Fig. 9: “WiFi settings” menu on PCM head unit

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

...

Check whether WiFi is activated on the PCM

Check whether Bluetooth is activated on your device

Test step

"Please check whether Bluetooth is activated in your device settings."

Note

"If you are connecting for the first time, make sure that the device is visible for other Bluetooth equipment. Please check this in your device settings as well."

Result check

"Is Bluetooth activated on your device?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Activate Bluetooth on your device. If you are trying to connect your device to your Porsche for the first time, switch on Bluetooth and activate your device's visibility option before starting the connection process."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether Bluetooth is activated on the PCM

...

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Illustrations: Bluetooth on device

Illustrations show menus on the iPhone 6 as an example

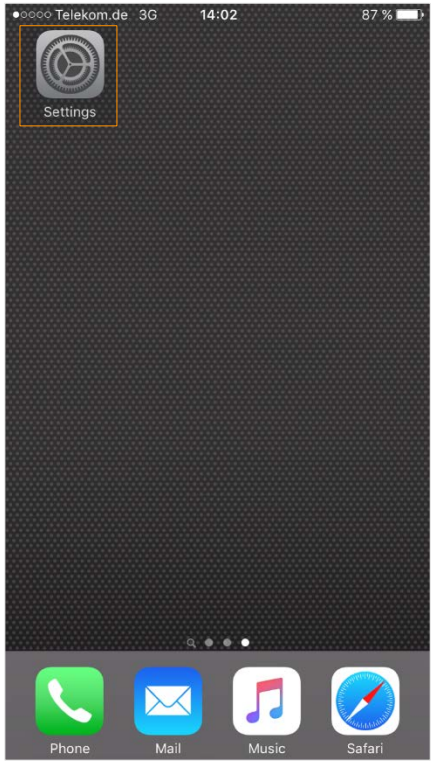

Fig. 10: iOS Home screen

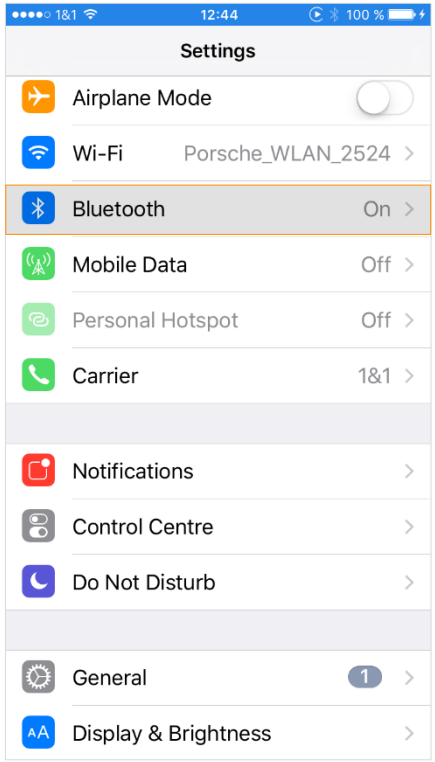

Fig. 11: iOS “Settings” menu

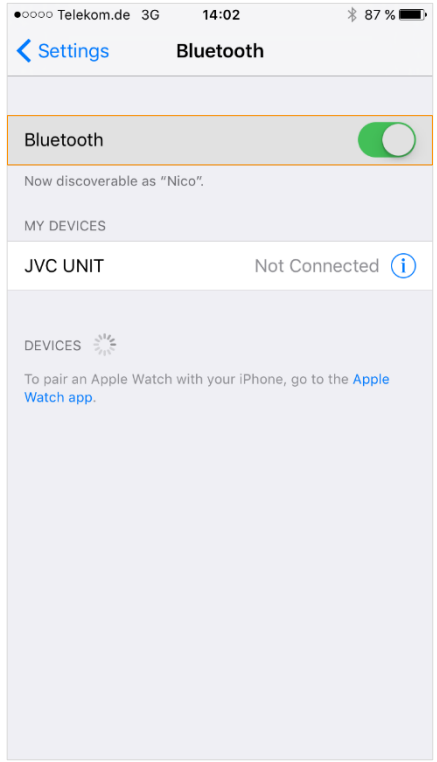

Fig. 12: iOS “Bluetooth” menu

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

...

Check whether Bluetooth is activated on your device

Check whether Bluetooth is activated on the PCM

Test step

"Please check whether Bluetooth is activated in your PCM settings. You will find the option under:
PHONE -> OPT -> SET PHONE -> Bluetooth -> Deactivate/activate Bluetooth."

Result check

"Is Bluetooth activated on PCM in your Porsche?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Activate the "Bluetooth" option on the PCM in your Porsche."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the device is supported

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Illustrations: Bluetooth on PCM

Fig. 13: “Set Phone” menu on PCM head unit

Fig. 14: “Bluetooth” menu on PCM head unit

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

...

Check whether Bluetooth is activated on the PCM

Check whether the device is supported

Test step

"Please specify the model designation of the device you want to use with your Porsche."

Note

The available documents must be used to check whether and to what extent the customer's device is supported.

Result check

Is the customer's device compatible?

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Your device is not compatible/not fully compatible with all the functions of your Porsche. For the full range of functions, please use a compatible device in your Porsche."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check service-specific or general causes of faults

- **Check the online connection when using a SIM card in the vehicle slot**
- **Check the online connection when using a device via Bluetooth or WiFi**
- **Check service-specific or general causes of faults**
  - Check whether the correct vehicle equipment is installed (Connect Plus package)
  - Check whether the mobile data allowance has been used up
  - Check whether the vehicle is/was moving
  - Check whether the correct operator control element is used
  - Check whether the data transmission rate is sufficient
  - Check whether the quality of the data from the content provider is good enough
  - Check whether the network coverage is poor (tunnel, weather, etc.)
  - Check whether the mobile phone network is down

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

Check whether the correct vehicle equipment is installed (Connect Plus package)

Test step

"Please specify the 17-character chassis number (VIN) of your Porsche. You will find this combination of digits and letters under the marking "E" (Germany) in your vehicle identification document or at the bottom edge of the windscreen."

Note

The VIN provided by the customer must be used to check whether the correct equipment is installed in the customer's vehicle.

Result check

Does the customer vehicle have the Connect Plus package installed?

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Unfortunately, Porsche Connect services are not available for your Porsche. The services can only be used in vehicles with the Porsche Connect Plus package."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the mobile data allowance has been used up

...

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

Check whether the correct vehicle equipment is installed (Connect Plus package)

Check whether the mobile data allowance has been used up

Test step

"Please check the status of your monthly data allowance."

Note

If data services and the telephone are used with the same SIM card, any text message sent by the mobile phone provider concerning the critical status of the monthly data allowance will be displayed in the customer's PCM system.
Menu item in PCM for recording usage (PHONE -> OPT -> SET PHONE -> Data connections -> Online data counter).

Result check

"Is some of your monthly data allowance still remaining?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Please contact your mobile phone provider in order to increase your data allowance."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the vehicle is/was moving

...

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

Illustrations: Mobile data allowance

Fig. 15: “Set Phone” menu on PCM head unit

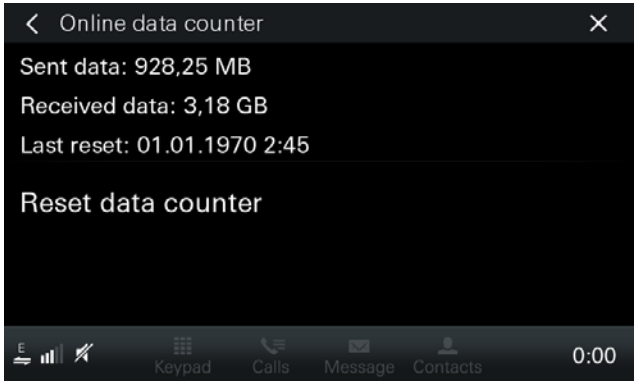

Fig. 17: “Online data counter” menu on PCM head unit

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

...

Check whether the mobile data allowance has been used up

Check whether the vehicle is/was moving

Test step

"Have you tried to use the service while driving?"

Result check

"Was your vehicle stationary when you tried to use the service?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"For your safety, certain services or individual service functions are only fully available when the vehicle is stationary. Please use these services when your vehicle is parked."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the correct operator control element is used

...

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

...

Check whether the vehicle is/was moving

Check whether the correct operator control element is used

Test step

"Which operating steps are you using?"

Note

Conceivable ambiguities when using the Online Search service:

- The two input lines for destination input on the PCM can be confused.

Result check

"Were the correct operator control elements used?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Proceed as described when using/operating the service."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the data transmission rate is sufficient

...

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

Illustrations: Wrong operator control element

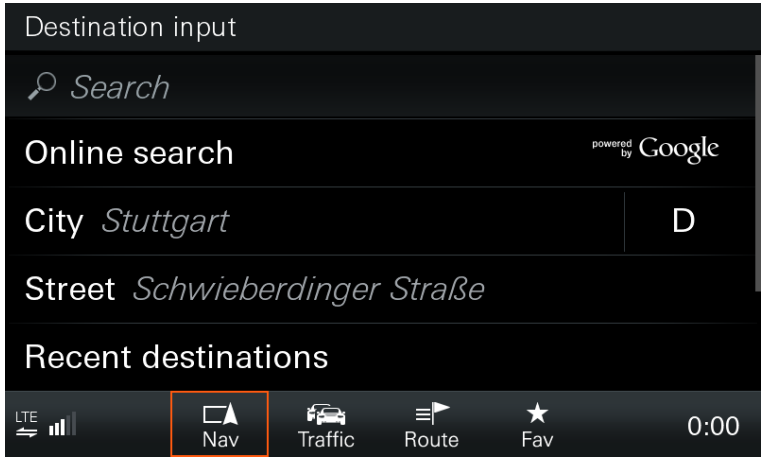

Fig. 18: Destination input screen on PCM head unit

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

...

Check whether the correct operator control element is used

Check whether the data transmission rate is sufficient

Test step

"Please check the network symbol on your PCM or mobile device."

Result check

Is the data network quality satisfactory?

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"The usability of the service can be limited when the data network quality is poor. Find a place where the data network quality is better."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the quality of the data from the content provider is good enough

...

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

...

Check whether the data transmission rate is sufficient

Check whether the quality of the data from the content provider is good enough

Test step

"Please check whether the function restriction is affecting just one service/App or several/all of them."

Note

The information must exist or be determined in the Call Centre.

Porsche is not responsible for the content of the services/Apps used!

Result check

"Are several services/Apps affected?" -> it is safe to assume that the quality of data from the provider is OK.

Yes	The cause was not identified. Continue fault finding with the next test step.
No	Wait for data update/inform provider

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the network coverage is poor (tunnel, weather, etc.)

...

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

...

Check whether the quality of the data from the content provider is good enough

Check whether the network coverage is poor (tunnel, weather, etc.)

Test step

"Please check the current network reception strength of your Porsche. To do this, check the icon on the left of the status bar."
"Please check the current network reception strength of your device. To do this, check the icon in the status bar at the top of the display."
"At least 2 bars should be displayed here."

Result check

"Is the reception strong enough (at least 2 bars or at least mobile phone standard 3G or E)?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Please move to an area with better reception."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the mobile phone network is down

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

Illustrations: Poor network quality

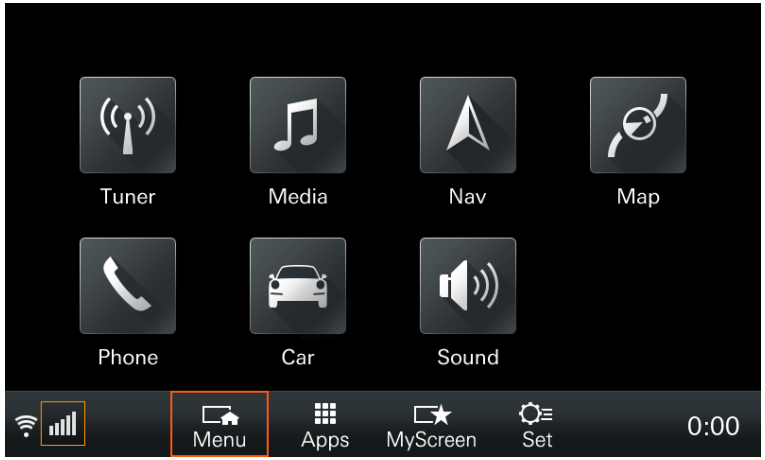

Fig. 19: Home screen on PCM head unit

Illustration shows iPhone 6 menu as an example

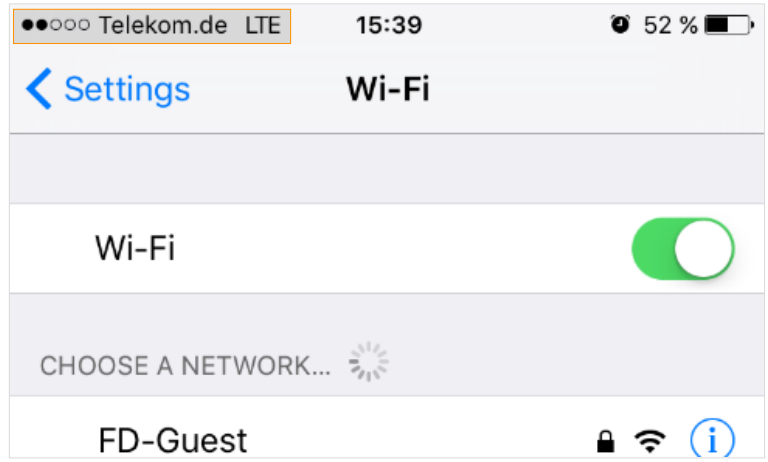

Fig. 20: iOS status bar

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or WiFi

Check service-specific or general causes of faults

...

Check whether the network coverage is poor (tunnel, weather, etc.)

Check whether the mobile phone network is down

Test step

"Please check the current network reception strength of your Porsche. To do this, check the icon on the left of the status bar."
"Please check the current network reception strength of your device. To do this, check the icon in the status bar at the top of the display."

Result check

"Do you have a network signal?"

Yes	The cause was not identified. Refer the customer to the Service department.
No	"Please move to an area with better reception or wait until the problem is fixed. The relevant department has already been informed and is working on resolving the problem."

Does the problem persist?

Yes (Contact the workshop) **No** (End fault finding)

Porsche Connect – Support Guideline

Status: November 2015

General information

Objectives

- *The Support Guideline supports you in narrowing down symptoms and correct any faults that are found in a targeted manner, or whether they need to be forwarded to Porsche.*
- *Fault finding for the Porsche Connect services is now more structured and straightforward.*
- *All services are divided into service categories based on their underlying technology. Faults that do not affect a complete service category, but only one individual service, can also be resolved using a service-based Fault Finding Guide.*
- *The use of exclusion criteria and basic questions makes it easier to determine the causes of faults.*
- *Faults that do not completely fit into a service category, but only one individual service in this category can also be resolved using a service-based Fault Finding Guide.*

Procedure for use

- *Select the relevant Support Guideline based on the affected service.*
- *Carry out the test steps in sequence until the fault is corrected or the problem has been addressed correctly.*
- *To get an overview of how to use this procedure, it is important to familiarise yourself with how services are provided and the division of the services into service categories. For more information, also refer to the overview in the appendix.*

- **Preliminary tests when using online navigation services (e.g. real-time traffic information)**
- **Preliminary tests if Porsche Connect app-based services are used (e.g. music streaming)**
- **Preliminary tests if Apple CarPlay is used**

Preliminary tests when using online navigation services (e.g. real-time traffic information)

- Restart procedure
- Test of comparable services
- Checking online connection and settings
- PCM diagnostics using the PIWIS Tester
- Extended troubleshooting in the workshop

Preliminary tests if Porsche Connect app-based services are used (e.g. music streaming)

Preliminary tests if Apple CarPlay is used

Preliminary tests when using online navigation services (e.g. real-time traffic information)

Restart procedure

Test step

"Please restart the PCM and the service."

