or installed backward
- ♦ Carrier-flow hose (Venturi pump) on turbocharger leaking or constricted
- ♦ Venturi pump on turbocharger faulty or constricted

Fault setting condition(s)
- The fault is set if the pressure difference between the ambient pressure and the pressure in the tank vent line is too low when the tank vent valve is activated (depending on the respective engine operating point).

ⓘ INFORMATION

♦ In the lower partial-load range, this is achieved, for example, by driving:
- in 2nd gear
- at approx. 25 km/h (16 mph)
- on a route that is as level as possible
- for approx. 20 seconds
- with tank vent valve open **(L170)**.

♦ In the upper partial-load range, this is achieved, for example, by driving:
- from vehicle standstill
- with the highest load possible (no sport mode, full throttle without kickdown, all electrical loads switched on, uphill driving, ...)
- in the M gate
- always in the highest possible gear
- at engine speeds < 2,300 rpm
- for approx. 5 seconds with tank vent valve open **(L170)**
- with a boost pressure > 150 hPa above ambient pressure **(P020 + A060)**

P1053

P1056

Diagnostic information - DME (DFI) control unit

Tank vent pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Ground supply faulty
- Tank vent pressure sensor faulty

Diagnostic information - DME (DFI) control unit

Tank vent pressure sensor implausible

Diagnostic conditions
● Drive with different operating conditions (idling, full-load acceleration, uniform partial-load operation and overrun phases)
then
♦ Switch off engine and wait for control unit run-on (approx. 90 seconds)
then
♦ Switch on ignition
then
♦ Engine start

Possible fault causes
♦ Tank vent pressure sensor faulty
♦ Tank vent valve stuck closed (see P0441)
♦ Both check valves stuck closed or installed backward (see P0441)

Fault setting condition(s)
Diagnostics part 1:
♦ In the area of the tank vent pressure sensor, a vacuum exists between the tank vent valve and the check valves when the engine is switched off.
♦ Immediately after the engine is switched off, the tank vent valve is opened briefly so that ambient pressure exists there.
♦ After the ignition is switched on, the pressure in the tank vent system is compared with the ambient pressure.
♦ The fault is set if the two pressure values differ by too much from each other.
♦ A deviation of the ambient pressure due to weather changes between the time when the engine is switched off and the time when the ignition is switched on again is taken into account.
♦ Diagnostics is rejected if the differences in the ambient pressure are too high.

Diagnostics part 2:
♦ When the engine is started, the pressure in the tank vent system must decrease by a certain amount due to the vacuum in the intake manifold.
♦ If this does not happen, a check is performed to determine whether the pressure in the tank vent system now decreases when the boost pressure is sufficient.
♦ The fault is set if the pressure does not change sufficiently in both cases.

P1069

Diagnostic information - DME (DFI) control unit

Mass air flow in near idle speed range, implausibly high

Diagnostic conditions
- Idling > 2 minute(s)
- Driving with different operating conditions
- None of the following faults stored: Intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Possible fault causes
- ♦ Oil filler cap leaking
- ♦ Throttle valve adaptation performed when boundary conditions were violated (see ⓘ 3)
- ♦ Positive crankcase ventilation hose leaking (see ⓘ 1)
- ♦ Leak in intake system - between throttle valve and engine (intake valve)
- ♦ Tank vent valve faulty (open)
- ♦ Intake manifold pressure sensor - electr. plug connection loose, oxidized, corroded, interrupted
- ♦ Fault in area of intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Fault setting condition(s)
Unacceptably large deviation between measured mass air flow and calculated mass air flow (see ⓘ **2**)

ⓘ INFORMATION

1. (Turbo only)
The following components are **NOT** tested when an overpressure test is carried out on the intake duct:
- ♦ Ventilation check valve (intake-air distributor)
- ♦ Ventilation check valve (turbocharger suction hose)
- ♦ Positive crankcase ventilation hose between ventilation check valve and crankcase
- ♦ Crankcase

2.
This diagnostic function monitors the intake system between the throttle valve and engine (intake valves).
- ♦ A mass air flow is calculated from the signals from the throttle valve potentiometer, engine speed sensor, intake air temperature sensor and ambient pressure sensor as well as other engine operating values.
- ♦ The calculated mass air flow is compared with that measured by the pressure sensor.
- ♦ A deviation may be due to both the calculated mass air flow and the measured mass air flow.

3.
A note to this effect is stored in the environmental data for the fault entry value > *XX-Status of*

throttle valve adaptation conditions<.

♦ The value indicates whether the throttle valve was taught when boundary conditions were violated.
♦ 0 ... 127 = Throttle valve was taught under the correct boundary conditions.
♦ 128 ... 255 = Throttle valve was taught when boundary conditions were violated.

P1071

Diagnostic information - DME (DFI) control unit

Mass air flow in near idle speed range, implausibly high

Diagnostic conditions
- Idling > 30 s,
  - then engine speed > 1,500 rpm > 1 s,
    - then idling > 30 s
- None of the following faults stored: Intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Possible fault causes
- Oil filler cap lost
- Positive crankcase ventilation hose leaking (see ⓘ **1**)
- Leak in intake system - between throttle valve and engine (intake valve)
- Tank vent valve faulty - open
- Intake manifold pressure sensor - electr. plug connection loose, oxidized, corroded, interrupted
- Fault in area of intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Fault setting condition(s)
Excessive deviation of the throttle valve position during the current engine idling phase compared to the most recent and the penultimate engine idling phases (see ⓘ **2**)

ⓘ INFORMATION

1. (Turbo only)
The following components are NOT tested when an overpressure test is carried out on the intake duct:
- Ventilation check valve (intake-air distributor)
- Ventilation check valve (turbocharger suction hose)
- Positive crankcase ventilation hose between ventilation check valve and crankcase
- Crankcase

2.
The diagnostic function checks whether the value >H040-Mass air flow correction factor< recorded during the current engine idling phase deviates too much from the value during the last engine idling phase:
- If NO, the new value is used as the next reference value, and diagnostics begins again in the next engine idling phase.
- If YES, the test is repeated in the next engine idling phase and compared with the value of the penultimate engine idling phase:
  - If NO relevant deviation still exists, the new value is used as the next reference value.
- The fault is entered if a relevant deviation exists AGAIN. The following information, among other data, is stored in the extended fault memory:

1. XX-Correction value after throttle valve adaptation

This percentage is determined from a characteristic, depending on the intake air temperature, during every throttle valve adaptation.
It serves to prevent incorrect diagnoses that can occur due to adaptation taking place when the throttle valve is too warm or cold.

2. XX-Correction value for mass air flow at idle

Snapshot of the actual value H040 approx. 3 sec. after idling begins (= stabilized state). It is used for comparison with the same value of the most recent (or penultimate if a fault is suspected) idling phase.

3. XX-Difference between the correction values of two idling phases

Difference in the snapshot of actual value H040 between the current idling phase and the same value of the most recent (or penultimate if a fault is suspected) idling phase.

4. XX-Throttle value taught in case of violated environmental conditions

1=YES / 0=NO

P1072

Diagnostic information - DME (DFI) control unit

Mass air flow in near idle speed range, implausibly high

Diagnostic conditions
- Idling > 2 minute(s)
- Driving with different operating conditions
- None of the following faults stored: Intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Possible fault causes
- ♦ Oil filler cap leaking
- ♦ Throttle valve adaptation performed when boundary conditions were violated (see ⓘ 3)
- ♦ Positive crankcase ventilation hose leaking (see ⓘ 1)
- ♦ Leak in intake system - between throttle valve and engine (intake valve)
- ♦ Tank vent valve faulty (open)
- ♦ Intake manifold pressure sensor - electr. plug connection loose, oxidized, corroded, interrupted
- ♦ Fault in area of intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Fault setting condition(s)
Unacceptably large deviation between measured mass air flow and calculated mass air flow (see ⓘ **2**)

ⓘ INFORMATION

1. (Turbo only)
The following components are **NOT** tested when an overpressure test is carried out on the intake duct:
- ♦ Ventilation check valve (intake-air distributor)

Diagnostic information - DME (DFI) control unit

Mass air flow in lower partial-load range, implausibly high

Diagnostic conditions
- Driving with different operating conditions
- None of the following faults stored: Intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Possible fault causes
- Variable intake manifold - mechanical fault (if fitted)
- Intake manifold pressure sensor - electric plug connection loose, oxidized, corroded, interrupted
- Fault in area of intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Fault setting condition(s)
Unacceptably large deviation between measured mass air flow and calculated mass air flow (see ⓘ)

ⓘ INFORMATION
This diagnostic function monitors the intake system between the throttle valve and engine (intake valves).
- A mass air flow is calculated from the signals from the throttle valve potentiometer, engine speed sensor, intake air temperature sensor and ambient pressure sensor as well as other engine operating values.
- The calculated mass air flow is compared with that measured by the pressure sensor.
- A deviation may be due to both the calculated mass air flow and the measured mass air flow.

Diagnostic information - DME (DFI) control unit

Mass air flow in upper partial-load range, implausibly high

Diagnostic conditions
- Driving with different operating conditions
- None of the following faults stored: Intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Possible fault causes
- Variable intake manifold - mechanical fault (if fitted)
- Intake manifold pressure sensor - electric plug connection loose, oxidized, corroded, interrupted
- Fault in area of intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Fault setting condition(s)
Unacceptably large deviation between measured mass air flow and calculated mass air flow (see ⓘ)

ⓘ INFORMATION

- A deviation may be due to both the calculated mass air flow and the measured mass air flow.

P1077

Diagnostic information - DME (DFI) control unit

Mass air flow in upper partial-load range, implausibly low

Diagnostic conditions
- Driving with different operating conditions
- None of the following faults stored: Intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Possible fault causes
- Air cleaner dirty/blocked/frozen
- Air intake (ahead of air cleaner) constricted
- Air guide ahead of throttle valve blocked/cross-section constricted
- Exhaust system blocked/cross-section constricted
- Variable intake manifold - mechanical fault (if fitted)
- Intake manifold pressure sensor - electr. plug connection loose, oxidized, corroded, interrupted
- Fault in area of intake manifold pressure sensor, throttle valve adjusting unit, ambient pressure sensor, intake air temperature sensor, rpm sensor, valve lift control, camshaft adjustment, variable intake manifold

Fault setting condition(s)
Unacceptably large deviation between measured mass air flow and calculated mass air flow (see ⓘ)

Ambient temperature sensor: deviation
(See Air-conditioning system regulator)

Diagnostic conditions
- Time since ignition off > 8 hours, then:
  - Drive > 25 km/h (16 mph) > 45 s within the first 6 minutes after engine start
  - NO drop in temperatures (e.g. due to drive from a garage into a cooler environment)

Possible fault causes
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Ambient temperature sensor faulty

Fault setting condition(s)
- The temperature measured by the ambient temperature sensor (T050) deviates too much from the mean value of the engine, engine oil, intake air and ambient air temperatures (T160) (See ⓘ).

Fault effects
♦ Substitute value from model

ⓘ INFORMATION

Step 1
♦ When the engine is started after the ignition has been switched off for more than 8 hours, the engine coolant, engine oil, intake air and ambient air temperatures are compared with each other.
♦ They may deviate from the calculated mean value (T160) by only a certain amount (depending on the switch-off time).
♦ A suspected fault is set if the deviation is too large. However, the fault must still be confirmed in the second step.

Step 2
♦ Within the first six minutes after ignition on, a check is performed to determine whether the following conditions were met:
- Drive > 25 km/h (16 mph) for longer than 45 seconds in total
- None of the four temperatures decreased too much (e.g. due to drive from a garage into a cooler environment)

♦ If all conditions were met, the fault is entered in the fault memory.
♦ If one of the conditions was NOT met, the diagnostic result is rejected and NO fault is entered in the fault memory.
♦ If the vehicle is NOT driven within 6 minutes after starting and the aforementioned conditions are met, the suspected fault is rejected and NO fault is entered in the fault memory.

P1114

Diagnostic information - DME (DFI) control unit

Intake air temperature sensor: deviation

Diagnostic conditions
- Time since ignition off > 8 hours, then:
  - Drive > 25 km/h (16 mph) > 45 s within the first 6 minutes after engine start
  - NO drop in temperatures (e.g. due to drive from a garage into a cooler environment)

Possible fault causes
- Short circuit to B+/ground/between lines or open circuit in the lines
- Intake air temperature sensor faulty

Fault setting condition(s)
- The temperature measured by the intake air temperature sensor (T040) deviates too much from the mean value of the engine, engine oil, intake air and ambient air temperatures (T160) (See ⓘ)

Fault effects
- Substitute value from model

ⓘ INFORMATION

Step 1
- When the engine is started after the ignition has been switched off for more than 8 hours, the engine coolant, engine oil, intake air and ambient air temperatures are compared with each other.
- They may deviate from the calculated mean value (T160) by only a certain amount (depending on the switch-off time).
- A suspected fault is set if the deviation is too large. However, the fault must still be confirmed in the second step.

Step 2
- Within the first six minutes after ignition on, a check is performed to determine whether the following conditions were met:
  - Drive > 25 km/h (16 mph) for longer than 45 seconds in total
  - None of the four temperatures decreased too much (e.g. due to drive from a garage into a cooler environment)
- If all conditions were met, the fault is entered in the fault memory.
- If one of the conditions was NOT met, the diagnostic result is rejected and NO fault is entered in the fault memory.
- If the vehicle is NOT driven within 6 minutes after starting and the aforementioned conditions are met, the suspected fault is rejected and NO fault is entered in the fault memory.

P1147

Diagnostic information - DME (DFI) control unit

Oil pressure control valve: power supply

ⓘ INFORMATION

♦ The oil pressure control valve is supplied with 12 V while the engine is running.
♦ A short circuit to B+ can be detected only during control unit run-on.

Diagnostic conditions

- Engine running, then:
- Ignition off > 1 minute(s)

Possible fault causes

♦ Short circuit to B+ (power supply to oil pressure control valve)
♦ Oil pressure control valve faulty

P1148

Diagnostic information - DME (DFI) control unit

Oil pressure control valve: power supply

Diagnostic conditions
- Engine running

Possible fault causes
- Open circuit/short circuit to ground (power supply to oil pressure control valve)
- Short circuit to B+/ground or open circuit in the line (oil pressure control valve activation)
- Oil pressure control valve faulty

P1149

Diagnostic information - DME (DFI) control unit

Oil pressure control valve: power supply

Diagnostic conditions
- Engine running

Possible fault causes
- Open circuit/short circuit to ground (power supply to oil pressure control valve)
- Short circuit to B+/ground or open circuit in the line (oil pressure control valve activation)
- Oil pressure control valve faulty

Diagnostic information - DME (DFI) control unit

Oil pressure control valve: activation

ⓘ INFORMATION

♦ The oil pressure control valve is controlled via a PWM signal.
♦ The PWM signal depends, among other things, on the ambient conditions (temperatures, off time, etc.), operating point of the engine (rpm, load, oil temperature), measured oil pressure (at the oil pressure sensor) …
♦ A fault is detected if the PWM signal is outside a defined range for > 8 seconds.

Diagnostic conditions
● Engine running

Possible fault causes
♦ Short circuit to B+ (oil pressure control valve activation)
♦ Open circuit/short circuit to B+ (power supply to oil pressure control valve)
♦ Oil pressure control valve faulty

Diagnostic information - DME (DFI) control unit

Oil pressure control valve: activation

ⓘ INFORMATION

♦ The oil pressure control valve is controlled via a PWM signal.
♦ The PWM signal depends, among other things, on the ambient conditions (temperatures, off time, etc.), operating point of the engine (rpm, load, oil temperature), measured oil pressure (at the oil pressure sensor) …
♦ A fault is detected if the PWM signal is outside a defined range for > 8 seconds.
♦ The oil pressure is reduced to the minimum pressure in the event of a short circuit to ground.

Diagnostic conditions
● Engine running

Possible fault causes
♦ Short circuit to ground (oil pressure control valve activation)
♦ Open circuit/short circuit to ground (power supply to oil pressure control valve)
♦ Oil pressure control valve faulty

Fault effects
♦ Power supply to oil pressure control valve - is switched off

Diagnostic information - DME (DFI) control unit

Oil pressure control valve: activation

ⓘ INFORMATION

♦ The oil pressure control valve is controlled via a PWM signal.
♦ The PWM signal depends, among other things, on the ambient conditions (temperatures, off time, etc.), operating point of the engine (rpm, load, oil temperature), measured oil pressure (at the oil pressure sensor) …
♦ A fault is detected if the PWM signal is outside a defined range for > 8 seconds.

Diagnostic conditions
● Engine running

Possible fault causes
♦ Open circuit (oil pressure control valve activation)
♦ Open circuit/short circuit to ground (power supply to oil pressure control valve)
♦ Oil pressure control valve faulty

P1157

Engine compartment temperature sensor

Diagnostic conditions
- Ignition on

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Engine compartment temperature sensor faulty

Diagnostic information - DME (DFI) control unit

Exhaust gas implausible, bank 1

Diagnostic conditions
Perform all short tests in sequence
or
● Engine temperature > 60 °C (140 °F)
● Time since engine start > 10 second(s)
● Catalytic converter temperature 540 ... 750 °C (1,004 ... 1,382 °F)
● Drive for 60 seconds with slight acceleration at 40 ... 130 km/h (24 … 80 mph)
● Active carbon filter loading < 0.7
● Engine speed < 3,000 rpm
● Lambda control ahead of catalytic converter active
● Lambda control behind catalytic converter active
● None of the following faults stored: Oxygen sensor(s) - electrical fault, intake manifold pressure sensor or throttle adjusting unit

Possible fault causes
♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

Fault setting condition(s)
● The oxygen sensor ahead of the bank 1 catalytic converter measures the corresponding oxygen value after mixture lean-out/enrichment.
● Despite a sufficiently long waiting time, the corresponding voltage limit value (< 150 mV / > 800 mV) is not reached at the oxygen sensor behind the bank 1 catalytic converter.

Diagnostic information - DME (DFI) control unit

Exhaust gas implausible, bank 2

Diagnostic conditions
Perform all short tests in sequence
or
● Engine temperature > 60 °C (140 °F)
● Time since engine start > 10 second(s)
● Catalytic converter temperature 540 ... 750 °C (1,004 ... 1,382 °F)
● Drive for 60 seconds with slight acceleration at 40 ... 130 km/h (24 … 80 mph)
● Active carbon filter loading < 0.7
● Engine speed < 3,000 rpm
● Lambda control ahead of catalytic converter active
● Lambda control behind catalytic converter active
● None of the following faults stored: Oxygen sensor(s) - electrical fault, intake manifold pressure sensor or throttle valve adjusting unit

Possible fault causes
♦ Oxygen sensor downstream of catalytic converter, bank 2 faulty

Fault setting condition(s)
● The oxygen sensor ahead of the bank 2 catalytic converter measures the corresponding oxygen value after mixture lean-out/enrichment.
● Despite a sufficiently long waiting time, the corresponding voltage limit value (< 150 mV / > 800 mV) is not reached at the oxygen sensor behind the bank 2 catalytic converter.

Diagnostic information - DME (DFI) control unit

Exhaust gas implausible, bank 1

Diagnostic conditions
Perform all short tests in sequence
or
● Engine temperature > 60 °C (140 °F)
● Time since engine start > 10 second(s)

● None of the following faults stored: Oxygen sensor(s) - electrical fault, intake manifold pressure sensor or throttle valve adjusting unit

Possible fault causes
♦ Oxygen sensor downstream of catalytic converter, bank 2 faulty

Fault setting condition(s)
● The oxygen sensor ahead of the bank 2 catalytic converter measures the corresponding oxygen value after mixture lean-out/enrichment.
● Despite a sufficiently long waiting time, the corresponding voltage limit value (< 150 mV / > 800 mV) is not reached at the oxygen sensor behind the bank 2 catalytic converter.

Diagnostic information - DME (DFI) control unit

Positive crankcase ventilation driver

ⓘ INFORMATION

♦ Diagnosis only takes place when the component has been activated.
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

Diagnostic conditions

- Ambient temperature < 0 °C (32 °F)
- Engine start detected
- Vehicle voltage > 12 V

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Positive crankcase ventilation heating tube faulty

P1181

Diagnostic information - DME (DFI) control unit

Positive crankcase ventilation driver

ⓘ INFORMATION

♦ Diagnosis only takes place when the component has been activated.
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

Diagnostic conditions

- Ambient temperature < 0 °C (32 °F)
- Engine start detected
- Vehicle voltage > 12 V

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Positive crankcase ventilation heating tube faulty

Diagnostic information - DME (DFI) control unit

Positive crankcase ventilation driver

ⓘ INFORMATION

♦ Diagnosis only takes place when the component has been activated.
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

Diagnostic conditions

- Ambient temperature < 0 °C (32 °F)
- Engine start detected

♦ Positive crankcase ventilation heating tube faulty

Diagnostic information - DME (DFI) control unit

Intake manifold pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running
- None of the following faults stored: P0234, P1638, P1639, P0107, P0108, P2228, P2229

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Ground supply faulty
- ♦ Intake manifold pressure sensor faulty

- **Turbo only**
  - Only if fault P1189 or P1190 (boost pressure sensor) is entered at the same time:
- ♦ Leak in vacuum hose at boost pressure control cycle valve or wastegate
- ♦ Boost pressure control cycle valve leaking
- ♦ Wastegate leaking

Fault setting condition(s)
- The actual value exceeds the defined upper or lower limit (H065)

Fault effects
- ♦ Substitute value from model

Diagnostic information - DME (DFI) control unit

Intake manifold pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running
- None of the following faults stored: P0234, P1638, P1639, P0107, P0108, P2228, P2229

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Ground supply faulty
- ♦ Intake manifold pressure sensor faulty

- **Turbo only**
  - Only if fault P1189 or P1190 (boost pressure sensor) is entered at the same time:
- ♦ Leak in vacuum hose at boost pressure control cycle valve or wastegate
- ♦ Boost pressure control cycle valve leaking
- ♦ Wastegate leaking

Fault setting condition(s)
- The actual value exceeds the defined upper or lower limit (H065)

Fault effects
- ♦ Substitute value from model

Diagnostic information - DME (DFI) control unit

Ambient pressure sensor implausible

Diagnostic conditions
- Ignition on > 10 second(s)
- then: Acceleration with wide-open throttle for as long as possible, immediately followed by an overrun phase lasting as long as possible
- None of the following faults stored: P1638, P1639, P0107, P0108, P2228, P2229, P1183, P1184, P1187, P1188, P1189, P1190

Possible fault causes
- Fault P0069 also entered:
  - ♦ Intake manifold pressure sensor fault

- No fault P0069 entered:
  - ♦ DME (DFI) control unit faulty

Fault effects
- ♦ Substitute value from model

P1187

Diagnostic information - DME (DFI) control unit

Ambient pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running
- None of the following faults stored: P1638, P1639, P0107, P0108, P2228, P2229

Possible fault causes
♦ DME (DFI) control unit faulty

Fault setting condition(s)
- The actual value exceeds the defined upper or lower limit.
  > *A060-Ambient pressure from DME (measured)* <

Fault effects
♦ Substitute value from model

P1188

Diagnostic information - DME (DFI) control unit

Ambient pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running
- None of the following faults stored: P1638, P1639, P0107, P0108, P2228, P2229

Possible fault causes
♦ DME (DFI) control unit faulty

Fault setting condition(s)
- The actual value exceeds the defined upper or lower limit.
  > *A060-Ambient pressure from DME (measured)* <

Fault effects
♦ Substitute value from model

Diagnostic information - DME (DFI) control unit

Boost pressure sensor (pressure sensor ahead of throttle valve): electrical fault

Diagnostic conditions
- Ignition on or engine running
- None of the following faults stored: P0234, P1638, P1639, P0107, P0108, P2228, P2229

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Ground supply faulty
- ♦ Boost pressure sensor faulty

- **Only if fault P1183 or P1184** (intake manifold pressure sensor) **is entered at the same time**:
  - ♦ Leak in vacuum hose at boost pressure control cycle valve or wastegate
  - ♦ Boost pressure control cycle valve leaking
  - ♦ Wastegate leaking

Fault setting condition(s)
The actual value exceeds the defined upper or lower limit (H210).

Fault effects
- ♦ Substitute value from model

P1190

Diagnostic information - DME (DFI) control unit

Boost pressure sensor (pressure sensor ahead of throttle valve): electrical fault

Diagnostic conditions
- Ignition on or engine running
- None of the following faults stored: P0234, P1638, P1639, P0107, P0108, P2228, P2229

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Ground supply faulty
- ♦ Boost pressure sensor faulty

- **Only if fault P1183 or P1184** (intake manifold pressure sensor) **is entered at the same time**:
  - ♦ Leak in vacuum hose at boost pressure control cycle valve or wastegate
  - ♦ Boost pressure control cycle valve leaking
  - ♦ Wastegate leaking

Fault setting condition(s)
The actual value exceeds the defined upper or lower limit (H210).

Fault effects
- ♦ Substitute value from model

Diagnostic information - DME (DFI) control unit

Intake air temperature implausible

Diagnostic conditions
- Vehicle has NOT been and is NOT standing in the sun.
- Engine off > 9 hour(s)
- Engine coolant temperature cooling > 35 °C (95 °F), with:
  - Engine off
- then cold start, at:
  - Coolant temperature < 37 °C (98.6 °F)
  - Difference between intake air temperature <=> engine coolant temperature < 6 °C (42.8 °F)
- then driving, with:
  - Engine running > 23 minute(s)
  - Distance driven > 7 km (4 mi.)
  - Engine coolant temperature up to > 94 °C (201 °F)

Possible fault causes
- ♦ Intake air temperature sensor faulty (in intake manifold pressure sensor)
- ♦ Resistor installed (instead of intake air temperature sensor)

Fault setting condition(s)
- Change in intake air temperature < 1.5 °C (34.7 °F), at:
  - Diagnostic conditions

Fault effects
- ♦ Substitute coolant temperature value

P11A1

Diagnostic information - DME (DFI) control unit

Pressure sensor ahead of throttle valve faulty

Diagnostic conditions
- Ignition on

Possible fault causes
♦ Pressure sensor ahead of throttle valve faulty

P1280

Diagnostic information - DME (DFI) control unit

Fuel pump control unit

Diagnostic conditions
- Switch on ignition or engine start (electric fuel pump activated)

Possible fault causes
♦ Fuel pump control unit implausible

Fault effects
♦ The control unit attempts to bring the fuel pump to the setpoint value.

P1281

Diagnostic information - DME (DFI) control unit

Fuel pump control unit: overtemperature

Diagnostic conditions
- Switch on ignition or engine start (electric fuel pump activated)

Possible fault causes
- Overloading of fuel pump control unit

Fault effects
- The control unit attempts to bring the fuel pump to the setpoint value.

P1282

Diagnostic information - DME (DFI) control unit

Electric fuel pump: sluggish

Diagnostic conditions
- Switch on ignition or engine start (electric fuel pump activated)

Possible fault causes
- Foreign body in electric fuel pump
- Fuel line blocked
- Electric fuel pump faulty

Fault setting condition(s)
- Current draw max. 30% > setpoint value

Fault effects
- The control unit attempts to bring the fuel pump to the setpoint value.

P1283

Diagnostic information - DME (DFI) control unit

Electric fuel pump: blocked

Diagnostic conditions
- Switch on ignition or engine start (electric fuel pump activated)

Possible fault causes
- Foreign body in electric fuel pump
- Electric fuel pump faulty

Fault setting condition(s)
- Current draw at least 30% > setpoint value

Fault effects
- The control unit attempts to bring the fuel pump to the setpoint value.

P1284

Diagnostic information - DME (DFI) control unit

Electric fuel pump: electrical fault

Diagnostic conditions
- Switch on ignition or engine start (electric fuel pump activated)

Possible fault causes
- ♦ Short circuit in lines for fuel pump control unit ⇒ Electric fuel pump
- ♦ Electric fuel pump faulty

Fault effects
- ♦ Electric fuel pump switched off
- ♦ Electric fuel pump activated and tested after 50 ... 150 millisecond(s)

P1285

Diagnostic information - DME (DFI) control unit

Electric fuel pump: electrical fault

Diagnostic conditions
- Switch on ignition or engine start (electric fuel pump activated)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Open circuit in lines for fuel pump control unit ⇒ Electric fuel pump
- ♦ Open circuit in ground line for electric fuel pump
- ♦ Electric fuel pump faulty

Fault effects
- ♦ Electric fuel pump switched off
- ♦ Electric fuel pump activated and tested after 50 ... 150 millisecond(s)

P1286

Diagnostic information - DME (DFI) control unit

Speed deviation

Diagnostic conditions
- Switch on ignition or engine start (electric fuel pump activated)

Possible fault causes
- Supply voltage for fuel pump control unit too low
- Loose contact or corrosion on connectors or lines
- Leak in fuel line
- Fuel line blocked
- Foreign body in electric fuel pump
- Electric fuel pump sluggish

Fault setting condition(s)
- Speed of electric fuel pump deviates from setpoint speed, at:
  - Supply voltage for fuel pump control unit < 12.5 V
  - Fuel counter-pressure too high
  - Fuel counter-pressure too low
  - Electric fuel pump sluggish

Fault effects
- The control unit attempts to bring the fuel pump to the setpoint value.

P1287

Diagnostic information - DME (DFI) control unit

Electric fuel pump: brief failure

Diagnostic conditions
- Switch on ignition or engine start (electric fuel pump activated)

Possible fault causes
♦ Loose contact or corrosion on connectors or lines

Fault setting condition(s)
- Electric fuel pump failed briefly while driving

Fault effects
♦ The control unit attempts to bring the fuel pump to the setpoint value.

Diagnostic information - DME (DFI) control unit

Fuel high-pressure sensor implausible

ⓘ INFORMATION

♦ Faults in the fuel high-pressure injection system area are frequently caused by defects in the pre-delivery circuit (fuel low pressure).
♦ Therefore, the pre-delivery circuit must be checked first in case of problems in the area of the fuel high-pressure injection system.

Diagnostic conditions
- Time since engine start > 250 second(s)
- Engine temperature - 10 ... +100 °C (14 … 212 °F)
- Engine speed 450 .... 4,000 rpm
- Lambda control active

Possible fault causes
♦ Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
♦ Fuel high-pressure system leaking
♦ Fuel high-pressure sensor faulty
♦ Fuel high-pressure pump faulty

Fault setting condition(s)
Long-term deviation in fuel high-pressure actual value - setpoint value
(The setpoint value is calculated using several variables, e.g. lambda control, quantity control valve, ...).

Diagnostic information - DME (DFI) control unit

Fuel high-pressure sensor implausible

ⓘ INFORMATION

♦ Faults in the fuel high-pressure injection system area are frequently caused by defects in the pre-delivery circuit (fuel low pressure).
♦ Therefore, the pre-delivery circuit must be checked first in case of problems in the area of the fuel high-pressure injection system.

Diagnostic conditions
- Time since engine start > 250 second(s)
- Engine temperature - 10 ... +100 °C (14 … 212 °F)
- Engine speed 450 .... 4,000 rpm
- Lambda control active

Possible fault causes
♦ Pre-delivery quantity or pressure in the fuel low-pressure circuit too low
♦ Fuel high-pressure system leaking
♦ Fuel high-pressure sensor faulty
♦ Fuel high-pressure pump faulty

Fault setting condition(s)
Long-term deviation in fuel high-pressure actual value - setpoint value
(The setpoint value is calculated using several variables, e.g. lambda control, quantity control valve, ...).

Diagnostic information - DME (DFI) control unit

Bank 2 intake camshaft timing

Diagnostic conditions
- Time since engine start > 10 second(s)

Possible fault causes
- ♦ Timing wrong (chain jump)
- ♦ Camshaft sensor loose
- ♦ Timing set incorrectly (after repairs)
- ♦ Hall sender rotor (camshaft) wrong or damaged

Fault setting condition(s)
Current timing <> stored timing (last engine run)

P1340

Diagnostic information - DME (DFI) control unit

Bank 1 intake camshaft timing

Diagnostic conditions
- Time since engine start > 10 second(s)

Possible fault causes
- ♦ Timing wrong (chain jump)
- ♦ Camshaft sensor loose
- ♦ Timing set incorrectly (after repairs)
- ♦ Hall sender rotor (camshaft) wrong or damaged

Fault setting condition(s)
Current timing <> stored timing (last engine run)

P1342

Diagnostic information - DME (DFI) control unit

Bank 1 exhaust camshaft timing

Diagnostic conditions
- Time since engine start > 10 second(s)

Possible fault causes
- ♦ Timing wrong (chain jump)
- ♦ Camshaft sensor loose
- ♦ Timing set incorrectly (after repairs)
- ♦ Hall sender rotor (camshaft) wrong or damaged

Fault setting condition(s)
Current timing <> stored timing (last engine run)

P1343

Diagnostic information - DME (DFI) control unit

Bank 2 exhaust camshaft timing

Diagnostic conditions
- Time since engine start > 10 second(s)

Possible fault causes
- ♦ Timing wrong (chain jump)
- ♦ Camshaft sensor loose
- ♦ Timing set incorrectly (after repairs)
- ♦ Hall sender rotor (camshaft) wrong or damaged

Fault setting condition(s)
Current timing <> stored timing (last engine run)

P1346

Diagnostic information - DME (DFI) control unit

Valve lift control, bank 1 + bank 2

Diagnostic conditions
ⓘ Diagnostics is interrupted if the tank vent valve is > 35% activated (L170) **and** the carbon canister load is > 0.50 (L150).

- **Time since engine start** > 5 minute(s)

The following conditions must be met and must be valid at least 3 times (See ⓘ):
- Driving with engine speed and load conditions as constant as possible for > 10 seconds with:
  - Minimum acceleration
  - Small lift (actual value A220 = 0)
  - **Engine speed** 1,000 ... 2,000 rpm (A020)
  - Mass air flow 320 … 120 mg/stroke (A050)

immediately afterwards:
- Drive for > 5 seconds with:
  - Acceleration
  - Large lift (actual value A220 = 1)
  - **Engine speed** up to max. 3,500 rpm (A020)

Possible fault causes
♦ Engine oil pressure too high or too low
♦ Loose contact or corrosion on connectors or lines (power supply for solenoid valve for hydraulic valve lift control)

Fault setting condition(s)
- A check is performed to determine whether the lambda controllers of both banks each exhibit a deviation of > +/- 20% approx. 4 seconds before and after valve lift switchover.
- The fault is entered if this occurs 3 times during a drive under the diagnostic conditions.

ⓘ If the deviation occurs on only one bank, another fault is entered (see P1372/P1373).

ⓘ INFORMATION
A drive with the aforementioned conditions can be performed as follows, for example:
- Engine at operating temperature
- Selector lever set to M in the highest possible gear
- NO kickdown, so that the gear is held
- Level route
- Vehicle rolls at approx. 50 km/h (30 mph) for approx. 10 seconds
- Then acceleration to max. 3,500 rpm with:
  - Acceleration not too low (large lift - actual value A220 = 1)

Diagnostic information - DME (DFI) control unit

Valve lift control, bank 1 + bank 2

Diagnostic conditions
ⓘ Diagnostics is interrupted if the tank vent valve is > 35% activated (L170) **and** the carbon canister load is > 0.50 (L150).

- **Time since engine start** > 5 minute(s)

The following conditions must be met and must be valid at least 3 times (See ⓘ):
- Driving with engine speed and load conditions as constant as possible for > 10 seconds with:
  - Minimum acceleration
  - Small lift (actual value A220 = 0)
  - **Engine speed** 1,000 ... 2,000 rpm (A020)
  - Mass air flow 320 … 120 mg/stroke (A050)

immediately afterwards:
- Drive for > 5 seconds with:
  - Acceleration
  - Large lift (actual value A220 = 1)
  - **Engine speed** up to max. 3,500 rpm (A020)

Possible fault causes
♦ Engine oil pressure too high or too low
♦ Loose contact or corrosion on connectors or lines (power supply for solenoid valve for hydraulic valve lift control)

Fault setting condition(s)
- A check is performed to determine whether the lambda controllers of both banks each exhibit a deviation of > +/- 20% approx. 4 seconds before and after valve lift switchover.
- The fault is entered if this occurs 3 times during a drive under the diagnostic conditions.

ⓘ If the deviation occurs on only one bank, another fault is entered (see P1372/P1373).

ⓘ INFORMATION
A drive with the aforementioned conditions can be performed as follows, for example:
- Engine at operating temperature
- Selector lever set to M in the highest possible gear
- NO kickdown, so that the gear is held
- Level route
- Vehicle rolls at approx. 50 km/h (30 mph) for approx. 10 seconds
- Then acceleration to max. 3,500 rpm with:
  - Acceleration not too low (large lift - actual value A220 = 1)

Diagnostic information - DME (DFI) control unit

Valve lift control, cylinder X - large lift

Diagnostic conditions
- Short test for valve lift of individual cylinders (if available)

or
- Driving in partial-load range
  - > 5 minute(s)
  - Engine speed 1,250 … 3,000 rpm
  - Mass air flow 180 … 500 mg/stroke

- then idling
  - Air conditioning [OFF]
  - > 2 minute(s)
  - Engine speed 500 … 1,000 rpm
  - Mass air flow 90 … 250 mg/stroke

Possible fault causes
- Fuel injector faulty or borderline
  (opens too late/not long enough/not enough or leaking)
- Bar ignition module faulty
- Leak in intake-air distributor
- Insufficient compression
  (e.g. cylinder liner damaged, valve seat ring faulty, ...)
- Valve lifter faulty
  (Intake valve has not switched to the other lift or has not switched quickly enough)

Fault setting condition(s)
- The diagnostic function detects uneven running for the specified cylinder.
- Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.
- Uneven running is interpreted as a misfire or valve lift fault, depending on type.

Diagnostic information - DME (DFI) control unit

Valve lift control, cylinder X - large lift

Diagnostic conditions
- Short test for valve lift of individual cylinders (if available)

or
- Driving in partial-load range
  - > 5 minute(s)
  - Engine speed 1,250 … 3,000 rpm
  - Mass air flow 180 … 500 mg/stroke

- then idling
  - Air conditioning [OFF]
  - > 2 minute(s)
  - Engine speed 500 … 1,000 rpm
  - Mass air flow 90 … 250 mg/stroke

Possible fault causes
- Fuel injector faulty or borderline
  (opens too late/not long enough/not enough or leaking)
- Bar ignition module faulty
- Leak in intake-air distributor
- Insufficient compression
  (e.g. cylinder liner damaged, valve seat ring faulty, ...)
- Valve lifter faulty
  (Intake valve has not switched to the other lift or has not switched quickly enough)

Fault setting condition(s)
- The diagnostic function detects uneven running for the specified cylinder.
- Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.
- Uneven running is interpreted as a misfire or valve lift fault, depending on type.

Diagnostic information - DME (DFI) control unit

Valve lift control, cylinder X - large lift

Diagnostic conditions
- Short test for valve lift of individual cylinders (if available)

or
- Driving in partial-load range
  - > 5 minute(s)
  - Engine speed 1,250 … 3,000 rpm
  - Mass air flow 180 … 500 mg/stroke

  - Air conditioning [OFF]
  - > 2 minute(s)
  - Engine speed 500 … 1,000 rpm
  - Mass air flow 90 … 250 mg/stroke

Possible fault causes
- Fuel injector faulty or borderline
  (opens too late/not long enough/not enough or leaking)
- Bar ignition module faulty
- Leak in intake-air distributor
- Insufficient compression
  (e.g. cylinder liner damaged, valve seat ring faulty, ...)
- Valve lifter faulty
  (Intake valve has not switched to the other lift or has not switched quickly enough)

Fault setting condition(s)
- The diagnostic function detects uneven running for the specified cylinder.
- Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.
- Uneven running is interpreted as a misfire or valve lift fault, depending on type.

P1372

Diagnostic information - DME (DFI) control unit

Valve lift control, bank 1
- V6 Turbo only

Diagnostic conditions
- Perform a short test

or:
- Engine oil temperature < 120 °C (248 °F) (T030)
- Air conditioning [OFF]

- Small lift:
  - Engine speed 1,000 .... 2,500 rpm (A020)
  - Mass air flow (A050)
    - > 300 … > 135 mg/stroke (depending on: engine speed)
  - Intake camshaft adjustment > 16° (N060)

- Large lift:
  - Engine speed 1,000 .... 2,400 rpm (A020)
  - Mass air flow (A050)
    - > 400 … > 170 mg/stroke (depending on: engine speed)

Possible fault causes
♦ Oil supply too low
⇒ (e.g. dirty (oil circuit), scavenging restrictor faulty (cylinder head), ...)
♦ Large differences in exhaust backpressure between banks (e.g. due to constricted or blocked passage of an exhaust branch).
♦ Wrong timing, one bank (intake camshaft or exhaust camshaft)
♦ Solenoid valve for hydraulic valve lift control faulty
⇒ (mechanical fault or electrical fault in circuit)

Fault setting condition(s)
Based on the lambda controllers, the diagnostic function detects that all the valves on this bank have either not switched to the other lift or have not switched quickly enough during valve lift switchover.

P1373

Diagnostic information - DME (DFI) control unit

Valve lift control, bank 2
- V6 Turbo only

Diagnostic conditions
- Perform a short test

or:
- Engine oil temperature < 120 °C (248 °F) (T030)
- Air conditioning [OFF]

- Small lift:
  - Engine speed 1,000 .... 2,500 rpm (A020)
  - Mass air flow (A050)
    - > 300 … > 135 mg/stroke (depending on: engine speed)
  - Intake camshaft adjustment > 16° (N060)

- Large lift:
  - Engine speed 1,000 .... 2,400 rpm (A020)
  - Mass air flow (A050)
    - > 400 … > 170 mg/stroke (depending on: engine speed)

Possible fault causes
♦ Oil supply too low
⇒ (e.g. dirty (oil circuit), scavenging restrictor faulty (cylinder head), ...)
♦ Large differences in exhaust backpressure between banks (e.g. due to constricted or blocked passage of an exhaust branch).
♦ Wrong timing, one bank (intake camshaft or exhaust camshaft)
♦ Solenoid valve for hydraulic valve lift control faulty
⇒ (mechanical fault or electrical fault in circuit)

Fault setting condition(s)
Based on the lambda controllers, the diagnostic function detects that all the valves on this bank have either not switched to the other lift or have not switched quickly enough during valve lift switchover.

Diagnostic information - DME (DFI) control unit

Valve lift control, cylinder X - large lift

Diagnostic conditions
- Short test for valve lift of individual cylinders (if available)

or
- Driving in partial-load range
  - > 5 minute(s)
  - Engine speed 1,250 … 3,000 rpm
  - Mass air flow 180 … 500 mg/stroke

- then idling
  - Air conditioning [OFF]
  - > 2 minute(s)
  - Engine speed 500 … 1,000 rpm
  - Mass air flow 90 … 250 mg/stroke

Possible fault causes
- Fuel injector faulty or borderline
  (opens too late/not long enough/not enough or leaking)
- Bar ignition module faulty
- Leak in intake-air distributor
- Insufficient compression
  (e.g. cylinder liner damaged, valve seat ring faulty, ...)
- Valve lifter faulty
  (Intake valve has not switched to the other lift or has not switched quickly enough)

Fault setting condition(s)
- The diagnostic function detects uneven running for the specified cylinder.
- Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.
- Uneven running is interpreted as a misfire or valve lift fault, depending on type.

Diagnostic information - DME (DFI) control unit

Valve lift control, cylinder X - large lift

- Uneven running is interpreted as a misfire or valve lift fault, depending on type.

P1380

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

Diagnostic information - DME (DFI) control unit

Valve lift control - one bank in wrong lift
- Panamera V8T from MY E
- Cayenne V8T from MY F

ⓘ INFORMATION
Based on the lambda controllers, the diagnostic function detects that all the valves on **ONE** bank have either not switched to the other lift or have not switched quickly enough during valve lift switchover.
♦ The diagnostic function **CANNOT** detect which of the two banks is faulty **while the vehicle is moving**.
♦ **After** the fault memory has been erased **AND** a **valve lift short test** is then performed, the diagnostic function detects which bank is working incorrectly. The following codes **then** mean:
- Fault code P1381 = bank 1 faulty
- Fault code P1382 = bank 2 faulty

Diagnostic conditions
- Perform a short test

or
- Engine oil temperature < 120 °C (248 °F) (T030)
- Air conditioning [OFF]

- Small lift:
  - Engine idling ▶ Engine speed 550 ... 850 rpm (A020)
  - Mass air flow (A050)
    - > 130 … > 140 mg/stroke
    - < 250 … < 150 mg/stroke (depending on: engine speed)

- Large lift:
  - Engine speed 1,400 ... 6,500 rpm (A020)
  - Mass air flow (A050)
    - > 750 … > 325 mg/stroke (depending on: engine speed)

Possible fault causes
♦ Oil supply too low
⇒ (e.g. dirty (oil circuit), scavenging restrictor faulty (cylinder head), ...)
♦ Large differences in exhaust backpressure between banks (e.g. due to constricted or blocked passage of an exhaust branch).
♦ Wrong timing, one bank (intake camshaft or exhaust camshaft)
♦ Solenoid valve for hydraulic valve lift control faulty
⇒ (mechanical fault or electrical fault in circuit)

Fault setting condition(s)
Based on the lambda controllers, the diagnostic function detects that all the valves on this bank have either not switched to the other lift or have not switched quickly enough during valve lift switchover.

Diagnostic information - DME (DFI) control unit

Valve lift control - one bank in wrong lift
- Panamera V8T from MY E

♦ The diagnostic function **CANNOT** detect which of the two banks is faulty **while the vehicle is moving**.
♦ **After** the fault memory has been erased **AND** a **valve lift short test** is then performed, the diagnostic function detects which bank is working incorrectly. The following codes **then** mean:
- Fault code P1381 = bank 1 faulty
- Fault code P1382 = bank 2 faulty

Diagnostic conditions
- Perform a short test

or
- Engine oil temperature < 120 °C (248 °F) (T030)
- Air conditioning [OFF]

- Small lift:
  - Engine idling ▶ Engine speed 550 ... 850 rpm (A020)
  - Mass air flow (A050)
    - > 130 … > 140 mg/stroke
    - < 250 … < 150 mg/stroke (depending on: engine speed)

- Large lift:
  - Engine speed 1,400 ... 6,500 rpm (A020)
  - Mass air flow (A050)
    - > 750 … > 325 mg/stroke (depending on: engine speed)

Possible fault causes
♦ Oil supply too low
⇒ (e.g. dirty (oil circuit), scavenging restrictor faulty (cylinder head), ...)
♦ Large differences in exhaust backpressure between banks (e.g. due to constricted or blocked passage of an exhaust branch).
♦ Wrong timing, one bank (intake camshaft or exhaust camshaft)
♦ Solenoid valve for hydraulic valve lift control faulty
⇒ (mechanical fault or electrical fault in circuit)

Fault setting condition(s)
Based on the lambda controllers, the diagnostic function detects that all the valves on this bank have either not switched to the other lift or have not switched quickly enough during valve lift switchover.

Diagnostic information - DME (DFI) control unit

Bank 1 misfire after cold start

Diagnostic conditions
- Cold start (catalytic converter heating measure)
- Idle speed up to the red range on the tachometer
- No overrun phase(s)
- None of the following faults stored: P0335, P0336, P0371, P0373

Possible fault causes

♦ Affected by block heater

♦ Loose contact or corrosion on connectors or lines
♦ Power supply or ground supply faulty

♦ Spark plug(s) oily due to oil entrainment in the cylinder
♦ Wrong spark plug(s)
♦ Mechanical or electrical fault in spark plug(s)
♦ Bar ignition module faulty
♦ Power supply or ground supply faulty

♦ Wrong fuel quality
♦ Fuel tank empty
♦ Water in fuel tank
♦ Fuel line dirty/blocked
♦ Mechanical fault in electric fuel pump
♦ Mechanical fault in fuel high-pressure pump

♦ Fuel injector faulty or borderline
(opens too late/not long enough/not enough or leaking)
♦ Oxygen sensor(s) faulty

♦ Exhaust system constricted/blocked
♦ Catalytic converter faulty

♦ Leak in intake-air distributor
♦ Foreign bodies in intake-air distributor
♦ Camshaft adjustment fault
♦ Wrong timing - exhaust camshaft
♦ Valve lift control fault
♦ Valve lifter faulty
(Intake valve has not switched to the other lift or has not switched quickly enough)
♦ Mechanical fault in valve drive
♦ Insufficient compression
(e.g. cylinder liner damaged, valve seat ring faulty, ...)

Fault setting condition(s)

● The diagnostic function detects uneven running for the specified cylinder.
● Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.
● Uneven running is interpreted as a misfire or valve lift fault, depending on type.

Diagnostic information - DME (DFI) control unit

Bank 2 misfire after cold start

Diagnostic conditions
- Cold start (catalytic converter heating measure)
- Idle speed up to the red range on the tachometer
- No overrun phase(s)
- None of the following faults stored: P0335, P0336, P0371, P0373

Possible fault causes

♦ Affected by block heater

♦ Loose contact or corrosion on connectors or lines
♦ Power supply or ground supply faulty

♦ Spark plug(s) oily due to oil entrainment in the cylinder
♦ Wrong spark plug(s)
♦ Mechanical or electrical fault in spark plug(s)
♦ Bar ignition module faulty
♦ Power supply or ground supply faulty

♦ Wrong fuel quality
♦ Fuel tank empty
♦ Water in fuel tank
♦ Fuel line dirty/blocked
♦ Mechanical fault in electric fuel pump
♦ Mechanical fault in fuel high-pressure pump

♦ Fuel injector faulty or borderline
(opens too late/not long enough/not enough or leaking)
♦ Oxygen sensor(s) faulty

♦ Exhaust system constricted/blocked
♦ Catalytic converter faulty

♦ Leak in intake-air distributor
♦ Foreign bodies in intake-air distributor
♦ Camshaft adjustment fault
♦ Wrong timing - exhaust camshaft
♦ Valve lift control fault
♦ Valve lifter faulty
(Intake valve has not switched to the other lift or has not switched quickly enough)
♦ Mechanical fault in valve drive
♦ Insufficient compression
(e.g. cylinder liner damaged, valve seat ring faulty, ...)

Fault setting condition(s)

● The diagnostic function detects uneven running for the specified cylinder.
● Uneven running is calculated from the expected and actual crankshaft acceleration due to combustion.
● Uneven running is interpreted as a misfire or valve lift fault, depending on type.

Diagnostic information - DME (DFI) control unit

Ignition timing angle after cold start

Diagnostic conditions
- Cold start
- then driving

Possible fault causes
ⓘ This fault entry is used for information purposes only; the actual cause of the fault is in another area.
♦ Significant engine running problems force the engine control system to leave the permitted ignition timing range in order to keep the engine running.

P1460

Diagnostic information - DME (DFI) control unit

Radiator fan: overtemperature

⚠WARNING
Exposed running fan blades!
Danger of limbs being severed!
Risk of serious injury due to ejected foreign bodies!
♦ **ALWAYS** keep hair or clothing out of the rotating range of the fan.
♦ DO NOT reach into the rotating fan.
♦ **DO NOT** place tools or other items in the rotating range of the fan.
♦ Perform work on the fan only with the ignition switched off.
♦ Secure the ignition to prevent it from being switched on accidentally by other persons.

NOTE
Sensitive electronics!
Risk of irreparable damage to electronic components!
♦ **DO NOT** carry out electrical tests.
♦ **DO NOT** connect external power sources.

ⓘ INFORMATION
♦ The control unit is activated by the DME control unit via a signal line.
♦ In the opposite direction, the control unit can report faults to the DME control unit.

Diagnostic conditions
● Radiator fan activated > 5 minute(s)

Possible fault causes
♦ Radiator air intake covered (car cover)
♦ Radiator fan control unit faulty

Fault setting condition(s)
● Overtemperature in radiator fan control unit

Fault effects
● 1st threshold exceeded:
  ♦ Radiator fan speed = 1,800 rpm (lowest power loss)
● 2nd threshold exceeded:
  ♦ Radiator fan switched off

P1461

Diagnostic information - DME (DFI) control unit

Radiator fan: electrical fault

⚠WARNING

Exposed running fan blades!
Danger of limbs being severed!
Risk of serious injury due to ejected foreign bodies!

- **ALWAYS** keep hair or clothing out of the rotating range of the fan.
- DO NOT reach into the rotating fan.
- **DO NOT** place tools or other items in the rotating range of the fan.
- Perform work on the fan only with the ignition switched off.
- Secure the ignition to prevent it from being switched on accidentally by other persons.

NOTE

Sensitive electronics!
Risk of irreparable damage to electronic components!

- **DO NOT** carry out electrical tests.
- **DO NOT** connect external power sources.

ⓘ INFORMATION

- The control unit is activated by the DME control unit via a signal line.
- In the opposite direction, the control unit can report faults to the DME control unit.

Diagnostic conditions

- Radiator fan activated > 5 minute(s)

Possible fault causes

- Radiator fan faulty
- Radiator fan control unit faulty

Fault effects

- Radiator fan switched off

Diagnostic information - DME (DFI) control unit

Radiator fan: internal power supply

⚠WARNING

Exposed running fan blades!
Danger of limbs being severed!
Risk of serious injury due to ejected foreign bodies!

- ♦ **ALWAYS** keep hair or clothing out of the rotating range of the fan.
- ♦ DO NOT reach into the rotating fan.
- ♦ **DO NOT** place tools or other items in the rotating range of the fan.
- ♦ Perform work on the fan only with the ignition switched off.
- ♦ Secure the ignition to prevent it from being switched on accidentally by other persons.

NOTE

Sensitive electronics!
Risk of irreparable damage to electronic components!

- ♦ **DO NOT** carry out electrical tests.
- ♦ **DO NOT** connect external power sources.

ⓘ INFORMATION

- ♦ The control unit is activated by the DME control unit via a signal line.
- ♦ In the opposite direction, the control unit can report faults to the DME control unit.

Diagnostic conditions

- ● Radiator fan activated > 5 minute(s)

Possible fault causes

- ♦ Radiator fan faulty
- ♦ Radiator fan control unit faulty

P1466

Diagnostic information - DME (DFI) control unit

Radiator fan: mechanical fault

⚠WARNING
Exposed running fan blades!
Danger of limbs being severed!
Risk of serious injury due to ejected foreign bodies!
♦ **ALWAYS** keep hair or clothing out of the rotating range of the fan.
♦ DO NOT reach into the rotating fan.
♦ **DO NOT** place tools or other items in the rotating range of the fan.
♦ Perform work on the fan only with the ignition switched off.
♦ Secure the ignition to prevent it from being switched on accidentally by other persons.

NOTE
Sensitive electronics!
Risk of irreparable damage to electronic components!
♦ **DO NOT** carry out electrical tests.
♦ **DO NOT** connect external power sources.

ⓘ INFORMATION
♦ The control unit is activated by the DME control unit via a signal line.
♦ In the opposite direction, the control unit can report faults to the DME control unit.

Diagnostic conditions
● Radiator fan activated > 5 minute(s)

Possible fault causes
♦ Radiator fan sluggish or blocked
♦ Radiator fan faulty

Fault setting condition(s)
● Radiator fan current draw too high

Fault effects
● Sluggish:
  ♦ Radiator fan speed reduced to 0 rpm
● Blocked:
  ♦ Engine shakes loose

P1476

Diagnostic information - DME (DFI) control unit

Insufficient vacuum for leakage diagnosis pump

Diagnostic conditions

- Perform tank leak short test

or

- Driving > 150 second(s) with:
  - Engine start temperature 5 ... 50 °C (41 … 122 °F)
  - Time since engine start 5 second(s) ... 20 minute(s)
  - Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
    ⇒ See actual value A060-Ambient pressure from DME (measured)
  - Height difference < 20 m (66 ft.)
  - Intake air temperature > 5 °C (41 °F)
  - Intake air temperature: fluctuation(s) < 10 °C (50 °F)
  - Vehicle speed 0 ... 120 km/h (0 … 75 mph)
  - Acceleration/deceleration max. -2 m/s² … +2 m/s²
  - High partial-load share

Possible fault causes

- ♦ Vacuum system leaking (See ⓘ)
- ♦ Vacuum pump faulty

Fault setting condition(s)

- Reed switch signal missing or delayed

ⓘ INFORMATION

The vacuum system includes:

- ♦ Mechanical vacuum pump
- ♦ Main load circuit:
  - ♦ Brake booster
- ♦ Auxiliary load circuit:
  - ♦ Variable intake manifold (not Turbo)
  - ♦ Boost pressure control cycle valve (Turbo only)
  - ♦ Diverter solenoid valve (Turbo only)
  - ♦ Exhaust flap (if fitted)
  - ♦ Acoustic simulator (V6 Turbo only)
  - ♦ Tank leakage diagnosis pump (USA, Canada and South Korea only)

Diagnostic information - DME (DFI) control unit

Exhaust flap: mechanical fault

Diagnostic conditions
- Open and close exhaust flap (e.g. via drive link)

Possible fault causes
- ♦ Foreign object in flap
- ♦ Mechanism sluggish or faulty
- ♦ Servo motor faulty

Fault setting conditions
- The servo motor reports a flap actual position that deviates from the specified setpoint position
- The flap actual position is implausible

Diagnostic information - DME (DFI) control unit

Exhaust flap: mechanical fault

Diagnostic conditions
● Open and close exhaust flap (e.g. via drive link)

Possible fault causes
♦ Foreign object in flap
♦ Mechanism sluggish or faulty
♦ Servo motor faulty

Fault setting conditions
● The servo motor reports a flap actual position that deviates from the specified setpoint position
● The flap actual position is implausible

P1502

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit

Diagnostic conditions
- Vehicle standstill
- Coolant temperature 5 ... 100 °C (41 … 212 °F)
- Intake air temperature 5 ... 40 °C (41 … 104 °F)
- Accelerator pedal not pressed (0%)
- Ignition off
- then switch on ignition > 60 second(s) with engine off

Possible fault causes
- ♦ Adaptation was not performed (successfully).
- ♦ Throttle valve adjusting unit faulty

P1506

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit

Diagnostic conditions
- Vehicle standstill
- Coolant temperature 5 ... 100 °C (41 … 212 °F)
- Intake air temperature 5 ... 40 °C (41 … 104 °F)
- Accelerator pedal not pressed (0%)
- Ignition off
- then switch on ignition > 60 second(s) with engine off

Possible fault causes
- ♦ Adaptation was not performed (successfully).
- ♦ Throttle valve adjusting unit faulty

P1507

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit

Diagnostic conditions
- Vehicle standstill
- Coolant temperature 5 ... 100 °C (41 … 212 °F)
- Intake air temperature 5 ... 40 °C (41 … 104 °F)
- Accelerator pedal not pressed (0%)
- Ignition off
- then switch on ignition > 60 second(s) with engine off

Possible fault causes
- ♦ Adaptation was not performed (successfully).
- ♦ Throttle valve adjusting unit faulty

P1508

Diagnostic information - DME (DFI) control unit

Control unit function monitoring

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill

Possible fault causes
- ♦ Power supply or ground supply faulty ⇒ See P1559
- ♦ DME (DFI) control unit software error ▶ Re-program

ⓘ INFORMATION
- ♦ All calculations for functions in the control unit are monitored by a higher-level unit.
- ♦ A fault is entered if monitoring detects implausible calculations.

P1509

Diagnostic information - DME (DFI) control unit

Control unit function monitoring

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill

Possible fault causes
- ♦ Power supply or ground supply faulty ⇒ See P1559
- ♦ DME (DFI) control unit software error ▶ Re-program

ⓘ INFORMATION
- ♦ All calculations for functions in the control unit are monitored by a higher-level unit.
- ♦ A fault is entered if monitoring detects implausible calculations.

P1512

Diagnostic information - DME (DFI) control unit

Starter activation with powertrain closed

Diagnostic conditions
- Restart by Start/Stop system

Possible fault causes
- DME (DFI) control unit faulty

Fault setting condition(s)
- The starter was actuated by the Start/Stop system although a closed powertrain was detected (gear engaged + clutch closed).

Fault effects
- Start/Stop system deactivated

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit - adaptation aborted due to environmental condition

Diagnostic conditions

- Vehicle standstill
- Coolant temperature 5 ... 100 °C (41 … 212 °F)
- Intake air temperature 5 ... 40 °C (41 … 104 °F)
- Accelerator pedal not pressed (0%)
- Ignition off
- then switch on ignition > 60 second(s) with engine off

Possible fault causes

♦ Adaptation aborted due to environmental condition

Fault setting condition(s)

One or more of the stated conditions were not met (see ⓘ)

Fault effects

♦ Engine **cannot** be started

ⓘ INFORMATION

Forced adaptation can be performed using the PIWIS Tester.

Diagnostic information - DME (DFI) control unit

Ambient temperature via CAN
- Panamera from MY E (NOT Panamera GTS)
- Cayenne from MY F

Diagnostic conditions
- Ignition on > 15 second(s)

Possible fault causes
♦ Air-conditioning regulator does not work or is faulty

Fault setting condition(s)
Ambient temperature of air-conditioning regulator is not received for > 12 seconds
▶ Initialization value of 77 °C (171 °F) is output.

Fault effects

♦ Substitute value from model
♦ If a fault is present when recording the ambient temperature, positive crankcase ventilation is continuously activated.

Diagnostic information - DME (DFI) control unit

Switch-off time fault

Diagnostic conditions
- Engine running
- then switch off ignition
- immediately afterwards: ignition on > 10 minute(s)

Possible fault causes
♦ The power supply of the DME (DFI) control unit was interrupted during control unit run-on (See P1572)
♦ DME (DFI) control unit faulty

ⓘ INFORMATION
1. The DME control unit receives time information from the instrument cluster at regular intervals (approx. 4 sec.) when the ignition is on.

2. The switch-off time A145_Time since engine stop (manual via ignition lock) is calculated in the DME control unit.

Diagnostic information - DME (DFI) control unit

Oil pump activation

ⓘ INFORMATION

♦ The measured oil pressure is compared with the setpoint oil pressure.
♦ The setpoint oil pressure depends, among other things, on the ambient conditions (temperatures, off time, etc.), operating point of the engine …
♦ A fault is detected if the PWM signal is outside a defined range for > 30 seconds.

Diagnostic conditions
● Engine running

Possible fault causes
♦ Dynamic driving style when oil level is near minimum (oil foaming)
♦ Engine oil pressure too low (oil level, oil quality, oil thinning, dirt in oil circuit, oil circuit faulty - increased leakage inside the engine)
♦ Engine oil pressure too high (oil quality, oil thickening, dirt in oil circuit, oil circuit faulty)
♦ Oil pressure sensor faulty (incorrect trimming)
♦ Oil pressure control valve faulty
♦ Oil pump faulty

Diagnostic information - DME (DFI) control unit

Oil pump activation

ⓘ INFORMATION

♦ The measured oil pressure is compared with the setpoint oil pressure.
♦ The setpoint oil pressure depends, among other things, on the ambient conditions (temperatures, off time, etc.), operating point of the engine …
♦ A fault is detected if the PWM signal is outside a defined range for > 30 seconds.

Diagnostic conditions
● Engine running

Possible fault causes
♦ Dynamic driving style when oil level is near minimum (oil foaming)
♦ Engine oil pressure too low (oil level, oil quality, oil thinning, dirt in oil circuit, oil circuit faulty - increased leakage inside the engine)
♦ Engine oil pressure too high (oil quality, oil thickening, dirt in oil circuit, oil circuit faulty)
♦ Oil pressure sensor faulty (incorrect trimming)
♦ Oil pressure control valve faulty
♦ Oil pump faulty

P1538

Diagnostic information - DME (DFI) control unit

Oil pump activation

ⓘ INFORMATION

♦ The oil pressure control valve is controlled via a PWM signal.
♦ The PWM signal depends, among other things, on the ambient conditions (temperatures, off time, etc), operating point of the engine (rpm, load, oil temperature), measured oil pressure (at the oil pressure sensor) …
♦ A fault is detected if the PWM signal is outside a defined range for > 8 seconds.

Diagnostic conditions
● Engine running

Possible fault causes
♦ Engine oil pressure too low (oil level, oil quality, oil thinning, dirt in oil circuit, oil circuit faulty)
♦ Engine oil pressure too high (oil quality, oil thickening, dirt in oil circuit, oil circuit faulty)
♦ Oil pressure sensor faulty
♦ Oil pressure control valve faulty
♦ Oil pump faulty

Diagnostic information - DME (DFI) control unit

Oil pump activation

ⓘ INFORMATION

♦ The oil pressure control valve is controlled via a PWM signal.
♦ The PWM signal depends, among other things, on the ambient conditions (temperatures, off time, etc), operating point of the engine (rpm, load, oil temperature), measured oil pressure (at the oil pressure sensor) …
♦ A fault is detected if the PWM signal is outside a defined range for > 8 seconds.

Diagnostic conditions
● Engine running

Possible fault causes
♦ Engine oil pressure too low (oil level, oil quality, oil thinning, dirt in oil circuit, oil circuit faulty)
♦ Engine oil pressure too high (oil quality, oil thickening, dirt in oil circuit, oil circuit faulty)
♦ Oil pressure sensor faulty
♦ Oil pressure control valve faulty
♦ Oil pump faulty

P1540

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit

Diagnostic conditions
- Vehicle standstill
- Coolant temperature 5 ... 100 °C (41 … 212 °F)
- Intake air temperature 5 ... 40 °C (41 … 104 °F)
- Accelerator pedal not pressed (0%)
- Ignition off
- then switch on ignition > 60 second(s) with engine off

Possible fault causes
- ♦ Adaptation was not performed (successfully).
- ♦ Throttle valve adjusting unit faulty

P1541

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit

Diagnostic conditions
- Vehicle standstill
- Coolant temperature 5 ... 100 °C (41 … 212 °F)
- Intake air temperature 5 ... 40 °C (41 … 104 °F)
- Accelerator pedal not pressed (0%)
- Ignition off
- then switch on ignition > 60 second(s) with engine off

Possible fault causes
- ♦ Adaptation was not performed (successfully).
- ♦ Throttle valve adjusting unit faulty

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit - start test

Diagnostic conditions
- **Throttle valve adjusting unit** adapted
- Switch on ignition , then
  - Switch off ignition for > 1 **min.**
    - Switch on ignition

Possible fault causes
♦ Throttle valve adjusting unit faulty

Fault setting condition(s)
The start test was faulty twice in a row (See ⓘ).