Result check

"Is the service function still limited?"

Yes	The cause was not identified. Continue troubleshooting with the next test step.
No	Provide feedback to the customer. Exit Support Guideline.

Yes (Next test step) **No** (Exit Support Guideline)

Test of comparable services

...

Preliminary tests if Porsche Connect app-based services are used (e.g. music streaming)

Preliminary tests if Apple CarPlay is used

Preliminary tests when using online navigation services (e.g. real-time traffic information)

Restart procedure

Test of comparable services

Test step

"Check the functionality of another online navigation service (e.g. "Google Earth", RTTI, "Google Street View", "POI search")."

Result check

"Is the function of another online navigation system also limited?"

Yes	The cause was not identified. Continue troubleshooting with the next test step.
No	"Perform a detailed check using the service specific Fault Finding Guide. Start with the check category "Check service-specific or general causes of faults". Exit Support Guideline.

Yes (Next test step) **No** (Exit Support Guideline)

Checking online connection and settings

...

Preliminary tests if Porsche Connect app-based services are used (e.g. music streaming)

Preliminary tests if Apple CarPlay is used

Preliminary tests when using online navigation services (e.g. real-time traffic information)

...

Test of comparable services

Checking online connection and settings

Test step

"Check the online connection."

a) "Establish the online connection with a SIM card in your PCM, please refer to the steps from the "Check the online connection when using a SIM card in the vehicle slot" category of the Fault Finding Guide of the specific service."

b) "Establish the online connection via your terminal device, please refer to the steps from category "Check the online connection when using a terminal device via Bluetooth or WiFi" of the Fault Finding Guide of the specific service."

Result check

"Is there a problem with the online connection?"

Yes	The cause was not identified. Continue troubleshooting with the next test step.
No	"Create a PRMS ticket and attach the completed "Porsche Connect Checklist". Exit Support Guideline."

Yes (Next test step) **No** (Exit Support Guideline)

PCM diagnostics using the PIWIS Tester

Extended troubleshooting in the workshop

Preliminary tests if Porsche Connect app-based services are used (e.g. music streaming)

Preliminary tests if Apple CarPlay is used

Preliminary tests when using online navigation services (e.g. real-time traffic information)

...

Checking online connection and settings

PCM diagnostics using the PIWIS Tester

Test step

"Check the PCM with the help of the PIWIS Tester."

Result check

"Has an error been detected in the PCM?"

Yes	The cause was not identified. Continue troubleshooting with the next test step.
No	"Create a PRMS ticket and attach the completed "Porsche Connect Checklist". Exit Support Guideline."

Yes (Next test step) **No** (Exit Support Guideline)

Extended troubleshooting in the workshop

Preliminary tests if Porsche Connect app-based services are used (e.g. music streaming)

Preliminary tests if Apple CarPlay is used

Preliminary tests when using online navigation services (e.g. real-time traffic information)

...

PCM diagnostics using the PIWIS Tester

Extended troubleshooting in the workshop

Test step

"Perform a comprehensive troubleshooting in the workshop with the help of the relevant workshop literature and checking methods."

Result check

"Could the error not be identified and eliminated?"

Yes	Provide feedback to the customer. Exit Support Guideline.
No	"Create a PRMS ticket and attach the completed "Porsche Connect Checklist". Exit Support Guideline."

Yes (Exit Support Guideline)

No (Exit Support Guideline)

Preliminary tests when Porsche Connect app-based services are used (e.g. music streaming)

Preliminary tests when Apple CarPlay is used

- **Preliminary tests when using online navigation services (e.g. real-time traffic information)**
- **Preliminary tests when Porsche Connect app-based services are used (e.g. music streaming)**
  - Restart procedure
  - Test on comparable services
  - Checking online connection and settings
  - PCM diagnostics using the PIWIS Tester
  - Extended troubleshooting in the workshop
- **Preliminary tests if Apple CarPlay is used**

Preliminary tests when using online navigation services (e.g. real-time traffic information)

Preliminary tests when Porsche Connect app-based services are used (e.g. music streaming)

Restart procedure

Test step

"Please restart the PCM, your final device and Porsche Connect app/service."

Result check

"Is the service function still limited?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	The cause was identified. Exit Support Guideline.

Yes (Next test step) **No** (Exit Support Guideline)

Test on comparable services

...

Preliminary tests when Apple CarPlay is used

Preliminary tests when using online navigation services (e.g. real-time traffic information)

Preliminary tests when Porsche Connect app-based services are used (e.g. music streaming)

Restart procedure

Test of comparable services

Test step

"Check the functionality of another Porsche Connect app service (e.g. "My desinations", contacts, calendar, Napster/Papsody(U.S. version), radio.net)."

Result check

"Is the service function also limited?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Perform a detailed check using the service specific Fault Finding Guide. Start with the check category "Check service-specific or general causes of faults". Exit Support Guideline.

Yes (Next test step) **No** (Exit Support Guideline)

Checking online connection and settings

...

Preliminary tests when Apple CarPlay is used

Preliminary tests when using online navigation services (e.g. real-time traffic information)

Preliminary tests when Porsche Connect app-based services are used (e.g. music streaming)

...

Checking online connection and settings

Test step

"Check the online connection."

a) "Establish the online connection with a SIM card in your PCM, please refer to the test steps in the "Check the online connection when using a SIM card in the vehicle slot" category of the Fault Finding Guide of the specific service."
b) "Establish the online connection via your terminal device, please refer to the steps from category "Check the online connection when using a terminal device via Bluetooth or WiFi" of the Fault Finding Guide of the specific service."
c) "To check the WLAN connection between the Porsche Connect app and the PCM, please refer to the relevant FAQs and the operating instructions of the vehicle."

Result check

"Is there a problem with the online connection?"

Yes	The cause was not identified. Continue Fault Finding with the next test step.
No	"Create a PRMS ticket and attach the completed "Porsche Connect Checklist". Exit Support Guideline."

Yes (Next test step) **No** (Exit Support Guideline)

PCM diagnostics using the PIWIS Tester

Extended troubleshooting in the workshop

Preliminary tests if Apple CarPlay is used

Preliminary tests when using online navigation services (e.g. real-time traffic information)

Preliminary tests when Porsche Connect app-based services are used (e.g. music streaming)

...

PCM diagnostics using the PIWIS Tester

Test step

"Check the PCM with the help of the PIWIS Tester."

Result check

"Has an error been detected in the PCM?"

Yes	Continue Fault Finding with the next test step.
No	"Create a PRMS ticket and attach the completed "Porsche Connect Checklist". Exit Support Guideline."

Yes (Next test step) **No** (Exit Support Guideline)

Extended troubleshooting in the workshop

Preliminary tests if Apple CarPlay is used

Preliminary tests when using online navigation services (e.g. real-time traffic information)

Preliminary tests if Porsche Connect app-based services are used (e.g. music streaming)

...

Extended troubleshooting in the workshop

Test step

"Perform a comprehensive fault finding procedure in the workshop with the help of the relevant workshop literature and checking methods."

Result check

"Could the error not be identified and eliminated?"

Yes	Provide feedback to the customer. Exit Support Guideline.
No	"Create a PRMS ticket and attach the completed "Porsche Connect Checklist". Exit Support Guideline."

Yes (Exit Support Guideline)

No (Exit Support Guideline)

Preliminary tests when Apple CarPlay is used

Preliminary tests when using online navigation services (e.g. real-time traffic information)

Preliminary tests when Porsche Connect app-based services are used (e.g. music streaming)

Preliminary tests when Apple CarPlay is used

Restart procedure

Test step

"Please restart the PCM, your iPhone and Apple CarPlay."

Result check

"Is the functioning of Apple CarPlay still limited?"

Yes	"Perform a detailed check using the service specific Fault Finding Guide for Apple CarPlay." Note: If Apple CarPlay Fault Finding does not find a solution for the problem, please continue with steps and 2 and 3 of the Support Guideline ("Apple CarPlay" service category), if required.
No	Provide feedback to the customer. Exit Support Guideline.

Ja (FSL Apple CarPlay) **No** (Exit Support Guideline)

Replacement of USB cable

...

Preliminary tests when using online navigation services (e.g. real-time traffic information)

Preliminary tests when Porsche Connect app-based services are used (e.g. music streaming)

Preliminary tests when Apple CarPlay is used

...

PCM diagnostics using the PIWIS Tester

Test step

"Check the PCM with the help of the PIWIS Tester."

Result check

"Have any errors been found by the PCM?"

Yes	The cause was not identified. Continue Fault Finding with the next test step.
No	"Refer the customer to Apple Support for Apple CarPlay." Close Support Guideline.

Yes (Next test step) **No** (Exit Support Guideline)

Extended troubleshooting in the workshop

Preliminary tests when using online navigation services (e.g. real-time traffic information)

Preliminary tests when Porsche Connect app-based services are used (e.g. music streaming)

Preliminary tests when Apple CarPlay is used

...

PCM diagnostics using the PIWIS Tester

Extended troubleshooting in the workshop

Test step

"Perform a comprehensive troubleshooting procedure in the workshop with the help of the relevant workshop literature and checking methods."

Result check

"Could the error not be identified and eliminated?"

Yes	Provide feedback to the customer. Exit Support Guideline.
No	"Create a PRMS ticket and attach the completed "Porsche Connect Checklist". Exit Support Guideline."

Yes (Exit Support Guideline) **No** (Exit Support Guideline)

Diagnostic information - high-voltage charger control unit

High-voltage charger control unit, internal fault

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

● Internal control unit fault

Possible fault causes

♦ **High-voltage charger control unit** ⇒ If the infrastructure has been tested as OK but charging is not possible and a fault code is active, replace the control unit

Fault effects

♦ Cancellation/restart of charging process or charging not possible

100004

Diagnostic information - high-voltage charger control unit

High-voltage charger control unit, internal fault

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

● Internal control unit fault

Possible fault causes

♦ **High-voltage charger control unit** ⇒ If the infrastructure has been tested as OK but charging is not possible and a fault code is active, replace the control unit

Fault effects

♦ Cancellation/restart of charging process or charging not possible

100120

Diagnostic information - high-voltage charger control unit

Programming operation in progress

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

♦ Invalid data record

Possible fault causes

♦ Ongoing programming operation or programming run-on time (15 minutes) not elapsed

Fault effects

♦ Function restriction of high-voltage system

100130

Diagnostic information - high-voltage charger control unit

Programming

DANGER

High voltage!
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- No data record programmed
- Wrong data record programmed
- Programmed data record does not match a control unit of the high-voltage system
- Programmed data record does not match the immobilizer system.

Fault effects

♦ Function restriction of high-voltage system

100200

Diagnostic information - high-voltage charger control unit

Charge, efficiency too low

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

♦ Efficiency too low < 80%

Possible fault causes

♦ Poor mains quality
♦ Check infrastructure
♦ Check charging cable
♦ Check lines
♦ Check charging socket
♦ Check **high-voltage battery control unit** fault memory
♦ **High-voltage charger control unit**

Fault effects

♦ Charging power very low ⇒ Charging time correspondingly much too long

200000

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

200010

Diagnostic information - high-voltage charger control unit

Fault in charging process due to vehicle

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Possible fault causes

♦ Check **high-voltage battery control unit**
♦ Check **DME control unit**
♦ Check AC and DC charging (DC charging is possible only in the 918 Spyder)
♦ Check status of high-voltage mains
♦ Check current and voltage measured values

Fault effects

♦ Cancellation of charging process or charging not possible

200020

Diagnostic information - high-voltage charger control unit

Fault in charging process due to infrastructure

DANGER

High voltage!
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

♦ Fault in charging process due to infrastructure detected

Possible fault causes

♦ Charging station faulty or incompatible ⇒ Check a different charging station
♦ Power Line Communication (PLC) faulty

Fault effects

♦ Cancellation of charging process or charging not possible

200110

Diagnostic information - high-voltage charger control unit

Interior air conditioning

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ Too many loads active ⇒ Switch loads off
♦ **High-voltage battery** ⇒ Charge battery
♦ Air conditioning switch-off stage active
♦ Battery conditioning active

Fault effects

♦ Air-conditioning power reduced by 25% - 75%
♦ Interior air conditioning not possible without mains power
♦ Interior air conditioning not possible

200200

Diagnostic information - high-voltage charger control unit

Control-Pilot (communication line)

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

♦ No or implausible signal via Control-Pilot (communication line)
♦ Short circuit to B+
♦ Short circuit to B- or open circuit

Possible fault causes

♦ Operating error (charging station not activated within 4 minutes of inserting the plug)
♦ Charging cable not properly plugged in at the vehicle or at the charging station
♦ Universal charger (ICCPD) faulty (perform a self-test)
♦ Charging cable faulty
♦ Charging socket faulty
♦ Vehicle wiring harness faulty (open circuit in Control-Pilot (communication line) due to possible previous repair work)
♦ **High-voltage charger control unit**

Fault effects

♦ Charging not possible

200220

Diagnostic information - high-voltage charger control unit

High voltage of infrastructure

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following document in the PIWIS information system:

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

♦ Voltage L1 - above limit value (U > 264 V)
♦ Voltage L1 - below limit value (U < 90 V)
♦ Voltage L1 - open circuit

Possible fault causes

♦ Operating error (charging station not activated within 4 minutes of inserting the plug)
♦ Universal charger (ICCPD) faulty (perform a self-test)
♦ Contact resistance between charging plug and charging socket too high (soiling or foreign objects present)
♦ Charging socket damp/wet (water drain of the charging-socket housing blocked)
♦ Charging socket plug contacts worn or charging plug socket contacts spread apart
♦ Charging cable or charging socket faulty
♦ Charging station (infrastructure) faulty (voltage is not connected or is too high)
♦ Vehicle wiring harness faulty (open circuit in high-voltage line L1 or Control-Pilot

(communication line) due to possible previous repair work)
♦ **High-voltage charger control unit**

Fault effects

♦ Cancellation of charging process or charging not possible

Diagnostic information - high-voltage charger control unit

Proximity line (plug detection)

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following document in the PIWIS information system:

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

♦ Control-Pilot (communication line) active, but no or implausible signal via proximity line (plug detection)
♦ Proximity line (plug detection) - short circuit or open circuit detected

Possible fault causes

♦ Universal charger (ICCPD) faulty (perform a self-test)
♦ PRX resistor (2.7 kohm) between CP/PE pin in charging socket faulty
♦ Contact resistance between charging plug and charging socket too high (dirty or foreign objects present)
♦ Charging socket damp/wet (water drain on charging-socket housing blocked)
♦ Charging socket plug contacts worn or charging plug socket contacts spread apart
♦ Charging cable or charging socket faulty
♦ Vehicle wiring harness faulty (open circuit or short circuit in the proximity line (plug detection) due to possible previous repair work)
♦ Short circuit between lines
♦ **High-voltage charger control unit**

Fault effects

♦ Charging not possible

200301

Diagnostic information - high-voltage charger control unit

Proximity line (plug detection)

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

♦ Control-Pilot (communication line) active, but no or implausible signal via proximity line (plug detection)
♦ Proximity line (plug detection) - short circuit or open circuit detected

Possible fault causes

♦ Universal charger (ICCPD) faulty (perform a self-test)
♦ PRX resistor (2.7 kohm) between CP/PE pin in charging socket faulty
♦ Contact resistance between charging plug and charging socket too high (dirty or foreign objects present)
♦ Charging socket damp/wet (water drain on charging-socket housing blocked)
♦ Charging socket plug contacts worn or charging plug socket contacts spread apart
♦ Charging cable or charging socket faulty
♦ Vehicle wiring harness faulty (open circuit or short circuit in the proximity line (plug detection) due to possible previous repair work)

♦ **High-voltage charger control unit**

Fault effects

♦ Charging not possible

200302

Diagnostic information - high-voltage charger control unit

Charging-socket plug lock

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following document in the PIWIS information system:

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Possible fault causes

♦ Charging plug not inserted properly
♦ Check charging plug/charging socket for soiling or foreign objects
♦ Charging socket damp/wet (water drain on charging-socket housing blocked)
♦ Charging plug faulty
♦ Plug lock blocked, mechanical fault
♦ Vehicle wiring harness faulty (open circuit/short circuit in the line(s) to the **plug lock servo motor** due to possible previous repair work)
♦ **Plug lock servo motor** faulty
♦ **High-voltage charger control unit**

Fault effects

♦ Charging not possible

200303

Diagnostic information - high-voltage charger control unit

Charging-socket plug lock

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

200700

Diagnostic information - high-voltage charger control unit

High-voltage activation/switch-off

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Infrastructure connected to the vehicle

Fault setting conditions

♦ Fault in high-voltage activation/switch-off; the control units involved **(DME control unit** and **high-voltage battery control unit)** must send the correct mode.

Possible fault causes

♦ Check high-voltage mode in the **DME control unit** and **high-voltage battery control unit**
⇒ **Fault not in high-voltage charger control unit!**

Fault effects

Activation:
♦ Charging is not possible or charging is cancelled immediately

Deactivation:

♦ It might not be possible to establish driving readiness

200710

Diagnostic information - high-voltage charger control unit

High-voltage activation/switch-off

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ **Fault not in high-voltage charger control unit!**

Fault effects

Activation:
♦ Charging is not possible or charging is cancelled immediately

Deactivation:

♦ It might not be possible to establish driving readiness

200800

Diagnostic information - high-voltage charger control unit

Crash signal

DANGER

High voltage!
Death or severe injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition

♦ Crash signal from **POSIP triggering unit** detected via CAN bus.

Possible fault causes

♦ Crash event
♦ **POSIP triggering unit** faulty

Fault effects

♦ Switch-off of high-voltage system

200901

Diagnostic information - high-voltage charger control unit

Charge-now button

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following document in the PIWIS information system:

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Possible fault causes

♦ Operating error (button pressed for a long time)
♦ Charge-now button stuck/jammed
♦ Wiring harness faulty (open circuit/short circuit in the signal line to the Charge-now button due to due to possible previous repair work)
♦ Charge-now button faulty

Fault effects

♦ Change between time-shifted charging and immediate charging not possible
♦ Time-shifted charging can be cancelled only via the menu in the instrument cluster to permit immediate charging

C00200

Diagnostic information - valid for all control units

Communication with CAN bus

INFORMATION
Communication with the CAN bus designated in the fault text is/was not possible.

Possible fault causes

♦ Short circuit of the CAN-High line to ground
♦ Short circuit of the CAN-High line to B+
♦ Short circuit of the CAN-High line to interference signal
♦ Open circuit in the CAN-High line

♦ Short circuit of the CAN-Low line to ground
♦ Short circuit of the CAN-Low line to B+
♦ Short circuit of the CAN-Low line to interference signal
♦ Open circuit in the CAN-Low line

♦ Defective control unit in combination with the designated CAN bus

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions in the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

C00201

Diagnostic information - valid for all control units

Communication with CAN bus

INFORMATION
Communication with the CAN bus designated in the fault text is/was not possible.

Possible fault causes

♦ Short circuit of the CAN-High line to ground
♦ Short circuit of the CAN-High line to B+
♦ Short circuit of the CAN-High line to interference signal
♦ Open circuit in the CAN-High line

♦ Short circuit of the CAN-Low line to ground
♦ Short circuit of the CAN-Low line to B+
♦ Short circuit of the CAN-Low line to interference signal
♦ Open circuit in the CAN-Low line

♦ Defective control unit in combination with the designated CAN bus

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions in the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

C00500

Diagnostic information - high-voltage charger control unit

Power Line Communication (PLC)

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

NOTE

♦ 918 Spyder only
♦ DC charging only

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

♦ No Power Line Communication (PLC)

Possible fault causes

♦ Charging station faulty or incompatible ⇒ Check a different charging station
♦ Power Line Communication (PLC) - open circuit in line
♦ Check charging socket
♦ **High-voltage charger control unit**

Fault effects

♦ Cancellation of charging process or charging not possible

D01100

Diagnostic information - high-voltage charger control unit

Power supply

DANGER

High voltage!
Death or severe injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

♦ **Power supply**, above limit value (U > 16 V)
♦ **Power supply**, below limit value (U < 9 V)

Possible fault causes

♦ Check vehicle electrical system voltage
♦ Check lines for short circuit or open circuit
♦ **High-voltage charger control unit**

Fault effects

♦ Function restriction

D01200

Diagnostic information - high-voltage charger control unit

Power supply

DANGER

High voltage!
Death or severe injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

♦ **Power supply**, above limit value (U > 16 V)
♦ **Power supply**, below limit value (U < 9 V)

Possible fault causes

♦ Check vehicle electrical system voltage
♦ Check lines for short circuit or open circuit
♦ **High-voltage charger control unit**

Fault effects

♦ Function restriction

D12106

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

♦ Fault in the designated control unit
♦ Note in the designated control unit

Fault effects

♦ Functions in the control unit are available only with restrictions
♦ Functions in the control unit are not available

D1235D

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

♦ Fault in the designated control unit
♦ Note in the designated control unit

Fault effects

♦ Functions in the control unit are available only with restrictions
♦ Functions in the control unit are not available

D1235E

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

♦ Fault in the designated control unit
♦ Note in the designated control unit

Fault effects

♦ Functions in the control unit are available only with restrictions
♦ Functions in the control unit are not available

D1235F

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

♦ Fault in the designated control unit
♦ Note in the designated control unit

Fault effects

♦ Functions in the control unit are available only with restrictions
♦ Functions in the control unit are not available

D12360

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

♦ Fault in the designated control unit
♦ Note in the designated control unit

Fault effects

♦ Functions in the control unit are available only with restrictions
♦ Functions in the control unit are not available

D12363

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

D12364

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

D12365

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

D12366

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

D12367

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

D12368

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

D12369

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

D1236A

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

D1236B

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

D1236C

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

♦ Fault in the designated control unit
♦ Note in the designated control unit

Fault effects

♦ Functions in the control unit are available only with restrictions
♦ Functions in the control unit are not available

D20000

Diagnostic information - valid for all control units

Communication with CAN bus

INFORMATION
Communication with the CAN bus designated in the fault text is/was not possible.

Possible fault causes

♦ Short circuit of the CAN-High line to ground
♦ Short circuit of the CAN-High line to B+
♦ Short circuit of the CAN-High line to interference signal
♦ Open circuit in the CAN-High line

♦ Short circuit of the CAN-Low line to ground
♦ Short circuit of the CAN-Low line to B+
♦ Short circuit of the CAN-Low line to interference signal
♦ Open circuit in the CAN-Low line

♦ Defective control unit in combination with the designated CAN bus

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions in the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

D20001

Diagnostic information - valid for all control units

Communication with CAN bus

INFORMATION
Communication with the CAN bus designated in the fault text is/was not possible.

Possible fault causes

♦ Short circuit of the CAN-High line to ground
♦ Short circuit of the CAN-High line to B+
♦ Short circuit of the CAN-High line to interference signal
♦ Open circuit in the CAN-High line

♦ Short circuit of the CAN-Low line to ground
♦ Short circuit of the CAN-Low line to B+
♦ Short circuit of the CAN-Low line to interference signal
♦ Open circuit in the CAN-Low line

♦ Defective control unit in combination with the designated CAN bus

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions in the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

D40000

Diagnostic information - high-voltage charger control unit

Power supply

DANGER

High voltage!
Death or severe injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

♦ **Power supply**, above limit value (U > 16 V)
♦ **Power supply**, below limit value (U < 9 V)

Possible fault causes

♦ Check vehicle electrical system voltage
♦ Check lines for short circuit or open circuit
♦ **High-voltage charger control unit**

Fault effects

♦ Function restriction

D40100

Diagnostic information - high-voltage charger control unit

Power supply

DANGER

High voltage!
Death or severe injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

♦ **Power supply**, above limit value (U > 16 V)
♦ **Power supply**, below limit value (U < 9 V)

Possible fault causes

♦ Check vehicle electrical system voltage
♦ Check lines for short circuit or open circuit
♦ **High-voltage charger control unit**

Fault effects

♦ Function restriction

Diagnostic information - high-voltage charger control unit

High-voltage DC voltage sensors 1 and 2

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

- ♦ De-energize the vehicle in accordance with the guidelines.
- ♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- High-voltage system active

Fault setting condition(s)

- ♦ High-voltage DC voltage sensor 1 - above limit value
- ♦ High-voltage DC voltage sensor 1 - below limit value
- ♦ High-voltage DC voltage sensor 1 - short circuit to B+
- ♦ High-voltage DC voltage sensor 1 - short circuit to ground
- ♦ High-voltage DC voltage sensor 2 - above limit value
- ♦ High-voltage DC voltage sensor 2 - below limit value
- ♦ High-voltage DC voltage sensor 2 - short circuit to B+
- ♦ High-voltage DC voltage sensor 2 - short circuit to ground
- ♦ High-voltage DC voltage sensors 1 **and** 2, difference value implausible

Possible fault causes

- ♦ Infrastructure faulty
- ♦ High-voltage DC voltage sensor 1 or 2 faulty
- ♦ **High-voltage charger control unit**

Fault effects

- Reduced charging power
- Active charging process is cancelled or charging is not possible

E10102

Diagnostic information - high-voltage charger control unit

High-voltage system voltage

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Infrastructure connected to the vehicle
- Vehicle in charging mode

Fault setting condition(s)

- High voltage (DC) during the charging process, above limit value (U > 450 V)
- High voltage (DC) during the charging process, below limit value (U < 220 V)

Possible fault causes

♦ High-voltage lines to **high-voltage battery control unit**
♦ High-voltage lines to **high-voltage power electronics control unit**
♦ Infrastructure faulty
♦ Fault in charging station
♦ **High-voltage battery** voltage
♦ **High-voltage charger control unit** faulty

Fault effects

♦ Active charging process is cancelled or charging is not possible

E10103

Diagnostic information - high-voltage charger control unit

High-voltage DC current sensor

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

Fault effects

- ♦ Reduced charging power
- ♦ Active charging process is cancelled or charging is not possible

E10113

Diagnostic information - high-voltage charger control unit

High-voltage DC voltage sensors 1 and 2

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following document in the PIWIS information system:

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs. In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- High-voltage system active

Fault setting condition(s)

♦ High-voltage DC voltage sensor 1 - above limit value
♦ High-voltage DC voltage sensor 1 - below limit value
♦ High-voltage DC voltage sensor 1 - short circuit to B+
♦ High-voltage DC voltage sensor 1 - short circuit to ground
♦ High-voltage DC voltage sensor 2 - above limit value
♦ High-voltage DC voltage sensor 2 - below limit value
♦ High-voltage DC voltage sensor 2 - short circuit to B+
♦ High-voltage DC voltage sensor 2 - short circuit to ground
♦ High-voltage DC voltage sensors 1 **and** 2, difference value implausible

Possible fault causes

♦ Infrastructure faulty
♦ High-voltage DC voltage sensor 1 or 2 faulty
♦ **High-voltage charger control unit**

Fault effects

- ♦ Reduced charging power
- ♦ Active charging process is cancelled or charging is not possible

Diagnostic information - high-voltage charger control unit

Charging-socket plug symbol LED

DANGER

High voltage!
Death or severe injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Possible fault causes

♦ Short circuit to ground
♦ Short circuit to B+
♦ Open circuit
♦ Charging socket
♦ LED faulty
♦ **High-voltage charger control unit**

Fault effects

♦ Charging status not clearly identifiable

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Charging socket lid lock coded
- Ignition on

Fault setting condition(s)

- Open circuit detected
- Short circuit to B+
- Short circuit to ground
- Activation time exceeded

Possible fault causes

♦ Charging socket lid lock - mechanical fault
♦ Short circuit to B+ in lines
♦ Short circuit to ground in lines
♦ Short circuit between lines
♦ Open circuit in line
♦ **Charging socket lid lock actuating element** faulty
♦ **High-voltage charger control unit**

Fault effects

- ♦ Charging-socket lid lock activation not possible
- ♦ Charging remains possible through mechanical emergency unlocking

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

- **Temperature sensor** - above limit value
- **Temperature sensor** - below limit value
- **Temperature sensor** - short circuit to B+
- **Temperature sensor** - short circuit to ground

Possible fault causes

♦ **Temperature sensor** stuck (faulty)
♦ **High-voltage charger control unit**

Fault effects

♦ Cancellation of charging process or charging not possible

FF0006

Diagnostic information - high-voltage charger control unit

Temperature sensor(s)

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

- **Temperature sensor** - above limit value
- **Temperature sensor** - below limit value
- **Temperature sensor** - short circuit to B+
- **Temperature sensor** - short circuit to ground

Possible fault causes

♦ **Temperature sensor** stuck (faulty)
♦ **High-voltage charger control unit**

Fault effects

♦ Cancellation of charging process or charging not possible

FF0007

Diagnostic information - high-voltage charger control unit

Temperature sensor(s)

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

- **Temperature sensor** - above limit value
- **Temperature sensor** - below limit value
- **Temperature sensor** - short circuit to B+
- **Temperature sensor** - short circuit to ground

Possible fault causes

♦ **Temperature sensor** stuck (faulty)
♦ **High-voltage charger control unit**

Fault effects

♦ Cancellation of charging process or charging not possible

FF0009

Diagnostic information - high-voltage charger control unit

High-voltage charger control unit, temperature - above limit value

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

● Internal temperature , above limit value (T > 120 °C/248 °F)

Possible fault causes

♦ Internal components too hot
♦ Ambient temperature of the **high-voltage battery control unit** too high
♦ Check low-temperature cooling circuit system ⇒ Bleed if necessary
♦ Temperature sensor faulty
♦ **High-voltage charger control unit** faulty

Fault effects

♦ Cancellation of charging process or charging not possible

FF000A

Diagnostic information - high-voltage charger control unit

High-voltage charger control unit, temperature - above limit value

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

● Internal temperature , above limit value (T > 120 °C/248 °F)

Possible fault causes

♦ Internal components too hot
♦ Ambient temperature of the **high-voltage battery control unit** too high
♦ Check low-temperature cooling circuit system ⇒ Bleed if necessary
♦ Temperature sensor faulty
♦ **High-voltage charger control unit** faulty

Fault effects

♦ Cancellation of charging process or charging not possible

FF000B

Diagnostic information - high-voltage charger control unit

Function restriction, coolant temperature - above limit value

DANGER

High voltage!
Death or severe injuries due to high voltage or high current!