ⓘ INFORMATION
Start test: When the ignition is switched on , the throttle valve is opened by a certain value, and must then close on its own.

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit - start test

Diagnostic conditions
- **Throttle valve adjusting unit** adapted
- Switch on ignition , then
  - Switch off ignition for > 1 **min.**
    - Switch on ignition

Possible fault causes
♦ Throttle valve adjusting unit faulty

Fault setting condition(s)
The start test was faulty twice in a row (See ⓘ).

ⓘ INFORMATION
Start test: When the ignition is switched on , the throttle valve is opened by a certain value, and must then close on its own.

P1544

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit stuck

Diagnostic conditions
- Throttle valve adjusting unit adapted
- Vehicle standstill
- No gear engaged or selector-lever position P or N
- Intake air temperature > 5 °C (41 °F)
- Idle speed
- then short acceleration
- then engine speed > 2,200 rpm

Possible fault causes
- Throttle valve adjusting unit frozen
- Throttle valve adjusting unit faulty

P1546

Diagnostic information - DME (DFI) control unit

Wheel speed implausible

Diagnostic conditions
- Driving

Possible fault causes
- ♦ Fault in PSM area

Fault setting condition(s)
- The wheel speed deviates from the other wheel speeds for too long.

P1547

Diagnostic information - DME (DFI) control unit

Wheel speed implausible

Diagnostic conditions
- Driving

Possible fault causes
- Fault in PSM area

Fault setting condition(s)
- The wheel speed deviates from the other wheel speeds for too long.

P1548

Diagnostic information - DME (DFI) control unit

Wheel speed implausible

Diagnostic conditions
- Driving

Possible fault causes
- Fault in PSM area

Fault setting condition(s)
- The wheel speed deviates from the other wheel speeds for too long.

P1549

Diagnostic information - DME (DFI) control unit

Wheel speed implausible

Diagnostic conditions
- Driving

Possible fault causes
- Fault in PSM area

Fault setting condition(s)
- The wheel speed deviates from the other wheel speeds for too long.

P1550

Diagnostic information - DME (DFI) control unit

Control unit function monitoring

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill

Possible fault causes
- ♦ Power supply or ground supply faulty ⇒ See P1559
- ♦ DME (DFI) control unit software error ▶ Re-program

ⓘ INFORMATION
- ♦ All calculations for functions in the control unit are monitored by a higher-level unit.
- ♦ A fault is entered if monitoring detects implausible calculations.

P1552

Diagnostic information - DME (DFI) control unit

Control unit function monitoring

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill

Possible fault causes
- ♦ Power supply or ground supply faulty ⇒ See P1559
- ♦ DME (DFI) control unit software error ▶ Re-program

ⓘ INFORMATION
- ♦ All calculations for functions in the control unit are monitored by a higher-level unit.
- ♦ A fault is entered if monitoring detects implausible calculations.

P1556

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

P1557

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

P1558

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

P1559

Diagnostic information - DME (DFI) control unit

Control unit restart during operation (warm reset)

Diagnostic conditions
- Engine start

Possible fault causes
♦ Vehicle electrical system voltage < 6 V during starting process (e.g. battery discharged or faulty), e.g. due to contact resistance in the lines to the DME control unit.
♦ Excessive difference in internal monitoring processes in the control unit, e.g. in case of reversal of the engine's direction of rotation due to inadvertent shifting into reverse gear when the vehicle is driving forward.

Fault setting condition(s)
This fault is entered if the DME control unit performs a restart during operation (soft reboot/warm reset).

Diagnostic information - DME (DFI) control unit

Vehicle speed PSM

Diagnostic conditions
- Driving with:
  - Engine temperature > 30 °C (86 °F)
  - Overrun phase(s) > 1.5 second(s)
  - Engine speed 1.408 .... 3,000 rpm
- None of the following faults stored: U0129, P0503

Possible fault causes
♦ Fault in PSM area

Fault setting condition(s)
- Vehicle speed < 3 km/h or 1 mph (measured value), with:
  - Diagnostic conditions

P1563

Diagnostic information - DME (DFI) control unit

Cruise control coding

Diagnostic conditions
- Ignition on

Possible fault causes
- Vehicle data incorrect
  (See PIWIS Tester II ▶ Additional menu [F7] ▶ Maintenance of vehicle data)
- Vehicle equipment wrong
- DME (DFI) control unit coded incorrectly - The data record does not match the vehicle.
- Steering wheel electronics control unit coded incorrectly

Diagnostic information - DME (DFI) control unit

Cruise control request despite main switch being off

Diagnostic conditions
- Driving
- Main cruise control switch [OFF]

Possible fault causes
- For cruise control ⇒ DME control unit faulty
- For ACC ⇒ Fault in ACC control unit (adaptive cruise control)

Fault setting condition(s)
- Torque request from cruise control (ACC or cruise control) although the main switch on the steering-column stalk is set to [OFF]

Fault effects
- ♦ No throttle response
- ♦ Increased idle speed (approx. 1,000 .... 1,600 rpm)
- ♦ Electronic throttle emergency mode (see ⓘ)

ⓘ INFORMATION

Electronic throttle emergency mode
During electronic throttle emergency mode, no power is supplied to the throttle valve, which then drops to emergency air position.
- ♦ Idle speed increases to approx. 1,000 .... 1,200 rpm.
- ♦ If the accelerator pedal is pressed, the engine will run at max. 1,600 rpm (set via ignition, injection, ...). ▶ **Limp home**.
- ♦ If the accelerator and brake are pressed at the same time, the engine will run at idle speed.
- ♦ If the engine speed exceeds 1,600 rpm, cylinders will be deactivated.
- ♦ If cylinder deactivation is not sufficient, the DME control unit performs a reset and fault code **P1559** is stored in the fault memory (the original faults were previously stored as reset-resistant faults in the fault memory).

P1565

Diagnostic information - DME (DFI) control unit

Adaptive cruise control (ACC) implausible

Diagnostic conditions
- Driving

Possible fault causes
- Fault in adaptive cruise control (ACC) area

Fault setting condition(s)
- Simultaneous detection of
  - Request: Acceleration - adaptive cruise control (ACC)

  and
  - Input signal: Brake light switch

P1575

Diagnostic information - DME (DFI) control unit

Accelerator pedal potentiometer implausible

Diagnostic conditions
- Ignition on > 3 second(s)
- then accelerator pedal pressed down fully > 3 second(s)
- then release accelerator pedal fully
- then idling > 10 second(s)

Possible fault causes
- ♦ Short circuit to B+/ground/between lines or open circuit in wiring to potentiometer 1 and 2
- ♦ Accelerator pedal potentiometer 1 and 2 faulty

Fault setting condition(s)
- Both potentiometers detected as faulty.
- Individual faults are also entered in most cases.

Fault effects
- ♦ Engine does not respond to throttle, engine speed 1,000 rpm

Diagnostic information - DME V8 DFI

Kickdown adaptation

INFORMATION
♦ A fault is detected if an adaptation process is terminated unsuccessfully 20 times.

Diagnostic conditions

- Ignition switched on
- Adaptation requested via Tester
- Accelerator pedal pressed down fully

Possible fault causes

♦ Adaptation requested, but started too late (max. 10 sec.)
♦ Accelerator pedal not kept constantly pressed down fully for at least 1 sec.
♦ Accelerator pedal not pressed down fully
♦ Accelerator pedal module loose

P1582

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

P1600

Diagnostic information - DME (DFI) control unit

Vehicle speed PSM

Diagnostic conditions
- Driving
- None of the following faults stored: U0129

Possible fault causes
- Fault in PSM area

Fault setting condition(s)
- Vehicle speed > 350 km/h or 218 mph (measured value)

P1620

Diagnostic information - DME (DFI) control unit

Crash signal monitoring

Diagnostic conditions
- Engine start

Possible fault causes
- Airbag drive link test
- Engine switch-off following:
  - Accident detection

P1641

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

P1642

Diagnostic information - DME (DFI) control unit

Control unit faulty

Diagnostic conditions
- Ignition on > 10 second(s)
- then idling > 30 second(s)
- then engine speed > 1,000 rpm > 60 seconds with:
  - Vehicle standstill
- then driving > 60 second(s)

Possible fault causes
♦ DME (DFI) control unit faulty

P1657

Diagnostic information - DME (DFI) control unit

Diverter solenoid valve

Diagnostic conditions
- Driving with 1 full-load acceleration and 1 overrun phase

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Diverter solenoid valve faulty

P1658

Diagnostic information - DME (DFI) control unit

Diverter solenoid valve

Diagnostic conditions
- Driving with 1 full-load acceleration and 1 overrun phase

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Diverter solenoid valve faulty

P1659

Diagnostic information - DME (DFI) control unit

Diverter solenoid valve

Diagnostic conditions
- Driving with 1 full-load acceleration and 1 overrun phase

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Diverter solenoid valve faulty

P1680

Diagnostic information - DME (DFI) control unit

Exhaust flap: short circuit in signal line

Diagnostic conditions
- Switch on ignition 5 x

Possible fault causes
- ♦ Servo motor signal line ◄► Short circuit to B+ or ground in DME control unit
- ♦ Servo motor faulty

Fault setting conditions
- Static signal on the servo motor signal line ◄► DME control unit

Fault effects
- ♦ If it still functions, the servo motor opens the flap as far as possible

P1681

Diagnostic information - DME (DFI) control unit

Exhaust flap: short circuit in signal line

Diagnostic conditions
- Switch on ignition 5 x

Possible fault causes
- ♦ Servo motor signal line ◄► Short circuit to B+ or ground in DME control unit
- ♦ Servo motor faulty

Fault setting conditions
- Static signal on the servo motor signal line ◄► DME control unit

Fault effects
- ♦ If it still functions, the servo motor opens the flap as far as possible

P1682

Diagnostic information - DME (DFI) control unit

Exhaust flap: no signal

Diagnostic conditions
- Switch on ignition 5 x

Possible fault causes
- ♦ Servo motor signal line ◄► Open circuit in DME control unit
- ♦ Servo motor power supply or ground supply faulty
- ♦ Servo motor faulty

Fault setting conditions
- No signal on the servo motor signal line ◄► DME control unit

Fault effects
- ♦ If it still functions, the servo motor opens the flap as far as possible

Diagnostic information - DME (DFI) control unit

Exhaust flap: short circuit in signal line

Diagnostic conditions
- Switch on ignition 5 x

Possible fault causes
- ♦ Servo motor signal line ◄► Short circuit to B+ or ground in DME control unit
- ♦ Servo motor faulty

Fault setting conditions
- Static signal on the servo motor signal line ◄► DME control unit

Fault effects
- ♦ If it still functions, the servo motor opens the flap as far as possible

Diagnostic information - DME (DFI) control unit

Exhaust flap: short circuit in signal line

Diagnostic conditions
- Switch on ignition 5 x

Possible fault causes
- ♦ Servo motor signal line ◄► Short circuit to B+ or ground in DME control unit
- ♦ Servo motor faulty

Fault setting conditions
- Static signal on the servo motor signal line ◄► DME control unit

Fault effects
- ♦ If it still functions, the servo motor opens the flap as far as possible

Diagnostic information - DME (DFI) control unit

Exhaust flap: no signal

Diagnostic conditions
- Switch on ignition 5 x

Possible fault causes
- Servo motor signal line ◄► Open circuit in DME control unit
- Servo motor power supply or ground supply faulty
- Servo motor faulty

Fault setting conditions
- No signal on the servo motor signal line ◄► DME control unit

Fault effects
- If it still functions, the servo motor opens the flap as far as possible

P1696

Diagnostic information - DME (DFI) control unit

Generator - electrical fault

Diagnostic conditions
- Engine running

Fault setting condition(s)
- Fault in gateway control unit

P1699

Diagnostic information - DME (DFI) control unit

Generator - no communication

Diagnostic conditions
- Engine running

Fault setting condition(s)

P2088

Diagnostic information - DME (DFI) control unit

Intake camshaft adjustment output stage, bank 1

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

P2089

Diagnostic information - DME (DFI) control unit

Intake camshaft adjustment output stage, bank 1

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

P2090

Diagnostic information - DME (DFI) control unit

Bank 1 exhaust camshaft adjustment output stage

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

P2091

Diagnostic information - DME (DFI) control unit

Bank 1 exhaust camshaft adjustment output stage

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

P2092

Diagnostic information - DME (DFI) control unit

Intake camshaft adjustment output stage, bank 2

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

P2093

Diagnostic information - DME (DFI) control unit

Intake camshaft adjustment output stage, bank 2

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

P2094

Diagnostic information - DME (DFI) control unit

Bank 2 exhaust camshaft adjustment output stage

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

P2095

Diagnostic information - DME (DFI) control unit

Bank 2 exhaust camshaft adjustment output stage

Diagnostic conditions
- Time since engine start > 10 second(s)
- None of the following faults stored: P1556, P1557, P1558

Possible fault causes
- Short circuit to B+/ground or open circuit in the line (activation)
- Short circuit to ground or open circuit in the lines (power supply)
- Fuse faulty
- Solenoid valve for hydraulic camshaft adjustment faulty

P2096

Diagnostic information - DME (DFI) control unit

Lambda correction behind catalytic converter bank 1 - control limit exceeded (too lean)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- None of the following faults stored:
  - Camshaft adjustment faults
  - Valve lift control faults
  - P2270, P2271 or P0041

- Perform all short tests in sequence (without tank leak test).

or

- Steady driving > 20 minute(s) at:
  - approx. 80 km/h (50 mph)
  - in the highest gear
  - lambda control (behind catalytic converter) active

Possible fault causes

♦ Leak in exhaust system between oxygen sensor upstream of catalytic converter and oxygen sensor downstream of catalytic converter, bank 1

♦ Camshaft adjustment fault

♦ Valve lift control fault

♦ Mechanical fault in valve drive

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty (aged)

Fault setting condition(s)

♦ Adaptation limit (4%) exceeded

P2097

Diagnostic information - DME (DFI) control unit

Lambda correction behind catalytic converter bank 1 - control limit exceeded (too rich)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- None of the following faults stored:
  - Camshaft adjustment faults
  - Valve lift control faults
  - P2270, P2271 or P0041

- Perform all short tests in sequence (without tank leak test).

or

- Steady driving > 20 minute(s) at:
  - approx. 80 km/h (50 mph)
  - in the highest gear
  - lambda control (behind catalytic converter) active

Possible fault causes

♦ Leak in exhaust system between oxygen sensor upstream of catalytic converter and oxygen sensor downstream of catalytic converter, bank 1

♦ Camshaft adjustment fault

♦ Valve lift control fault

♦ Mechanical fault in valve drive

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty (aged)

Fault setting condition(s)

♦ Adaptation limit (4%) exceeded

P2098

Diagnostic information - DME (DFI) control unit

Lambda correction behind catalytic converter bank 2 - control limit exceeded (too lean)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- None of the following faults stored:
  - Camshaft adjustment faults
  - Valve lift control faults
  - P2270, P2271 or P0041

♦ Leak in exhaust system between oxygen sensor upstream of catalytic converter and oxygen sensor downstream of catalytic converter, bank 2

♦ Camshaft adjustment fault

♦ Valve lift control fault

♦ Mechanical fault in valve drive

♦ Oxygen sensor upstream of catalytic converter bank 2 faulty (aged)

Fault setting condition(s)

♦ Adaptation limit (4%) exceeded

P2100

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit driver

Diagnostic conditions
- Ignition on

Possible fault causes
- Short circuit between lines (servo motor)
- Throttle valve adjusting unit faulty

Fault effects
The vehicle is in limp-home mode, i.e. the engine is running at 1,200 to 1,800 rpm.

P2101

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit - position deviation/control range

Diagnostic conditions
- Throttle valve adjusting unit adapted
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit between lines (servo motor)
- Throttle valve adjusting unit faulty

Fault effects
The vehicle is in limp-home mode, i.e. the engine is running at 1,200 to 1,800 rpm.

P2103

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit - position deviation/control range

Diagnostic conditions
- Throttle valve adjusting unit adapted
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit between lines (servo motor)
- Throttle valve adjusting unit faulty

Fault effects
The vehicle is in limp-home mode, i.e. the engine is running at 1,200 to 1,800 rpm.

Diagnostic information - DME (DFI) control unit

Throttle valve potentiometer 1 implausible

Diagnostic conditions
- Engine running
- None of the following faults stored: P2127 or P2128 (throttle valve potentiometer 2)

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines (potentiometer)
- Throttle valve adjusting unit faulty

Fault setting condition(s)
- Throttle valve potentiometer 1 (measured) - mass air flow (calculated)
  ⇒ Deviation too high

Fault effects
The vehicle is in limp-home mode, i.e. the engine is running at 1,200 to 1,800 rpm.

P2122

Diagnostic information - DME (DFI) control unit

Throttle potentiometer 1

Diagnostic conditions
- Ignition on > 5 second(s)
- then engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines (**potentiometer**)
- ♦ **Throttle valve adjusting unit** faulty

Fault effects
- ♦ No acceleration initially + increased idle speed (approx. 800 rpm)
  - ▶ until the accelerator pedal is released fully.
  - ♦ Then acceleration, with
    - ♦ significantly reduced engine torque (max. approx.100 ... 180 Nm)
    - ♦ and limited engine speed (max. approx. 5,000 rpm).
  - ♦ If the accelerator and brake are pressed at the same time, the engine will run at idle speed.

P2123

Diagnostic information - DME (DFI) control unit

Throttle potentiometer 1

Diagnostic conditions
- Ignition on > 5 second(s)
- then engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines (**potentiometer**)
- ♦ **Throttle valve adjusting unit** faulty

Fault effects
- ♦ No acceleration initially + increased idle speed (approx. 800 rpm)
  - ▶ until the accelerator pedal is released fully.
  - ♦ Then acceleration, with
    - ♦ significantly reduced engine torque (max. approx.100 ... 180 Nm)
    - ♦ and limited engine speed (max. approx. 5,000 rpm).
  - ♦ If the accelerator and brake are pressed at the same time, the engine will run at idle speed.

Diagnostic information - DME (DFI) control unit

Throttle valve potentiometer 2 implausible

Diagnostic conditions
- Engine running
- None of the following faults stored: P2122 or P2123 (throttle valve potentiometer 1)

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines (potentiometer)
- Throttle valve adjusting unit faulty

Fault setting condition(s)
- Throttle valve potentiometer 2 (measured) - mass air flow (calculated)
  ⇒ Deviation too high

Fault effects
The vehicle is in limp-home mode, i.e. the engine is running at 1,200 to 1,800 rpm.

P2127

Diagnostic information - DME (DFI) control unit

Throttle potentiometer 2

Diagnostic conditions
- Ignition on > 5 second(s)
- then engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines (**potentiometer**)
- ♦ **Throttle valve adjusting unit** faulty

Fault effects
- ♦ No acceleration initially + increased idle speed (approx. 800 rpm)
  - ▶ until the accelerator pedal is released fully.
  - ♦ Then acceleration, with
    - ♦ significantly reduced engine torque (max. approx.100 ... 180 Nm)
    - ♦ and limited engine speed (max. approx. 5,000 rpm).
  - ♦ If the accelerator and brake are pressed at the same time, the engine will run at idle speed.

Diagnostic information - DME (DFI) control unit

Throttle potentiometer 2

Diagnostic conditions
- Ignition on > 5 second(s)
- then engine running

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines (**potentiometer**)
- ♦ **Throttle valve adjusting unit** faulty

Fault effects
- ♦ No acceleration initially + increased idle speed (approx. 800 rpm)
  - ▶ until the accelerator pedal is released fully.
  - ♦ Then acceleration, with
    - ♦ significantly reduced engine torque (max. approx.100 ... 180 Nm)
    - ♦ and limited engine speed (max. approx. 5,000 rpm).
  - ♦ If the accelerator and brake are pressed at the same time, the engine will run at idle speed.

Diagnostic information - DME (DFI) control unit

Throttle valve adjusting unit - channel comparison

Diagnostic conditions
- Throttle valve adjusting unit adapted
- Idling and short acceleration
- then driving with different operating conditions

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Throttle valve adjusting unit faulty

Fault setting condition(s)
- The two potentiometer values differ too greatly from each other.
- It is not clear which value is incorrect.

Fault effects
- No throttle response
- Increased idle speed (approx. 1,000 .... 1,600 rpm)
- Electronic throttle emergency mode (see ⓘ)

ⓘ INFORMATION

Electronic throttle emergency mode

During electronic throttle emergency mode, no power is supplied to the throttle valve, which then drops to emergency air position.
- Idle speed increases to approx. 1,000 .... 1,200 rpm.
- If the accelerator pedal is pressed, the engine will run at max. 1,600 rpm (set via ignition, injection, ...). ▶ **Limp home**.
- If the accelerator and brake are pressed at the same time, the engine will run at idle speed.
- If the engine speed exceeds 1,600 rpm, cylinders will be deactivated.
- If cylinder deactivation is not sufficient, the DME control unit performs a reset and fault code **P1559** is stored in the fault memory (the original faults were previously stored as reset-resistant faults in the fault memory).

P2181

Diagnostic information - DME (DFI) control unit

Thermostat stuck open

Diagnostic conditions
- Driving > 10 minutes, with:
  - Engine start temperature (T072) -10 °C... +60 °C (+14 °F... +140 °C)
  - Ambient temperature (T050) > -10 °C (+14 °F)
  - Average vehicle speed (A100) > 35 ... 60 km/h (22 ... 37 mph)
    (depending on outside temperature > +60 °C ... < +20 °C/> +140 °F ... < +68 °F)
  - Vehicle speed max. 100 km/h (62 mph)
  - As few overrun phases as possible (< 100 second(s) in total)
  - Average mass air flow (H020) > 25 ... 35 kg/h
    (depending on outside temperature > +30 °C ... < -10 °C/> +86 °F ... < +14 °F)
  - With heating until engine coolant temperature > 80 °C/176 °F (T020)

or
- System test of thermal management (if available)

Possible fault causes
- ♦ Influence by block heater
- ♦ 3/2-way valve faulty, with :
  - Original auxiliary heater
- ♦ Seal in thermostat housing faulty
- ♦ Thermostat housing faulty
- ♦ Thermostat faulty
- ♦ Engine coolant temperature sensor faulty or loose contact or corrosion on plugs or lines

Fault setting condition(s)
- Engine coolant temperature (T020) < setpoint 80 °C (176 °F), at:
  - End of diagnostics (see ⓘ)

Fault effects
- ♦ Radiator shutter is opened
- ♦ Radiator shutter remains open until the fault has been healed or deleted from the fault memory

ⓘ INFORMATION
- ♦ Diagnostics had ended when the calculated temperature model has reached 80 °C (176 °F).
- ♦ Diagnostics is evaluated only if the aforementioned diagnostic conditions were met.

P2183

Diagnostic information - DME (DFI) control unit

Coolant temperature at radiator outlet implausible
- Only Panamera V6S up to MY D

Diagnostic conditions
- Thermal management system test (if available)

or
- Drive > 10 minute(s) with:
  - Engine start temperature < 40 °C (104 °F)
  - Engine speed > 2,000 rpm
  - Vehicle speed 20 ... 60 km/h (12 … 37 mph)
  - With heating until coolant temperature > 70 °C (158 °F)
- None of the following faults stored: P0116, P0117, P0118, P0119, P050C, P3081, P3082

Possible fault causes
- ♦ Engine coolant temperature sensor (See ⓘ 1)
- ♦ Radiator air intake covered
- ♦ Radiator outlet coolant temperature sensor faulty

Fault setting condition(s)
- Coolant temperature at radiator outlet > 25 °C (77 °F) warmer than engine temperature (See ⓘ 1), at:
  - Engine start

or
- Engine coolant temperature at radiator outlet heats up to < setpoint value (calculated), at:
  - End of diagnostics (See ⓘ 2)

ⓘ INFORMATION

1.
Engine temperature = intake air temperature (as substitute value for engine coolant temperature):
- If fault P0116, P0117, P0118, P0119, P050C, P3080 or P3081 has been previously detected in the system

⇒ The following fault can occur during the next drive:
♦ > *P2183* - Engine coolant temperature *at radiator outlet implausible* <

2.
The diagnostic function ends under the following conditions:
- Engine coolant temperature > 70 °C (158 °F), then:
  - Certain conditions must be met for an overall period (vehicle speed, engine speed, power supply to thermostat).

Diagnostic information - DME (DFI) control unit

Radiator outlet coolant temperature sensor: electrical fault

Diagnostic conditions
- Ignition on

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Radiator outlet coolant temperature sensor faulty

Fault setting condition(s)
- Coolant temperature at radiator outlet (measured) < -40 °C (-40 °F) (P2184), with:
  - Ignition on or engine running

  and
  - Intake air temperature > -30 °C (-22 °F)

  or
  - Engine running > 31 minute(s)

or
- Coolant temperature at radiator outlet (measured) > +140 °C (284 °F) (P2185), with:
  - Ignition on or engine running

Diagnostic information - DME (DFI) control unit

Radiator outlet coolant temperature sensor: electrical fault

Diagnostic conditions
- Ignition on

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Radiator outlet coolant temperature sensor faulty

Fault setting condition(s)
- Coolant temperature at radiator outlet (measured) < -40 °C (-40 °F) (P2184), with:
  - Ignition on or engine running
  - and
  - Intake air temperature > -30 °C (-22 °F)
  - or
  - Engine running > 31 minute(s)

or
- Coolant temperature at radiator outlet (measured) > +140 °C (284 °F) (P2185), with:
  - Ignition on or engine running

Diagnostic information - DME (DFI) control unit

Radiator outlet coolant temperature sensor: loose contact

Diagnostic conditions
- Ignition on
- None of the following faults stored: P2184, P2185

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Radiator outlet coolant temperature sensor faulty

Fault setting condition(s)
Coolant temperature at radiator outlet: actual-value jumps > 3 °C (37 °F)

Fault effects
- ♦ Substitute value = last actual value that was detected as OK, with:
  - Actual-value jumps > 9.75 °C (49.5 °F)

P2195

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 1 - signal too lean/too rich

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Engine running > 3 minute(s) with:
  - No overrun phase(s)
  - All oxygen sensor(s) ready for operation
  - Lambda control active
  - Engine speed 640 .... 4,000 rpm
  - Load 15 ... 70%
  - Catalytic converter temperature > 400 °C (752 °F)
  - Mass air flow 10 ... 520 kg/h
- None of the following faults stored: P2270, P2271, P0041

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

Fault setting condition(s)

The oxygen sensor signal deviates by a certain value from the control value (rich/lean mixture) within a certain time. (Significant deviation occurs suddenly)

P2196

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 1 - signal too lean/too rich

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Engine running > 3 minute(s) with:
  - No overrun phase(s)
  - All oxygen sensor(s) ready for operation
  - Lambda control active
  - Engine speed 640 .... 4,000 rpm
  - Load 15 ... 70%
  - Catalytic converter temperature > 400 °C (752 °F)
  - Mass air flow 10 ... 520 kg/h
- None of the following faults stored: P2270, P2271, P0041

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

Fault setting condition(s)

The oxygen sensor signal deviates by a certain value from the control value (rich/lean mixture) within a certain time. (Significant deviation occurs suddenly)

P2197

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 2 - signal too lean/too rich

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 3 minute(s) with:
  - No overrun phase(s)
  - All oxygen sensor(s) ready for operation
  - Lambda control active
  - Engine speed 640 .... 4,000 rpm
  - Load 15 ... 70%
  - Catalytic converter temperature > 400 °C (752 °F)
  - Mass air flow 10 ... 520 kg/h
- None of the following faults stored: P2272, P2273, P0041

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

Fault setting condition(s)

The oxygen sensor signal deviates by a certain value from the control value (rich/lean mixture) within a certain time. (Significant deviation occurs suddenly)

P2198

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 2 - signal too lean/too rich

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 3 minute(s) with:
  - No overrun phase(s)
  - All oxygen sensor(s) ready for operation
  - Lambda control active
  - Engine speed 640 .... 4,000 rpm
  - Load 15 ... 70%
  - Catalytic converter temperature > 400 °C (752 °F)
  - Mass air flow 10 ... 520 kg/h
- None of the following faults stored: P2272, P2273, P0041

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

Fault setting condition(s)

The oxygen sensor signal deviates by a certain value from the control value (rich/lean mixture) within a certain time. (Significant deviation occurs suddenly)

Diagnostic information - DME (DFI) control unit

Deviation in air/fuel mixture, cylinder 1

Diagnostic conditions
- Perform short test >Individual cylinder mixture adaptation<

or
- Driving with engine speed and load conditions that are as constant as possible:
  - 4th ... 7th gear
  - Engine speed 1,090 ... 3,000 rpm
  - Engine load 155 … 544 mg/stroke
  - Active carbon filter load < 0.8

Possible fault causes
- Spark plugs oily (e.g. due to oil entrainment in the cylinder)
- Wrong spark plug(s)
- Mechanical or electrical fault in spark plug(s)
- Bar ignition module faulty
- Power supply or ground supply faulty

- Wrong fuel injector
- Fuel injector faulty or borderline
  (opens too late/not long enough/not enough or leaking)

- Insufficient compression
  (e.g. cylinder liner damaged, valve seat ring faulty, ...)

Fault setting condition(s)
The specified cylinder deviates from the ideal fuel/air mixture by more than 12% of the injection quantity (see ⓘ).

ⓘ INFORMATION
- For fuel trim adaptation of the individual cylinders, the mixture of one individual cylinder is always "leaned out" by a certain percentage.
- The other cylinders of the bank are enriched until the lambda value is balanced again and the mixture control unit no longer has to regulate.
- This takes place in sequence for each cylinder a total of 3 times.
- The adaptation function now takes the mean value of each cylinder and adapts the injection time by the corresponding percentage, but by no more than 5%.
- The diagnostic function evaluates the 3 mixture lean-out cycles and uses this to produce the respective actual value >Injection quantity deviation, cylinder X< **(L500 ... L550)**.
- Cylinders that deviate by more than 12% are entered as faulty (P219C ... P21A1):
  - The mixture adaptation value of this bank and the 3 actual values >Injection quantity deviation, cylinder X< of the bank with the faulty cylinder are entered in the fault environments 1 ... 4.
  - Fault type >No signal< means that the mixture is too rich
  - Fault type >Signal implausible< means that the mixture is too lean

Diagnostic information - DME (DFI) control unit

Deviation in air/fuel mixture, cylinder 2

Diagnostic conditions
- Perform short test >Individual cylinder mixture adaptation<

or
- Driving with engine speed and load conditions that are as constant as possible:
  - 4th ... 7th gear
  - Engine speed 1,090 ... 3,000 rpm
  - Engine load 155 … 544 mg/stroke
  - Active carbon filter load < 0.8

Possible fault causes
- Spark plugs oily (e.g. due to oil entrainment in the cylinder)
- Wrong spark plug(s)
- Mechanical or electrical fault in spark plug(s)
- Bar ignition module faulty
- Power supply or ground supply faulty

- Wrong fuel injector
- Fuel injector faulty or borderline
  (opens too late/not long enough/not enough or leaking)

- Insufficient compression
  (e.g. cylinder liner damaged, valve seat ring faulty, ...)

Fault setting condition(s)
The specified cylinder deviates from the ideal fuel/air mixture by more than 12% of the injection quantity (see ⓘ).

ⓘ INFORMATION
- For fuel trim adaptation of the individual cylinders, the mixture of one individual cylinder is always "leaned out" by a certain percentage.
- The other cylinders of the bank are enriched until the lambda value is balanced again and the mixture control unit no longer has to regulate.

- The diagnostic function evaluates the 3 mixture lean-out cycles and uses this to produce the respective actual value >Injection quantity deviation, cylinder X< **(L500 ... L550)**.
- Cylinders that deviate by more than 12% are entered as faulty (P219C ... P21A1):
  - The mixture adaptation value of this bank and the 3 actual values >Injection quantity deviation, cylinder X< of the bank with the faulty cylinder are entered in the fault environments 1 ... 4.
  - Fault type >No signal< means that the mixture is too rich
  - Fault type >Signal implausible< means that the mixture is too lean

Diagnostic information - DME (DFI) control unit

Deviation in air/fuel mixture, cylinder 3

Diagnostic conditions
- Perform short test >Individual cylinder mixture adaptation<

or
- Driving with engine speed and load conditions that are as constant as possible:
  - 4th ... 7th gear
  - Engine speed 1,090 ... 3,000 rpm
  - Engine load 155 … 544 mg/stroke
  - Active carbon filter load < 0.8

Possible fault causes
- Spark plugs oily (e.g. due to oil entrainment in the cylinder)
- Wrong spark plug(s)
- Mechanical or electrical fault in spark plug(s)
- Bar ignition module faulty
- Power supply or ground supply faulty

- Wrong fuel injector
- Fuel injector faulty or borderline
  (opens too late/not long enough/not enough or leaking)

- Insufficient compression
  (e.g. cylinder liner damaged, valve seat ring faulty, ...)