♦ De-energise the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► **Please read the following document in the PIWIS information system:**

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Fault setting condition(s)

● Coolant temperature - above limit value (T > 70 °C/158 °F)

Possible fault causes

♦ Ambient temperature of the **high-voltage battery control unit** too high
♦ Check low-temperature cooling circuit system ⇒ Bleed if necessary

Fault effects

♦ Reduction in charging power

FF000C

Diagnostic information - high-voltage charger control unit

Infrastructure

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

► Please read the following document in the PIWIS information system:

♦ **2X00IN** Isolating high-voltage electrical system from power supply/Starting high-voltage electrical system

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

⇒ Infrastructure connected to the vehicle

Possible fault causes

♦ Fault in charging station infrastructure
♦ Charging socket soiled/faulty
♦ Charging cable faulty

Fault effects

♦ Charging not possible

FF000E

Diagnostic information - high-voltage charger control unit

Temperature sensor(s)

⚠DANGER

High voltage!
Risk of death or serious injuries due to high voltage or high current!

♦ De-energize the vehicle in accordance with the guidelines.
♦ Work must not be performed on parts carrying a high voltage.

Diagnostic information - rear-differential lock

Power supply

ⓘ NOTE

Visual inspection : In the following fault-finding section, please check first that the affected > contacts< of the control unit plug connection and the >contacts< of the plug connections on the servo motor are neither damaged nor corroded. Remove any soiling or corrosion/oxidation. Replace damaged parts/lines.

ⓘ NOTE

Control unit replacement: Before replacement, the ground connections, power supply and plug connections on the control unit must be checked and to be found OK. Always check the control unit coding. After the test drive, read out the fault memory again using the **PIWIS Tester**. Additional causes of faults that could damage the control unit should be detected and corrected.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test on transfer box control unit

Possible fault causes

- ♦ Battery empty or faulty
- ♦ Fuse faulty
- ♦ Short circuit to ground
- ♦ Open circuit
- ♦ Three-phase generator faulty
- ♦ Control unit faulty

Possible fault effects

- ♦ The functions available in the rear-axle differential lock control unit cannot be activated

Diagnostic information - rear-differential lock

Potentiometer 1, rear-differential lock

ⓘ NOTE
This fault relates to the signal for potentiometer >1< (sensor 1), which is integrated as a unit with potentiometer >2< (sensor 2) and the temperature sensor in the servo motor.

ⓘ NOTE
Visual inspection: In the next troubleshooting section, please check first that the affected > contacts< of the control unit plug connection and the >contacts< of the plug connection on the servo motor are neither damaged nor corroded. Remove any soiling or corrosion/oxidation. Replace damaged parts/lines.

ⓘ NOTE
Control unit replacement: Before replacing a control unit, the ground connections, power supply and plug connections on the control unit must be checked to make sure that they are OK. Always check the control unit coding. After the test drive, read out the fault memory again using the **PIWIS Tester**. Additional causes of faults that could damage the control unit should be detected and corrected.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test on rear-differential lock control unit

Possible fault causes

- ♦ Short circuit to B+
- ♦ Open circuit/short circuit to ground
- ♦ Potentiometer faulty
- ♦ Rear-differential lock control unit faulty

Diagnostic information - Rear-differential lock

Valve

ⓘ NOTE
Visual inspection: In the next fault finding section, please check first that the affected >contacts < of the control unit plug connection and the >contacts< of the plug connection on the valve are neither damaged nor corroded. Remove any soiling or corrosion/oxidation. Replace damaged parts/lines.

ⓘ NOTE
Control unit replacement: Before replacing a control unit, the ground connections, power supply and plug connections on the control unit must be checked to make sure that they are OK. Always check the control unit coding. After the test drive, read out the fault memory again using the **PIWIS Tester**. Additional causes of faults that could damage the control unit should be detected and corrected.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test on transfer box control unit
- Engine running
- Selector lever position >P<
- Engage rear-differential lock

Possible fault causes

- Short circuit to ground
- Open circuit in line
- Valve
- **Control module** faulty

Diagnostic information - rear-differential lock

Potentiometer 2, rear-differential lock

ⓘ NOTE
This fault relates to the signal for potentiometer >2< (sensor 2), which is integrated as a unit with potentiometer >1< (sensor 1) and the temperature sensor in the servo motor.

ⓘ NOTE
Visual inspection: In the next troubleshooting section, please check first that the affected > contacts< of the transfer box control unit plug connection and the >contacts< of the plug connection on the servo motor are neither damaged nor corroded. Remove any soiling or corrosion/oxidation. Replace damaged parts/lines.

ⓘ NOTE
Control unit replacement: Before replacing a control unit, the ground connections, power supply and plug connections on the control unit must be checked to make sure that they are OK. Always check the control unit coding. After the test drive, read out the fault memory again using the **PIWIS Tester**. Additional causes of faults that could damage the control unit should be detected and corrected.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test on rear-differential lock control unit

Possible fault causes

- ♦ Short circuit to B+
- ♦ Open circuit/short circuit to ground
- ♦ Potentiometer faulty
- ♦ Rear-differential lock control unit faulty

Diagnostic information - Rear-differential lock

Power supply for sensors

ⓘ NOTE

This fault relates to the power supply for the sensors: potentiometer >1< (sensor 1) and potentiometer >2< (sensor 2) as well as the servo motor temperature sensor, which are integrated as a unit in the servo motor.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Rear-differential control unit internal function test

Possible fault causes

♦ >Upper limit value exceeded<,
Voltage supply line (5 V) short circuit to B+ (12 V)
♦ >Lower limit value exceeded<,
Voltage supply line (5 V) short circuit to ground
♦ Rear-differential lock control unit faulty

Affected contacts on the rear-differential lock control unit connector

♦ Potentiometer 1 / 2
♦ Power supply, 5 V temperature sensor

Diagnostic information - Axle-differential lock

Control unit malfunction

This fault causes the power/voltage supply to the servo motor >A/B<, brakes >A/B<, sensors and CAN communication to switch off.

ⓘ NOTE
Before replacing the control unit, the ground connections, power supply and plug connections on the control unit must be checked.

After the test drive, read out the fault memory again with the **PIWIS Tester**. Additional fault sources that could damage the control unit are to be recognized and remedied.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

ⓘ NOTE
The internal function test must be completed successfully before the functions stored in the transverse lock control unit can be activated.

- Ignition on
- Transverse lock control unit internal function test

Possible fault causes

♦ >Implausible signal<, a fault being detected in the computer during the internal function test in the transfer box control unit.

Possible fault effects

♦ The functions available in the axle-differential lock control unit cannot be activated

Diagnostic information - rear-differential lock

Power supply to rear-differential lock servo motor

ⓘ NOTE
Visual inspection: In the next troubleshooting section, please check first that the affected > contacts< of the control unit plug connection and the >contacts< of the plug connection on the servo motor are neither damaged nor corroded. Remove any soiling or corrosion/oxidation. Replace damaged parts/lines.

ⓘ NOTE
Control unit replacement: Before replacing a control unit, the ground connections, power supply and plug connections on the control unit must be checked to make sure that they are OK. Always check the control unit coding. After the test drive, read out the fault memory again using the **PIWIS Tester**. Additional causes of faults that could damage the control unit should be detected and corrected.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test on rear-differential lock control unit
- Engine running
- Selector-lever position >P<
- Engage rear-differential lock

Possible fault causes

- ♦ Short circuit to B+
- ♦ Short circuit to ground
- ♦ Open circuit in line
- ♦ Control unit faulty

Diagnostic information - rear-differential lock

Voltage/ground supply for servo motor brake

ⓘ NOTE

Visual inspection: In the next troubleshooting section, please check first that the affected > contacts< of the control unit plug connection and the >contacts< of the plug connection on the servo motor are neither damaged nor corroded. Remove any soiling or corrosion/oxidation. Replace damaged parts/lines.

ⓘ NOTE

Control unit replacement: Before replacing a control unit, the ground connections, power supply and plug connections on the control unit must be checked to make sure that they are OK. Always check the control unit coding. After the test drive, read out the fault memory again using the **PIWIS Tester**. Additional causes of faults that could damage the control unit should be detected and corrected.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test on transfer box control unit
- Engine running
- Selector-lever position >P<
- Engage rear-differential lock

Possible fault causes

- ♦ Short circuit to B+
- ♦ Short circuit to ground
- ♦ Open circuit in line
- ♦ Control unit faulty

Diagnostic information - rear-differential lock

Voltage/ground supply for servo motor brake

ⓘ NOTE

Visual inspection: In the next troubleshooting section, please check first that the affected > contacts< of the control unit plug connection and the >contacts< of the plug connection on the servo motor are neither damaged nor corroded. Remove any soiling or corrosion/oxidation. Replace damaged parts/lines.

ⓘ NOTE

Control unit replacement: Before replacing a control unit, the ground connections, power supply and plug connections on the control unit must be checked to make sure that they are OK. Always check the control unit coding. After the test drive, read out the fault memory again using the **PIWIS Tester**. Additional causes of faults that could damage the control unit should be detected and corrected.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test on transfer box control unit
- Engine running
- Selector-lever position >P<
- Engage rear-differential lock

Possible fault causes

- ♦ Short circuit to B+
- ♦ Short circuit to ground
- ♦ Open circuit in line
- ♦ Control unit faulty

Diagnostic information - rear-differential lock

Servo motor temperature sensor

ⓘ NOTE
The servo motor temperature sensor is integrated with potentiometer >1< (sensor 1) and potentiometer >2< (sensor 2) as a unit in the servo motor.

ⓘ NOTE
Visual inspection: In the next troubleshooting section, please check first that the affected > contacts< of the control unit plug connection and the >contacts< of the plug connection on the servo motor are neither damaged nor corroded. Remove any soiling or corrosion/oxidation. Replace damaged parts/lines.

ⓘ NOTE
Control unit replacement: Before replacing a control unit, the ground connections, power supply and plug connections on the control unit must be checked to make sure that they are OK. Always check the control unit coding. After the test drive, read out the fault memory again using the **PIWIS Tester**. Additional causes of faults that could damage the control unit should be detected and corrected.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test on rear-differential lock control unit

Possible fault causes

- ♦ Short circuit to B+
- ♦ Short circuit to ground
- ♦ Open circuit in line
- ♦ Servo motor temperature sensor faulty

Diagnostic information - rear-differential lock

Motor or position sensor polarity reversal

Diagnostic conditions

- Ignition on

Possible fault causes

- If work was carried out previously on the electric lines:
  - ♦ Motor lines connected the wrong way around
  - ♦ Position sensor lines connected the wrong way around

- If **NO** work was carried out previously on the electric lines:
  - ♦ Wrong rear-differential lock control unit (**see** ⓘ)

ⓘ INFORMATION

- **This only applies to Panamera vehicles from model year 2014!**

The 2 digits in the 10th + 11th places of the 11-digit spare part number are decisive:
- 970.618.303.**03** ⇒ Wrong rear-differential lock control unit
- 970.618.303.**04** (or higher) ⇒ **Correct** rear-differential lock control unit

Diagnostic information - Axle-differential lock

Axle-differential lock mechanical fault

ⓘ NOTE
After successful read out, the fault memory must be erased and then read out again after satisfying the diagnostic conditions below.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Transverse lock control unit internal function test
- Vehicle stationary
- Engine running
- Brake actuated
- Selector lever position >N<
- Via the left rocker switch on the >selector switch (running gear control unit)<, alternately select the functions >LOW RANGE< and >axle-differential lock LOW RANGE 100%< (see Driver's Manual)

Possible fault causes

♦ >Mechanical fault<, mechanical wear in axle-differential lock

Diagnostic information - Axle-differential lock

Axle-differential lock

ⓘ NOTE
After successful read out, the fault memory must be erased and then read out again after satisfying the diagnostic conditions below.

ⓘ NOTE
Visual inspection : In the next troubleshooting section, please check first that the affected > contacts< of the control unit plug connection and the >contacts< of the plug connections on the servo motor are neither damaged nor corroded. Remove any soiling or corrosion/oxidation. Replace damaged parts/wires.

ⓘ NOTE
Control unit replacement: Before replacing a control unit, the ground connections, power supply and plug connections on the control unit must be checked to make sure that they are OK. Please observe the coding of the control unit. After the test drive, read out the fault memory again with the **PIWIS Tester**. Additional causes of faults that could damage the control unit should be detected and remedied.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Transverse lock control unit internal function test
- Vehicle stationary
- Engine running
- Brake actuated
- Selector lever position >N<
- Via the left rocker switch on the >>selector switch (running gear control unit)< <, alternately select the functions >LOW RANGE< and >axle-differential lock LOW RANGE 100%< (see Driver's Manual)

Possible fault causes

♦ >Mechanical fault<, mechanical wear in axle-differential lock

Diagnostic information - Axle-differential lock

Current sensor in control unit

ⓘ NOTE
The current sensor is integrated in the transverse lock control unit and can not be separately replaced.

ⓘ NOTE
Visual inspection : In the next troubleshooting section, please check first that the affected > contacts< of the control unit plug connection and the >contacts< of the plug connections on the servo motor are neither damaged nor corroded. Remove any soiling or corrosion/oxidation. Replace damaged parts/wires.

ⓘ NOTE
Control unit replacement: Before replacing a control unit, the ground connections, power supply and plug connections on the control unit must be checked to make sure that they are OK. Please observe the coding of the control unit. After the test drive, read out the fault memory again with the **PIWIS Tester**. Additional causes of faults that could damage the control unit should be detected and remedied.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Transverse lock control unit internal function test

Possible fault causes

♦ Implausible signal

Diagnostic information - Rear-differential lock

Valve

ⓘ NOTE
Visual inspection: In the next fault finding section, please check first that the affected >contacts < of the control unit plug connection and the >contacts< of the plug connection on the valve are neither damaged nor corroded. Remove any soiling or corrosion/oxidation. Replace damaged parts/lines.

ⓘ NOTE
Control unit replacement: Before replacing a control unit, the ground connections, power supply and plug connections on the control unit must be checked to make sure that they are OK. Always check the control unit coding. After the test drive, read out the fault memory again using the **PIWIS Tester**. Additional causes of faults that could damage the control unit should be detected and corrected.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test on transfer box control unit
- Engine running
- Selector lever position >P<
- Engage rear-differential lock

Possible fault causes

- ♦ Short circuit to ground
- ♦ Open circuit in line
- ♦ Valve
- ♦ **Control module** faulty

Diagnostic information - rear-differential lock

Servo motor brake

ⓘ NOTE
Visual inspection: In the next troubleshooting section, please check first that the affected > contacts< of the control unit plug connection and the >contacts< of the plug connection on the servo motor are neither damaged nor corroded. Remove any soiling or corrosion/oxidation. Replace damaged parts/lines.

ⓘ NOTE
Control unit replacement: Before replacing a control unit, the ground connections, power supply and plug connections on the control unit must be checked to make sure that they are OK. Always check the control unit coding. After the test drive, read out the fault memory again using the **PIWIS Tester**. Additional causes of faults that could damage the control unit should be detected and corrected.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test on transfer box control unit
- Engine running
- Selector-lever position >P<
- Engage rear-differential lock

Possible fault causes

- ♦ Short circuit to ground
- ♦ Open circuit in line
- ♦ Rear-differential lock control unit faulty

Diagnostic information - rear-differential lock

Motor or position sensor polarity reversal

Diagnostic conditions

- Ignition on

Possible fault causes

♦ Motor lines connected the wrong way around
♦ Position sensor lines connected the wrong way around

Diagnostic information - Axle-differential lock

Control unit faulty

ⓘ NOTE
Before replacing the control unit, the ground connections, power supply and plug connections on the control unit must be checked.

After the test drive, read out the fault memory again using the Porsche PIWIS Tester II. Additional causes of faults that could damage the transverse lock control unit should be detected and remedied.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Transverse lock control unit internal function test

Possible fault causes

♦ Axle-differential lock control unit faulty

Possible fault effects

♦ The functions available in the axle-differential lock control unit cannot be activated

Diagnostic information - Axle-differential lock

Control unit faulty

ⓘ NOTE
Before replacing the control unit, the ground connections, power supply and plug connections on the control unit must be checked.

After the test drive, read out the fault memory again using the Porsche PIWIS Tester II. Additional causes of faults that could damage the transverse lock control unit should be detected and remedied.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Transverse lock control unit internal function test

Possible fault causes

♦ Axle-differential lock control unit faulty

Possible fault effects

♦ The functions available in the axle-differential lock control unit cannot be activated

Diagnostic information - Axle-differential lock

Control unit faulty

ⓘ NOTE
Before replacing the control unit, the ground connections, power supply and plug connections on the control unit must be checked.

After the test drive, read out the fault memory again using the Porsche PIWIS Tester II. Additional causes of faults that could damage the transverse lock control unit should be detected and remedied.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Transverse lock control unit internal function test

Possible fault causes

♦ Axle-differential lock control unit faulty

Possible fault effects

♦ The functions available in the axle-differential lock control unit cannot be activated

Diagnostic information - rear-differential lock

Power supply to rear-differential lock servo motor

ⓘ NOTE
Visual inspection: In the next troubleshooting section, please check first that the affected > contacts< of the control unit plug connection and the >contacts< of the plug connection on the servo motor are neither damaged nor corroded. Remove any soiling or corrosion/oxidation. Replace damaged parts/lines.

ⓘ NOTE
Control unit replacement: Before replacing a control unit, the ground connections, power supply and plug connections on the control unit must be checked to make sure that they are OK. Diagnosis information All-wheel final drive

Power supply

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test

Fault setting condition(s)

- Voltage drop below Threshold (5V)
- **Supply voltage** Too high
- **Supply voltage** too low

Possible fault causes

- Signal implausible
- **Supply voltage** Battery

Fault effects

- No all-wheel drive function

Diagnosis information All-wheel final drive

Power supply

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test

Fault setting condition(s)

- Voltage drop below Threshold (5V)
- **Supply voltage** Too high
- **Supply voltage** too low

Possible fault causes

- Signal implausible
- **Supply voltage** Battery

Fault effects

- No all-wheel drive function

Diagnosis information All-wheel final drive

000010 Travel sensor Servo motor Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel control unit (PTM)** Internal function test
- **Servo motor** at standstill

Possible fault causes

♦Short circuit to B+/ground or open circuit in the line
♦Faulty Final stage
♦System self test Fault

Guided Fault Finding
♦Control unit faulty

Diagnostic information - all-wheel final drive

000011 Servo motor actuator faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel drive control unit (PTM)** internal function test
- **Clutch** active
- **Servo motor** at standstill (engine torque hold)
- **Clutch** in run-on mode

Possible fault causes

♦ Corrosion on all-wheel drive servo motor plug connection
♦ Short circuit to B+/ground or open circuit in the line
♦ System self-diagnosis fault

Guided Fault Finding

♦ Check all-wheel drive servo motor plug connection for corrosion or damage
♦ If the plug connection is OK, the all-wheel drive control unit (PTM) is faulty and must be replaced.

Diagnosis information All-wheel final drive

000012 Actuator Servo motor Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel control unit (PTM)** Internal function test
- Clutch Active
- **Servo motor** at standstill

Possible fault causes
♦Short circuit to B+/ground or open circuit in the line
♦System self test Fault

Guided Fault Finding
♦Control unit faulty

Diagnostic information - all-wheel final drive

000101-000109, 000013 Control unit faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel drive control unit (PTM)** internal function test
- **Clutch** active
- **Servo motor** at standstill

Possible fault causes
♦ Short circuit to B+/ground or open circuit in the line
♦ Fault during system self-diagnosis during the starting process

Fault effects
♦ No all-wheel drive function
♦ Fault message in instrument cluster: *all-wheel drive failure, rear-wheel drive only, continued driving possible*

Guided Fault Finding

♦ If the fault code is currently displayed and cannot be deleted, the all-wheel drive control unit is faulty

♦ If the fault code is only stored in the fault memory and can be deleted, no further action is required

Diagnostic information - all-wheel final drive

000101-000109, 000013 Control unit faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel drive control unit (PTM)** internal function test
- **Clutch** active
- **Servo motor** at standstill

Possible fault causes
♦ Short circuit to B+/ground or open circuit in the line
♦ Fault during system self-diagnosis during the starting process

Fault effects
♦ No all-wheel drive function
♦ Fault message in instrument cluster: *all-wheel drive failure, rear-wheel drive only, continued driving possible*

Guided Fault Finding

♦ If the fault code is currently displayed and cannot be deleted, the all-wheel drive control unit is faulty

♦ If the fault code is only stored in the fault memory and can be deleted, no further action is required

Diagnostic information - all-wheel final drive

000101-000109, 000013 Control unit faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel drive control unit (PTM)** internal function test
- **Clutch** active
- **Servo motor** at standstill

Possible fault causes
♦ Short circuit to B+/ground or open circuit in the line
♦ Fault during system self-diagnosis during the starting process

Fault effects
♦ No all-wheel drive function
♦ Fault message in instrument cluster: *all-wheel drive failure, rear-wheel drive only, continued driving possible*

Guided Fault Finding

♦ If the fault code is currently displayed and cannot be deleted, the all-wheel drive control unit is faulty

♦ If the fault code is only stored in the fault memory and can be deleted, no further action is required

Diagnostic information - all-wheel final drive

000101-000109, 000013 Control unit faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel drive control unit (PTM)** internal function test
- **Clutch** active
- **Servo motor** at standstill

Possible fault causes
♦ Short circuit to B+/ground or open circuit in the line
♦ Fault during system self-diagnosis during the starting process

Fault effects
♦ No all-wheel drive function
♦ Fault message in instrument cluster: *all-wheel drive failure, rear-wheel drive only, continued driving possible*

Guided Fault Finding

♦ If the fault code is currently displayed and cannot be deleted, the all-wheel drive control unit is faulty

♦ If the fault code is only stored in the fault memory and can be deleted, no further action is required

Diagnostic information - all-wheel final drive

000101-000109, 000013 Control unit faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel drive control unit (PTM)** internal function test
- **Clutch** active
- **Servo motor** at standstill

Possible fault causes
♦ Short circuit to B+/ground or open circuit in the line
♦ Fault during system self-diagnosis during the starting process

Fault effects
♦ No all-wheel drive function
♦ Fault message in instrument cluster: *all-wheel drive failure, rear-wheel drive only, continued driving possible*

Guided Fault Finding

♦ If the fault code is currently displayed and cannot be deleted, the all-wheel drive control unit is faulty

♦ If the fault code is only stored in the fault memory and can be deleted, no further action is required

Diagnostic information - all-wheel final drive

000101-000109, 000013 Control unit faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel drive control unit (PTM)** internal function test
- **Clutch** active
- **Servo motor** at standstill

Possible fault causes
♦ Short circuit to B+/ground or open circuit in the line
♦ Fault during system self-diagnosis during the starting process

Fault effects
♦ No all-wheel drive function
♦ Fault message in instrument cluster: *all-wheel drive failure, rear-wheel drive only, continued driving possible*

Guided Fault Finding

♦ If the fault code is currently displayed and cannot be deleted, the all-wheel drive control unit is faulty

♦ If the fault code is only stored in the fault memory and can be deleted, no further action is required

Diagnostic information - all-wheel final drive

000101-000109, 000013 Control unit faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel drive control unit (PTM)** internal function test
- **Clutch** active
- **Servo motor** at standstill

Possible fault causes
♦ Short circuit to B+/ground or open circuit in the line
♦ Fault during system self-diagnosis during the starting process

Fault effects
♦ No all-wheel drive function
♦ Fault message in instrument cluster: *all-wheel drive failure, rear-wheel drive only, continued driving possible*

Guided Fault Finding

♦ If the fault code is currently displayed and cannot be deleted, the all-wheel drive control unit is faulty

♦ If the fault code is only stored in the fault memory and can be deleted, no further action is required

Diagnostic information - all-wheel final drive

000101-000109, 000013 Control unit faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel drive control unit (PTM)** internal function test
- **Clutch** active

♦ If the fault code is currently displayed and cannot be deleted, the all-wheel drive control unit is faulty

♦ If the fault code is only stored in the fault memory and can be deleted, no further action is required

Diagnostic information - all-wheel final drive

000101-000109, 000013 Control unit faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel drive control unit (PTM)** internal function test
- **Clutch** active
- **Servo motor** at standstill

Possible fault causes
♦ Short circuit to B+/ground or open circuit in the line
♦ Fault during system self-diagnosis during the starting process

Fault effects
♦ No all-wheel drive function
♦ Fault message in instrument cluster: *all-wheel drive failure, rear-wheel drive only, continued driving possible*

Guided Fault Finding

♦ If the fault code is currently displayed and cannot be deleted, the all-wheel drive control unit is faulty

♦ If the fault code is only stored in the fault memory and can be deleted, no further action is required

Diagnosis information All-wheel final drive

000110 Engine torque Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel control unit (PTM)** Internal function test
- Clutch position loss

Possible fault causes

♦Fault Stop
♦Fault **Travel sensor**
♦Fault Stop Position/s

Guided Fault Finding
♦**Transfer box**

Diagnosis information All-wheel final drive

000111 Plausibility check Servo motor Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel control unit (PTM)** Internal function test
- Clutch position loss

Possible fault causes

♦Fault Stop
♦Fault **Travel sensor**
♦Fault Stop Position/s

Guided Fault Finding
♦Control unit faulty
♦**Transfer box**

Diagnosis information All-wheel final drive

000112 Armature resistance Servo motor Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel control unit (PTM)** Internal function test

Possible fault causes

♦ Armature circuit resistance Signal implausible

Guided Fault Finding
♦Control unit faulty

Diagnosis information All-wheel final drive

000113 Calibration Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel control unit (PTM)** Internal function test

Possible fault causes

♦ Mechanical or electrical fault during initial calibration

Guided Fault Finding
♦ Drive link test Forced calibration perform
♦ Drive link test Faulty **Transfer box** Faulty

Diagnosis information All-wheel final drive

000114 Transfer box End of life reached

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel control unit (PTM)** Internal function test

Possible fault causes

♦ Detection of a disc packet at max. wear limit

Guided Fault Finding
♦ **Transfer box** Faulty

Diagnosis information All-wheel final drive

000115 Classification Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel control unit (PTM)** Internal function test

Possible fault causes

♦ Fault in area Commissioning

Guided Fault Finding
♦ Perform control unit commissioning procedure under Maintenance/repairs

Diagnostic information - all-wheel final drive

000116 Offset compensation faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 9 V ... 16 V
- Ignition on
- **All-wheel drive control unit (PTM)** internal function test

Possible fault causes

♦ Fault in determining the offset current in the control unit.

Fault effects

- No all-wheel drive function

Diagnostic information - all-wheel final drive

000117 Service life, all-wheel drive

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 9 V ... 16 V
- Ignition on
- **All-wheel drive control unit (PTM)** internal function test

Possible fault causes

♦ End of the design service life of the **all-wheel drive control unit (PTM)**

Fault finding information

- Replace **all-wheel drive control unit (PTM)**

Diagnostic information - all-wheel final drive

000118 Control unit temperature - above limit value

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 9 V ... 16 V
- Ignition on
- **All-wheel drive control unit (PTM)** internal function test

Possible fault causes

♦ Overtemperature of **all-wheel drive control unit (PTM)**

Fault finding information

- Allow **all-wheel drive control unit (PTM)** to cool down

Diagnostic information - all-wheel final drive

000120/000119/000118 Clutch temperature sensor

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel drive control unit (PTM)** internal function test
- **Clutch** open

Possible fault causes

♦ Overtemperature
♦ Corrosion on all-wheel drive servo motor plug connection

Fault effects

- For P000118 + P000119 Control unit overtemperature fault
=> Check wheel speed sensors => Control unit faulty
- In case of U000120 **Clutch** open, no function of all-wheel final drive
=> Check wheel speed sensors => Control unit faulty

Diagnostic information - all-wheel final drive

000120/000119/000118 Clutch temperature sensor

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel drive control unit (PTM)** internal function test
- **Clutch** open

Possible fault causes

♦ Overtemperature
♦ Corrosion on all-wheel drive servo motor plug connection

Fault effects

- For P000118 + P000119 Control unit overtemperature fault
=> Check wheel speed sensors => Control unit faulty
- In case of U000120 **Clutch** open, no function of all-wheel final drive
=> Check wheel speed sensors => Control unit faulty

Diagnosis information All-wheel final drive

U000121 Oil service life reached

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

► Oil change to Workshop Manual perform

000122

ⓘ INFORMATION

No information is available at present for this fault code.

Please contact your importer if necessary.

Diagnosis information All-wheel final drive

Power supply

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test

Fault setting condition(s)

- Voltage drop below Threshold (5V)
- **Supply voltage** Too high
- **Supply voltage** too low

Possible fault causes

- Signal implausible
- **Supply voltage** Battery

Fault effects

- No all-wheel drive function

Diagnosis information All-wheel final drive

Power supply

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test

Fault setting condition(s)

- Voltage drop below Threshold (5V)
- **Supply voltage** Too high
- **Supply voltage** too low

Possible fault causes

- Signal implausible
- **Supply voltage** Battery

Fault effects

- No all-wheel drive function

Diagnosis information - All-wheel drive

PSM activation by All-wheel drive

ⓘ INFORMATION

This entry in the fault memory is used only for information purposes.
It is stored in order to be able to follow the behaviour of the vehicle/control unit.

♦ The reason for PSM activation is also stored in the All-wheel drive fault memory.
► Follow the description for the fault that caused PSM activation.

♦ If no other faults are stored in the All-wheel drive fault memory, check to see if a clutch class was coded.
► See Actual values ▶ A_General ▶ A60_Offset class, transfer gear
ⓘ Required offset class = same letter as on the final-drive housing of the front axle
► See Actual values ▶ A_General ▶ A90_Offset, transfer gear
ⓘ Required Increasing class = same letter as on the final-drive housing of the front axle

► If actual value = >no class<, then:
► Enter the clutch class using the PIWIS Tester
▶ Drive links/checks ▶ Set classification memory

Diagnostic conditions

• Ignition on

Fault setting condition(s)

♦ Faulty All-wheel drive, or an operating state that requires protection for the All-wheel drive.