Fault setting condition(s)
The specified cylinder deviates from the ideal fuel/air mixture by more than 12% of the injection quantity (see ⓘ).

ⓘ INFORMATION
- For fuel trim adaptation of the individual cylinders, the mixture of one individual cylinder is always "leaned out" by a certain percentage.
- The other cylinders of the bank are enriched until the lambda value is balanced again and the mixture control unit no longer has to regulate.
- This takes place in sequence for each cylinder a total of 3 times.
- The adaptation function now takes the mean value of each cylinder and adapts the injection time by the corresponding percentage, but by no more than 5%.
- The diagnostic function evaluates the 3 mixture lean-out cycles and uses this to produce the respective actual value >Injection quantity deviation, cylinder X< **(L500 ... L550)**.
- Cylinders that deviate by more than 12% are entered as faulty (P219C ... P21A1):
  - The mixture adaptation value of this bank and the 3 actual values >Injection quantity deviation, cylinder X< of the bank with the faulty cylinder are entered in the fault environments 1 ... 4.
  - Fault type >No signal< means that the mixture is too rich
  - Fault type >Signal implausible< means that the mixture is too lean

Diagnostic information - DME (DFI) control unit

Deviation in air/fuel mixture, cylinder 4

Diagnostic conditions
- Perform short test >Individual cylinder mixture adaptation<

or
- Driving with engine speed and load conditions that are as constant as possible:
  - 4th ... 7th gear
  - Engine speed 1,090 ... 3,000 rpm
  - Engine load 155 … 544 mg/stroke
  - Active carbon filter load < 0.8

Possible fault causes
- Spark plugs oily (e.g. due to oil entrainment in the cylinder)
- Wrong spark plug(s)
- Mechanical or electrical fault in spark plug(s)
- Bar ignition module faulty
- Power supply or ground supply faulty

- Wrong fuel injector
- Fuel injector faulty or borderline
  (opens too late/not long enough/not enough or leaking)

- Insufficient compression
  (e.g. cylinder liner damaged, valve seat ring faulty, ...)

Fault setting condition(s)
The specified cylinder deviates from the ideal fuel/air mixture by more than 12% of the injection quantity (see ⓘ).

ⓘ INFORMATION
- For fuel trim adaptation of the individual cylinders, the mixture of one individual cylinder is always "leaned out" by a certain percentage.

Diagnostic information - DME (DFI) control unit

Ambient pressure sensor implausible

Diagnostic conditions
- Ignition on > 10 second(s)
- then: Acceleration with wide-open throttle for as long as possible, immediately followed by an overrun phase lasting as long as possible
- None of the following faults stored: P1638, P1639, P0107, P0108, P2228, P2229, P1183, P1184, P1187, P1188, P1189, P1190

Possible fault causes
- Fault P0069 also entered:
  - ♦ Intake manifold pressure sensor fault

- No fault P0069 entered:
  - ♦ DME (DFI) control unit faulty

Fault effects
- ♦ Substitute value from model

P2228

Diagnostic information - DME (DFI) control unit

Ambient pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running

Possible fault causes
- DME (DFI) control unit faulty

Fault effects
- Substitute value from model

P2229

Diagnostic information - DME (DFI) control unit

Ambient pressure sensor: electrical fault

Diagnostic conditions
- Ignition on or engine running

Possible fault causes
- DME (DFI) control unit faulty

Fault effects
- Substitute value from model

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 1: open circuit in pumping current (APE)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 10 minute(s) with:
  - Engine at operating temperature
  - at least 1 overrun phase(s) > 6 second(s)
- then idling > 40 second(s)

Possible fault causes

♦ Open circuit in pumping current line (APE - contact 1)

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 2: open circuit in pumping current (APE)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 10 minute(s) with:
  - Engine at operating temperature
  - at least 1 overrun phase(s) > 6 second(s)
- then idling > 40 second(s)

Possible fault causes

♦ Open circuit in pumping current line (APE - contact 1)

♦ Oxygen sensor upstream of catalytic converter bank 2 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 1: open circuit in signal (RE+/IPN)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 10 minute(s) with:
  - Engine at operating temperature
  - at least 1 overrun phase(s) > 6 second(s)
- then idling > 40 second(s)

Possible fault causes

♦ Open circuit in signal line (RE+/IPN - contact 6/contact 2)

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 2: open circuit in signal (RE+/IPN)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 10 minute(s) with:
  - Engine at operating temperature
  - at least 1 overrun phase(s) > 6 second(s)
- then idling > 40 second(s)

Possible fault causes

♦ Open circuit in line (RE+/IPN - contact 6/contact 2)

♦ Oxygen sensor upstream of catalytic converter bank 2 faulty

P2257

Diagnostic information - DME (DFI) control unit

Secondary-air pump relay driver

Diagnostic conditions
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in lines for secondary-air pump relay activation
- Secondary-air pump relay faulty

P2258

Diagnostic information - DME (DFI) control unit

Secondary-air pump relay driver

Diagnostic conditions
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in lines for secondary-air pump relay activation
- Secondary-air pump relay faulty

P2263

Diagnostic information - DME (DFI) control unit

Basic boost pressure too low

Diagnostic conditions
- 3 full-load accelerations:
  - in 3rd gear (no gearshift)
  - Engine speed between 1,500 rpm and max. engine speed
- then steady driving

Possible fault causes
- ♦ Insufficient vacuum supply due to leak in vacuum system or faulty vacuum pump (see ⓘ)
- ♦ Leak between turbocharger (on pressure side) and intake valve (engine)
- ♦ Vacuum hose leaking at boost pressure control cycle valve or diverter solenoid valve
- ♦ Diverter solenoid valve not installed or installed incorrectly
- ♦ Diverter solenoid valve leaking or stuck
- ♦ Diverter valve not installed or installed incorrectly
- ♦ Diverter valve leaking or stuck
- ♦ Boost pressure control cycle valve stuck open electrically or mechanically
- ♦ Wastegate mechanical fault, leaking or stuck open
- ♦ Turbocharger (1 or 2) stiff or stuck

Fault setting condition(s)
- Boost pressure (calculated) < setpoint value (depending on operating condition)

ⓘ INFORMATION
The vacuum system includes:
- ♦ Mechanical vacuum pump
- ♦ Main load circuit:
  - ♦ Brake booster
- ♦ Auxiliary load circuit:
  - ♦ Boost pressure control cycle valve
  - ♦ Diverter solenoid valve
  - ♦ Exhaust flap (if fitted)
  - ♦ Acoustic simulator (V6 Turbo only)
  - ♦ Tank leakage diagnosis pump (USA, Canada and South Korea only)

P2270

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 1 - signal too lean/too rich

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Steady driving > 20 minute(s) at:
  - approx. 80 km/h (50 mph)
  - in the highest gear
  - Lambda control (behind catalytic converter) active

Possible fault causes

♦ Leak in exhaust system between oxygen sensor upstream of catalytic converter and oxygen sensor downstream of catalytic converter, bank 1

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

Fault setting condition(s)

♦ The oxygen sensor signal deviates by a certain value from the control value (rich/lean mixture) within a certain time.

P2271

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 1 - signal too lean/too rich

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Steady driving > 20 minute(s) at:
  - approx. 80 km/h (50 mph)
  - in the highest gear
  - Lambda control (behind catalytic converter) active

Possible fault causes

♦ Leak in exhaust system between oxygen sensor upstream of catalytic converter and oxygen sensor downstream of catalytic converter, bank 1

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Oxygen sensor downstream of catalytic converter, bank 1 faulty

Fault setting condition(s)

♦ The oxygen sensor signal deviates by a certain value from the control value (rich/lean mixture) within a certain time.

P2272

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 2 - signal too lean/too rich

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Steady driving > 20 minute(s) at:
  - approx. 80 km/h (50 mph)
  - in the highest gear
  - Lambda control (behind catalytic converter) active

Possible fault causes

♦ Leak in exhaust system between oxygen sensor upstream of catalytic converter and oxygen sensor downstream of catalytic converter, bank 2

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Oxygen sensor downstream of catalytic converter, bank 2 faulty

Fault setting condition(s)

♦ The oxygen sensor signal deviates by a certain value from the control value (rich/lean mixture) within a certain time.

P2273

Diagnostic information - DME (DFI) control unit

Oxygen sensor downstream of catalytic converter, bank 2 - signal too lean/too rich

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Perform all short tests in sequence (without tank leak test).

or

- Steady driving > 20 minute(s) at:
  - approx. 80 km/h (50 mph)
  - in the highest gear
  - Lambda control (behind catalytic converter) active

Possible fault causes

♦ Leak in exhaust system between oxygen sensor upstream of catalytic converter and oxygen sensor downstream of catalytic converter, bank 2

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Oxygen sensor downstream of catalytic converter, bank 2 faulty

Fault setting condition(s)

♦ The oxygen sensor signal deviates by a certain value from the control value (rich/lean mixture) within a certain time.

P2294

Diagnostic information - DME (DFI) control unit

Bank 2 quantity control valve output stage

Diagnostic conditions
- Ignition on > 5 second(s)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Quantity control valve faulty (in bank 2 fuel high-pressure pump)

P2295

Diagnostic information - DME (DFI) control unit

Bank 2 quantity control valve output stage

Diagnostic conditions
- Ignition on > 5 second(s)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Quantity control valve faulty (in bank 2 fuel high-pressure pump)

P2296

Diagnostic information - DME (DFI) control unit

Bank 2 quantity control valve output stage

Diagnostic conditions
- Ignition on > 5 second(s)

Possible fault causes
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Short circuit to B+/ground/between lines or open circuit in the lines
- ♦ Quantity control valve faulty (in bank 2 fuel high-pressure pump)

Diagnostic information - DME (DFI) control unit

Implausible signal for oxygen sensor ahead of bank 1 catalytic converter (during overrun shutoff)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor ahead of the catalytic converter with the sensor behind the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Driving with:
  - Exhaust temperature > 200 °C (392 °F)
  - Overrun phase(s) > 8 second(s)

Possible fault causes

♦ Unintentional fuel supply, e.g. due to:
  ♦ dripping fuel injector
  ♦ high fuel content in engine oil
  ♦ large quantity of evaporating engine oil

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Oxygen sensor ahead of bank 1 catalytic converter faulty (aged)

P2298

Diagnostic information - DME (DFI) control unit

Implausible signal for oxygen sensor ahead of bank 1 catalytic converter (during overrun shutoff)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor ahead of the catalytic converter with the sensor behind the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Driving with:
  - Exhaust temperature > 200 °C (392 °F)
  - Overrun phase(s) > 8 second(s)

Possible fault causes

♦ Unintentional fuel supply, e.g. due to:
  ♦ dripping fuel injector
  ♦ high fuel content in engine oil
  ♦ large quantity of evaporating engine oil

♦ Short circuit to B+/ground/between lines or open circuit in the lines

♦ Oxygen sensor ahead of bank 2 catalytic converter faulty (aged)

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 1

⚠WARNING
High voltage !
Risk of death or serious injury due to high voltage or high current!
♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE
Sensitive electronics!
Risk of irreparable damage to electronic components!
♦ **DO NOT** carry out electrical tests.
♦ **DO NOT** connect external power sources.
♦ Check ground supply.

Diagnostic conditions
- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)

Possible fault causes
♦ Loose contact or corrosion on connectors or lines
♦ Short circuit to B+ or open circuit in the lines (ground supply)
♦ Short circuit to ground or open circuit in the lines (power supply)
♦ Short circuit to B+/ground or open circuit in the line (activation)
♦ Bar ignition module on cylinder 1 faulty

P2301

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 1

⚠WARNING
High voltage !
Risk of death or serious injury due to high voltage or high current!
♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE
Sensitive electronics!
Risk of irreparable damage to electronic components!
♦ **DO NOT** carry out electrical tests.
♦ **DO NOT** connect external power sources.
♦ Check ground supply.

Diagnostic conditions
- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)

Possible fault causes
♦ Loose contact or corrosion on connectors or lines
♦ Short circuit to B+ or open circuit in the lines (ground supply)
♦ Short circuit to ground or open circuit in the lines (power supply)
♦ Short circuit to B+/ground or open circuit in the line (activation)
♦ Bar ignition module on cylinder 1 faulty

P2302

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 1 - SoftShutDown

⚠WARNING
High voltage!
Risk of death or serious injury due to high voltage or high current!
♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE
Sensitive electronics!
Risk of irreparable damage to electronic components!
♦ **DO NOT** carry out electrical tests.
♦ **DO NOT** connect external power sources.
♦ Check ground supply.

Diagnostic conditions
- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)
- None of the following faults stored: P0351, P2300, P2301

Possible fault causes
- Only P2302:
  - ♦ Bar ignition module on cylinder 1 faulty

- P2302 + P0351 or P2300 or P2301:
  - ♦ Loose contact or corrosion on connectors or lines
  - ♦ Short circuit to B+ or open circuit in the lines (ground supply)
  - ♦ Short circuit to ground or open circuit in the lines (power supply)
  - ♦ Short circuit to B+/ground or open circuit in the line (activation)

Diagnostic conditions
- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)

Possible fault causes
♦ Loose contact or corrosion on connectors or lines
♦ Short circuit to B+ or open circuit in the lines (ground supply)
♦ Short circuit to ground or open circuit in the lines (power supply)
♦ Short circuit to B+/ground or open circuit in the line (activation)
♦ Bar ignition module on cylinder 3 faulty

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 3 - SoftShutDown

⚠WARNING
High voltage!
Risk of death or serious injury due to high voltage or high current!
♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE
Sensitive electronics!
Risk of irreparable damage to electronic components!
♦ **DO NOT** carry out electrical tests.
♦ **DO NOT** connect external power sources.
♦ Check ground supply.

Diagnostic conditions
- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)
- None of the following faults stored: P0351, P2300, P2301

Possible fault causes
- Only P2308:
  - ♦ Bar ignition module on cylinder 3 faulty

- P2308 + P0353 or P2306 or P2307:
  - ♦ Loose contact or corrosion on connectors or lines
  - ♦ Short circuit to B+ or open circuit in the lines (ground supply)
  - ♦ Short circuit to ground or open circuit in the lines (power supply)
  - ♦ Short circuit to B+/ground or open circuit in the line (activation)
  - ♦ Bar ignition module on cylinder 3 faulty

P2309

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 4

⚠WARNING
High voltage !
Risk of death or serious injury due to high voltage or high current!
♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE
Sensitive electronics!
Risk of irreparable damage to electronic components!
♦ **DO NOT** carry out electrical tests.
♦ **DO NOT** connect external power sources.
♦ Check ground supply.

Diagnostic conditions
- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)

Possible fault causes
♦ Loose contact or corrosion on connectors or lines
♦ Short circuit to B+ or open circuit in the lines (ground supply)
♦ Short circuit to ground or open circuit in the lines (power supply)
♦ Short circuit to B+/ground or open circuit in the line (activation)
♦ Bar ignition module on cylinder 4 faulty

Diagnostic information - DME (DFI) control unit

Misfiring during mixture adaptation phase

Diagnostic conditions

- Perform short test >Individual cylinder mixture adaptation<

or

- Driving with engine speed and load conditions that are as constant as possible:
  - 4th ... 7th gear
  - Engine speed 1,090 ... 3,000 rpm
  - Engine load 155 … 544 mg/stroke
  - Active carbon filter load < 0.8

Possible fault causes

♦ Mixture in the specified cylinder is too lean

Fault setting condition(s)

- If, during mixture adaptation of the individual cylinders (see ⓘ), rough running of a cylinder close to misfiring is detected, the function is aborted for the affected bank and a suspected fault is logged.
- The function is repeated up to 2 times in this highway cycle.
- If the function is aborted again in each of the 4 highway cycles over several drives, the fault entry >Misfiring during mixture adaptation phase, cylinder X< (P230A … F) will appear.

ⓘ INFORMATION

♦ For fuel trim adaptation of the individual cylinders, the mixture of one individual cylinder is always "leaned out" by a certain percentage.
♦ The other cylinders of the bank are enriched until the lambda value is balanced again and the mixture control unit no longer has to regulate.
♦ This takes place in sequence for each cylinder a total of 3 times.
♦ The adaptation function now takes the mean value of each cylinder and adapts the injection time by the corresponding percentage, but by no more than 5%.
♦ The diagnostic function evaluates the 3 mixture lean-out cycles and uses this to produce the respective actual value >Injection quantity deviation, cylinder X< **(L500 ... L550)**.
♦ Cylinders that deviate by more than 12% are entered as faulty (P219C ... P21A1):
  ♦ The mixture adaptation value of this bank and the 3 actual values >Injection quantity deviation, cylinder X< of the bank with the faulty cylinder are entered in the fault environments 1 ... 4.
  ♦ Fault type >No signal< means that the mixture is too rich
  ♦ Fault type >Signal implausible< means that the mixture is too lean

Diagnostic information - DME (DFI) control unit

Misfiring during mixture adaptation phase

Diagnostic conditions

- Perform short test >Individual cylinder mixture adaptation<

or

- Driving with engine speed and load conditions that are as constant as possible:
  - 4th ... 7th gear
  - Engine speed 1,090 ... 3,000 rpm
  - Engine load 155 … 544 mg/stroke
  - Active carbon filter load < 0.8

Possible fault causes

♦ Mixture in the specified cylinder is too lean

Fault setting condition(s)

- If, during mixture adaptation of the individual cylinders (see ⓘ), rough running of a cylinder close to misfiring is detected, the function is aborted for the affected bank and a suspected fault is logged.
- The function is repeated up to 2 times in this highway cycle.
- If the function is aborted again in each of the 4 highway cycles over several drives, the fault entry >Misfiring during mixture adaptation phase, cylinder X< (P230A … F) will appear.

Bar ignition module on cylinder 4

⚠WARNING
High voltage !
Risk of death or serious injury due to high voltage or high current!
♦ Start engine only if all the bar ignition modules have been installed and connected.

NOTE
Sensitive electronics!
Risk of irreparable damage to electronic components!
♦ **DO NOT** carry out electrical tests.
♦ **DO NOT** connect external power sources.
♦ Check ground supply.

Diagnostic conditions
- Time since engine start > 2 second(s)
- Engine temperature > -30 °C (-22 °F)

Possible fault causes
♦ Loose contact or corrosion on connectors or lines
♦ Short circuit to B+ or open circuit in the lines (ground supply)
♦ Short circuit to ground or open circuit in the lines (power supply)
♦ Short circuit to B+/ground or open circuit in the line (activation)
♦ Bar ignition module on cylinder 4 faulty

P2311

Diagnostic information - DME (DFI) control unit

Bar ignition module on cylinder 4 - SoftShutDown

⚠WARNING
High voltage!
Risk of death or serious injury due to high voltage or high current!

Diagnostic information - DME (DFI) control unit

Leakage diagnosis pump driver

Diagnostic conditions

- Perform tank vent valve and tank leak short tests

or:

- Time since engine start > 10 second(s)
- Leakage diagnosis pump activated
- No fault entered for: P1556, P1557, P1558

Possible fault causes

- Vacuum system leaking (See ⓘ)
- Vacuum pump faulty
- Short circuit to B+ or open circuit in the lines (power supply or leakage diagnosis pump activation)
- Leakage diagnosis pump faulty

ⓘ INFORMATION

The vacuum system includes:

- Mechanical vacuum pump
- Main load circuit:
  - Brake booster
- Auxiliary load circuit:
  - Variable intake manifold (not Turbo)
  - Boost pressure control cycle valve (Turbo only)
  - Diverter solenoid valve (Turbo only)
  - Exhaust flap (if fitted)
  - Acoustic simulator (V6 Turbo only)
  - Tank leakage diagnosis pump (USA, Canada and South Korea only)

Diagnostic information - DME (DFI) control unit

Leakage diagnosis pump driver: below limit value

Diagnostic conditions
- Perform tank vent valve and tank leak short tests

or:
- Time since engine start > 10 second(s)
- Leakage diagnosis pump not activated
- No fault entered for: P1556, P1557, P1558

Possible fault causes
- Vacuum system leaking (See ⓘ)
- Vacuum pump faulty
- Short circuit to ground (leakage diagnosis pump activation)
- Leakage diagnosis pump faulty

ⓘ INFORMATION
The vacuum system includes:
- Mechanical vacuum pump
- Main load circuit:
  - Brake booster
- Auxiliary load circuit:
  - Variable intake manifold (not Turbo)
  - Boost pressure control cycle valve (Turbo only)

- Vacuum system leaking (See ⓘ)
- Vacuum pump faulty
- Short circuit to B+ or open circuit in the lines (power supply or leakage diagnosis pump activation)
- Leakage diagnosis pump faulty

ⓘ INFORMATION

The vacuum system includes:

- Mechanical vacuum pump
- Main load circuit:
  - Brake booster
- Auxiliary load circuit:
  - Variable intake manifold (not Turbo)
  - Boost pressure control cycle valve (Turbo only)
  - Diverter solenoid valve (Turbo only)
  - Exhaust flap (if fitted)
  - Acoustic simulator (V6 Turbo only)
  - Tank leakage diagnosis pump (USA, Canada and South Korea only)

P2403

Diagnostic information - DME (DFI) control unit

Reed switch for leakage diagnosis pump

Diagnostic conditions

- Perform tank leak short test

or

- Driving > 150 second(s) with:
  - Engine start temperature 5 ... 50 °C (41 … 122 °F)
  - Time since engine start 5 second(s) ... 20 minute(s)
  - Ambient pressure > 730 hPa (= location below approx 2,400 ... 2,700 m/7,874 ... 8,858 ft.)
    ⇒ See actual value > A060-Ambient pressure from DME (measured) <
  - Height difference < 20 m (66 ft.)
  - Intake air temperature > 5 °C (41 °F)
  - Intake air temperature: fluctuation(s) < 10 °C (50 °F)
  - Vehicle speed 0 ... 120 km/h (0 … 75 mph)
  - Acceleration/deceleration max. -2 m/s² … +2 m/s²
  - High partial-load share

Possible fault causes

- Vacuum system leaking (See ⓘ)
- Vacuum pump faulty
- Open circuit/short circuit to B+ (signal line)
- Leakage diagnosis pump faulty (reed switch)

Fault setting condition(s)

- Reed switch signal missing

ⓘ INFORMATION

The vacuum system includes:

  - Acceleration/deceleration max. -2 m/s² … +2 m/s²
  - High partial-load share

Possible fault causes

- Vacuum system leaking (See ⓘ)
- Vacuum pump faulty
- Tank vent valve stuck closed
- Purge-air line between tank vent valve and intake manifold trapped/blocked
- Short circuit to ground (signal line)
- Leakage diagnosis pump faulty (reed switch)

Fault setting condition(s)

- Reed switch signal permanently present

ⓘ INFORMATION

The vacuum system includes:

- Mechanical vacuum pump
- Main load circuit:
  - Brake booster
- Auxiliary load circuit:
  - Variable intake manifold (not Turbo)
  - Boost pressure control cycle valve (Turbo only)

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 1 - sensor in air

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Lambda control active
- Driving > 10 second(s) with:
  - No overrun phase(s)
- No fault entered for: oxygen sensor(s) or mixture preparation

Possible fault causes

♦ Fuel injector mechanical fault/blocked
(e.g. due to chip in the fuel rail)

♦ Oxygen sensor upstream of catalytic converter bank 1 not installed (only electrically connected)

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 2 - sensor in air

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Lambda control active
- Driving > 10 second(s) with:
  - No overrun phase(s)
- No fault entered for: oxygen sensor(s) or mixture preparation

Possible fault causes

♦ Fuel injector mechanical fault/blocked
(e.g. due to chip in the fuel rail)

♦ Oxygen sensor upstream of catalytic converter bank 2 not installed (only electrically connected)

♦ Oxygen sensor upstream of catalytic converter bank 2 faulty

Diagnostic information - DME (DFI) control unit

Oil level sensor

Diagnostic conditions
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground or open circuit in the lines
- Oil level sensor faulty

Diagnostic information - DME (DFI) control unit

Oil level sensor

Diagnostic conditions
- Ignition on

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to ground or open circuit in the lines
- Oil level sensor faulty

Diagnostic information - DME (DFI) control unit

Power supply, terminal 15 or 87

Diagnostic conditions
- Ignition on

or
- Engine running

Possible fault causes
- Vehicle electrical system supply voltage too high (e.g. jump-lead starting)
- Vehicle electrical system supply voltage too low
- Contact resistance, loose contact or corrosion on connectors or lines (DME (DFI) control unit)

Fault setting condition(s)
- Deviation of supply voltage at terminal 15 or 87:
  - < 10 V (P0658/P2531)

  or
  - > 16 V (P0659/P2532)

at:
- DME (DFI) control unit - connector [A], contact 34 ⇒ Terminal 15
- DME (DFI) control unit - connector [A], contact 3/5/6 ⇒ Terminal 87

P2532

Diagnostic information - DME (DFI) control unit

Power supply, terminal 15 or 87

Diagnostic conditions
- Ignition on

or
- Engine running

Possible fault causes
- Vehicle electrical system supply voltage too high (e.g. jump-lead starting)
- Vehicle electrical system supply voltage too low
- Contact resistance, loose contact or corrosion on connectors or lines (DME (DFI) control unit)

Fault setting condition(s)
- Deviation of supply voltage at terminal 15 or 87:
  - < 10 V (P0658/P2531)

  or
  - > 16 V (P0659/P2532)

at:
- DME (DFI) control unit - connector [A], contact 34 ⇒ Terminal 15
- DME (DFI) control unit - connector [A], contact 3/5/6 ⇒ Terminal 87

P2533

Diagnostic information - DME (DFI) control unit

Start request from front-end electronics: electrical fault

Diagnostic conditions
- PDK only: brake applied + selector lever position P or N
- Manual transmission only: completely depress clutch
- Ignition on > 3 second(s)
- Then start the engine

Possible fault causes
- ♦ Open circuit in request line between front-end electronics and DME control unit
- ♦ Short circuit to ground in request line between front-end electronics and DME control unit
- ♦ Short circuit to B+ in request line between front-end electronics and DME control unit

P2535

Diagnostic information - DME (DFI) control unit

Start request from front-end electronics: electrical fault

Diagnostic conditions
- PDK only: brake applied + selector lever position P or N
- Manual transmission only: completely depress clutch
- Ignition on > 3 second(s)
- Then start the engine

Possible fault causes
- ♦ Open circuit in request line between front-end electronics and DME control unit
- ♦ Short circuit to ground in request line between front-end electronics and DME control unit
- ♦ Short circuit to B+ in request line between front-end electronics and DME control unit

P2539

Diagnostic information - DME (DFI) control unit

Fuel low-pressure sensor: electrical fault

Diagnostic conditions
- Ignition on

or
- Engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Fuel low-pressure sensor faulty

P2541

Diagnostic information - DME (DFI) control unit

Fuel low-pressure sensor: electrical fault

Diagnostic conditions
- Ignition on

or
- Engine running

Possible fault causes
- Loose contact or corrosion on connectors or lines
- Short circuit to B+/ground/between lines or open circuit in the lines
- Fuel low-pressure sensor faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 1: open circuit in compensating current (RT)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 10 minute(s) with:
  - Engine at operating temperature
  - Exhaust temperature > 200 °C (392 °F)
  - at least 1 overrun phase(s) > 6 second(s)
- then idling > 40 second(s)

Possible fault causes

♦ Open circuit in compensating current line (RT - contact 5)

♦ Oxygen sensor upstream of catalytic converter bank 1 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 2: open circuit in compensating current (RT)

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Drive > 10 minute(s) with:
  - Engine at operating temperature
  - Exhaust temperature > 200 °C (392 °F)
  - at least 1 overrun phase(s) > 6 second(s)
- then idling > 40 second(s)

Possible fault causes

♦ Open circuit in line (RT - contact 5)

♦ Oxygen sensor upstream of catalytic converter bank 2 faulty

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 1 - electrical fault

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 30 second(s), at:
  - Exhaust temperature > 100 °C (212 °F)
  - Oxygen sensor upstream of catalytic converter ready for operation
  - No overrun phase(s)

Possible fault causes

♦ Fault in oxygen sensor upstream of catalytic converter, bank 1 area

Fault setting condition(s)

♦ Temperature implausible (oxygen sensor upstream of catalytic converter)

Fault effects

♦ Since oxygen sensing is interrupted the moment a fault is detected, the DME (DFI) control unit stores this fault as information.

♦ Further faults are entered

ⓘ The vehicle must be driven in the same driving cycle (without ignition reset) for this purpose.

Diagnostic information - DME (DFI) control unit

Oxygen sensor upstream of catalytic converter, bank 2 - electrical fault

NOTE

Plug connection disconnected = reference-air duct open!

Damage to oxygen sensor!

♦ **DO NOT** use spray, grease, fluid or similar products on the oxygen sensor plug connections.

ⓘ INFORMATION

♦ Do not interchange the oxygen sensor upstream of the catalytic converter with the sensor downstream of the catalytic converter as this will result in implausible fault entries.

♦ The connectors themselves are coded and cannot be interchanged.

Diagnostic conditions

- Engine running > 30 second(s), at:
  - Exhaust temperature > 100 °C (212 °F)
  - Oxygen sensor upstream of catalytic converter ready for operation
  - No overrun phase(s)

Possible fault causes

♦ Fault in oxygen sensor upstream of catalytic converter, bank 2 area

Fault setting condition(s)

♦ Temperature implausible (oxygen sensor upstream of catalytic converter)

Fault effects

♦ Since oxygen sensing is interrupted the moment a fault is detected, the DME (DFI) control unit stores this fault as information.

♦ Further faults are entered

ⓘ The vehicle must be driven in the same driving cycle (without ignition reset) for this purpose.

P3046

Diagnostic information - DME (DFI) control unit

Starter relay 1 stuck closed

Diagnostic conditions

- PDK only: brake applied + selector lever position P or N
- Manual transmission only: completely depress clutch
- Ignition on > 3 second(s)
- Then start the engine

Possible fault causes

♦ Starter relay 1 faulty
♦ Short circuit to B+ between starter relay 1 and starter relay 2

Fault effects

♦ None

Diagnostic information - DME (DFI) control unit

Starter relay 1 activation: electrical fault

Diagnostic conditions
- PDK only: brake applied + selector lever position P or N
- Manual transmission only: completely depress clutch
- Ignition on > 3 second(s)
- Then start the engine

Possible fault causes
- ♦ Open circuit in activation line between DME control unit and starter relay 1
- ♦ Short circuit to ground in activation line between DME control unit and starter relay 1
- ♦ Short circuit to B+ in activation line between DME control unit and starter relay 1
- ♦ Starter relay 1 faulty

Fault effects
- In case of short circuit to ground in activation line:
  - ♦ none
- In case of all other fault sources:
  - ♦ Engine cannot be started

Diagnostic information - DME (DFI) control unit

Starter relay 1 activation: electrical fault

Diagnostic conditions
- PDK only: brake applied + selector lever position P or N
- Manual transmission only: completely depress clutch
- Ignition on > 3 second(s)
- Then start the engine

Possible fault causes
- ♦ Open circuit in activation line between DME control unit and starter relay 1
- ♦ Short circuit to ground in activation line between DME control unit and starter relay 1
- ♦ Short circuit to B+ in activation line between DME control unit and starter relay 1
- ♦ Starter relay 1 faulty

Fault effects
- In case of short circuit to ground in activation line:
  - ♦ none
- In case of all other fault sources:
  - ♦ Engine cannot be started

Diagnostic information - DME (DFI) control unit

Starter relay 1 activation: electrical fault

Diagnostic conditions
- PDK only: brake applied + selector lever position P or N
- Manual transmission only: completely depress clutch
- Ignition on > 3 second(s)
- Then start the engine

Possible fault causes
- ♦ Open circuit in activation line between DME control unit and starter relay 1
- ♦ Short circuit to ground in activation line between DME control unit and starter relay 1
- ♦ Short circuit to B+ in activation line between DME control unit and starter relay 1
- ♦ Starter relay 1 faulty

Fault effects
- In case of short circuit to ground in activation line:
  - ♦ none
- In case of all other fault sources:
  - ♦ Engine cannot be started

P3050

Diagnostic information - DME (DFI) control unit

Starter relay 2 stuck closed

Diagnostic conditions

- PDK only: brake applied + selector lever position P or N
- Manual transmission only: completely depress clutch
- Ignition on > 3 second(s)
- Then start the engine

Possible fault causes

♦ Starter relay 2 faulty

Fault effects

♦ none

Diagnostic information - DME (DFI) control unit

Terminal 50 starter activation feedback line: electrical fault

Diagnostic conditions
- PDK only: brake applied + selector lever position P or N
- Manual transmission only: completely depress clutch
- Ignition on > 3 second(s)
- Then start the engine

Possible fault causes
♦ Open circuit in feedback line between DME control unit and starter relay 1; fuse might be faulty
♦ Short circuit to ground in feedback line between DME control unit and starter relay 1 or front-end electronics or DC/DC converter
♦ Short circuit to B+ in feedback line between DME control unit and starter relay 1
♦ Short circuit to B+ in activation line between starter relay 1 and starter terminal 50

Fault effects
♦ Fault entry in front-end electronics and DC/DC converter as well
♦ Monitoring of starter activation not possible

P3053

Diagnostic information - DME (DFI) control unit

Terminal 50 starter activation feedback line: electrical fault

Diagnostic conditions
- PDK only: brake applied + selector lever position P or N
- Manual transmission only: completely depress clutch
- Ignition on > 3 second(s)
- Then start the engine

Possible fault causes
♦ Open circuit in feedback line between DME control unit and starter relay 1; fuse might be faulty
♦ Short circuit to ground in feedback line between DME control unit and starter relay 1 or front-end electronics or DC/DC converter
♦ Short circuit to B+ in feedback line between DME control unit and starter relay 1
♦ Short circuit to B+ in activation line between starter relay 1 and starter terminal 50

Fault effects
♦ Fault entry in front-end electronics and DC/DC converter as well
♦ Monitoring of starter activation not possible

P3054

Diagnostic information - DME (DFI) control unit

Starter or crankshaft mechanically blocked

Diagnostic conditions
- PDK only: brake applied + selector lever position P or N
- Manual transmission only: completely depress clutch
- Ignition on > 3 second(s)
- Then start the engine

Possible fault causes
♦ Starter or crankshaft mechanically blocked

Fault effects
♦ Engine start not possible

P3081

Diagnostic information - DME (DFI) control unit

Engine coolant temperature implausible

Diagnostic conditions
- Thermal management system test (if available)

or
- Intake air temperature at engine start < 70 °C (158 °F) or coolant temperature at engine start < 70 °C (158 °F) (See ⓘ 1)
- Engine running > 3 minute(s) (with no overrun phase(s))
- None of the following faults stored: Coolant temperature sensor or intake air temperature sensor

Possible fault causes
- ♦ Affected by block heater
- ♦ 3/2-way valve faulty, with:
  - Original auxiliary heater
- ♦ Seal in thermostat housing faulty
- ♦ Thermostat housing faulty
- ♦ Thermostat faulty
- ♦ Air in the cooling system

Fault setting condition(s)
- Engine coolant temperature < 70 °C (158 °F), at:
  - End of diagnostics (See ⓘ 2)

Fault effects
- ♦ Engine temperature = temperature model (as substitute value for engine coolant temperature)
- ♦ The fault can be healed only if the thermostat has been tested and found to be OK.