Fault effects

♦ PSM was forcibly switched on by the All-wheel drive control unit.
♦ For documentation purposes, this is stored in the fault memory when the fault occurs.
♦ This switch-on request is also set if PSM was not switched off.
♦ It is only cancelled again if the engine was restarted and the ca use of the fault is no longer present.

Diagnostic information - all-wheel final drive

001001 Invalid control-unit signal

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 9 V ... 16 V
- Ignition on
- **All-wheel drive control unit (PTM)** internal function test

Possible fault causes

♦ Violation of the signal value range

Fault finding information

- This is a note
- No action is necessary
- Check **all-wheel drive control unit (PTM)** for further faults

Diagnosis information All-wheel final drive

Power supply

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test

Fault setting condition(s)

- Voltage drop below Threshold (5V)
- **Supply voltage** Too high
- **Supply voltage** too low

Possible fault causes

- Signal implausible
- **Supply voltage** Battery

Fault effects

- No all-wheel drive function

Diagnosis information All-wheel final drive

Power supply

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test

Fault setting condition(s)

- Voltage drop below Threshold (5V)
- **Supply voltage** Too high
- **Supply voltage** too low

Possible fault causes

- Signal implausible
- **Supply voltage** Battery

Fault effects

- No all-wheel drive function

Diagnosis information All-wheel final drive

011002/011003 Temperature lower limit value / upper limit value implausible

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test

Possible fault causes

- Overtemperature
- Signal implausible

Fault effects

- No all-wheel drive function

Guided Fault Finding
♦Control unit faulty

Diagnosis information All-wheel final drive

011002/011003 Temperature lower limit value / upper limit value implausible

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test

Possible fault causes

- Overtemperature
- Signal implausible

Fault effects

- No all-wheel drive function

Guided Fault Finding
♦Control unit faulty

Diagnostic information - all-wheel final drive

C11004 Data record

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 9 V ... 16 V
- Ignition on
- **All-wheel drive control unit (PTM)** internal function test

Possible fault causes

♦ **All-wheel drive control unit (PTM)** incorrectly coded or not coded

Diagnostic information - overall all-wheel drive system

C11005 Function restriction

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel drive control unit (PTM)** internal function test

Possible fault causes

♦ Corrosion on all-wheel drive servo motor plug connection
♦ Fault in monitoring of the overall system
♦ Timeout in the stop tests
♦ Broken mechanism suspected due to angle monitoring

Guided Fault Finding

♦ Check all-wheel drive servo motor plug connection for corrosion or damage
♦ If the plug connection is OK, the all-wheel drive control unit (PTM) is faulty and must be replaced.

Fault effects

- No all-wheel drive function
- PSM is activated by the all-wheel drive control unit (PTM)

Diagnosis information All-wheel final drive

U011006 Version coding Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 9 V ... 16 V
- Ignition on
- **All-wheel control unit (PTM)** Internal function test

Possible fault causes

♦ **Vehicle type** incorrectly coded or not coded

Diagnosis information All-wheel final drive

000113 Calibration Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **All-wheel control unit (PTM)** Internal function test

Possible fault causes

♦ Mechanical or electrical fault during initial calibration

Guided Fault Finding
♦ Drive link test Forced calibration perform
♦ Drive link test Faulty **Transfer box** Faulty

Diagnosis information - PDCC control unit

Vehicle different VIN

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ **PDCC control unit** off from a different Vehicle installed

Fault effects

♦ Limited function

Diagnosis information - PDCC control unit

Control module PDCC Faulty

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

- Incorrect interpretation in the **Control module**
- **Control module** PDCC Faulty

Fault effects

- Limited function

Diagnosis information - PDCC control unit

Unexpected system reset

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

- Incorrect fastening of the **Control module** PDCC
- Short Power supply Open circuit

Fault effects

- Limited function

Diagnosis information - PDCC control unit

Control module PDCC Faulty

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

- Incorrect interpretation in the **Control module**
- **Control module** PDCC Faulty

Fault effects

- Limited function

Diagnosis information - PDCC control unit

Power supply Control module

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ Overvoltage (>16.5V) for longer than 30 s
♦ Undervoltage (< 9.5V) present for longer than 30 s
Terminal 15 or Terminal 30
♦ **Control module** Faulty

Fault effects

♦ Limited function

Diagnosis information - PDCC control unit

Power supply Control module

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ Overvoltage (>16.5V) for longer than 30 s
♦ Undervoltage (< 9.5V) present for longer than 30 s
Terminal 15 or Terminal 30
♦ **Control module** Faulty

Fault effects

♦ Limited function

Diagnosis information - PDCC control unit

Pressure sensor

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Engine running

Possible fault causes

- Short circuit to B+/ground or open circuit in the line
- **Valve block** Faulty
- **Control module** PDCC Faulty
- Pressure Outside the valid value range

Fault effects

- No function

Diagnosis information - PDCC control unit

Pressure sensor

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Engine running

Possible fault causes

- Short circuit to B+/ground or open circuit in the line
- **Valve block** Faulty
- **Control module** PDCC Faulty
- Pressure Outside the valid value range

Fault effects

- No function

Diagnosis information - PDCC control unit

Pressure sensor

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Engine running

Possible fault causes

- Short circuit to B+/ground or open circuit in the line
- **Valve block** Faulty
- **Control module** PDCC Faulty
- Pressure Outside the valid value range

Fault effects

- No function

Diagnosis information - PDCC control unit

Pressure sensor

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Engine running

- Short circuit to B+/ground or open circuit in the line
- **Valve block** Faulty
- **Control module** PDCC Faulty
- Pressure Outside the valid value range

Fault effects

- No function

Diagnosis information - PDCC control unit

Pressure sensor

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Engine running

Possible fault causes

- Short circuit to B+/ground or open circuit in the line
- **Valve block** Faulty
- **Control module** PDCC Faulty
- Pressure Outside the valid value range

Fault effects

- No function

Diagnosis information - PDCC control unit

Pressure sensor

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Engine running

Possible fault causes

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

- while driving

Possible fault causes

- Short circuit to B+/ground/between lines or open circuit in the lines of the **Valve block**
- Pressure valve Faulty
- **Pressure sensor** Front axle chamber 1 Faulty
- **Pressure sensor** Front axle chamber 2 Faulty

Fault effects

- No function

Diagnosis information - PDCC control unit

Valve block FA

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

- while driving

Possible fault causes

- Short circuit to B+/ground/between lines or open circuit in the lines of the **Valve block**
- Pressure valve Faulty
- **Pressure sensor** Front axle chamber 1 Faulty
- **Pressure sensor** Front axle chamber 2 Faulty

Fault effects

- No function

Diagnosis information - PDCC control unit

Valve block FA

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

- while driving

Possible fault causes

- Short circuit to B+/ground/between lines or open circuit in the lines of the **Valve block**
- Pressure valve Faulty
- **Pressure sensor** Front axle chamber 1 Faulty
- **Pressure sensor** Front axle chamber 2 Faulty

Fault effects

- No function

Diagnosis information - PDCC control unit

Control module PDCC Faulty

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

- Incorrect interpretation in the **Control module**
- **Control module** PDCC Faulty

Fault effects

- Limited function

Diagnosis information - PDCC control unit

Control module PDCC Faulty

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

- Incorrect interpretation in the **Control module**
- **Control module** PDCC Faulty

Fault effects

- Limited function

Diagnosis information - PDCC control unit

Valve block RA

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

- while driving

Possible fault causes

- Short circuit to B+/ground/between lines or open circuit in the lines of the **Valve block**
- Pressure valve Faulty
- **Pressure sensor** Rear axle chamber 1 Faulty
- **Pressure sensor** Rear axle chamber 2 Faulty

Fault effects

- No function

Diagnosis information - PDCC control unit

Valve block RA

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

- while driving

Possible fault causes

- Short circuit to B+/ground/between lines or open circuit in the lines of the **Valve block**
- Pressure valve Faulty
- **Pressure sensor** Rear axle chamber 1 Faulty
- **Pressure sensor** Rear axle chamber 2 Faulty

Fault effects

- No function

000232

Diagnosis information - PDCC control unit

Valve block RA

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

- while driving

Possible fault causes

- Short circuit to B+/ground/between lines or open circuit in the lines of the **Valve block**
- Pressure valve Faulty
- **Pressure sensor** Rear axle chamber 1 Faulty

Hydraulic system Fault read in again

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ **Hydraulic system** Fault was read in again after delete .

Fault effects

♦ No function

Diagnosis information - PDCC control unit

Pressure build-up **Front axle** insufficient

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

- while driving

Possible fault causes

- **Hydraulic pump** failure
- **Valve block Front axle** Faulty
- Hydraulic fluid too low
- **Pivoting motor Front axle** Mechanical fault
- **Front anti-roll bar** Mechanical fault
- **Power distributor** Faulty

Fault effects

- No function

001002

Diagnosis information - PDCC control unit

Pressure build-up Rear axle insufficient

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

- while driving

Possible fault causes

- **Hydraulic pump** failure
- **Valve block** Rear axle Faulty
- Hydraulic fluid too low
- **Pivoting motor** Rear axle Mechanical fault
- **Rear anti-roll bar** Mechanical fault
- **Power distributor** Faulty

Fault effects

- No function

Diagnosis information - PDCC control unit

Pressure build-up **Front axle** insufficient

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

- while driving

Possible fault causes

- **Hydraulic pump** failure
- **Valve block Front axle** Faulty
- Hydraulic fluid too low
- **Pivoting motor Front axle** Mechanical fault
- **Front anti-roll bar** Mechanical fault
- **Power distributor** Faulty

Fault effects

- No function

Diagnosis information - PDCC control unit

Pressure relief valve

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Engine running

permissible roll angle exceeded

NOTE
The fault code is >present< only when the engine is running or when the vehicle is being driven.

Diagnostic conditions

- while driving

Possible fault causes

- Values Vehicle level , **Body acceleration sensor** , **Lateral-acceleration sensor**, **Sensor** Steering angle and **Vehicle speed** for plausibility Check
- **Pivoting motor** front axle or **Pivoting motor** rear axle Mechanical fault
- in the following **Control module** , Fault can be present:
  - **PSM control module**
  - **Steering wheel electronics control module**

Fault effects

- No function

Diagnosis information - PDCC control unit

Low-pressure test Rear axle : Pressure too high

Diagnostic conditions

- Low-pressure test performed

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ **Pressure valve** Rear axle
♦ **Pressure sensor** Chamber 1
♦ **Pressure sensor** Chamber 2

Diagnosis information - PDCC control unit

Low-pressure test Rear axle : Pressure too low

Diagnostic conditions

- Low-pressure test performed

Possible fault causes

- Short circuit to B+/ground/between lines or open circuit in the lines
- **Pressure valve** Rear axle
- **Pressure sensor** Chamber 1
- **Pressure sensor** Chamber 2
- **Hydraulic pump** Faulty
- **Pivoting motor** Mechanical fault

001202

Diagnosis information - PDCC control unit

Low-pressure test **Front axle** : Pressure too high

Diagnostic conditions

- Low-pressure test performed

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ **Pressure valve Front axle**
♦ **Pressure sensor** Chamber 1
♦ **Pressure sensor** Chamber 2

Diagnosis information - PDCC control unit

Low-pressure test **Front axle** : Pressure too low
Diagnostic conditions

- Low-pressure test performed

Possible fault causes

- Short circuit to B+/ground/between lines or open circuit in the lines
- **Pressure valve Front axle**
- **Pressure sensor** Chamber 1
- **Pressure sensor** Chamber 2
- **Hydraulic pump** Faulty
- **Pivoting motor** Mechanical fault

Diagnosis information - PDCC control unit

Low-pressure test -High-pressure test **Front axle** : **Valve block**

Diagnostic conditions

- Stationary test performed

Possible fault causes

♦ **Pressure sensor** Chamber 1
♦ **Pressure sensor** Chamber 2
♦ **Direction valve Front axle** stuck

Fault effects

♦ Limited function

001205

Diagnosis information - PDCC control unit

Low-pressure test - High-pressure test Rear axle : **Valve block**

Diagnostic conditions

- Stationary test performed

Possible fault causes

♦ **Pressure sensor** Chamber 1
♦ **Pressure sensor** Chamber 2
♦ **Direction valve** Rear axle stuck

Fault effects

♦ Limited function

Diagnosis information - PDCC control unit

High-pressure test not OK

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ High-pressure test was not or not completed without faults.

Fault effects

♦ No function

Diagnosis information - Level control

no or incorrect basic setting/adaptation

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- Initialization not completed

Fault effects

♦ **Level-control control unit (PASM)** No function
♦ Warning light red

Diagnosis information - Level control

Valve Vibration damper

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Vehicle is stationary

Fault setting condition(s)

- Ignition on
- Valve **Vibration damper** off
- Current **Shock absorber strut**
  - ♦ < 0.28 A
  - ♦ > 1.61 A

Fault effects

♦ **Level-control control unit (PASM)** Function restriction
♦ Warning light

Valve Vibration damper

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Vehicle is stationary

Diagnosis information - Level control

Level-control control unit (PASM) - sporadic valve fault

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- The control unit diagnoses electrical faults in the valves of the spring struts or their lines, but cannot assign this fault to any specific spring-strut valve.

⇒ Suspected component: **Level-control control unit (PASM)**

Fault effects

♦ No function restriction for SUV
♦ No function restriction for Panamera from model year E
♦ Red warning message and limp-home mode for Panamera < model year E

- Valve Additional volume off
- Current Valve Additional volume
  - ♦ < 0.28 A
  - ♦ > 1.61 A

Fault effects

♦ **Level-control control unit (PASM)** No function
♦ Warning light red

0001C1

Diagnosis information **- Level control**

Valve Additional volume

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Vehicle is stationary

Fault setting condition(s)

- Ignition on
- Valve Additional volume off
- Current Valve Additional volume
  - ♦ < 0.28 A
  - ♦ > 1.61 A

Fault effects

♦ **Level-control control unit (PASM)** No function
♦ Warning light red

Diagnosis information **- Level control**

Valve Additional volume

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Vehicle is stationary

Fault setting condition(s)

- Ignition on
- Valve Additional volume off

♦ **Level-control control unit (PASM)** Function restriction
♦ Warning light

Diagnosis information - Level control

Vent solenoid valve

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Vehicle is stationary

Fault setting condition(s)

- Ignition on
- **Vent solenoid valve** off
- Current **Vent solenoid valve**
  - ♦ < 0.28 A
  - ♦ > 1.61 A

Fault effects

♦ **Level-control control unit (PASM)** Function restriction
♦ Warning light

Diagnosis information - Level control

Vent solenoid valve

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Vehicle is stationary

Fault setting condition(s)

- Ignition on
- **Vent solenoid valve** off
- Current **Vent solenoid valve**
  - ♦ < 0.28 A
  - ♦ > 1.61 A

Fault effects

♦ **Level-control control unit (PASM)** Function restriction
♦ Warning light

Diagnostic information - leveling system

Compressor ON time exceeded

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Vehicle standstill

Fault setting condition(s)

- Ignition on
- **Compressor** ON time PWM > 50% for more than 10 min.

Fault effects

♦ **Leveling system control unit (PASM)** does not function

Diagnosis information - Level control

Relay Compressor

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Vehicle is stationary

Fault setting condition(s)

- Ignition on
- Relay **Compressor** to
- Current Relay **Compressor** > 4,34 A

Fault effects

♦ **Level-control control unit (PASM)** Function restriction
♦ Warning light

000210

Diagnosis information **- Level control**

Valve **Vibration damper** ON time exceeded

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Vehicle is stationary

Fault setting condition(s)

- Ignition on
- Valve **Shock absorber strut** ON time PWM > 40% via 10 min

Fault effects

♦ **Level-control control unit (PASM)** No function
♦ Warning light red

000211

Diagnosis information **- Level control**

Valve **Vibration damper** ON time exceeded

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Diagnosis information - Level control

Pressure transmitter Signal lead Short circuit to B+

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Voltage **Pressure transmitter** Signal lead
  - ♦ > 4.75 V

Possible fault causes

- Short circuit to B+ Signal lead **Pressure transmitter**
- Clogged/pinched air line between spring strut and valve block

Fault effects

♦ **Level-control control unit (PASM)** No function
♦ Warning light yellow

Diagnosis information - Level control

Pressure transmitter Signal lead Open circuit, Short circuit to ground

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- Voltage **Body acceleration sensor**
  - ♦ < 0.125V
- Open circuit Signal
- Open circuit Power supply

Fault effects

♦ **Level-control control unit (PASM)** No function
♦ Warning light yellow

Diagnosis information - Level control

Sensor Vehicle level Mechanical fault

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- **Vehicle speed** >7 km/h (4 mph)
- No cornering
- no Inclination
- Distortion detected

►**Connecting link for anti-roll bar** bent

Fault effects

♦ **Level-control control unit (PASM)** No function
♦ Warning light yellow

000263

Diagnosis information - Level control

Vehicle Inclination , Mechanical fault

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- **Vehicle speed** >7 km/h (4 mph)
- Measured value : **Front axle** > Rear axle or
  Rear axle > **Front axle**

Signal **Door**

NOTE
The Signal **Door** / Rear lid comes from **Rear-end electronics**

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- Short circuit to B+/ground or open circuit in the line

Fault effects

♦ **Level-control control unit (PASM)** No function

000268

Diagnosis information - Level control

Signal **Door**

NOTE
The Signal **Door** / Rear lid comes from **Rear-end electronics**

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- Short circuit to B+/ground or open circuit in the line

Fault effects

♦ **Level-control control unit (PASM)** No function

000270

Diagnosis information **- Level control**

Transport mode Active

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- Transport mode Active

Fault effects

♦ **Level-control control unit (PASM)** No function

Diagnosis information - Level control

Body acceleration sensor Implausible signal

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- no Vehicle is stationary
- no movement Signal **Body acceleration sensor**

Fault effects

- **Level-control control unit (PASM)** No function
- Warning light yellow

Diagnosis information - Level control

Body acceleration sensor Implausible signal

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- no Vehicle is stationary
- no movement Signal **Body acceleration sensor**

Fault effects

♦ **Level-control control unit (PASM)** No function
♦ Warning light yellow

Diagnosis information - Level control

Body acceleration sensor Implausible signal

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- no Vehicle is stationary
- no movement Signal **Body acceleration sensor**

Fault effects

♦ **Level-control control unit (PASM)** No function
♦ Warning light yellow

Diagnosis information - Level control

Power supply

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- **Supply voltage** at least 30 Second(s) < 10 V (C11000)
- **Supply voltage** at least 30 Second(s) > 16 V (C11001)
- **Supply voltage** briefly > 16 V or < 10 V (000274)

for G1 as of model year E:
- **Supply voltage** at least 60 Second(s) < 10 V (C11000)
- **Supply voltage** at least 60 Second(s) > 16 V (C11001)
- **Supply voltage** briefly > 16 V or < 10 V (000274)

Fault effects

♦ Level control not possible

000275

Diagnosis information - Level control

Sensor Vehicle level Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Signal **Sensor** Vehicle level f > 1,000 Hz

Fault effects

♦**Level-control control unit (PASM)** Limp-home 1 or 7 (in case of failure of several sensor signals)
♦Warning light yellow (emergency mode 1)
♦Warning light red (emergency mode 7)

Possible fault causes

- Signal lead **Sensor** Vehicle level Short circuit to B+
- **Sensor** Vehicle level Faulty

000276

Diagnosis information - Level control

Sensor Vehicle level Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- **Sensor** Vehicle level
  f < 588 Hz
- **Sensor** Vehicle level Faulty

Fault effects

- **Level-control control unit (PASM)** No function
- Warning light yellow

000277

Diagnosis information - Level control

Sensor Vehicle level Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Signal **Sensor** Vehicle level f > 1,000 Hz

Fault effects

♦**Level-control control unit (PASM)** Limp-home 1 or 7 (in case of failure of several sensor signals)
♦Warning light yellow (emergency mode 1)
♦Warning light red (emergency mode 7)

Possible fault causes

- Signal lead **Sensor** Vehicle level Short circuit to B+
- **Sensor** Vehicle level Faulty

Diagnosis information - Level control

Sensor Vehicle level Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- **Sensor** Vehicle level
  f < 588 Hz
- **Sensor** Vehicle level Faulty

Fault effects

- **Level-control control unit (PASM)** No function
- Warning light yellow

000279

Diagnosis information - Level control

Sensor Vehicle level Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Signal **Sensor** Vehicle level f > 1,000 Hz

Fault effects

♦**Level-control control unit (PASM)** Limp-home 1 or 7 (in case of failure of several sensor signals)
♦Warning light yellow (emergency mode 1)
♦Warning light red (emergency mode 7)

Possible fault causes

- Signal lead **Sensor** Vehicle level Short circuit to B+
- **Sensor** Vehicle level Faulty

Diagnosis information - Level control

Sensor Vehicle level Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- **Sensor** Vehicle level
  f < 588 Hz
- **Sensor** Vehicle level Faulty

Fault effects

- **Level-control control unit (PASM)** No function
- Warning light yellow

00027B

Diagnosis information - Level control

Sensor Vehicle level Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Signal **Sensor** Vehicle level f > 1,000 Hz

Fault effects

♦**Level-control control unit (PASM)** Limp-home 1 or 7 (in case of failure of several sensor signals)
♦Warning light yellow (emergency mode 1)
♦Warning light red (emergency mode 7)

Possible fault causes

- Signal lead **Sensor** Vehicle level Short circuit to B+
- **Sensor** Vehicle level Faulty

Diagnosis information - Level control

Sensor Vehicle level Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- **Sensor** Vehicle level
  f < 588 Hz
- **Sensor** Vehicle level Faulty

Fault effects

♦ **Level-control control unit (PASM)** No function
♦ Warning light yellow

00027D

Diagnosis information **- Level control**

Pressure transmitter Signal implausible

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- Actual pressure not suitable CLOSED Setpoint pressure

Fault effects

♦ **Level-control control unit (PASM)** No function

00027E

Diagnostic information - leveling system

Compressor ON time exceeded

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Vehicle standstill

Fault setting condition(s)

- Ignition on
- **Compressor** ON time PWM > 50% for more than 10 min.

Fault effects

♦ **Leveling system control unit (PASM)** does not function

000280

Diagnosis information **- Level control**

Temperature sensor Compressor Signal lead Open circuit Short circuit to B+

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- Voltage **Temperature sensor Compressor** Signal lead 2.9 V

Fault effects

- **Level-control control unit (PASM)** No function
- Warning light yellow

000281

Diagnosis information **- Level control**

Temperature sensor Compressor Open circuit¸ Short circuit to ground

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- Voltage **Temperature sensor Compressor** 0.10 V

Fault effects

- **Level-control control unit (PASM)** No function
- Warning light yellow

000283

Diagnosis information - Level control

Control position not adjustable, vehicle too high or too low

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- Control position is reached after 12 s not - downward control
- Control position is reached after 25 s not - upward control from accumulator
- Control position is reached after 60 s not - upward control from environment

Fault effects

- **Level control** No level adjustment
- Warning light red
- **Level control** Limp-home 7

Possible fault causes

- Pressure retaining valves, valves in valve block
- Pneumatic lines not connected correctly
- Compressor relay power supply fuse faulty
- Leak in the pneumatic system
- Leak in the compressor (in combination with fault codes 000320 and 000328)

Diagnosis information - Level control

Control position not adjustable, vehicle too high or too low

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- Control position is reached after 12 s not - downward control
- Control position is reached after 25 s not - upward control from accumulator
- Control position is reached after 60 s not - upward control from environment

Fault effects

♦ **Level control** No level adjustment
♦ Warning light red
♦ **Level control** Limp-home 7

Possible fault causes

- Pressure retaining valves, valves in valve block
- Pneumatic lines not connected correctly
- Compressor relay power supply fuse faulty
- Leak in the pneumatic system
- Leak in the compressor (in combination with fault codes 000320 and 000328)

000285

Diagnosis information **- Level control**

Leak in air system **Level control**

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- Leak in air system to 5 x switch-on

Fault effects

♦ **Level-control control unit (PASM)** Limited function
♦ Warning light yellow

Diagnosis information - Level control

Service mode not completed

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Control unit is in diagnostic mode
- Calibration cancelled

Fault effects

♦ **Level control** - Level control deactivated
♦ Warning light red

Measures

- Switch off ignition / Switch on ignition
- Fault memory delete
- If available, perform drive link test >Complete diagnostic session<

Diagnosis information - Level control

Ventilation not possible

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- **Compressor** , **Direction valve** or **Vent solenoid valve** Faulty

Fault effects

- **Level-control control unit (PASM)** No function
- Warning light yellow

Diagnosis information - Level control

System filling not possible

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- **Direction valve** Faulty
- **Compressor** Faulty
- Leaks in the **System**

Fault effects

♦ **Level-control control unit (PASM)** No function
♦ Warning light yellow

Diagnosis information - Level control

Supply voltage too low No function **Level control** in run-on mode

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Battery positive voltage too low

Fault effects

♦No level control in run-on mode

Diagnosis information - Level control

Level control switched off, mode Car jack

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

Mode Car jack manual switched

Fault effects

♦ **Level control** No function

Diagnosis information - Level control

Valve Additional volume Gear change implausible

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- 5 x **ON** Valve Additional volume
- Voltage Valve Additional volume
  < 12.5 V
  > 14.5 V

Fault effects

♦ **Level-control control unit (PASM)** No function
♦ Warning light red

Diagnosis information - Level control

Valve Additional volume Gear change implausible

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- 5 x **ON** Valve Additional volume
- Voltage Valve Additional volume
  < 12.5 V
  > 14.5 V

Fault effects

♦ **Level-control control unit (PASM)** No function
♦ Warning light red

Diagnosis information - Level control

Valve Additional volume Gear change implausible

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- 5 x **ON** Valve Additional volume
- Voltage Valve Additional volume
  < 12.5 V
  > 14.5 V

Fault effects

♦ **Level-control control unit (PASM)** No function
♦ Warning light red

Diagnosis information - Level control

Valve Additional volume Gear change implausible

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- 5 x **ON** Valve Additional volume
- Voltage Valve Additional volume
  < 12.5 V
  > 14.5 V

Fault effects

♦ **Level-control control unit (PASM)** No function
♦ Warning light red

Diagnosis information - Level control

Level control implausible

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- Engine running

- **Door** and **Cover** Closed
- **Level control** Active

Level control from ► Vehicle not lowering
Level control Open ► Vehicle not lifting

Fault effects

♦ **Level-control control unit (PASM)** No function
♦ Yellow warning message in instrument cluster

Possible fault causes

- Pneumatic lines connected incorrectly
- Leak in the compressor (in combination with fault codes 000284 and 000328)
- Faulty fuse for compressor relay supply
- Faulty compressor relay

Diagnosis information - Level control

Supply voltage continuously too low

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

für G1 bis Modelljahr D:
● 5 x Fault code 000274 in **Level-control control unit (PASM)**

for all other model lines and models:
● 10 x Fault code 000274 in **Level-control control unit (PASM)**

Fault effects

♦ Limited function **PASM control module**

♦ for G1 as of model year E: Warning light yellow
♦ for all other model lines and models: Warning light red

Diagnosis information - Level control

Sensor Vehicle level Outside the valid value range

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on

for G1:
- Signal from >70% Open <30% or from <30% Open >70%

for all other model lines and models:
- Signal from >90% Open <10% or from <10% Open >90%

Fault effects

Fault effects

♦ **Level-control control unit (PASM)** No function , Limited function
♦ Warning light yellow

Diagnosis information - Level control

Compressor Leak

For vehicles with chassis numbers:

970: xxx-xxx
92A: xxx-xxx

simultaneous occurrence of the fault memory entries:

- 000284 Control position not adjustable, vehicle too high or too low
- 000320 Level control implausible
- 000328 System air quantity too low

requires that the ideal power supply and activation of the compressor must be ensured.

Tests:

- Fuse, compressor PASM / LF
- Relay, compressor PASM / LF
- Wiring, compressor PASM / LF

If no function restriction can be determined,
a leak in the compressor unit must be assumed and it must be replaced.

Diagnosis information - Level control

System air quantity too low

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- System air quantity below the nominal filling quantity

Fault effects

♦ **Level-control control unit (PASM)** No function

Possible fault causes

- Leak in the pneumatic system
- Stuck bypass valve
- Leak in the compressor (in combination with fault codes 000284 and 000320)

Diagnostic information - level control

Extreme level reached; vehicle too high/too low

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- At least 3 level sensors must function without faults

Possible fault causes

♦ One axle is higher/lower than the defined height limit

Fault 000334 (vehicle too high) is set if the following deviation from normal level is measured:
Front axle: > 50 mm (2 inches)
Rear axle: > 50 mm (2 inches)

Fault 000335 (vehicle too low) is set if the following deviation from normal level is measured:
Front axle: < -60 mm (-2.4 inches)
Rear axle: < -60 mm (-2.4 inches)

ⓘ An extreme level can also result from an air spring system filling process, for example.
► To correct to normal level, perform the "height sensor component test" procedure under "Maintenance/repairs" in vehicle diagnostics.

Fault effects

♦ Warning light red

Setpoints

The faults for extreme-level detection are set to passive as soon as the measured values lie within the tolerance and are simultaneously at least 10 mm (0.4 inch) away from the respective limit value:
000334: Front axle/rear axle < 40 mm (1.6 inches)
000335: Front axle/rear axle > -50 mm (-2 inches)

Diagnostic information - level control

Extreme level reached; vehicle too high/too low

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- At least 3 level sensors must function without faults

Possible fault causes

♦ One axle is higher/lower than the defined height limit

Fault 000334 (vehicle too high) is set if the following deviation from normal level is measured:
Front axle: > 50 mm (2 inches)
Rear axle: > 50 mm (2 inches)

Fault 000335 (vehicle too low) is set if the following deviation from normal level is measured:
Front axle: < -60 mm (-2.4 inches)
Rear axle: < -60 mm (-2.4 inches)

ⓘ An extreme level can also result from an air spring system filling process, for example.
► To correct to normal level, perform the "height sensor component test" procedure under "Maintenance/repairs" in vehicle diagnostics.