ⓘ INFORMATION

1.

The diagnostic function starts under the following conditions:
- If the system was free of faults before
  - Engine coolant temperature at engine start < 70 °C (158 °F)
- If fault has been previously detected in the system
  - Intake air temperature at engine start < 70 °C (158 °F) (engine temperature substitute value only for engine start)

2.

Diagnostics is ended,
- after engine running > 3 minute(s) (with no overrun phase(s)),

and if:
- the calculated temperature model reaches 70 °C (158 °F) before the measured coolant temperature has reached 70 °C (158 °F) (fault entry),

or
- the measured coolant temperature reaches 70 °C (158 °F) before the calculated temperature model has reached 70 °C (158 °F) (NO fault entry).

Diagnostic information - DME (DFI) control unit

Engine coolant temperature stuck

Diagnostic conditions

- Thermal management system test (if available)

or

- Time since ignition off > 6 hour(s)
- Intake air temperature at engine start < 45 °C (113 °F)
- Intake air temperature at engine start = ambient temperature +/- 20 °C (68 °F)
- Engine running > 30 second(s)

Possible fault causes

- ♦ Switch-off time incorrect = gateway control unit faulty (See ⓘ 1)
- ♦ 3/2-way valve faulty, with:
  - Original auxiliary heater
- ♦ Loose contact or corrosion on connectors or lines
- ♦ Engine coolant temperature sensor faulty
- ♦ Affected by block heater

Fault setting condition(s)

- Engine start temperature > 35 ... > 65 °C (95 … 149 °F) (See ⓘ 2)

ⓘ INFORMATION

1.

If the engine switch-off time (formed in the gateway control unit) that is output is greater than the actual value, the engine does not appear to have cooled down sufficiently.
This can be checked by switching the vehicle off - with the engine at operating temperature - for longer than 6 hours (ignition off). After this time:

- ♦ Switch on ignition and connect the PIWIS Tester.
- ♦ Select the following actual values: T020, T030, T040.
- ♦ Compare the actual values:
  - The engine temperature (T020) deviates significantly
  - ⇒ Check and repair the temperature sensor and wiring.
  - The values are similar
  - ⇒ If an auxiliary heater is installed in the vehicle,
    - ♦ switch on the auxiliary heater and leave it on for at least 15 minutes, then:
    - ♦ Compare the actual values again:
      - The engine temperature (T020) deviates significantly
      - ⇒ Replace 3/2-way directional-control valve
      - The values are similar. The calculation of the shut-off time is probably incorrect
      - ⇒ Replace gateway control unit.
  - ⇒ If no auxiliary heater is installed in the vehicle:
    - ♦ the switch-off time calculation is probably incorrect
      - ⇒ Replace gateway control unit.

2.

Setpoint value depends on:

- Time since ignition off

and

- Intake air temperature at engine start

Example: Engine start temperature setpoint value: max. 65 °C (149 °F)

- Time since ignition off: 6.1 hour(s)

and

- Intake air temperature at engine start: 44 °C (111 °F)

P3088

Diagnostic information - DME (DFI) control unit

Starter relay 1 or 2 does not close

Diagnostic conditions
- PDK only: brake applied + selector lever position P or N
- Manual transmission only: completely depress clutch
- Ignition on > 3 second(s)
- Then start the engine

Possible fault causes
- ♦ Starter relay 1 faulty
- ♦ Starter relay 2 faulty
- ♦ Open circuit in power supply to starter relay 1 terminal 86
- ♦ Open circuit in power supply to starter relay 2 terminal 86
- ♦ Open circuit in power supply to starter relay 2 terminal 30

Fault effects
- ♦ Engine start not possible

U0073

Diagnostic information - valid for all control units

Communication with CAN bus

INFORMATION
Communication with the CAN bus designated in the fault text is/was not possible.

Possible fault causes

♦ Short circuit of the CAN-High line to ground
♦ Short circuit of the CAN-High line to B+
♦ Short circuit of the CAN-High line to interference signal
♦ Open circuit in the CAN-High line

♦ Short circuit of the CAN-Low line to ground
♦ Short circuit of the CAN-Low line to B+
♦ Short circuit of the CAN-Low line to interference signal
♦ Open circuit in the CAN-Low line

♦ Defective control unit in combination with the designated CAN bus

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

U0142

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

C11000

Diagnosis information - Adaptive cruise control (ACC)

Supply voltage Below limit

NOTE
● This fault is set if the vehicle electrical system voltage falls below 8.5 V even for fractions of a second.
Due to this short debounce time, a low vehicle electrical system voltage will occur first or only in the ACC control unit.
If this fault occurs frequently, the cause may therefore be both the line connection to the ACC control unit or low battery capacity.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● **Supply voltage** less than 8.5 V, longer than 240 milliseconds
● Fuse F23, Fuse carrier right
● Battery capacity exhausted

Fault effects

♦ System switches off
♦ Display on instrument cluster

C11001

Diagnosis information - Adaptive cruise control (ACC)

Supply voltage Limit exceeded

NOTE
This fault is set if the vehicle electrical system voltage exceeds 16 V even for fractions of a second.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Engine running

Fault setting condition(s)

- **Supply voltage** more than 16 V, longer than 320 milliseconds
- Incorrect jump starting
- **Alternator**

Fault effects

- System switches off
- Display on instrument cluster

Diagnosis information - Adaptive cruise control (ACC)

Control module Temperature - Limit value exceeded

NOTE
This fault is set if the temperature in the control unit exceeds 115 °C (239 °F) for longer than 1.5 minutes.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- **Device temperature** higher than 115° C (239 °F) for longer than 1.5 minutes
- Sensor ventilation faulty

Fault effects

- System switches off
- Display on instrument cluster

C11005

Diagnosis information - Adaptive cruise control (ACC)

Control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Internal control unit fault

Fault effects

♦ System switches off
♦ Display on instrument cluster

Diagnosis information - Adaptive cruise control (ACC)

Vehicle reaction implausible

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Vehicle reaction not as expected upon acceleration
- Distance sensor control unit incorrectly coded, engine type naturally aspirated engine or turbo engine
- Vehicle reaction not as expected upon braking
- In trailer mode; trailer not detected
- DME control unit and / or PSM incorrectly coded

Fault effects

♦ System switches off
♦ Display on instrument cluster

D00000

Diagnosis information - Adaptive cruise control (ACC)

Control module Temperature - Limit value exceeded

NOTE
This fault is set if the temperature in the control unit exceeds 115 °C (239 °F) for longer than 1.5 minutes.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- **Device temperature** higher than 115° C (239 °F) for longer than 1.5 minutes
- Sensor ventilation faulty

Fault effects

- System switches off
- Display on instrument cluster

D00000

Diagnosis information - Adaptive cruise control (ACC)

Sensor Malfunction

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- System in diagnostic mode
- Sensor not available
- Function block active
- System malfunctioning

Fault effects

♦ System switches off
♦ Display on instrument cluster

D00001

Diagnosis information - Adaptive cruise control (ACC)

Sensor Malfunction

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- System in diagnostic mode
- Sensor not available
- Function block active
- System malfunctioning

Fault effects

- System switches off
- Display on instrument cluster

D00002

Diagnosis information - Adaptive cruise control (ACC)

Sensor blind

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Preceding trip with distance control

Fault setting condition(s)

- Sensor lens covered
- Sensor lens dirty
- Sensor lens covered in ice
- Sensor does not see obstacle for a long time
- Sensor lens damaged irreparably
- Sensor incorrectly adjusted

Fault effects

♦ System switches off
♦ Display on instrument cluster

D00003

Diagnosis information - Adaptive cruise control (ACC)

Sensor Malfunction

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- System in diagnostic mode
- Sensor not available
- Function block active
- System malfunctioning

Fault effects

♦ System switches off
♦ Display on instrument cluster

D00004

Diagnosis information - Adaptive cruise control (ACC)

Sensor Incorrectly adjusted

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Preceding drive with distance control

Fault setting condition(s)

- Deviation between driving axis and sensor beam larger (1.5°<)
  See also Workshop Manual
- Distance measuring sensor out of adjustment
- **Control module** New, initial adjustment/setting procedure (under “Maintenance/Adjustment” in the PIWIS Tester) not carried out
- Distance measuring sensor mount loose or bent
- Driving axis of chassis displaced
- Wheel settings of rear axle not correct

Fault effects

- System switches off
- Display on instrument cluster

Diagnosis information - Adaptive cruise control (ACC)

Vehicle reaction implausible

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Vehicle reaction not as expected upon acceleration
- Distance sensor control unit incorrectly coded, engine type naturally aspirated engine or turbo engine
- Vehicle reaction not as expected upon braking
- In trailer mode; trailer not detected
- DME control unit and / or PSM incorrectly coded

Fault effects

♦ System switches off
♦ Display on instrument cluster

D00007

Diagnosis information - Adaptive cruise control (ACC)

Sensor Malfunction

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- System in diagnostic mode
- Sensor not available
- Function block active
- System malfunctioning

Fault effects

♦ System switches off
♦ Display on instrument cluster

Diagnosis information - Adaptive cruise control (ACC)

Sensor Incorrectly adjusted

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Preceding drive with distance control

Fault setting condition(s)

- Deviation between driving axis and sensor beam larger (1.5°<)
  See also Workshop Manual
- Distance measuring sensor out of adjustment
- **Control module** New, initial adjustment/setting procedure (under “Maintenance/Adjustment” in the PIWIS Tester) not carried out
- Distance measuring sensor mount loose or bent
- Driving axis of chassis displaced
- Wheel settings of rear axle not correct

Fault effects

- System switches off
- Display on instrument cluster

D00009

Diagnosis information - Adaptive cruise control (ACC)

Vehicle identification, different Vehicle Identification Number (VIN)
Vehicle Identification Number (VIN) , implausible

NOTE
This fault is set when the control unit's Vehicle Identification Number (VIN) is not identical to the one reported over CAN.
A new control unit receives the Vehicle Identification Number (VIN) when it is connected for the first time.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Coded Vehicle Identification Number (VIN) in the control unit is not identical to the vehicle's VIN sent via CAN.
- Control unit is new, initial commissioning / vehicle handover not yet performed.
- Control unit originates from another vehicle.
- Vehicle Identification Number (VIN) not correctly entered in the **Control module Adaptive cruise control (ACC)** .

► Check and correct the Vehicle Identification Number (VIN) of the **Control module Adaptive cruise control (ACC)** (in the PIWIS Tester ⇒ **Control module Adaptive cruise control (ACC)** ⇒ Extended identification ⇒ Chassis number)

Fault effects

- System does not function
- Display on instrument cluster

P056100

Diagnosis information - High-voltage power electronics control unit

Voltage monitoring

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● Difference between the terminal 30 voltage (supply voltage) and the terminal 30 voltage (vehicle electrical system supply) too high

Possible fault causes

♦ Load in 12-V vehicle electrical system too high
♦ **High-voltage power electronics control unit**

Fault effects

Hybrid functionality restricted

P056200

Diagnosis information - High-voltage power electronics control unit

Power supply

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ **Power supply**, Limit exceeded
♦ **Power supply**, Below limit

P056300

Diagnosis information - High-voltage power electronics control unit

Power supply

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

● Ignition on

Possible fault causes

♦ **Power supply**, Limit exceeded
♦ **Power supply**, Below limit

P060400

Diagnostic information - high-voltage power electronics control unit

Function restriction

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ Internal fault in **high-voltage power electronics control unit**

Fault effects

♦ No function

P060600

Diagnostic information - high-voltage power electronics control unit

Function restriction

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

P064F00

Diagnosis information - High-voltage power electronics control unit

Coding

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

INFORMATION
The following codes of the DME, high-voltage battery and high-voltage power electronics control units must agree:

- Vehicle manufacturer
- Country
- Model
- Type of cooling

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ Coding incorrect or not carried out

P068600

Diagnosis information - High-voltage power electronics control unit

Contactors

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ **Power supply**, Limit exceeded
♦ **Power supply**, Below limit

P0A9000

Diagnosis information - High-voltage power electronics control unit

Electric machine

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ Electrical fault in circuit

Fault effects

♦ No function

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● Traction network Limit exceeded

Possible fault causes

♦ **High-voltage battery**
♦ **High-voltage battery control unit**
♦ **High-voltage power electronics control unit**

Fault effects

♦ High-voltage system switch-off
♦ No charging of the 12-V vehicle electrical system battery

P151A00

Diagnosis information - High-voltage power electronics control unit

Coding

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

INFORMATION
The following codes of the DME, high-voltage battery and high-voltage power electronics control units must agree:

- Vehicle manufacturer
- Country
- Model
- Type of cooling

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ Coding incorrect or not carried out

P157000

Diagnosis information - High-voltage power electronics control unit

Engine control unit blocked

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ Immobilizer not taught or incorrectly taught

Fault effects

♦ No hybrid functionality

P160900

Diagnosis information - High-voltage power electronics control unit

Crash signal

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● Crash signal from POSIP triggering unit detected via CAN bus.

Possible fault causes

♦ Crash event
♦ **POSIP triggering unit** Faulty

Fault effects

♦ High-voltage system switch-off

P178E00

Diagnosis information - High-voltage power electronics control unit

Temperature recording

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ **Temperature**, Limit exceeded
♦ **Temperature**, Below limit
♦ **Cooling system** Faulty
♦ **High-voltage power electronics control unit** faulty

P30A000

Diagnosis information - High-voltage power electronics control unit

High-voltage load switch-off

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● HV network discharge time too long (after load switch-off)

Possible fault causes

♦ Component in the HV network does not respond to switch-off request
♦ **High-voltage battery control unit**
♦ **High-voltage power electronics control unit**

Fault effects

♦ High-voltage system switch-off

P33CB00

Diagnostic information - high-voltage power electronics control unit

Function restriction

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ Internal fault in **high-voltage power electronics control unit**

Fault effects

♦ No function

P33CC00

Diagnostic information - high-voltage power electronics control unit

High-voltage power electronics (DC/DC converter) control unit reset overflow

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● Reset overflow

Possible fault causes

● If the following fault codes are currently stored, correct these faults first:
⇒ P33D500 12-V vehicle electrical system supply voltage, polarity reversed (004AE4)
⇒ P33CB00 High-voltage power electronics control unit, function restriction (004ACB)
⇒ P33CB00 High-voltage power electronics control unit, function restriction (004ACD)
⇒ P32B300 High-voltage system input current, above limit value (0060C1)
⇒ P33CB00 High-voltage power electronics control unit, function restriction (004AE2)
● **High-voltage power electronics control unit**

Fault effects

♦ High-voltage system switch-off

P33CE00

Diagnosis information - High-voltage power electronics control unit

Power supply

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ **Power supply**, Limit exceeded
♦ **Power supply**, Below limit

P33CF00

Diagnosis information - High-voltage power electronics control unit

12-V output voltage

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Output voltage, Limit exceeded
- Output voltage, Below limit

Possible fault causes

♦ Overvoltage:
- external power source
- **High-voltage power electronics control unit** Faulty

♦ Undervoltage:
- Short circuit to ground or open circuit in lines
- Fuse
- **Vehicle electrical system** - Battery
- **High-voltage power electronics control unit** Faulty

Fault effects

♦ Hybrid functionality restricted

P33D000

Diagnosis information - High-voltage power electronics control unit

12-V output voltage

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Output voltage, Limit exceeded
- Output voltage, Below limit

Possible fault causes

♦ Overvoltage:
- external power source
- **High-voltage power electronics control unit** Faulty

♦ Undervoltage:
- Short circuit to ground or open circuit in lines
- Fuse
- **Vehicle electrical system** - Battery
- **High-voltage power electronics control unit** Faulty

Fault effects

♦ Hybrid functionality restricted

P33D100

Diagnosis information - High-voltage power electronics control unit

High input voltage

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● High input voltage, Limit exceeded
● High input voltage, Below limit

Possible fault causes

♦ **High-voltage battery**
♦ **High-voltage battery control unit** Faulty
♦ **High-voltage power electronics control unit** Faulty

Fault effects

♦ Hybrid functionality restricted

P33D400

Diagnosis information - Electric machine

Function restriction

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ **Electric machine** demagnetized

Fault effects

♦ High-voltage system switch-off

P33D500

Diagnosis information - High-voltage power electronics control unit

12-V vehicle electrical system polarity reversed

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- 12-V vehicle electrical system polarity reversed

Possible fault causes

- Plus and minus poles interchanged

Fault effects

♦ 12-V vehicle electrical system cannot be charged

P33D700

Diagnostic information - electric machine

Electric machine - electrical fault

DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ **Electric machine** faulty

Fault effects

♦ Hybrid functionality restricted

In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ **Electric machine** faulty

Fault effects

♦ Hybrid functionality restricted

U000100

Diagnostic information - valid for all control units

Communication with CAN bus

INFORMATION
Communication with the CAN bus designated in the fault text is/was not possible.

Possible fault causes

♦ Short circuit of the CAN-High line to ground
♦ Short circuit of the CAN-High line to B+
♦ Short circuit of the CAN-High line to interference signal
♦ Open circuit in the CAN-High line

♦ Short circuit of the CAN-Low line to ground
♦ Short circuit of the CAN-Low line to B+
♦ Short circuit of the CAN-Low line to interference signal
♦ Open circuit in the CAN-Low line

♦ Defective control unit in combination with the designated CAN bus

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions in the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

U000200

Diagnostic information - valid for all control units

Communication with CAN bus

Diagnostic information - high-voltage battery control unit

12-V vehicle electrical system supply voltage

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

♦ 12-V vehicle electrical system, supply voltage - above limit value
♦ 12-V vehicle electrical system, supply voltage - below limit value

Possible fault causes

♦ **High-voltage power electronics control unit** faulty
♦ **High-voltage battery control unit** faulty

Fault effects

♦ Function restriction

0054CE

Diagnostic information - high-voltage battery control unit

12-V vehicle electrical system supply voltage

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

♦ 12-V vehicle electrical system, supply voltage - above limit value
♦ 12-V vehicle electrical system, supply voltage - below limit value

Possible fault causes

♦ **High-voltage power electronics control unit** faulty
♦ **High-voltage battery control unit** faulty

Fault effects

♦ Function restriction

Temperature sensor/s

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

ⓘ INFORMATION

If the temperature of the high-voltage battery is continuously too high, perform the >Bleeding water cooling circuit< sequence as necessary.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● **Temperature sensor**, above limit value (125 °C/257 °F)
● **Temperature sensor**, below limit value (-40 °C/-40 °F)
● **Temperature sensor** stuck
● Difference between the temperature of a module and the temperature of the adjacent modules too high

Possible fault causes

♦ Fault in cooling circuit (low temperature)
♦ **Temperature sensor** - short circuit to B+
♦ **Temperature sensor** - short circuit to ground

♦ **Temperature sensor** - open circuit
♦ **Temperature sensor** faulty
♦ **High-voltage cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ Hybrid functionality restricted

Diagnostic information - high-voltage battery control unit

High-voltage battery - cell voltage out of tolerance

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Cell voltage out of tolerance

Possible fault causes

♦ **Cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ High-voltage system switch-off (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Cell module voltage relative to the total of its cell voltages implausible
- Cell modules - voltage fluctuations
- Cell modules - voltage test fault

Possible fault causes

♦ **Cell module controller** faulty
♦ **High-voltage battery control unit**
♦ **Cell module(s)** faulty

Fault effects

♦ Restricted hybrid functionality (yellow hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage battery - cell voltage monitoring

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.

Diagnostic information - high-voltage battery control unit

High-voltage battery, temperature - above limit value

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

ⓘ INFORMATION

If the temperature of the high-voltage battery is continuously too high, perform the >Bleed low-temperature water cooling circuit< procedure if necessary.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

• **High-voltage battery** , temperature - above limit value

Possible fault causes

♦ Fault in cooling system (check/bleed low-temperature water cooling circuit)
♦ **Temperature sensor(s)** faulty
♦ **High-voltage battery control unit** faulty
♦ **Cell module(s)** faulty

Fault effects

♦ High-voltage system switch-off (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage battery, temperature - below limit value

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

• **High-voltage battery** , temperature - below limit value

Possible fault causes

♦ **Temperature sensor(s)** faulty
♦ **High-voltage battery heater** faulty
♦ **High-voltage battery control unit** faulty

Fault effects

♦ High-voltage system switch-off (red hybrid warning lamp comes on in the **instrument cluster**)

Temperature sensor/s

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

ⓘ INFORMATION

If the temperature of the high-voltage battery is continuously too high, perform the >Bleeding water cooling circuit< sequence as necessary.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● **Temperature sensor**, above limit value (125 °C/257 °F)
● **Temperature sensor**, below limit value (-40 °C/-40 °F)
● **Temperature sensor** stuck
● Difference between the temperature of a module and the temperature of the adjacent modules too high

Possible fault causes

♦ Fault in cooling circuit (low temperature)
♦ **Temperature sensor** - short circuit to B+
♦ **Temperature sensor** - short circuit to ground

♦ **Temperature sensor** - open circuit
♦ **Temperature sensor** faulty
♦ **High-voltage cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ Hybrid functionality restricted

● Ignition on

Fault setting condition(s)

● **Temperature sensor**, above limit value (125 °C/257 °F)
● **Temperature sensor**, below limit value (-40 °C/-40 °F)
● **Temperature sensor** stuck
● Difference between the temperature of a module and the temperature of the adjacent modules too high

Possible fault causes

♦ Fault in cooling circuit (low temperature)
♦ **Temperature sensor** - short circuit to B+
♦ **Temperature sensor** - short circuit to ground

♦ **Temperature sensor** - open circuit
♦ **Temperature sensor** faulty
♦ **High-voltage cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ Hybrid functionality restricted

Diagnostic information - high-voltage battery

Temperature sensor/s

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

ⓘ INFORMATION

If the temperature of the high-voltage battery is continuously too high, perform the >Bleeding water cooling circuit< sequence as necessary.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

ⓘ INFORMATION

If the temperature of the high-voltage battery is continuously too high, perform the >Bleeding water cooling circuit< sequence as necessary.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● **Temperature sensor**, above limit value (125 °C/257 °F)
● **Temperature sensor**, below limit value (-40 °C/-40 °F)
● **Temperature sensor** stuck
● Difference between the temperature of a module and the temperature of the adjacent modules too high

Possible fault causes

♦ Fault in cooling circuit (low temperature)
♦ **Temperature sensor** - short circuit to B+
♦ **Temperature sensor** - short circuit to ground

♦ **Temperature sensor** - open circuit
♦ **Temperature sensor** faulty
♦ **High-voltage cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ Hybrid functionality restricted

00559C

Diagnostic information - high-voltage battery control unit

High-voltage battery, temperature - above limit value

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

ⓘ INFORMATION

If the temperature of the high-voltage battery is continuously too high, perform the >Bleed low-temperature water cooling circuit< procedure if necessary.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

• **High-voltage battery** , temperature - above limit value

Possible fault causes

♦ Fault in cooling system (check/bleed low-temperature water cooling circuit)
♦ **Temperature sensor(s)** faulty
♦ **High-voltage battery control unit** faulty
♦ **Cell module(s)** faulty

Fault effects

♦ High-voltage system switch-off (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage battery, temperature - below limit value

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

Temperature sensor/s

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

ⓘ INFORMATION

If the temperature of the high-voltage battery is continuously too high, perform the >Bleeding water cooling circuit< sequence as necessary.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● **Temperature sensor**, above limit value (125 °C/257 °F)
● **Temperature sensor**, below limit value (-40 °C/-40 °F)
● **Temperature sensor** stuck
● Difference between the temperature of a module and the temperature of the adjacent modules too high

Possible fault causes

♦ Fault in cooling circuit (low temperature)
♦ **Temperature sensor** - short circuit to B+
♦ **Temperature sensor** - short circuit to ground

♦ **Temperature sensor** - open circuit
♦ **Temperature sensor** faulty
♦ **High-voltage cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ Hybrid functionality restricted

♦ **Cell module(s)** faulty

Fault effects

♦ Restricted hybrid functionality (yellow hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - valid for all control units

Communication with CAN bus

INFORMATION
Communication with the CAN bus designated in the fault text is/was not possible.

Possible fault causes

♦ Short circuit of the CAN-High line to ground
♦ Short circuit of the CAN-High line to B+
♦ Short circuit of the CAN-High line to interference signal
♦ Open circuit in the CAN-High line

♦ Short circuit of the CAN-Low line to ground
♦ Short circuit of the CAN-Low line to B+
♦ Short circuit of the CAN-Low line to interference signal
♦ Open circuit in the CAN-Low line

♦ Defective control unit in combination with the designated CAN bus

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions in the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

Diagnostic information - high-voltage battery control unit

Function restriction

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following documents in the PIWIS information system:

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles

♦ Short circuit of the CAN-Low line to interference signal
♦ Open circuit in the CAN-Low line

♦ Defective control unit in combination with the designated CAN bus

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions in the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

0057DD

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

0057DE

Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

Diagnostic information - high-voltage battery control unit

High-voltage system, pilot line

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ Service connector, **not** closed
♦ Pilot line - open circuit
♦ Pilot line - short circuit to ground
♦ Pilot line - short circuit to B+
♦ **High-voltage battery control unit** faulty
♦ **High-voltage power electronics control unit** faulty
♦ **Front-axle high-voltage power electronics control unit** faulty (only for the 918S)
♦ **High-voltage charger control unit**
♦ **High-voltage A/C compressor**
♦ **High-voltage evaporator (chiller)**
♦ **High-voltage interior heater** (not for the 918S)
♦ **High-voltage battery heater**

Fault effects

♦ High-voltage system switch-off with advance warning (red hybrid warning lamp comes on in the

instrument cluster)

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

Diagnostic information - valid for all control units

Read out control unit fault memory content

Communication with CAN bus

INFORMATION
Communication with the CAN bus designated in the fault text is/was not possible.