Fault effects

♦ Warning light red

Setpoints

000344

Diagnosis information - Level-control control unit (PASM)

Switch Loading aid - LED electrical fault

Diagnostic conditions

- Ignition on

Fault setting condition(s)

- Short circuit to B+/ground/between lines or open circuit in the lines
- Switch Loading aid Faulty

Fault effects

- Limited function Switch Loading aid

Nominal values Line test

Short circuit to B+ :

♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground :

♦ Setpoint resistance **> 0.9 MOhm**

Open circuit :

♦ Setpoint resistance **< 2 Ohm**

Diagnosis information - Level-control control unit (PASM)

Switch Loading aid - LED electrical fault

Diagnostic conditions

- Ignition on

Fault setting condition(s)

- Short circuit to B+/ground/between lines or open circuit in the lines
- Switch Loading aid Faulty

Fault effects

- Limited function Switch Loading aid

Nominal values Line test

Short circuit to B+ :

♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground :

♦ Setpoint resistance **> 0.9 MOhm**

Open circuit :

♦ Setpoint resistance **< 2 Ohm**

000346

Diagnosis information - Level-control control unit (PASM)

Switch Loading aid - LED electrical fault

Diagnostic conditions

- Ignition on

Fault setting condition(s)

- Short circuit to B+/ground/between lines or open circuit in the lines
- Switch Loading aid Faulty

Fault effects

- Limited function Switch Loading aid

Nominal values Line test

Short circuit to B+ :

♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground :

♦ Setpoint resistance **> 0.9 MOhm**

Open circuit :

♦ Setpoint resistance **< 2 Ohm**

000347

Diagnosis information - Level-control control unit (PASM)

Switch Loading aid - Electrical fault

Diagnostic conditions

- Ignition on

Fault setting condition(s)

- Short circuit to ground
- Signal implausible (only redundant switch contact is enabled or lifting/lowering without redundant switch contact is enabled, see wiring diagram)
- Switch Loading aid actuated continuously (stuck or actuated for > 60 s)
- Switch Loading aid Faulty

Fault effects

- Limited function Switch Loading aid

Nominal values Line test

Short circuit to B+ :
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground :
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit :
♦ Setpoint resistance **< 2 Ohm**

000352

Diagnosis information - Level-control control unit (PASM)

Vehicle Identification Number (VIN) implausible

Diagnostic conditions

♦ Ignition on

Possible fault causes

♦ **Level-control control unit (PASM)** off for a different Vehicle installed

Fault effects

♦ Limited function

000353

ⓘ INFORMATION

No information is available at present for this fault code.

Please contact your importer if necessary.

Diagnosis information - Level control

Power supply

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- **Supply voltage** at least 30 Second(s) < 10 V (C11000)
- **Supply voltage** at least 30 Second(s) > 16 V (C11001)
- **Supply voltage** briefly > 16 V or < 10 V (000274)

for G1 as of model year E:
- **Supply voltage** at least 60 Second(s) < 10 V (C11000)
- **Supply voltage** at least 60 Second(s) > 16 V (C11001)
- **Supply voltage** briefly > 16 V or < 10 V (000274)

Fault effects

♦ Level control not possible

Diagnosis information - Level control

Power supply

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- **Supply voltage** at least 30 Second(s) < 10 V (C11000)
- **Supply voltage** at least 30 Second(s) > 16 V (C11001)
- **Supply voltage** briefly > 16 V or < 10 V (000274)

for G1 as of model year E:
- **Supply voltage** at least 60 Second(s) < 10 V (C11000)
- **Supply voltage** at least 60 Second(s) > 16 V (C11001)
- **Supply voltage** briefly > 16 V or < 10 V (000274)

Fault effects

♦ Level control not possible

C11005

Diagnosis information **- Level control**

Control module Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on

Fault effects

♦ **Level-control control unit (PASM)** No function

C11006

Diagnosis information - Level-control control unit (PASM)

Control module not coded

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ **Level-control control unit (PASM) not coded**

Fault effects

♦ Limited function

C11007

Diagnosis information - Level-control control unit (PASM)

Control module Calibration

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ **Level-control control unit (PASM)** Calibration incorrect or not carried out

Fault effects

♦ Limited function

C11008

Diagnosis information - Tire pressure monitoring system control module

Production mode Active

Diagnostic conditions

- Ignition on

Possible fault causes

♦ Production mode Active

Fault setting condition(s)

- Production mode Active switched

800302

Diagnosis information - Tire pressure monitoring system control module

Data record **Instrument cluster** implausible

Diagnostic conditions

● Wheel set selection performed / Modification loading

Possible fault causes

● Setpoint pressure **Instrument cluster** implausible :
Outside the valid value range (**1.7** ... **5.1** bar)
● Setpoint pressure **Instrument cluster** not present

ⓘ This fault indicates an incorrect data record in the instrument cluster or an instrument cluster with incorrect parameter assignment.

Fault effects

♦ none or Limited function

Diagnosis information - Tire pressure monitoring system control module

Pressure warning - Minimum pressure for Race track mode below limit

Diagnostic conditions

- Ignition on
- Monitoring Active (e.g. while driving)
- If monitoring is not active (e.g. after an extended period of non-use), setting of the fault entry after occurrence of the fault cause can take up to 2 minutes.
- Selection Race track mode **Instrument cluster**

Possible fault causes

- Minimum pressure for Race track mode below limit (Tyre pressure < 1.8 bar)

Fault effects

♦ Warning light **Tire Pressure Monitoring (TPM)**
♦ Monitoring still Active

Diagnosis information - Tire pressure monitoring system control module

Fault during Learning phase

Diagnostic conditions

- Wheel set selection **Instrument cluster**
- teaching while driving / during Vehicle is stationary

Possible fault causes

- Wheels not detected or not detected as own wheels (less than 4 wheel IDs are received)
- Too many different wheel electronics units are sending data (more than 4 wheel IDs are received)
- The wheel electronics are not allocated to the respective wheel position within the learning phase of 9 minutes. (No direction of rotation detected, insufficient signal strength on the left/right side of the vehicle, faulty wheel electronics)

Fault effects

♦ Learning phase not completed / none **Tire Pressure Monitoring (TPM)**

Diagnosis information - Tire pressure monitoring system control module

Fault during Learning phase

Diagnostic conditions

- Wheel set selection **Instrument cluster**
- teaching while driving / during Vehicle is stationary

Possible fault causes

- Wheels not detected or not detected as own wheels (less than 4 wheel IDs are received)
- Too many different wheel electronics units are sending data (more than 4 wheel IDs are received)
- The wheel electronics are not allocated to the respective wheel position within the learning phase of 9 minutes. (No direction of rotation detected, insufficient signal strength on the left/right side of the vehicle, faulty wheel electronics)

Fault effects

♦ Learning phase not completed / none **Tire Pressure Monitoring (TPM)**

Diagnosis information - Tire pressure monitoring system control module

Fault during Learning phase

Fault effects

♦ Learning phase not completed / none **Tire Pressure Monitoring (TPM)**

Diagnosis information - Tire pressure monitoring system control module

Wheel electronics Faulty

NOTE
Pollution of the environment if wheel electronics are not disposed of correctly.
♦ Wheel electronics contain batteries with lithium thionyl chloride.
♦ Do not disposed of these batteries in normal trash (see Environment Manual).
♦ Used or faulty wheel electronics must be brought to the specified return centers for batteries.

Diagnostic conditions

● while driving

Possible fault causes

● **Wheel electronics** Faulty

NOTE
If **all 4 wheel electronics** are entered as a fault code, the cause may be a fault in the **TPM control unit**.

Fault effects

♦ No monitoring of the tire pressure for the affected wheel
♦ Warning light **Tire Pressure Monitoring (TPM)**

Diagnosis information - Tire pressure monitoring system control module

Wheel electronics - no Signal

NOTE
Pollution of the environment if wheel electronics are not disposed of correctly.
♦ Wheel electronics contain batteries with lithium thionyl chloride.
♦ Do not disposed of these batteries in normal trash (see Environment Manual).
♦ Used or faulty wheel electronics must be brought to the specified return centers for batteries.

Diagnostic conditions

- Ignition on
- while driving , After a waiting time of approx. **10 min**

Possible fault causes

- none **Wheel electronics** installed
- incorrect component(s) **Wheel electronics** installed
- **Wheel electronics** Faulty

NOTE
If **all 4 wheel electronics** are entered as a fault code, the cause may be a fault in the **TPM control unit**.

Fault effects

♦ No monitoring of the tire pressure for the affected wheel
♦ Warning light **Tire Pressure Monitoring (TPM)**

Diagnosis information - Tire pressure monitoring system control module

Wheel electronics - Overtemperature

NOTE
Pollution of the environment if wheel electronics are not disposed of correctly.
♦ Wheel electronics contain batteries with lithium thionyl chloride.
♦ Do not disposed of these batteries in normal trash (see Environment Manual).
♦ Used or faulty wheel electronics must be brought to the specified return centers for batteries.

Diagnostic conditions

● while driving

Possible fault causes

● **Temperature Wheel electronics** > 120 °C (°F) (reversible)
● **Wheel electronics** Faulty

Fault effects

♦ No monitoring of the tire pressure for the affected wheel

Diagnosis information - Tire pressure monitoring system control module

Wheel electronics Faulty

NOTE

Pollution of the environment if wheel electronics are not disposed of correctly.

- ♦ Wheel electronics contain batteries with lithium thionyl chloride.
- ♦ Do not disposed of these batteries in normal trash (see Environment Manual).
- ♦ Used or faulty wheel electronics must be brought to the specified return centers for batteries.

Diagnostic conditions

- while driving

Possible fault causes

- **Wheel electronics** Faulty

NOTE

If **all 4 wheel electronics** are entered as a fault code, the cause may be a fault in the **TPM control unit**.

Fault effects

- ♦ No monitoring of the tire pressure for the affected wheel
- ♦ Warning light **Tire Pressure Monitoring (TPM)**

Diagnosis information - Tire pressure monitoring system control module

Wheel electronics - no Signal

NOTE

Pollution of the environment if wheel electronics are not disposed of correctly.

- ♦ Wheel electronics contain batteries with lithium thionyl chloride.
- ♦ Do not disposed of these batteries in normal trash (see Environment Manual).
- ♦ Used or faulty wheel electronics must be brought to the specified return centers for batteries.

Diagnostic conditions

- Ignition on
- while driving , After a waiting time of approx. **10 min**

Possible fault causes

- none **Wheel electronics** installed
- incorrect component(s) **Wheel electronics** installed
- **Wheel electronics** Faulty

NOTE

If **all 4 wheel electronics** are entered as a fault code, the cause may be a fault in the **TPM control unit**.

Fault effects

- ♦ No monitoring of the tire pressure for the affected wheel
- ♦ Warning light **Tire Pressure Monitoring (TPM)**

Diagnosis information - Tire pressure monitoring system control module

Wheel electronics - Overtemperature

NOTE
Pollution of the environment if wheel electronics are not disposed of correctly.
♦ Wheel electronics contain batteries with lithium thionyl chloride.
♦ Do not disposed of these batteries in normal trash (see Environment Manual).
♦ Used or faulty wheel electronics must be brought to the specified return centers for batteries.

Diagnostic conditions

● while driving

Possible fault causes

● **Temperature Wheel electronics** > 120 °C (°F) (reversible)
● **Wheel electronics** Faulty

Fault effects

♦ No monitoring of the tire pressure for the affected wheel

Diagnosis information - Tire pressure monitoring system control module

Wheel electronics Faulty

NOTE
Pollution of the environment if wheel electronics are not disposed of correctly.
♦ Wheel electronics contain batteries with lithium thionyl chloride.
♦ Do not disposed of these batteries in normal trash (see Environment Manual).
♦ Used or faulty wheel electronics must be brought to the specified return centers for batteries.

Diagnostic conditions

● while driving

Possible fault causes

● **Wheel electronics** Faulty

NOTE
If **all 4 wheel electronics** are entered as a fault code, the cause may be a fault in the **TPM control unit**.

Fault effects

♦ No monitoring of the tire pressure for the affected wheel
♦ Warning light **Tire Pressure Monitoring (TPM)**

Diagnosis information - Tire pressure monitoring system control module

Wheel electronics - no Signal

NOTE

Pollution of the environment if wheel electronics are not disposed of correctly.

♦ Wheel electronics contain batteries with lithium thionyl chloride.
♦ Do not disposed of these batteries in normal trash (see Environment Manual).
♦ Used or faulty wheel electronics must be brought to the specified return centers for batteries.

Diagnostic conditions

- Ignition on
- while driving , After a waiting time of approx. **10 min**

Possible fault causes

- none **Wheel electronics** installed

Fault effects

♦ No monitoring of the tire pressure for the affected wheel
♦ Warning light **Tire Pressure Monitoring (TPM)**

Diagnosis information - Tire pressure monitoring system control module

Wheel electronics - Overtemperature

NOTE
Pollution of the environment if wheel electronics are not disposed of correctly.
♦ Wheel electronics contain batteries with lithium thionyl chloride.
♦ Do not disposed of these batteries in normal trash (see Environment Manual).
♦ Used or faulty wheel electronics must be brought to the specified return centers for batteries.

Diagnostic conditions

● while driving

Possible fault causes

● **Temperature Wheel electronics** > 120 °C (°F) (reversible)
● **Wheel electronics** Faulty

Fault effects

♦ No monitoring of the tire pressure for the affected wheel

Diagnosis information - Tire pressure monitoring system control module

Pressure warning - Pressure too low (Warning stage 2)

Diagnostic conditions

- Ignition on
- Monitoring Active (e.g. while driving)
- If monitoring is not active (e.g. after an extended idle time), it can take up to 2 minutes for the fault to be entered after the fault cause occurs.

Possible fault causes

- Pressure too low

INFORMATION
The warning thresholds for this fault/this warning are higher than those for warning level 1; they are different depending on country or warning threshold coding and also depend on the current speed.

- Loss of pressure > 20% for EU
- Loss of pressure > 25% for USA
- Loss of pressure > 0.4 bar and **Vehicle speed** > 160 **km/h**
- Loss of pressure > 0.5 bar and **Vehicle speed** < 160 **km/h**

Fault effects

- Warning light **Tire Pressure Monitoring (TPM)**
- Monitoring still Active

Diagnosis information - Tire pressure monitoring system control module

Pressure warning - Minimum pressure below limit

Diagnostic conditions

- Ignition on
- Monitoring Active (e.g. while driving)
- If monitoring is not active (e.g. after an extended idle time), it can take up to 2 minutes for the fault to be entered after the fault cause occurs.

Possible fault causes

- Minimum pressure below limit

INFORMATION
The warning thresholds for this fault/this warning are different depending on country or coding.

- Tyre pressure < 1.6 bar or
- Tyre pressure < 1.4 bar

Fault effects

- Warning light **Tire Pressure Monitoring (TPM)**
- Monitoring still Active

Diagnosis information - Tire pressure monitoring system control module

Pressure warning - Pressure too low (Warning stage 1)

Diagnostic conditions

- Ignition on
- Check for fault condition every 10 minutes

Possible fault causes

- Loss of pressure > 0.3 bar

Fault effects

♦ none - Monitoring still Active

Diagnosis information - Tire pressure monitoring system control module

Pressure warning - Pressure too low (Warning stage 2)

Diagnostic conditions

- Ignition on
- Monitoring Active (e.g. while driving)
- If monitoring is not active (e.g. after an extended idle time), it can take up to 2 minutes for the fault to be entered after the fault cause occurs.

Possible fault causes

- Pressure too low

INFORMATION
The warning thresholds for this fault/this warning are higher than those for warning level 1; they are different depending on country or warning threshold coding and also depend