Possible fault causes

♦ Short circuit of the CAN-High line to ground
♦ Short circuit of the CAN-High line to B+
♦ Short circuit of the CAN-High line to interference signal
♦ Open circuit in the CAN-High line

♦ Short circuit of the CAN-Low line to ground
♦ Short circuit of the CAN-Low line to B+
♦ Short circuit of the CAN-Low line to interference signal
♦ Open circuit in the CAN-Low line

♦ Defective control unit in combination with the designated CAN bus

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions in the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

0058F1

Diagnostic information - high-voltage battery control unit

High-voltage battery, current monitoring

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Measured current outside of measuring range
- Difference in the measured current between current sensors is too high
- Current sensor offset too high
- Measured value stuck
- No signal or implausible signal

Possible fault causes

♦ Short circuit in current sensor (shunt or Hall)
♦ **High-voltage charger control unit** faulty
♦ **High-voltage power electronics control unit** faulty
♦ **High-voltage battery control unit** faulty
♦ **High-voltage battery** faulty

Fault effects

♦ Function restriction or high-voltage system switch-off with advance warning (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

12-V vehicle electrical system supply voltage

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

♦ 12-V vehicle electrical system, supply voltage - above limit value
♦ 12-V vehicle electrical system, supply voltage - below limit value

Possible fault causes

♦ **High-voltage power electronics control unit** faulty
♦ **High-voltage battery control unit** faulty

Fault effects

♦ Function restriction

Diagnostic information - high-voltage battery control unit

High-voltage battery, state of charge

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

♦ **High-voltage battery** , high voltage - below limit value

Possible fault causes

♦ Charging manager faulty
♦ **High-voltage charger control unit** faulty
♦ **High-voltage power electronics control unit** faulty
♦ **High-voltage battery control unit** faulty
♦ **High-voltage battery**

Fault effects

Depending on the state of charge, the **high-voltage battery control unit** reacts in several stages:
♦ Stage 1: Indication of state of charge ⇒ No function restriction
♦ Stage 2: Red hybrid warning lamp in the instrument cluster ⇒ Switch-off of the high-voltage system with

advance warning

♦ Stage 3: Red hybrid warning lamp in the instrument cluster ⇒ Switch-off of the high-voltage system without advance warning; the vehicle is no longer ready to drive

0058FB

Diagnostic information - high-voltage battery

Temperature sensor/s

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

ⓘ INFORMATION

If the temperature of the high-voltage battery is continuously too high, perform the >Bleeding water cooling circuit< sequence as necessary.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● **Temperature sensor**, above limit value (125 °C/257 °F)
● **Temperature sensor**, below limit value (-40 °C/-40 °F)
● **Temperature sensor** stuck
● Difference between the temperature of a module and the temperature of the adjacent modules too high

Possible fault causes

♦ Fault in cooling circuit (low temperature)
♦ **Temperature sensor** - short circuit to B+
♦ **Temperature sensor** - short circuit to ground

♦ **Temperature sensor** - open circuit
♦ **Temperature sensor** faulty
♦ **High-voltage cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ Hybrid functionality restricted

Diagnostic information - high-voltage battery control unit

Function restriction

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ Internal fault in **high-voltage battery control unit**

Fault effects

♦ Function restriction or high-voltage system switch-off with advance warning (red hybrid warning lamp comes on in the **instrument cluster**)

0058FD

Diagnostic information - high-voltage battery control unit

High-voltage battery - cell voltage out of tolerance

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following documents in the PIWIS information system:

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Cell voltage out of tolerance

Possible fault causes

♦ **Cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ High-voltage system switch-off (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage battery - cell voltage out of tolerance

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

ⓘ INFORMATION

If the temperature of the high-voltage battery is continuously too high, perform the >Bleed low-temperature water cooling circuit< procedure if necessary.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

• **High-voltage battery** , temperature - above limit value

Possible fault causes

♦ Fault in cooling system (check/bleed low-temperature water cooling circuit)
♦ **Temperature sensor(s)** faulty
♦ **High-voltage battery control unit** faulty
♦ **Cell module(s)** faulty

Fault effects

♦ High-voltage system switch-off (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage battery - cell voltage out of tolerance

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● Measured current outside the measuring range
● Current-sensor offset too high
● Measured value stuck

Possible fault causes

♦ Current sensor (Hall), Short circuit
♦ **High-voltage battery control unit** Faulty
♦ **High-voltage battery** Faulty

Fault effects

♦ High-voltage system switch-off

Diagnosis information - High-voltage battery control unit

Current monitoring

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

High-voltage E-box, voltage sensors

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following documents in the PIWIS information system:

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- High-voltage battery voltage sensor - above limit value
- High-voltage battery voltage sensor - below limit value
- High-voltage battery voltage sensor - short circuit to ground
- High-voltage battery voltage sensor - short circuit to B+
- Minus contactor voltage sensor - above limit value
- Minus contactor voltage sensor - below limit value
- Minus contactor voltage sensor - short circuit to ground
- Minus contactor voltage sensor - short circuit to B+
- Minus contactor voltage sensor - out of tolerance
- High-voltage system voltage sensor - voltage too high
- High-voltage system voltage sensor - voltage too low
- High-voltage system voltage sensor - electrical fault
- Plus contactor/pre-charging contactor voltage sensor - signal implausible
- Plus contactor/pre-charging contactor voltage sensor - above limit value
- Plus contactor/pre-charging contactor voltage sensor - below limit value
- Plus contactor/pre-charging contactor voltage sensor - short circuit to ground
- Plus contactor/pre-charging contactor voltage sensor - short circuit to B+

Possible fault causes

♦ Voltage sensor in **high-voltage E-box** faulty
♦ **High-voltage battery control unit**
♦ **High-voltage battery**

Fault effects

♦ No function restriction
♦ If fault code 'P0B1500' is stored, DC charging is no longer possible

Diagnostic information - high-voltage battery control unit

High-voltage E-box, voltage sensors

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Contactor does not close
- Contactor does not open
- Contactor opens too slowly
- Open circuit in control line
- Above temperature limit value
- Working circuit - short circuit to ground
- Working circuit - short circuit to B+
- Control circuit - short circuit to ground
- Control circuit - short circuit to B+

Possible fault causes

♦ Line(s) faulty (short circuit or open circuit)

♦ **Plus contactor** faulty
♦ **Minus contactor** faulty
♦ **Pre-charging contactor** faulty
♦ **High-voltage battery control unit** faulty

Fault effects

♦ High-voltage system switch-off with advance warning (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage E-box, plus/minus contactor and pre-charging contactor

ⓘ **For more information, see Guided Fault Finding**

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following documents in the PIWIS information system:

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

00A7F8

Diagnostic information - high-voltage charger control unit

High-voltage system voltage

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Infrastructure connected to the vehicle
- Vehicle in charging mode

Fault setting condition(s)

- High voltage (DC) during the charging process, above limit value (U > 450 V)
- High voltage (DC) during the charging process, below limit value (U < 220 V)

Possible fault causes

♦ High-voltage lines to **high-voltage battery control unit**
♦ High-voltage lines to **high-voltage power electronics control unit**
♦ Infrastructure faulty
♦ Fault in charging station
♦ **High-voltage battery** voltage
♦ **High-voltage charger control unit** faulty

Fault effects

♦ Active charging process is cancelled or charging is not possible

Diagnostic information - high-voltage charger control unit

High-voltage DC voltage sensors 1 and 2

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- High-voltage system active

Fault setting condition(s)

♦ High-voltage DC voltage sensor 1 - above limit value
♦ High-voltage DC voltage sensor 1 - below limit value
♦ High-voltage DC voltage sensor 1 - short circuit to B+
♦ High-voltage DC voltage sensor 1 - short circuit to ground
♦ High-voltage DC voltage sensor 2 - above limit value
♦ High-voltage DC voltage sensor 2 - below limit value
♦ High-voltage DC voltage sensor 2 - short circuit to B+
♦ High-voltage DC voltage sensor 2 - short circuit to ground
♦ High-voltage DC voltage sensors 1 **and** 2, difference value implausible

Possible fault causes

♦ Infrastructure faulty
♦ High-voltage DC voltage sensor 1 or 2 faulty
♦ **High-voltage charger control unit**

Fault effects

- ♦ Reduced charging power
- ♦ Active charging process is cancelled or charging is not possible

- Control circuit - short circuit to B+

Possible fault causes

♦ Line(s) faulty (short circuit or open circuit)

♦ **Plus contactor** faulty
♦ **Minus contactor** faulty
♦ **Pre-charging contactor** faulty
♦ **High-voltage battery control unit** faulty

Fault effects

♦ High-voltage system switch-off with advance warning (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage E-box, plus/minus contactor and pre-charging contactor

ⓘ **For more information, see Guided Fault Finding**

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following documents in the PIWIS information system:

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Contactor does not close
- Contactor does not open
- Contactor opens too slowly
- Open circuit in control line
- Above temperature limit value
- Working circuit - short circuit to ground
- Working circuit - short circuit to B+
- Control circuit - short circuit to ground
- Control circuit - short circuit to B+

Possible fault causes

♦ Line(s) faulty (short circuit or open circuit)

♦ **Plus contactor** faulty
♦ **Minus contactor** faulty
♦ **Pre-charging contactor** faulty
♦ **High-voltage battery control unit** faulty

Fault effects

♦ High-voltage system switch-off with advance warning (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage E-box, plus/minus contactor and pre-charging contactor

Diagnosis information - High-voltage battery control unit

Crash signal

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● Crash signal from POSIP triggering unit detected via CAN bus.
or
● Crash signal from POSIP triggering unit detected via signal line.

Possible fault causes

♦ Signal lead Short circuit to ground
♦ Signal lead Short circuit to B+
♦ **POSIP triggering unit** Faulty
♦ Crash event

Fault effects

♦ High-voltage system switch-off

Diagnosis information - High-voltage battery control unit

Current monitoring

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● Measured current outside the measuring range
● Current-sensor offset too high
● Measured value stuck

Possible fault causes

♦ Current sensor (Hall), Short circuit
♦ **High-voltage battery control unit** Faulty
♦ **High-voltage battery** Faulty

Fault effects

♦ High-voltage system switch-off

Diagnosis information - High-voltage battery control unit

Current monitoring

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

ⓘ INFORMATION
The following coding values for the DME, high-voltage battery and high-voltage power electronics control units must match:

- Vehicle manufacturer
- Country
- Model
- Type of cooling

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Coding incorrect or not carried out

Diagnostic information - high-voltage battery control unit

High-voltage system, pilot line

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ Service connector, **not** closed
♦ Pilot line - open circuit
♦ Pilot line - short circuit to ground
♦ Pilot line - short circuit to B+
♦ **High-voltage battery control unit** faulty
♦ **High-voltage power electronics control unit** faulty
♦ **Front-axle high-voltage power electronics control unit** faulty (only for the 918S)
♦ **High-voltage charger control unit**
♦ **High-voltage A/C compressor**
♦ **High-voltage evaporator (chiller)**
♦ **High-voltage interior heater** (not for the 918S)
♦ **High-voltage battery heater**

Fault effects

♦ High-voltage system switch-off with advance warning (red hybrid warning lamp comes on in the

instrument cluster)

Diagnostic information - high-voltage battery control unit

High-voltage system, insulation fault

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following documents in the PIWIS information system:

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

• **High-voltage battery** , temperature - below limit value

Possible fault causes

♦ **Temperature sensor(s)** faulty
♦ **High-voltage battery heater** faulty
♦ **High-voltage battery control unit** faulty

Fault effects

♦ High-voltage system switch-off (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

Function restriction

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ Internal fault in **high-voltage battery control unit**

Fault effects

♦ Function restriction or high-voltage system switch-off with advance warning (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

Function restriction

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ **High-voltage battery** , reference voltage - above limit value
♦ **High-voltage battery** , reference voltage - below limit value
♦ **High-voltage battery** , reference voltage - signal implausible

Fault effects

♦ None (yellow hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage network, plus harness implausible

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Voltage in the high-voltage line (plus) rises too rapidly

Possible fault causes

♦ No load present

Fault effects

♦ High-voltage system switch-off with advance warning (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage E-box, plus/minus contactor and pre-charging contactor

ⓘ **For more information, see Guided Fault Finding**

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following documents in the PIWIS information system:

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Contactor does not close
- Contactor does not open
- Contactor opens too slowly
- Open circuit in control line
- Above temperature limit value
- Working circuit - short circuit to ground
- Working circuit - short circuit to B+
- Control circuit - short circuit to ground
- Control circuit - short circuit to B+

Possible fault causes

♦ Line(s) faulty (short circuit or open circuit)

♦ **Plus contactor** faulty
♦ **Minus contactor** faulty
♦ **Pre-charging contactor** faulty
♦ **High-voltage battery control unit** faulty

Fault effects

♦ High-voltage system switch-off with advance warning (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage E-box, plus/minus contactor and pre-charging contactor

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

♦ Efficiency too low < 80%

Possible fault causes

♦ Poor mains quality
♦ Check infrastructure
♦ Check charging cable
♦ Check lines
♦ Check charging socket
♦ Check **high-voltage battery control unit** fault memory
♦ **High-voltage charger control unit**

Fault effects

♦ Charging power very low ⇒ Charging time correspondingly much too long

Diagnostic information - high-voltage charger control unit

High-voltage AC voltage sensors

Applies to the following sensors:

♦ High-voltage AC voltage sensor L1
♦ High-voltage AC voltage sensor L2
♦ High-voltage voltage sensor, capacitor 1 (rail 1)
♦ High-voltage voltage sensor, capacitor 2 (rail 1)
♦ High-voltage voltage sensor, capacitor 1 (rail 2)
♦ High-voltage voltage sensor, capacitor 2 (rail 2)

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

- Above limit value
- Below limit value
- Short circuit to B+
- Short circuit to ground
- Open circuit
- Signal implausible

Possible fault causes

♦ Infrastructure faulty
♦ High-voltage AC voltage sensor faulty
♦ **High-voltage charger control unit**

Fault effects

♦ Reduced charging power
♦ Active charging process is cancelled or charging is not possible

Diagnostic information - high-voltage charger control unit

Proximity line (plug detection)

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

♦ Control-Pilot (communication line) active, but no or implausible signal via proximity line (plug detection)
♦ Proximity line (plug detection) - short circuit or open circuit detected

Possible fault causes

♦ Universal charger (ICCPD) faulty (perform a self-test)
♦ PRX resistor (2.7 kohm) between CP/PE pin in charging socket faulty
♦ Contact resistance between charging plug and charging socket too high (dirty or foreign objects present)
♦ Charging socket damp/wet (water drain on charging-socket housing blocked)
♦ Charging socket plug contacts worn or charging plug socket contacts spread apart
♦ Charging cable or charging socket faulty
♦ Vehicle wiring harness faulty (open circuit or short circuit in the proximity line (plug detection) due to possible previous repair work)
♦ Short circuit between lines
♦ **High-voltage charger control unit**

Fault effects

♦ Charging not possible

Diagnostic information - high-voltage charger control unit

Control-Pilot (communication line)

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

♦ No or implausible signal via Control-Pilot (communication line)
♦ Short circuit to B+
♦ Short circuit to B- or open circuit

Possible fault causes

♦ Operating error (charging station not activated within 4 minutes of inserting the plug)
♦ Charging cable not properly plugged in at the vehicle or at the charging station
♦ Universal charger (ICCPD) faulty (perform a self-test)
♦ Charging cable faulty
♦ Charging socket faulty
♦ Vehicle wiring harness faulty (open circuit in Control-Pilot (communication line) due to possible previous repair work)
♦ **High-voltage charger control unit**

Fault effects

♦ Charging not possible

Diagnostic information - high-voltage charger control unit

High-voltage charger control unit, temperature - above limit value

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

● Internal temperature , above limit value (T > 120 °C/248 °F)

Possible fault causes

♦ Internal components too hot
♦ Ambient temperature of the **high-voltage battery control unit** too high
♦ Check low-temperature cooling circuit system ⇒ Bleed if necessary
♦ Temperature sensor faulty
♦ **High-voltage charger control unit** faulty

Fault effects

♦ Cancellation of charging process or charging not possible

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

Diagnostic information - high-voltage charger control unit

Charging-socket plug lock

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Possible fault causes

♦ Plug lock - mechanical fault
♦ Lines - short circuit to ground
♦ Lines - short circuit to B+
♦ Lines - open circuit
♦ **Plug lock actuator** faulty
♦ **High-voltage charger control unit**

Fault effects

♦ Charging not possible

Diagnostic information - high-voltage charger control unit

Charging socket temperature sensor

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

- **Temperature sensor** - above limit value
- **Temperature sensor** - below limit value
- **Temperature sensor** - signal implausible
- **Temperature sensor** - short circuit to B+
- **Temperature sensor** - short circuit to ground or open circuit

Possible fault causes

♦ Check **temperature sensor** plug connection for loose contacts, soiling and corrosion
♦ Check **temperature sensor** wiring for short circuit to B+
♦ Check **temperature sensor** wiring for short circuit to ground and open circuit
♦ **Temperature sensor** faulty

Fault effects

♦ Reduced charging power

00A93F

Diagnostic information - high-voltage charger control unit

Charging-socket temperature

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

P31D1:
● **Temperature sensor** - signal implausible
● **Temperature sensor** - above limit value
● **Temperature sensor** - below limit value

P31D2:
● Temperature > 60 °C (140 °F)

Possible fault causes

P31D1:
♦ Signal line, loose contact
♦ Vehicle wiring harness faulty (short circuit/open circuit in the signal line due to possible previous repair work)
♦ **Temperature sensor** faulty

P31D2:
♦ Contact resistance of the high-voltage line too high
♦ **Temperature sensor** faulty

Fault effects

P31D1:
♦ Charging power restricted
♦ Active charging process is cancelled or charging is not possible

P31D2:
♦ Active charging process is cancelled or charging is not possible

Diagnostic information - high-voltage charger control unit

Charge-now button

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Possible fault causes

♦ Operating error (button pressed for a long time)
♦ Charge-now button stuck/jammed
♦ Wiring harness faulty（open circuit/short circuit in the signal line to the Charge-now button due to due to possible previous repair work)
♦ Charge-now button faulty

Fault effects

♦ Change between time-shifted charging and immediate charging not possible
♦ Time-shifted charging can be cancelled only via the menu in the instrument cluster to permit immediate charging

Diagnostic information - valid for all control units

Communication with CAN bus

INFORMATION
Communication with the CAN bus designated in the fault text is/was not possible.

Possible fault causes

♦ Short circuit of the CAN-High line to ground
♦ Short circuit of the CAN-High line to B+
♦ Short circuit of the CAN-High line to interference signal
♦ Open circuit in the CAN-High line

♦ Short circuit of the CAN-Low line to ground
♦ Short circuit of the CAN-Low line to B+
♦ Short circuit of the CAN-Low line to interference signal
♦ Open circuit in the CAN-Low line

♦ Defective control unit in combination with the designated CAN bus

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions in the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

Diagnostic information - valid for all control units

Communication with CAN bus

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Cell voltage out of tolerance

Possible fault causes

♦ **Cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ High-voltage system switch-off (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage battery - cell voltage out of tolerance

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

Diagnostic information - high-voltage battery control unit

High-voltage battery - cell voltage out of tolerance

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

ⓘ INFORMATION

If the temperature of the high-voltage battery is continuously too high, perform the >Bleeding water cooling circuit< sequence as necessary.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● **Temperature sensor**, above limit value (125 °C/257 °F)
● **Temperature sensor**, below limit value (-40 °C/-40 °F)
● **Temperature sensor** stuck
● Difference between the temperature of a module and the temperature of the adjacent modules too high

Possible fault causes

♦ Fault in cooling circuit (low temperature)
♦ **Temperature sensor** - short circuit to B+
♦ **Temperature sensor** - short circuit to ground

♦ **Temperature sensor** - open circuit
♦ **Temperature sensor** faulty
♦ **High-voltage cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ Hybrid functionality restricted

If the temperature of the high-voltage battery is continuously too high, perform the >Bleeding water cooling circuit< sequence as necessary.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● **Temperature sensor**, above limit value (125 °C/257 °F)
● **Temperature sensor**, below limit value (-40 °C/-40 °F)
● **Temperature sensor** stuck
● Difference between the temperature of a module and the temperature of the adjacent modules too high

Possible fault causes

♦ Fault in cooling circuit (low temperature)
♦ **Temperature sensor** - short circuit to B+
♦ **Temperature sensor** - short circuit to ground

♦ **Temperature sensor** - open circuit
♦ **Temperature sensor** faulty
♦ **High-voltage cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ Hybrid functionality restricted

Diagnostic information - high-voltage battery

Temperature sensor/s

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

ⓘ INFORMATION

If the temperature of the high-voltage battery is continuously too high, perform the >Bleeding water cooling circuit< sequence as necessary.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● **Temperature sensor**, above limit value (125 °C/257 °F)
● **Temperature sensor**, below limit value (-40 °C/-40 °F)
● **Temperature sensor** stuck
● Difference between the temperature of a module and the temperature of the adjacent modules too high

Possible fault causes

♦ Fault in cooling circuit (low temperature)
♦ **Temperature sensor** - short circuit to B+
♦ **Temperature sensor** - short circuit to ground

♦ **Temperature sensor** - open circuit
♦ **Temperature sensor** faulty
♦ **High-voltage cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ Hybrid functionality restricted

High-voltage system, insulation fault

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

- ♦ De-energize the vehicle in accordance with the guidelines.
- ♦ Work must not be performed on parts carrying a high voltage.

► Please read the following documents in the PIWIS information system:

- ♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
- ♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
- ♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- High-voltage system; insulation fault from minus/plus wiring harness to vehicle ground
- Insulation sensor - electrical fault

Possible fault causes

- ♦ High-voltage line(s)
- ♦ **High-voltage battery heater**
- ♦ **High-voltage interior heater**
- ♦ **High-voltage evaporator**
- ♦ **High-voltage (A/C) compressor**
- ♦ **High-voltage charger control unit**
- ♦ **High-voltage battery**
- ♦ **High-voltage battery control unit**

Fault effects

♦ None (yellow hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage system, insulation fault

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

Programming

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following documents in the PIWIS information system:

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- No data record programmed
- Wrong data record programmed
- Programmed data record does not match a control unit of the high-voltage system
- Programmed data record does not match the immobilizer system.

Fault effects

♦ High-voltage system switch-off

Diagnosis information - High-voltage battery control unit

Current monitoring

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● Measured current outside the measuring range
● Current-sensor offset too high
● Measured value stuck

Possible fault causes

♦ Current sensor (shunt), Short circuit
♦ **High-voltage battery control unit** Faulty
♦ **High-voltage battery** Faulty

Fault effects

♦ High-voltage system switch-off

Diagnosis information - High-voltage battery control unit

Current monitoring

00AA2D

ⓘ INFORMATION

No information is available at present for this fault code.

Please contact your importer if necessary.

Diagnostic information - high-voltage battery control unit

Low-temperature circuit

DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● P0C3200 Low-temperature circuit - cooling requirement too high (00AA2E or 00AB69)
● P0C3200 Low-temperature circuit - chiller active, but temperature characteristic implausible (00A91A or 00AB64)

Possible fault causes

♦ Fault in cooling circuit (low temperature)
♦ **High-voltage battery control unit**

Fault effects

♦ Fault code P0C3200 (00AA2E, 00AB64 or 00AB69) ⇒ No function restriction
♦ Fault code P0C3200 (00A91A) ⇒ Hybrid functionality restricted (power reduction), yellow hybrid warning lamp comes on in the instrument cluster

Diagnosis information - High-voltage battery

High-voltage battery heater

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ **High-voltage battery heater**

Fault effects

♦ none

Diagnosis information - High-voltage battery

High-voltage battery heater

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ **High-voltage battery heater**

Fault effects

♦ none

Diagnosis information - High-voltage battery

High-voltage battery heater

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ **High-voltage battery heater**

Fault effects

♦ none

Diagnosis information - High-voltage battery

High-voltage battery heater

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ **High-voltage battery heater**

Fault effects

♦ none

Diagnostic information - high-voltage battery control unit

High-voltage network, plus harness implausible

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following documents in the PIWIS information system:

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Voltage in the high-voltage line (plus) rises too rapidly

Possible fault causes

♦ No load present

Fault effects

♦ High-voltage system switch-off with advance warning (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage system, insulation fault

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following documents in the PIWIS information system:

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- High-voltage system; insulation fault from minus/plus wiring harness to vehicle ground
- Insulation sensor - electrical fault

Possible fault causes

♦ High-voltage line(s)
♦ **High-voltage battery heater**
♦ **High-voltage interior heater**
♦ **High-voltage evaporator**
♦ **High-voltage (A/C) compressor**
♦ **High-voltage charger control unit**
♦ **High-voltage battery**
♦ **High-voltage battery control unit**

Fault effects

♦ None (yellow hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage system, insulation fault

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following documents in the PIWIS information system:

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- High-voltage system; insulation fault from minus/plus wiring harness to vehicle ground
- Insulation sensor - electrical fault

Possible fault causes

♦ High-voltage line(s)
♦ **High-voltage battery heater**
♦ **High-voltage interior heater**
♦ **High-voltage evaporator**
♦ **High-voltage (A/C) compressor**
♦ **High-voltage charger control unit**
♦ **High-voltage battery**
♦ **High-voltage battery control unit**

Fault effects

♦ None (yellow hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage battery, charging current

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Charging current too high

Possible fault causes

♦ **High-voltage charger control unit** faulty
♦ **High-voltage power electronics control unit** faulty
♦ **High-voltage battery control unit** faulty

Fault finding notes

♦ Read out the fault memory of the high-voltage components (**high-voltage charger control unit** , **high-voltage power electronics control unit**) and work through the faults.

Fault effects

♦ High-voltage system switch-off with advance warning (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage battery, discharging current

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following documents in the PIWIS information system:

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Discharging current too high

Possible fault causes

♦ **High-voltage power electronics control unit** faulty
♦ **High-voltage battery control unit** faulty

Fault effects

♦ High-voltage system switch-off with advance warning (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage battery, charging current

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Charging current too high

Possible fault causes

♦ **High-voltage charger control unit** faulty
♦ **High-voltage power electronics control unit** faulty
♦ **High-voltage battery control unit** faulty

Fault finding notes

♦ Read out the fault memory of the high-voltage components (**high-voltage charger control unit** , **high-voltage power electronics control unit**) and work through the faults.

Fault effects

♦ High-voltage system switch-off with advance warning (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage battery, discharging current

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following documents in the PIWIS information system:

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Discharging current too high

Possible fault causes

♦ **High-voltage power electronics control unit** faulty
♦ **High-voltage battery control unit** faulty

Fault effects

♦ High-voltage system switch-off with advance warning (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage fuse - high-voltage charger

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● No connection between **high-voltage charger control unit** and **high-voltage battery** contactor

Possible fault causes

♦ High-voltage fuse faulty
⇒ Visually check the high-voltage lines for damage
⇒ High-voltage line - short circuit
⇒ High-voltage line - open circuit

♦ **High-voltage battery**
♦ **High-voltage charger control unit**
♦ **High-voltage battery control unit**

Fault effects

♦ Charging is not possible via **high-voltage charger control unit**

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

Diagnostic information - valid for all control units

Read out control unit fault memory content

This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

00AA5D

Diagnostic information - valid for all control units

Read out control unit fault memory content

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

Diagnostic information - valid for all control units

Communication with LIN bus

INFORMATION
Communication with the LIN bus designated in the fault text is/was not possible.

Possible fault causes

♦ Short circuit to ground in the LIN line
♦ Short circuit to B+ in the LIN line
♦ Short circuit of the LIN line to an interference signal

♦ Faulty component in the system of the identified LIN bus

Fault effects

♦ Functions in the control unit are available only with restrictions
♦ Functions in the control unit are not available
♦ Cross-vehicle functions are not available

Diagnosis information - High-voltage battery

High-voltage battery heater

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ **High-voltage battery heater**

Fault effects

♦ none

Diagnosis information - High-voltage battery

High-voltage battery heater

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ **High-voltage battery heater**

Fault effects

♦ none

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

Diagnosis information - High-voltage battery control unit

Current monitoring

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● Measured current outside the measuring range
● Current-sensor offset too high
● Measured value stuck

Possible fault causes

♦ Current sensor (shunt), Short circuit
♦ **High-voltage battery control unit** Faulty
♦ **High-voltage battery** Faulty

Fault effects

♦ High-voltage system switch-off

Diagnosis information - High-voltage battery control unit

Current monitoring

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

Diagnostic information - high-voltage battery control unit

High-voltage E-box, reference voltage

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ **High-voltage battery** , reference voltage - above limit value
♦ **High-voltage battery** , reference voltage - below limit value
♦ **High-voltage battery** , reference voltage - signal implausible

Fault effects

♦ None (yellow hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage E-box, reference voltage

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles

♦ **High-voltage battery** , reference voltage - below limit value
♦ **High-voltage battery** , reference voltage - signal implausible

Fault effects

♦ None (yellow hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - valid for all control units

Communication with LIN bus

INFORMATION
Communication with the LIN bus designated in the fault text is/was not possible.

Possible fault causes

♦ Short circuit to ground in the LIN line
♦ Short circuit to B+ in the LIN line
♦ Short circuit of the LIN line to an interference signal

♦ Faulty component in the system of the identified LIN bus

Fault effects

♦ Functions in the control unit are available only with restrictions
♦ Functions in the control unit are not available
♦ Cross-vehicle functions are not available

Diagnostic information - high-voltage battery control unit

High-voltage E-box, plus/minus contactor and pre-charging contactor

ⓘ **For more information, see Guided Fault Finding**

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following documents in the PIWIS information system:

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Contactor does not close
- Contactor does not open
- Contactor opens too slowly
- Open circuit in control line
- Above temperature limit value
- Working circuit - short circuit to ground
- Working circuit - short circuit to B+
- Control circuit - short circuit to ground
- Control circuit - short circuit to B+

Possible fault causes

♦ Line(s) faulty (short circuit or open circuit)

♦ **Plus contactor** faulty
♦ **Minus contactor** faulty
♦ **Pre-charging contactor** faulty
♦ **High-voltage battery control unit** faulty

Fault effects

♦ High-voltage system switch-off with advance warning (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage battery, current monitoring

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles

Possible fault causes

♦ **Cell module(s)** , voltage implausible
♦ Battery ageing (replace **high-voltage battery**)

Fault effects

♦ Function not available or available only to a limited extent

00AA8C

Diagnostic information - high-voltage battery

Temperature sensor/s

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

ⓘ INFORMATION

If the temperature of the high-voltage battery is continuously too high, perform the >Bleeding water cooling circuit< sequence as necessary.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● **Temperature sensor**, above limit value (125 °C/257 °F)
● **Temperature sensor**, below limit value (-40 °C/-40 °F)
● **Temperature sensor** stuck
● Difference between the temperature of a module and the temperature of the adjacent modules too high

Possible fault causes

♦ Fault in cooling circuit (low temperature)
♦ **Temperature sensor** - short circuit to B+
♦ **Temperature sensor** - short circuit to ground

♦ **Temperature sensor** - open circuit
♦ **Temperature sensor** faulty
♦ **High-voltage cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ Hybrid functionality restricted

00AA8E

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Cell module voltage relative to the total of its cell voltages implausible
- Cell modules - voltage fluctuations
- Cell modules - voltage test fault

Possible fault causes

♦ **Cell module controller** faulty
♦ **High-voltage battery control unit**
♦ **Cell module(s)** faulty

Fault effects

♦ Restricted hybrid functionality (yellow hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage E-box, plus/minus contactor and pre-charging contactor

ⓘ For more information, see Guided Fault Finding

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following documents in the PIWIS information system:

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Contactor does not close
- Contactor does not open
- Contactor opens too slowly
- Open circuit in control line
- Above temperature limit value
- Working circuit - short circuit to ground
- Working circuit - short circuit to B+
- Control circuit - short circuit to ground
- Control circuit - short circuit to B+

Possible fault causes

♦ Line(s) faulty (short circuit or open circuit)

♦ **Plus contactor** faulty
♦ **Minus contactor** faulty
♦ **Pre-charging contactor** faulty
♦ **High-voltage battery control unit** faulty

Fault effects

♦ High-voltage system switch-off with advance warning (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage system emergency switch-off

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

• Deactivation due to malfunction

Possible fault causes

♦ Critical fault in one or more high-voltage components

Fault effects

♦ High-voltage system switch-off (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnosis information - High-voltage battery control unit

Current monitoring

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Measured current outside the measuring range
- Current-sensor offset too high
- Measured value stuck

Possible fault causes

♦ Current sensor (shunt), Short circuit
♦ **High-voltage battery control unit** Faulty
♦ **High-voltage battery** Faulty

Fault effects

♦ High-voltage system switch-off

Diagnosis information - High-voltage battery control unit

Current monitoring

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● Measured current outside the measuring range
● Current-sensor offset too high
● Measured value stuck

Possible fault causes

♦ Current sensor (shunt), Short circuit
♦ **High-voltage battery control unit** Faulty
♦ **High-voltage battery** Faulty

Fault effects

♦ High-voltage system switch-off

Diagnostic information - high-voltage battery control unit

High-voltage battery, worsening (performance)

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ **Cell module(s)** , voltage implausible
♦ Battery ageing (replace **high-voltage battery**)

Fault effects

♦ Function not available or available only to a limited extent

Diagnostic information - high-voltage battery control unit

High-voltage battery, state of charge

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

♦ **High-voltage battery** , high voltage - below limit value

Possible fault causes

♦ Charging manager faulty
♦ **High-voltage charger control unit** faulty
♦ **High-voltage power electronics control unit** faulty
♦ **High-voltage battery control unit** faulty
♦ **High-voltage battery**

Fault effects

Depending on the state of charge, the **high-voltage battery control unit** reacts in several stages:
♦ Stage 1: Indication of state of charge ⇒ No function restriction
♦ Stage 2: Red hybrid warning lamp in the instrument cluster ⇒ Switch-off of the high-voltage system with

advance warning

♦ Stage 3: Red hybrid warning lamp in the instrument cluster ⇒ Switch-off of the high-voltage system without advance warning; the vehicle is no longer ready to drive

Diagnostic information - high-voltage battery control unit

High-voltage battery, state of charge

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Cell voltage out of tolerance

Possible fault causes

♦ **Cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ High-voltage system switch-off (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage battery - cell voltage out of tolerance

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.

♦ **High-voltage battery control unit**

Fault effects

♦ High-voltage system switch-off (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage battery - cell voltage out of tolerance

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Cell voltage out of tolerance

Possible fault causes

♦ **Cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ High-voltage system switch-off (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage battery - cell voltage out of tolerance

⚠DANGER

High voltage!

♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Cell voltage out of tolerance

Possible fault causes

♦ **Cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ High-voltage system switch-off (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage battery - cell voltage out of tolerance

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following documents in the PIWIS information system:**

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Cell voltage out of tolerance

Possible fault causes

Diagnosis information - High-voltage battery control unit

Current monitoring

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● Measured current outside the measuring range
● Current-sensor offset too high
● Measured value stuck

Possible fault causes

♦ Current sensor (shunt), Short circuit
♦ **High-voltage battery control unit** Faulty
♦ **High-voltage battery** Faulty

Fault effects

♦ High-voltage system switch-off

Diagnostic information - high-voltage battery control unit

High-voltage E-box, plus/minus contactor and pre-charging contactor

ⓘ **For more information, see Guided Fault Finding**

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following documents in the PIWIS information system:

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Contactor does not close
- Contactor does not open
- Contactor opens too slowly
- Open circuit in control line
- Above temperature limit value
- Working circuit - short circuit to ground
- Working circuit - short circuit to B+
- Control circuit - short circuit to ground
- Control circuit - short circuit to B+

Possible fault causes

♦ Line(s) faulty (short circuit or open circuit)

♦ **Plus contactor** faulty
♦ **Minus contactor** faulty
♦ **Pre-charging contactor** faulty
♦ **High-voltage battery control unit** faulty

Fault effects

♦ High-voltage system switch-off with advance warning (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage E-box, plus/minus contactor and pre-charging contactor

ⓘ For more information, see Guided Fault Finding

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Contactor does not close
- Contactor does not open
- Contactor opens too slowly
- Open circuit in control line
- Above temperature limit value
- Working circuit - short circuit to ground
- Working circuit - short circuit to B+
- Control circuit - short circuit to ground
- Control circuit - short circuit to B+

Possible fault causes

♦ Line(s) faulty (short circuit or open circuit)

♦ **Plus contactor** faulty
♦ **Minus contactor** faulty
♦ **Pre-charging contactor** faulty
♦ **High-voltage battery control unit** faulty

Fault effects

♦ High-voltage system switch-off with advance warning (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage E-box, plus/minus contactor and pre-charging contactor

ⓘ For more information, see Guided Fault Finding

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following documents in the PIWIS information system:

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles

Diagnosis information - High-voltage battery

Temperature sensors

DANGER

High voltage !
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in ac cordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

ⓘ INFORMATION

If the temperature of the high-voltage battery is continuously too high, it must be checked whether the inlet and outlet ducts are clogged. The fans should run at 100% for 4 minutes in order to remove minor soiling.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- More than one temperature sensor detected as faulty

Possible fault causes

♦ **Temperature sensor** Faulty
♦ **High-voltage cell module** Faulty
♦ **High-voltage battery control unit** Faulty

Fault effects

♦ Function restriction

Diagnosis information - High-voltage battery

If the temperature of the high-voltage battery is continuously too high, it must be checked whether the inlet and outlet ducts are clogged. The fans should run at 100% for 4 minutes in order to remove minor soiling.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- More than one temperature sensor detected as faulty

Possible fault causes

♦ **Temperature sensor** Faulty
♦ **High-voltage cell module** Faulty
♦ **High-voltage battery control unit** Faulty

Fault effects

♦ Function restriction

Temperature sensor/s

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

ⓘ INFORMATION

If the temperature of the high-voltage battery is continuously too high, perform the >Bleeding water cooling circuit< sequence as necessary.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● **Temperature sensor**, above limit value (125 °C/257 °F)
● **Temperature sensor**, below limit value (-40 °C/-40 °F)
● **Temperature sensor** stuck
● Difference between the temperature of a module and the temperature of the adjacent modules too high

Possible fault causes

♦ Fault in cooling circuit (low temperature)
♦ **Temperature sensor** - short circuit to B+
♦ **Temperature sensor** - short circuit to ground

♦ **Temperature sensor** - open circuit
♦ **Temperature sensor** faulty
♦ **High-voltage cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ Hybrid functionality restricted

Possible fault causes

♦ Fault in cooling circuit (low temperature)
♦ **Temperature sensor** - short circuit to B+
♦ **Temperature sensor** - short circuit to ground

♦ **Temperature sensor** - open circuit
♦ **Temperature sensor** faulty
♦ **High-voltage cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ Hybrid functionality restricted

Diagnostic information - high-voltage battery

Temperature sensor/s

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

ⓘ INFORMATION

If the temperature of the high-voltage battery is continuously too high, perform the >Bleeding water cooling circuit< sequence as necessary.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● **Temperature sensor**, above limit value (125 °C/257 °F)
● **Temperature sensor**, below limit value (-40 °C/-40 °F)
● **Temperature sensor** stuck
● Difference between the temperature of a module and the temperature of the adjacent modules too high

Possible fault causes

♦ Fault in cooling circuit (low temperature)
♦ **Temperature sensor** - short circuit to B+
♦ **Temperature sensor** - short circuit to ground

♦ **Temperature sensor** - open circuit
♦ **Temperature sensor** faulty
♦ **High-voltage cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ Hybrid functionality restricted

Fault setting condition(s)

● **Temperature sensor**, above limit value (125 °C/257 °F)
● **Temperature sensor**, below limit value (-40 °C/-40 °F)
● **Temperature sensor** stuck
● Difference between the temperature of a module and the temperature of the adjacent modules too high

Possible fault causes

♦ Fault in cooling circuit (low temperature)
♦ **Temperature sensor** - short circuit to B+
♦ **Temperature sensor** - short circuit to ground

♦ **Temperature sensor** - open circuit
♦ **Temperature sensor** faulty
♦ **High-voltage cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ Hybrid functionality restricted

Temperature sensor/s

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

ⓘ INFORMATION

If the temperature of the high-voltage battery is continuously too high, perform the >Bleeding water cooling circuit< sequence as necessary.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● **Temperature sensor**, above limit value (125 °C/257 °F)
● **Temperature sensor**, below limit value (-40 °C/-40 °F)
● **Temperature sensor** stuck
● Difference between the temperature of a module and the temperature of the adjacent modules too high

Possible fault causes

♦ Fault in cooling circuit (low temperature)
♦ **Temperature sensor** - short circuit to B+
♦ **Temperature sensor** - short circuit to ground

♦ **Temperature sensor** - open circuit
♦ **Temperature sensor** faulty
♦ **High-voltage cell module** faulty
♦ **High-voltage battery control unit**

Fault effects

♦ Hybrid functionality restricted

Diagnostic information - high-voltage charger control unit

High-voltage system voltage

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Infrastructure connected to the vehicle
- Vehicle in charging mode

Fault setting condition(s)

- High voltage (DC) during the charging process, above limit value (U > 450 V)
- High voltage (DC) during the charging process, below limit value (U < 220 V)

Possible fault causes

♦ High-voltage lines to **high-voltage battery control unit**
♦ High-voltage lines to **high-voltage power electronics control unit**
♦ Infrastructure faulty
♦ Fault in charging station
♦ **High-voltage battery** voltage
♦ **High-voltage charger control unit** faulty

Fault effects

♦ Active charging process is cancelled or charging is not possible

Diagnostic information - high-voltage battery control unit

High-voltage E-box, plus/minus contactor and pre-charging contactor

ⓘ **For more information, see Guided Fault Finding**

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following documents in the PIWIS information system:

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Contactor does not close
- Contactor does not open
- Contactor opens too slowly
- Open circuit in control line
- Above temperature limit value
- Working circuit - short circuit to ground
- Working circuit - short circuit to B+
- Control circuit - short circuit to ground
- Control circuit - short circuit to B+

Possible fault causes

♦ Line(s) faulty (short circuit or open circuit)

♦ **Plus contactor** faulty
♦ **Minus contactor** faulty
♦ **Pre-charging contactor** faulty
♦ **High-voltage battery control unit** faulty

Fault effects

♦ High-voltage system switch-off with advance warning (red hybrid warning lamp comes on in the **instrument cluster**)

Diagnostic information - high-voltage battery control unit

High-voltage E-box, voltage sensors

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following documents in the PIWIS information system:

♦ **2X00IN** Isolation of high-voltage system from power supply for servicing work on e-hybrid vehicles
♦ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
♦ **2X00IN** General warning notes for working on the high-voltage vehicle electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- High-voltage battery voltage sensor - above limit value
- High-voltage battery voltage sensor - below limit value
- High-voltage battery voltage sensor - short circuit to ground
- High-voltage battery voltage sensor - short circuit to B+
- Minus contactor voltage sensor - above limit value
- Minus contactor voltage sensor - below limit value
- Minus contactor voltage sensor - short circuit to ground
- Minus contactor voltage sensor - short circuit to B+
- Minus contactor voltage sensor - out of tolerance
- High-voltage system voltage sensor - voltage too high
- High-voltage system voltage sensor - voltage too low
- High-voltage system voltage sensor - electrical fault
- Plus contactor/pre-charging contactor voltage sensor - signal implausible
- Plus contactor/pre-charging contactor voltage sensor - above limit value
- Plus contactor/pre-charging contactor voltage sensor - below limit value
- Plus contactor/pre-charging contactor voltage sensor - short circuit to ground
- Plus contactor/pre-charging contactor voltage sensor - short circuit to B+

Possible fault causes

♦ Voltage sensor in **high-voltage E-box** faulty
♦ **High-voltage battery control unit**
♦ **High-voltage battery**

Fault effects

♦ No function restriction
♦ If fault code 'P0B1500' is stored, DC charging is no longer possible

00ABBD

Diagnostic information - high-voltage battery control unit

High-voltage E-box, voltage sensors

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.

PORSCHE

Porsche Connect – Fault Finding Guide

Service: “Apple CarPlay”

Date: 11/2015

General information and initial questions

- Fault Finding Guides help you to locate the causes of faults step by step.
- Before you discuss the Fault Finding Guide with your customers, the following questions help you to carry out fault finding efficiently:

When did the service stop working?	Ambient conditions have a huge influence on the functionality of services. The use of services requires good reception (e.g. reception can be very limited in underground car parks).
How was the online connection established? Via the SIM card in the PCM or via the device (Bluetooth/Wi-Fi)?	Depending on how the online connection was established, you will find different test steps that you can use.
Are all services not working or are only individual services affected?	If individual services are not working, please concentrate initially on questions relating to “Check service-specific or general causes of faults”.

- For correcting faults, please also use the FAQs (Frequently Asked Questions) about Porsche Connect that are provided in the PPN.

Check service-specific or general causes of faults

Check service-specific or general causes of faults

- Check whether the correct vehicle equipment is installed (Connect package)
- Check whether the correct iPhone setup is being used
- Check whether a CarPlay-compatible iPhone is connected via a USB interface
- Check whether the iPhone cable is faulty
- Check whether the “Don’t ask again” checkbox in the iPhone use dialog was ticked
- Check whether the service is enabled on your device
- Check whether the iPhone is being used in iPod mode
- Check whether the correct USB interface is being used
- Check whether the CarPlay disclaimer was agreed to
- Check whether the mobile data allowance has been used up
- Check whether CarPlay-compatible versions of the App are being used
- Check whether the Push-to-talk button is being used correctly
- Check whether the data transmission rate is sufficient
- Check whether the OPT button was pressed
- Check whether the quality of the data from the content provider is good enough
- Check whether the network coverage is poor (tunnel, weather, etc.)
- Check whether the mobile phone network is down

Check service-specific or general causes of faults

Check whether the correct vehicle equipment is installed (Connect package)

Test step

"Please specify the 17-character chassis number (VIN) of your Porsche. You will find this combination of digits and letters under the marking "E" (Germany) in your vehicle identification document or at the bottom edge of the windscreen."

Note

The VIN provided by the customer must be used to check whether the correct equipment is installed in the customer's vehicle.
PR no.: 9WT

Result check

Does the customer vehicle have the Connect package installed?

Yes	The cause was not identified. Continue troubleshooting with the next test step.
No	"Unfortunately, Apple CarPlay is not available for your Porsche. The service can only be used in vehicles with the Porsche Connect package."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the correct iPhone setup is being used

...

Check service-specific or general causes of faults

› Check whether the correct vehicle equipment is installed (Connect package)

⌄ Check whether the correct iPhone setup is being used

Test step

"Please check whether your iPhone model is an iPhone 5 or higher and whether you have Version 7.1 or higher of iOS."

Note

Apple CarPlay is only available for iPhone 5 or higher AND iOS 7.1 or higher.

Porsche recommends iOS 8.4 or higher. Everything in the FFG assumes this is installed.

Result check

"Are you trying to use Apple CarPlay with a compatible setup?"

Yes	The cause was not identified. Continue troubleshooting with the next test step.
No	"Apple CarPlay is only available on an iPhone 5 running iOS 7.1 or higher. However, even with iOS 7.1 there are some restrictions in the range of available functions, which is why Porsche recommends iOS 8.4 or higher."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

› Check whether a CarPlay-compatible iPhone is connected via a USB interface

...

Check service-specific or general causes of faults

...

Check whether the correct iPhone setup is being used

Check whether a CarPlay-compatible iPhone is connected via a USB interface

Test step

"Please check whether a CarPlay-compatible iPhone has been connected to the correct USB interface."

Note

Correct USB interface:
in vehicles with a USB interface in the centre console –> connect the iPhone to that interface
otherwise: Use the USB interface in the glove box

Result check

"Has a CarPlay-compatible iPhone been connected to the CarPlay-compatible USB interface of your Porsche?"

Yes	The cause was not identified. Continue troubleshooting with the next test step.
No	"To use Apple CarPlay, connect a CarPlay-compatible iPhone to the CarPlay-compatible USB interface of your Porsche."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the iPhone cable is faulty

...

Check service-specific or general causes of faults

...

Check whether a CarPlay-compatible iPhone is connected via a USB interface

Check whether the iPhone cable is faulty

Test step

"Please check whether your iPhone cable is faulty. You can do this by using the cable to connect your iPhone to a PC or laptop, for example. If your iPhone is recognised, charging should start."

Note

The iPhone also outputs an error message if a faulty or incompatible cable is connected.

Result check

"Is your iPhone cable OK?"

Yes	The cause was not identified. Continue troubleshooting with the next test step.
No	"Please replace the faulty cable with a new one."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the "Don't ask again" checkbox in the iPhone use dialog was ticked

...

Check service-specific or general causes of faults

...

› Check whether the iPhone cable is faulty

⌄ Check whether the “Don’t ask again” checkbox in the iPhone use dialog was ticked

Test step

“Please check whether you ticked the checkbox in the final selection of the use dialog.”

Note

It is not possible for the customer to check this. The suggested solution can be tried without having to carry out the check.

Result check

“Was the checkbox in the use dialog left unticked?”

Yes	The cause was not identified. Continue troubleshooting with the next test step.
No	“Open the connection manager of your PCM. Go to “Apple CarPlay” and select the relevant iPhone. You can now change the mode that will be automatically selected when your iPhone is connected (“Use as iPod” or “Use with Apple CarPlay”) or delete the device from PCM memory (“Delete Device”). The next time the iPhone is connected it will be recognised for the first time and the selection dialog will be displayed again.”

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

› Check whether the service is enabled on your device

...

Check service-specific or general causes of faults

Illustrations: iPhone use dialog

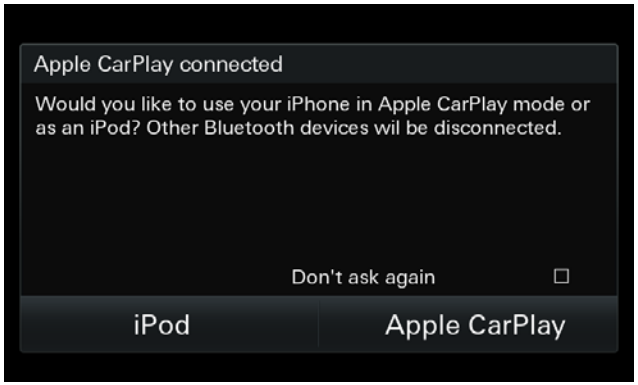

Fig. 1: iPhone use dialog

Fig. 2: iPhone use dialog, “Don’t ask again” box ticked

Check service-specific or general causes of faults

...

Check whether the “Don’t ask again” checkbox in the iPhone use dialog was ticked

Check whether the service is enabled on your device

Test step

“Please check whether you have activated the Restrictions in the settings for your device and thus disabled use of the service. To do this, proceed as follows:
Settings -> General -> Restrictions.
Now check whether the Restrictions are activated and whether the “CarPlay” slider is also activated.”

Note

If the service is deactivated on the iPhone, the PCM of the customer may go into an endless loop when asking about the use of the connected iPhone (use as iPod or with CarPlay).
When editing the Restriction settings, either the existing security code must be entered or a new one created.

Result check

“Do the Restrictions settings of your iPhone allow you to use the service?”

Yes	The cause was not identified. Continue troubleshooting with the next test step.
No	“Deactivate the Restrictions in your iPhone settings or enable the use of CarPlay as an exception to the active restrictions.”

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the iPhone is being used in iPod mode

...

Check service-specific or general causes of faults

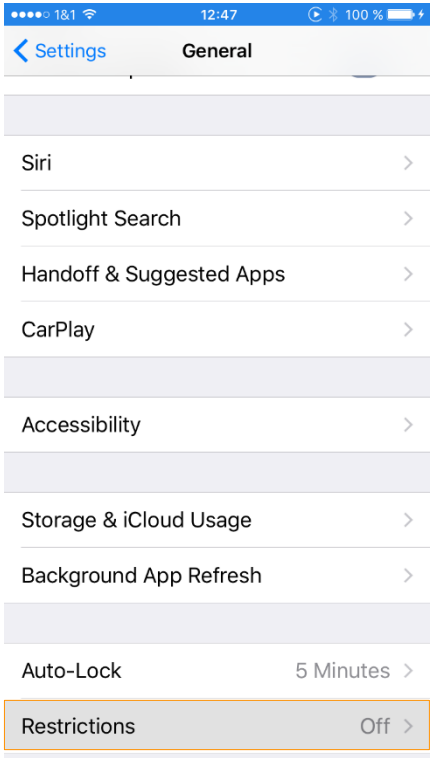

Fig. 4: “General” menu

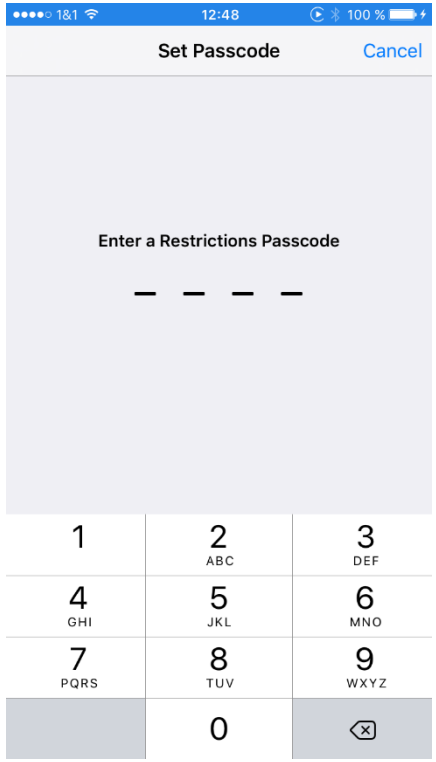

Fig. 5: Prompt to enter a Restrictions Passcode

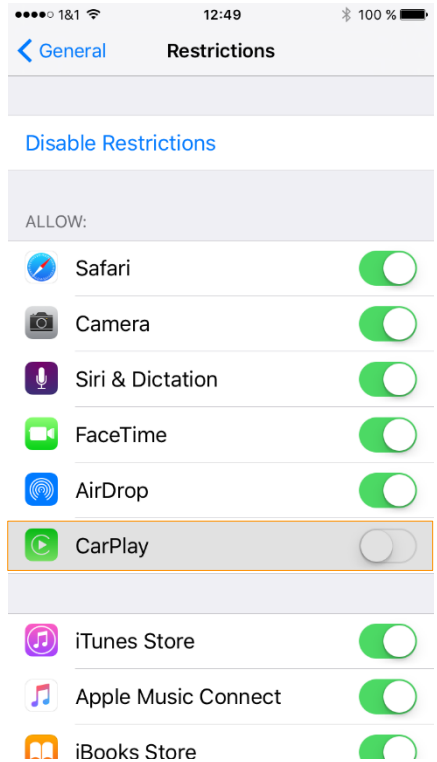

Fig. 6: “Restrictions” menu

Check service-specific or general causes of faults

...

› Check whether the service is enabled on your device

⌄ Check whether the iPhone is being used in iPod mode

Test step

"Please check whether your PCM is using or operating the connected iPhone in iPod mode. You can do this by pressing the SOURCE button to open the SOURCE menu. If "iPod" is displayed, your connected iPhone is being used as an iPod."

Result check

"Can you confirm that the connected iPhone is not being used as an iPod?"

Yes	The cause was not identified. Continue troubleshooting with the next test step.
No	"Change the use mode of the iPhone in Connection Manager. On your Home screen, tap one of the connection icons at the bottom left of the status bar. Select the "Apple CarPlay" option from the connection menu that is now displayed. The iPhone that is currently connected to the USB interface will now be displayed. Tap on it and enter the appropriate setting in the list box that pops up. In this case, choose "Use with Apple CarPlay"."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

› Check whether the correct USB interface is being used

...

Check service-specific or general causes of faults

Illustrations: iPod mode

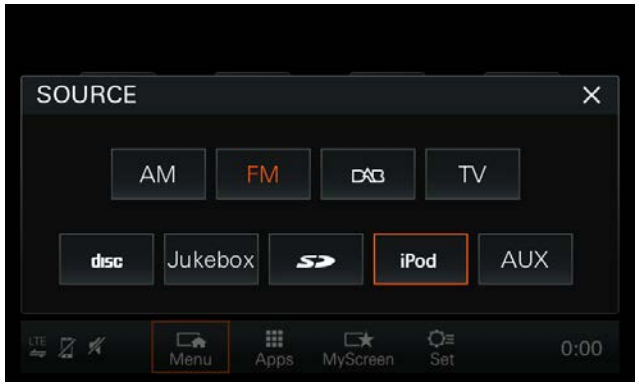

Fig. 8: PCM “SOURCE” display, with iPod

Check service-specific or general causes of faults

...

› Check whether the iPhone is being used in iPod mode

⌄ Check whether the correct USB interface is being used

Test step

"Please check whether your iPhone has been connected to the correct USB interface. If your Porsche has USB ports in the centre console, you must connect your iPhone to one of them before you can use Apple CarPlay. Otherwise please use the USB interface in the glove box."

Result check

"Was the iPhone connected to the correct USB interface?"

Yes	The cause was not identified. Continue troubleshooting with the next test step.
No	"Connect your iPhone to the designated Apple CarPlay-compatible USB interface. If your Porsche has USB ports in the centre console, you must use one of them. Otherwise the USB interface in the glove box must be used."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

› Check whether the CarPlay disclaimer was agreed to

...

Check service-specific or general causes of faults

...

Check whether the correct USB interface is being used

Check whether the CarPlay disclaimer was agreed to

Test step

"Please check whether you accepted the CarPlay disclaimer. Plug your iPhone cable into the CarPlay-compatible USB interface in your Porsche. A dialog prompting you to specify how you want to use your iPhone then appears. Select the "CarPlay" option. The Apple CarPlay disclaimer is now displayed."

Note

The Disclaimer is displayed after selecting CarPlay in the iPhone use dialog and must be accepted before Apple CarPlay can be used.

Result check

"Has the Disclaimer been accepted?"

Yes	The cause was not identified. Continue troubleshooting with the next test step.
No	"The use of Apple CarPlay requires the prior acceptance of the conditions contained in the Disclaimer."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the mobile data allowance has been used up

...

Check service-specific or general causes of faults

Illustrations: CarPlay Disclaimer

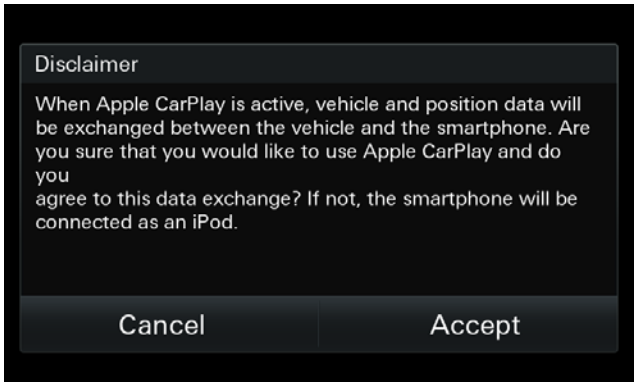

Fig. 9: PCM display, Apple CarPlay Disclaimer

Check service-specific or general causes of faults

...

Check whether the CarPlay disclaimer was agreed to

Check whether the mobile data allowance has been used up

Test step

"Please check the status of your monthly data allowance."

Note

If data services and the telephone are used with the same SIM card, any text message sent by the mobile phone provider concerning the critical status of the monthly data allowance will be displayed in the customer's PCM system.
Menu item in PCM for recording usage (PHONE -> OPT -> SET PHONE -> Data connections -> Online data counter).

Result check

"Is some of your monthly data allowance still remaining?"

Yes	The cause was not identified. Continue troubleshooting with the next test step.
No	"Please contact your mobile phone provider in order to increase your data allowance."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether CarPlay-compatible versions of the App are being used

...

Check service-specific or general causes of faults

Illustrations: Mobile data allowance

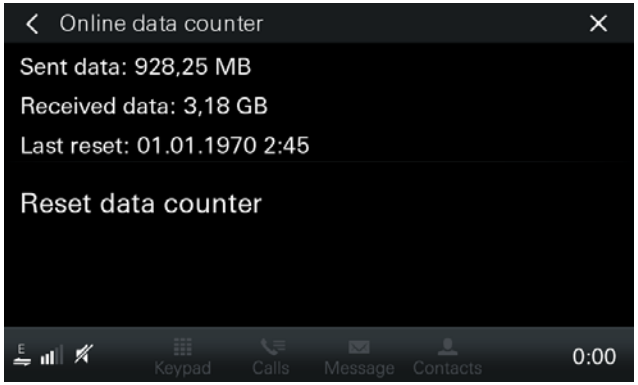

Fig. 12: “Online data counter” menu on PCM head unit

Check service-specific or general causes of faults

...

Check whether the mobile data allowance has been used up

Check whether CarPlay-compatible versions of the App are being used

Test step

"Please check whether the versions of the Apps installed on your iPhone are CarPlay-compatible. Refer to the App information in the App Store for further advice."

Note

The only Apps available through Apple CarPlay are those installed on the customer's iPhone in a version that is compatible with CarPlay.

Result check

"Are all the required Apps compatible with CarPlay?"

Yes	The cause was not identified. Continue troubleshooting with the next test step.
No	"Unfortunately, Apps that are not fully CarPlay-compatible cannot be used on your PCM through Apple CarPlay. Certain versions of some Apps are CarPlay-compatible. Update the App to its latest/correct version."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the Push-to-talk button is being used correctly

...

Check service-specific or general causes of faults

...

› Check whether CarPlay-compatible versions of the App are being used

⌄ Check whether the Push-to-talk button is being used correctly

Test step

"Please check whether you pressed and held the Push-to-talk button on your multifunction steering wheel in order to activate the Siri voice control system of Apple CarPlay."

Note

on vehicles WITH voice control for the PCM:
Short press the push-to-talk button on the MFSW for PCM voice control, long press the push-to-talk button on the MFSW for Siri

on vehicles WITHOUT voice control for the PCM:
LONG press the push-to-talk button on the MFSW for Siri

Result check

"Did you long press the push-to-talk button?"

Yes	The cause was not identified. Continue troubleshooting with the next test step.
No	"Even if your Porsche is not equipped with voice control for the PCM, you must still do a long press on the push-to-talk button on your multifunction steering wheel in order to activate voice control for Apple CarPlay."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

› Check whether the data transmission rate is sufficient

...

Check service-specific or general causes of faults

...

Check whether the Push-to-talk button is being used correctly

Check whether the data transmission rate is sufficient

Test step

"Please check the network symbol on your PCM or mobile device."

Note

A definitive statement on the network standard required cannot be made due to the wide range of factors involved.

Result check

"Is the quality of the data network good enough?"

Yes	The cause was not identified. Continue troubleshooting with the next test step.
No	"The usability of the service can be limited when the data network quality is poor. Find a place where the data network quality is better."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the OPT button was pressed

...

Check service-specific or general causes of faults

...

Check whether the data transmission rate is sufficient

Check whether the OPT button was pressed

Test step

"Please check whether the you have tried using the OPT button. The OPT button is located on the right underneath the PCM display, to the left of the Back button."

Note

A definitive statement on the network standard required cannot be made due to the wide range of factors involved.

Result check

"Can you confirm that you did not press the OPT button?"

Yes	The cause was not identified. Continue troubleshooting with the next test step.
No	"The OPT button is not assigned any functions while Apple CarPlay is being used."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the quality of the data from the content provider is good enough

...

Check service-specific or general causes of faults

...

Check whether the OPT button was pressed

Check whether the quality of the data from the content provider is good enough

Test step

"Please check whether the function restriction is affecting just one service/App or several/all of them."

Note

The information must exist or be determined in the Callcenter.

Porsche is not responsible for the content of the services/Apps used!

Result check

"Are several services/Apps affected?" -> it is likely that the data quality of the provider is OK.

Yes	The cause was not identified. Continue troubleshooting with the next test step.
No	Wait for data update/inform provider

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the network coverage is poor (tunnel, weather, etc.)

...

Check service-specific or general causes of faults

...

Check whether the quality of the data from the content provider is good enough

Check whether the network coverage is poor (tunnel, weather, etc.)

Test step

"Please check the current network reception strength of your Porsche. To do this, check the icon on the left of the status bar."
"Please check the current network reception strength of your device. To do this, check the icon in the status bar at the top of the display."
"At least 2 bars should be displayed here."

Result check

"Is the reception strong enough (at least 2 bars or at least mobile phone standard 3G or E)?"

Yes	The cause was not identified. Continue troubleshooting with the next test step.
No	"Please move to an area with better reception."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the network coverage is poor (tunnel, weather, etc.)

Check whether the mobile phone network is down

Test step

"Please check the current network reception strength of your Porsche. To do this, check the icon on the left of the status bar."
"Please check the current network reception strength of your device. To do this, check the icon in the status bar at the top of the display."

Result check

"Do you have a network signal?"

Yes	The cause was not identified. Refer the customer to the Service department.
No	"Please move to an area with better reception or wait until the problem is fixed. The relevant department has already been informed and is working on resolving the problem."

Does the problem persist?

Yes (Contact the workshop) **No** (End fault finding)

PORSCHE

Porsche Connect – Fault Finding Guide

Service: “Google Earth”

Date: October 2015

General information and initial questions

- Fault Finding Guides help you to locate the causes of faults step by step.
- Before you discuss the Fault Finding Guide with your customers, the following questions help you to carry out fault finding efficiently:

When did the service stop working?	Ambient conditions have a huge influence on the functionality of services. The use of services requires good reception (e.g. reception can be very limited in underground car parks).
How was the online connection established? Via the SIM card in the PCM or via the device (Bluetooth/WiFi)?	Depending on how the online connection was established, you will find different test steps that you can use.
Are all services not working or are only individual services affected?	If individual services are not working, please concentrate initially on questions relating to “Check service-specific or general causes of faults”.

- For correcting faults, please also use the FAQs (Frequently Asked Questions) about Porsche Connect that are provided in the PPN.

- **Check the online connection when using a SIM card in the vehicle slot**
- **Check the online connection when using a device via Bluetooth or WiFi**
- **Check service-specific or general causes of faults**

Check the online connection when using a SIM card in the vehicle slot

- Check whether there is a SIM card in the vehicle slot
- Check whether the SIM card is defective

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check whether there is a SIM card in the vehicle slot

Test step

"Check whether there is a SIM card in the vehicle slot. To do this, lift up the cover flap with the Porsche logo at the centre under your PCM display. Underneath, you will find the SD card slots and the SIM card slot for your Porsche."

Note

This can also be checked on the PCM head unit:
a) Status bar, left margin, connection icon, data connection.
b) Connections menu: possible displays: "SIM inserted", "PIN required", "Connect", hotspot name, device name.

Result check

"Is there a SIM card in the vehicle slot in your Porsche?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Insert a suitable SIM card in the vehicle slot of your Porsche and check whether a connection can be established."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the SIM card is defective

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Illustrations: SIM card in vehicle slot

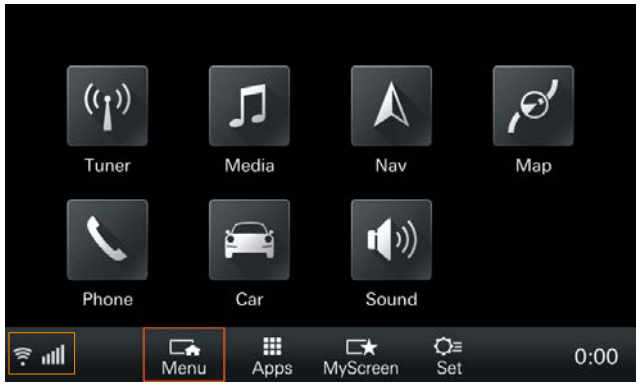

Fig. 1: Home screen on PCM head unit

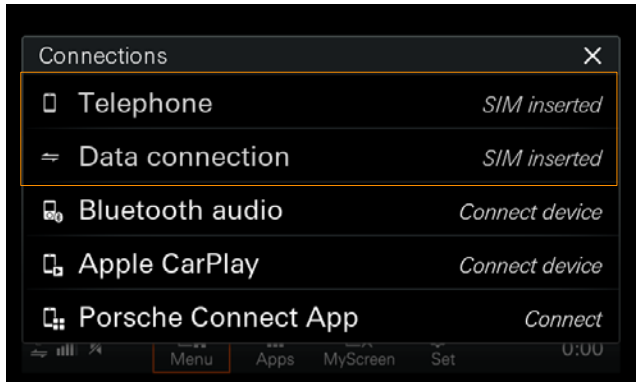

Fig. 2: “Connections” menu, version 1

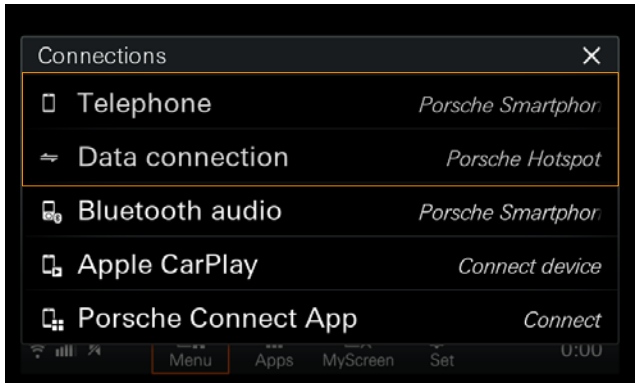

Fig. 3: “Connections” menu, version 2

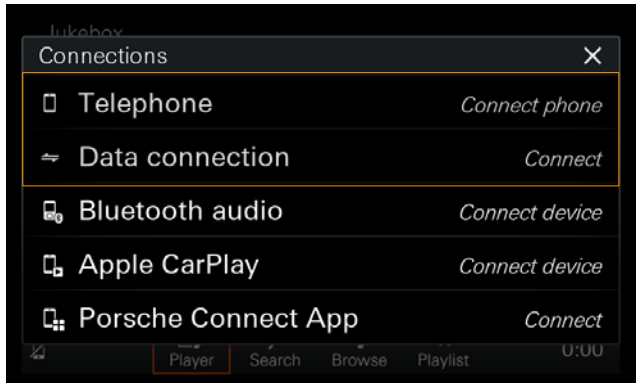

Fig. 4: “Connections” menu, version 3

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check whether there is a SIM card in the vehicle slot

Check whether the SIM card is defective

Test step

"Insert a different SIM card that you know is working perfectly in the vehicle slot of your Porsche."

Result check

"Is your original SIM card working?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Please contact your mobile phone service provider and request a new SIM card."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

- **Check the online connection when using a SIM card in the vehicle slot**
- **Check the online connection when using a device via Bluetooth or WiFi**
  - Check whether Bluetooth is activated on your device
  - Check whether Bluetooth is activated on the PCM
  - Check whether WiFi Hotspot/Mobile Internet is activated on your device
  - Check whether WiFi is activated on the PCM
  - Check whether the device is supported
- **Check service-specific or general causes of faults**

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Check whether Bluetooth is activated on your device

Test step

"Check whether Bluetooth is activated in your device settings."

Note

If you are connecting for the first time, make sure that the device is visible for other Bluetooth equipment. Please check this in your device settings as well.

Result check

"Is Bluetooth activated on your device?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Activate Bluetooth on your device. If you are trying to connect your device to your Porsche for the first time, switch on Bluetooth and activate your device's visibility option before starting the connection process."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether Bluetooth is activated on the PCM

...

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Illustrations: Bluetooth on device

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

...

Check whether Bluetooth is activated on the PCM

Check whether WiFi Hotspot/Mobile Internet is activated on your device

Test step

"Please check whether the options "WiFi Hotspot" (or "Hotspot") and "Mobile Internet" (or "Mobile Data") are activated in your device settings."

Result check

"Is WiFi Hotspot/Mobile Internet activated on your device?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Activate the options "WiFi Hotspot"/"Hotspot" and "Mobile Internet"/"Mobile Data" on your device."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether WiFi is activated on the PCM

...

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Illustrations: WiFi hotspot/mobile internet deactivated on device

Illustrations show menus on the iPhone 6 as an example

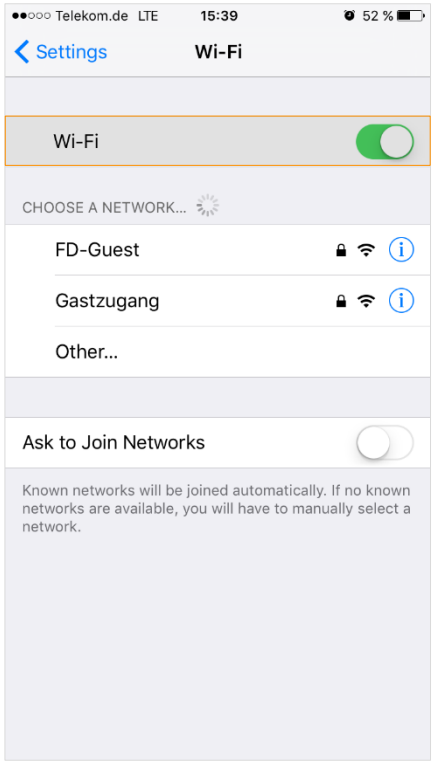

Fig. 10: iOS “WiFi” menu

Fig. 11: iOS “Personal Hotspot” menu

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

...

Check whether WiFi Hotspot/Mobile Internet is activated on your device

Check whether WiFi is activated on the PCM

Test step

"Please check whether the WiFi option is activated in your PCM settings. You will find the option under:
PHONE -> OPT -> SET PHONE -> WiFi settings -> Deactivate/Activate WiFi."

Result check

"Is WiFi activated on the PCM in your Porsche?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Activate the "WiFi" option on the PCM in your Porsche."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the device is supported

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Illustrations: WiFi on PCM

Fig. 13: “Set Phone” menu on PCM head unit

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

...

Check whether WiFi is activated on the PCM

Check whether the device is supported

Test step

"Please specify the model designation of the device you want to use with your Porsche."

Note

The available documents must be used to check whether and to what extent the customer's device is supported.

Result check

Is the customer's device compatible?

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Your device is not compatible/not fully compatible with all the functions of your Porsche. For the full range of functions, please use a compatible device in your Porsche."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check service-specific or general causes of faults

- **Check the online connection when using a SIM card in the vehicle slot**
- **Check the online connection when using a device via Bluetooth or WiFi**
- **Check service-specific or general causes of faults**
  - Check whether the licence is still valid
  - Check whether the correct vehicle equipment is installed (Connect package)
  - Check whether Google Earth is activated in the vehicle
  - Check for simultaneous use of service and phone
  - Check whether the mobile data allowance has been used up
  - Check whether the network coverage is poor (tunnel, weather, etc.)
  - Check whether the mobile phone network is down

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

Check whether the licence is still valid

Test step

"Please press "HOME" and select "Apps" in the status bar. Now press "OPT" and select "Services information" in the Options menu. Check whether the licence date for your desired service has already been exceeded."

Note

Alternatively, the licence period can be determined by entering the VIN in the PIWIS vehicle information. Please note that this option will not be available until mid-2016. Further information will be provided in good time.

Result check

"Is the licence still valid?"

No	"Please extend the licence for the service via the Porsche Connect Webshop." Please note that this option will not be available until mid-2016. Further information will be provided in good time. Please contact your local importer if you have any licence problems in the meantime.
Yes	The cause was not identified. Continue fault finding with the next test step.

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the correct vehicle equipment is installed (Connect package)

...

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

Illustrations: Licence period check

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

Check whether the licence is still valid

Check whether the correct vehicle equipment is installed (Connect package)

Test step

"Please specify the 17-character chassis number (VIN) of your Porsche. You will find this combination of digits and letters under the marking "E" (Germany) in your vehicle identification document or at the bottom edge of the windscreen."

Note

The VIN provided by the customer must be used to check whether the correct equipment is installed in the customer's vehicle.

Result check

Does the customer vehicle have the Connect package installed?

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Unfortunately, the RTTI service is not available for your Porsche. The service can only be used in vehicles with the Porsche Connect package."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether Google Earth is activated in the vehicle

...

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

...

Check whether Google Earth is activated in the vehicle

Test step

"Please check whether you have activated the map view for Google Earth. To do this, proceed as follows:
Tap "MAP" on your PCM start screen to go to the map display." Then EITHER:
a) "Touch the white icon (3 layers) at the top right of the screen. A menu bar containing several icons appears. You will see the "Google Earth" icon and name here." OR:
b) "Press "OPT". Select "SET MAP" in the Options menu. Select "Map view". Select "Layers". Select "Google Earth". You will see the "Google Earth satellite view" entry here."

Note

If the icon or menu item cannot be found in the specified location, the customer has not purchased the service.

Result check

"Is the "Google Earth" icon orange? or Is there a checkmark next to the "Google Earth satellite view" menu item?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Activate Google Earth by tapping the relevant icon or adding a checkmark next to the "Google Earth satellite view" menu item. Google Earth is activated if the icon is orange."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check for simultaneous use of service and phone

...

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

...

Check whether Google Earth is activated in the vehicle

Check for simultaneous use of service and phone

Test step

"Did you make a phone call while using the service or are you using your data services and the phone with the same SIM card?"

Result check

Were both applications used separately or are both applications used with different SIM cards?

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Availability of the service can sometimes be limited while you are using the phone. Especially when using the data services and telephone function with one SIM card and if network coverage is bad, the service can be limited temporarily in rare cases."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the mobile data allowance has been used up

...

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

...

Check for simultaneous use of service and phone

Check whether the mobile data allowance has been used up

Test step

"Please check the status of your monthly data allowance."

Note

If data services and the telephone are used with the same SIM card, any text message sent by the mobile phone provider concerning the critical status of the monthly data allowance will be displayed in the customer's PCM system.
Menu item in PCM for recording usage (PHONE -> OPT -> SET PHONE -> Data connections -> Online data counter).

Result check

"Is there any data remaining from the monthly data allowance?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Please contact your mobile phone provider in order to increase your data allowance."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the network coverage is poor (tunnel, weather, etc.)

...

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

Test step

"Please check the current network reception strength of your Porsche. To do this, check the icon on the left of the status bar."
"Please check the current network reception strength of your device. To do this, check the icon in the status bar at the top of the display."

Result check

"Do you have a network signal?"

Yes	The cause was not identified. Refer the customer to the Service department.
No	"Please move to an area with better reception or wait until the problem is fixed. The relevant department has already been informed and is working on resolving the problem."

Does the problem persist?

Yes (Contact the workshop) **No** (End fault finding)

Porsche Connect - Fault Finding Guide

Service: “Google Street View”

Date: August 2015

General information and initial questions

- Fault Finding Guides help you to locate the causes of faults step by step.
- Before discussing the Fault Finding Guide with your customers, the following questions will help you to carry out fault finding efficiently:

When did the service stop working?	Ambient conditions have a huge influence on the functionality of services. The use of services requires good reception (e.g. reception can be very limited in underground car parks).
How was the online connection established? Via the SIM card in the PCM or via the device (Bluetooth/Wi-Fi)?	Depending on how the online connection was established, you will find different test steps that you can use.
Are all services not working or are only individual services affected?	If individual services are not working, please concentrate initially on questions relating to “Check service-specific or general causes of faults”.

- For correcting faults, please also use the FAQs (Frequently Asked Questions) about Porsche Connect that are provided in the PPN.

- **Check the online connection when using a SIM card in the vehicle slot**
- **Check the online connection when using a device via Bluetooth or Wi-Fi**
- **Check service-specific or general causes of faults**

Check the online connection when using a SIM card in the vehicle slot

- Check whether there is a SIM card in the vehicle slot
- Check whether the SIM card is defective

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check whether there is a SIM card in the vehicle slot

Test step

"Check whether there is a SIM card in the vehicle slot. To do this, lift up the cover flap with the Porsche logo at the centre under your PCM display. Underneath, you will find the SD card slots and the SIM card slot for your Porsche."

Note

This can also be checked on the PCM head unit:
a) status bar, left margin, connection icon, data connection.
b) Connections menu: possible displays: "SIM inserted", "PIN required", "Connect", hotspot name, device name

Result check

"Is there a SIM card in the vehicle slot in your Porsche?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Insert a suitable SIM card in the vehicle slot of your Porsche and check whether a connection can be established."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the SIM card is defective

Check whether the device is supported

Test step

"Please specify the model designation of the device you want to use with your Porsche."

Note

The available documents must be used to check whether and to what extent the customer's device is supported.

Result check

Is the customer's device compatible?

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Your device is not compatible/not fully compatible with all functions in your Porsche. For the full range of functions, please use a compatible device in your Porsche."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check service-specific or general causes of faults

- **Check the online connection when using a SIM card in the vehicle slot**
- **Check the online connection when using a device via Bluetooth or Wi-Fi**
- **Check service-specific or general causes of faults**
  - Check whether licence is still valid
  - Check whether the correct vehicle equipment is installed (Connect package)
  - Check whether Google Earth is activated in the vehicle
  - Check whether the vehicle was moving
  - Check for simultaneous use of service and phone
  - Check whether Drag&Drop use was attempted
  - Check whether the mobile data volume has been used up
  - Check whether the network quality is poor (tunnel, weather, etc.)
  - Check whether the mobile phone network is down

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Check whether licence is still valid

Test step

"Please press "HOME" and select "Apps" from the status bar. Now press "OPT" and select "Services information" in the options menu. Check whether the licence date for your desired service has already been exceeded."

Note

Alternatively, the licence period can be determined with the help of the VIN using the PIWIS vehicle information. Please note that this option will not be available until mid-2016. Further information will be provided in good time.

Result check

"Is the licence still valid?"

No	"Please extend the licence for the service via the Porsche Connect Webshop." Please note that this option will not be available until mid-2016. Further information will be provided in good time. Please contact your local importer if you have any licence problems in the meantime.
Yes	The cause was not identified. Continue fault finding with the next test step.

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the correct vehicle equipment is installed (Connect package)

...

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Note

The VIN provided by the customer must be used to check whether the correct equipment is installed in the customer's vehicle.

Result check

Does the customer vehicle have the Connect package installed?

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Unfortunately, the RTTI service is not available for your Porsche. The service can only be used in vehicles with the Porsche Connect package."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether Google Earth is activated in the vehicle

...

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

...

Check whether Google Earth is activated in the vehicle

Test step

"Please check whether you have activated map view for Google Earth. To do this, proceed as follows:
Tap "MAP" on your PCM start screen to go to the map display." Then EITHER:
a) "Touch the white icon (3 layers) at the top right of the screen. A menu bar containing several icons appears. You will see the "Google Earth" icon and name here." OR:
b) "Press "OPT". Select "SET MAP" in the options menu. Select "Map view". Select "Layers". Select "Google Earth". You will see the "Google Earth satellite view" entry here."

Note

If the icon or menu entry cannot be found in the specified location, the customer has not purchased the service.

Result check

"Is the "Google Earth" icon orange? or Is there a checkmark next to the "Google Earth satellite view" menu entry?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Activate Google Earth by tapping the relevant icon or adding a checkmark next to the "Google Earth satellite view" menu entry. Google Earth is activated if the icon is orange."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the vehicle was moving

...

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Illustrations: Activating Google Earth

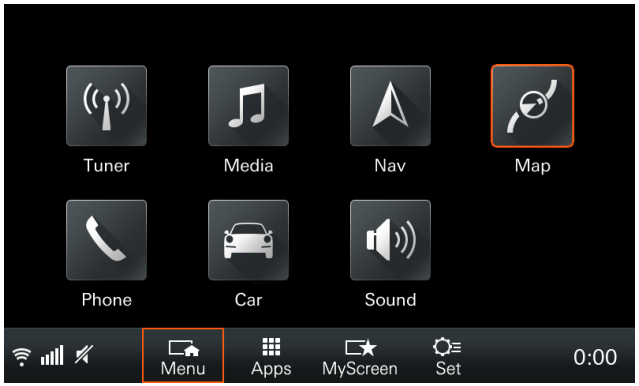

Fig. 18: Home screen on PCM head unit

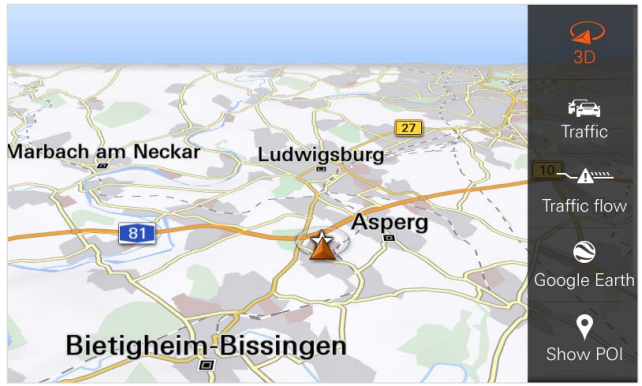

Fig. 19: Map view and menu on PCM head unit

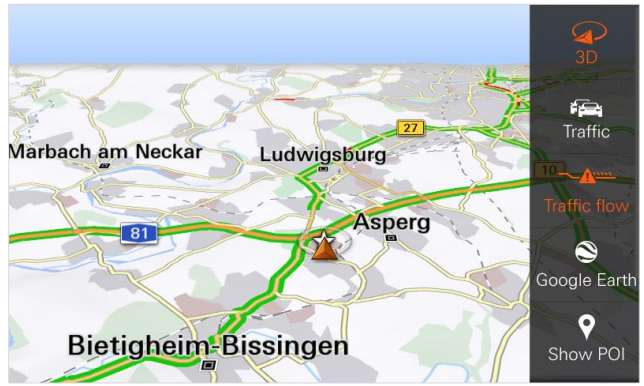

Fig. 20: Map view and menu on PCM head unit

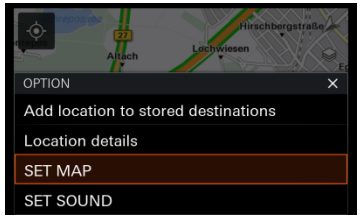

Fig. 21: OPT menu under “MAP”

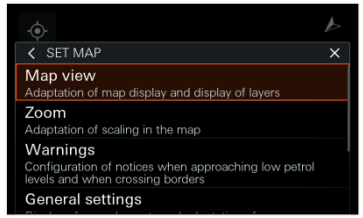

Fig. 22: “SET MAP” menu

Fig. 23: “Map view” menu

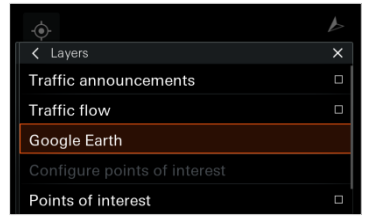

Fig. 24: “Layers” menu

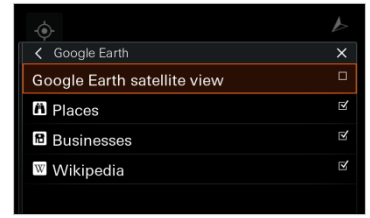

Fig. 25: “Google Earth” menu

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

...

Check whether Google Earth is activated in the vehicle

Check whether the vehicle was moving

Test step

"Have you tried to use Google Street View while driving?"

Result check

"Was your vehicle stationary when you tried to use the feature?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"For your safety, the "Google Street View" service is only available when the vehicle is stationary. Please use Google Street View when your vehicle is parked."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check for simultaneous use of service and phone

...

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

...

Check whether the vehicle was moving

Check for simultaneous use of service and phone

Test step

"Did you make a phone call while using the service or are you using your data services and the phone with the same SIM card?"

Result check

Were both applications used separately or are both applications used with different SIM cards?

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Availability of the service can sometimes be limited while you are using the phone. Especially when using the data services and telephone function with one SIM card and if network coverage is bad, the service can be limited temporarily in rare cases."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether Drag&Drop use was attempted

...

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

...

Check for simultaneous use of service and phone

Check whether Drag&Drop use was attempted

Test step

"Did you use Drag&Drop to place the yellow Pegman icon on the map?"

Note

The familiar Drag&Drop function for the Pegman icon from the Google Street View desktop application is not available. You simply need to tap the Pegman icon.

Result check

Was the yellow Pegman icon tapped correctly?

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Please only tap the GSV Pegman and do not try to position it on the map using Drag&Drop."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the mobile data volume has been used up

...

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Illustrations: Using the GSV icon

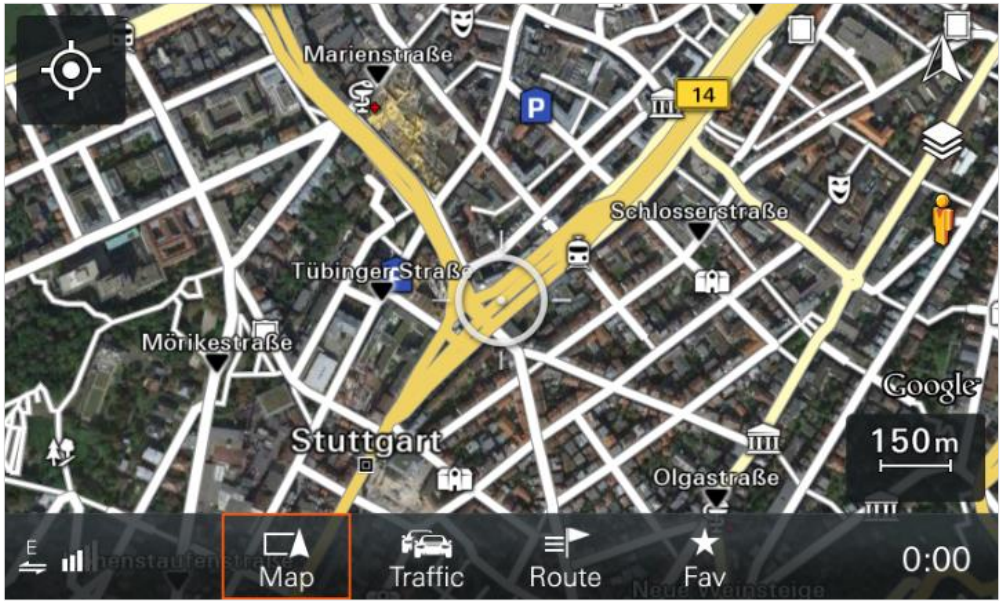

Fig. 26: Google Earth satellite view with GSV availability

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

...

Check whether Drag&Drop use was attempted

Check whether the mobile data volume has been used up

Test step

"Please check the status of your monthly data volume."

Note

If data services and the telephone are used with the same SIM card, any SMS sent by the mobile phone provider concerning the critical status of the monthly data allowance will be displayed in the customer's PCM system.
Menu item in PCM for recording usage (PHONE -> OPT -> SET PHONE -> Data connections -> Online data counter).

Result check

"Is there any data remaining from the monthly data allowance?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Please contact your mobile phone provider in order to increase your data volume."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the network quality is poor (tunnel, weather, etc.)

...

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Illustrations: mobile data volume

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

...

Check whether the mobile data volume has been used up

Check whether the network quality is poor (tunnel, weather, etc.)

Test step

"Please check the current network reception strength of your Porsche. To do this, check the icon at the left of the status bar."
"Please check the current network reception strength of your device. To do this, check the icon in the status bar at the top of the display."
"At least 2 bars should be displayed here."

Result check

"Is there enough reception (at least 2 bars or at least mobile phone standard 3G or E)?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Please move to an area with better reception."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the mobile phone network is down

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Illustrations: Poor network quality (tunnel, weather, etc.)

Check service-specific or general causes of faults

...

Check whether the network quality is poor (tunnel, weather, etc.)

Check whether the mobile phone network is down

Test step

"Please check the current network reception strength of your Porsche. To do this, check the icon at the left of the status bar."
"Please check the current network reception strength of your device. To do this, check the icon in the status bar at the top of the display."

Result check

"Do you have a network signal?"

Yes	The cause was not identified. Refer the customer to the Service department.
No	"Please move to an area with better reception or wait until the problem is fixed. The relevant department has already been informed and is working on resolving the problem."

Does the problem persist?

Yes (Contact the workshop) **No** (End fault finding)

Porsche Connect – Fault Finding Guide

Service: “Napster / Rhapsody”

Date: 11/2015

General information and initial questions

- Fault Finding Guides help you to locate the causes of faults step by step.
- Before you discuss the Fault Finding Guide with your customers, the following questions help you to carry out fault finding efficiently:

When did the service stop working?	Ambient conditions have a huge influence on the functionality of services. The use of services requires good reception (e.g. reception can be very limited in underground car parks).
How was the online connection established? Via the SIM card in the PCM or via the device (Bluetooth/Wi-Fi)?	Depending on how the online connection was establshed, you will find different test steps that you can use.
Are all services not working or are only individual services affected?	If individual services are not working, please concentrate initially on questions relating to “Check service-specific or general causes of faults”.

- For correcting faults, please also use the FAQs (Frequently Asked Questions) about Porsche Connect that are provided in the PPN.

- **Check the online connection when using a SIM card in the vehicle slot**
- **Check the online connection when using a device via Bluetooth or Wi-Fi**
- **Check service-specific or general causes of faults**

Check the online connection when using a SIM card in the vehicle slot

- Check whether there is a SIM card in the vehicle slot
- Check whether the SIM card is defective

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check whether there is a SIM card in the vehicle slot

Test step

"Check whether there is a SIM card in the vehicle slot. To do this, lift up the cover flap with the Porsche logo at the centre under your PCM display. Underneath, you will find the SD card slots and the SIM card slot for your Porsche."

Note

This can also be checked on the PCM head unit:
a) status bar, left margin, connection icon, data connection.
b) Connections menu: possible displays: "SIM inserted", "PIN required", "Connect", hotspot name, device name

Result check

"Is there a SIM card in the vehicle slot in your Porsche?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Insert a suitable SIM card in the vehicle slot of your Porsche and check whether a connection can be established."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the SIM card is defective

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Illustrations: SIM card in vehicle slot

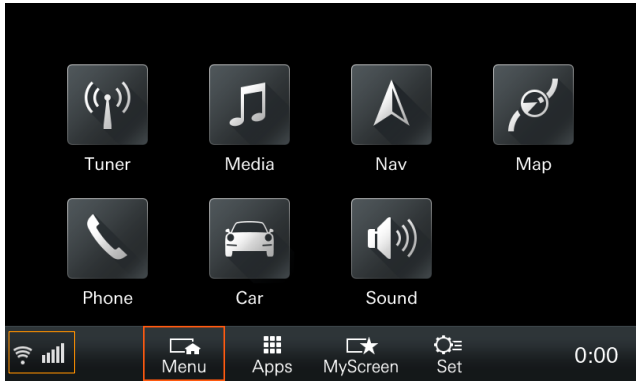

Fig. 1: Home screen of the PCM head unit

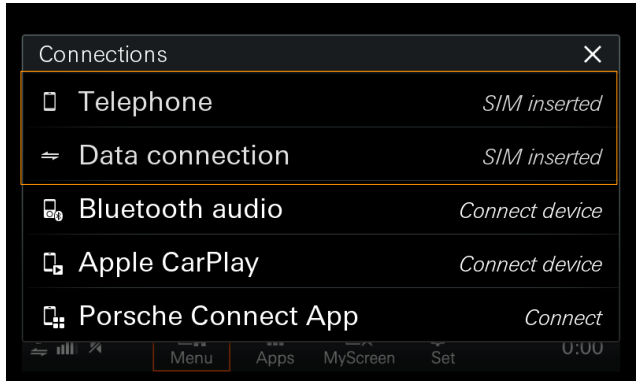

Fig. 2: “Connections” menu, version 1

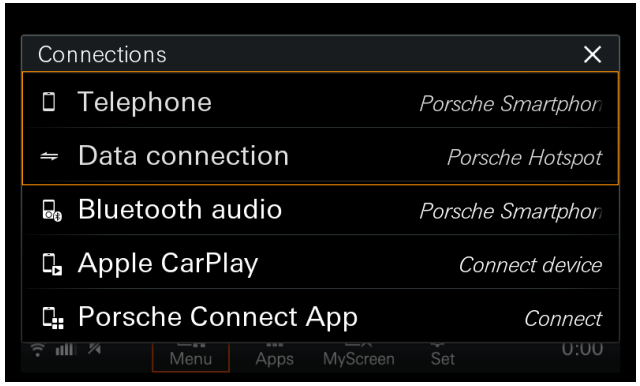

Fig. 3: “Connections” menu, version 2

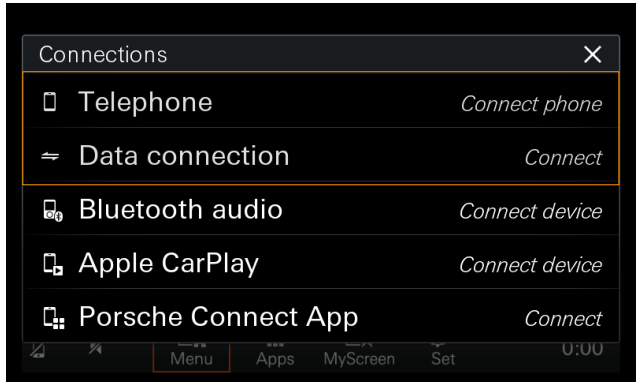

Fig. 4: “Connections” menu, version 3

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check whether there is a SIM card in the vehicle slot

Check whether the SIM card is defective

Test step

"Insert a different SIM card that you know is working perfectly in the vehicle slot of your Porsche."

Result check

"Is your original SIM card working?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Please contact your mobile phone service provider and request a new SIM card."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

- Check whether Wi-Fi Hotspot/Mobile Internet is activated on your device
- Check whether WLAN is activated on the PCM
- Check whether the device is entered in the vehicle WLAN
- Check whether the device is supported

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check whether Wi-Fi Hotspot/Mobile Internet is activated on your device

Test step

"Please check whether the options "Wi-Fi Hotspot" (or "Hotspot") and "Mobile Internet" (or "Mobile Data") are activated in your device settings."

Result check

"Is Wi-Fi Hotspot/Mobile Internet activated on your device?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Activate the options "Wi-Fi Hotspot"/"Hotspot" and "Mobile Internet"/"Mobile Data" on your device."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether WLAN is activated on the PCM

...

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check whether Wi-Fi Hotspot/Mobile Internet is activated on your device

Check whether WLAN is activated on the PCM

Test step

"Please check whether the WLAN option is activated in your PCM settings. You will find the option under:
PHONE -> OPT -> SET PHONE -> WLAN settings -> Disable/enable WLAN."

Result check

"Is WLAN activated on the PCM in your Porsche?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Activate the "WLAN" option on the PCM in your Porsche."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the device is entered in the vehicle WLAN

...

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Illustrations: WLAN on PCM

Fig. 8: “Set Phone” menu on PCM head unit

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

...

Check whether WLAN is activated on the PCM

Check whether the device is entered in the vehicle WLAN

Test step

"Please check whether your device is connected to the hotspot of your Porsche."

Note

A corresponding symbol to check the correct connection between the PCM and device will be integrated in the Porsche Connect app for the G2.

Result check

"Is your device entered in the vehicle hotspot?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"On your device, disconnect the connection to the other Wi-Fi network and connect to the hotspot of your Porsche."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the device is supported

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Illustrations: Device in vehicle WLAN

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

...

Check whether the device is entered in the vehicle WLAN

Check whether the device is supported

Test step

"Please specify the model designation of the device you want to use with your Porsche."

Note

The available documents must be used to check whether and to what extent the customer's device is supported.

Result check

Is the customer's device compatible?

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Your device is not compatible/not fully compatible with all the functions of your Porsche. For the full range of functions, please use a compatible device in your Porsche."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check service-specific or general causes of faults

- **Check the online connection when using a SIM card in the vehicle slot**
- **Check the online connection when using a device via Bluetooth or Wi-Fi**
- **Check service-specific or general causes of faults**
  - Check whether the correct vehicle equipment is installed (Connect package)
  - Check whether the required apps are (correctly) installed
  - Check whether the Porsche Connect app is active
  - Check whether the mobile data allowance has been used up
  - Check whether the data transmission rate is sufficient
  - Check whether the app and device are compatible
  - Check whether the network quality is poor (tunnel, weather, etc.)
  - Check whether the mobile phone network is down
  - Check whether the data quality from the content provider is sufficient
  - Check whether the vehicle is moving or is parked at a place where the GPS is weak

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Check whether the correct vehicle equipment is installed (Connect package)

Test step

"Please specify the 17-character chassis number (VIN) of your Porsche. You will find this combination of digits and letters under the marking "E" (Germany) in your vehicle identification document or at the bottom edge of the windscreen."

Note

The VIN provided by the customer must be used to check whether the correct equipment is installed in the customer's vehicle.

Result check

Does the customer vehicle have the Connect package installed?

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Unfortunately, Porsche Connect services are not available for your Porsche. The services can only be used in vehicles with the Porsche Connect package. "

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the required apps are (correctly) installed

...

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Check whether the correct vehicle equipment is installed (Connect package)

Check whether the required apps are (correctly) installed

Test step

"Please check whether you have installed both the Porsche Connect app and the corresponding service app on your device."

Result check

"Are all required apps correctly installed?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Please install the necessary apps in order to be able to use the services in your Porsche."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the Porsche Connect app is active

...

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Check whether the data quality from the content provider is sufficient

Check whether the vehicle is moving or is parked at a place where the GPS is weak

Test step

"Has your Porsche been moved in the interim by another driver, been towed away or, for example, parked in an underground car park?"

Result check

"Do none of the scenarios apply?"

Yes	The cause was not identified. Refer the customer to the Service department.
No	"The automatic reconnection when re-accessing your Porsche may not work if the latter's GPS position was changed after quitting (e.g. another driver moved the car or it was towed away) or if the GPS signal is lost when parking."

Does the problem persist?

Yes (Contact the workshop) **No** (End fault finding)

PORSCHE

Porsche Connect – Fault Finding Guide

Service: “Online Search”

Date: 12/2015

General information and initial questions

- Fault Finding Guides help you to locate the causes of faults step by step.
- Before you discuss the Fault Finding Guide with your customers, the following questions help you to carry out fault finding efficiently:

When did the service stop working?	Ambient conditions have a huge influence on the functionality of services. The use of services requires good reception (e.g. reception can be very limited in underground car parks).
How was the online connection established? Via the SIM card in the PCM or via the device (Bluetooth/WiFi)?	Depending on how the online connection was established, you will find different test steps that you can use.
Are all services not working or are only individual services affected?	If individual services are not working, please concentrate initially on questions relating to “Check service-specific or general causes of faults”.

- For correcting faults, please also use the FAQs (Frequently Asked Questions) about Porsche Connect that are provided in the PPN.

- **Check the online connection when using a SIM card in the vehicle slot**
- **Check the online connection when using a device via Bluetooth or WiFi**
- **Check service-specific or general causes of faults**

Check the online connection when using a SIM card in the vehicle slot

- Check whether there is a SIM card in the vehicle slot
- Check whether the SIM card is defective

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check whether there is a SIM card in the vehicle slot

Test step

"Check whether there is a SIM card in the vehicle slot. To do this, lift up the cover flap with the Porsche logo at the centre under your PCM display. Underneath, you will find the SD card slots and the SIM card slot for your Porsche."

Note

This can also be checked on the PCM head unit:
a) Status bar, left margin, connection icon, data connection.
b) Connections menu: possible displays: "SIM inserted", "PIN required", "Connect", hotspot name, device name.

Result check

"Is there a SIM card in the vehicle slot in your Porsche?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Insert a suitable SIM card in the vehicle slot of your Porsche and check whether a connection can be established."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the SIM card is defective

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot
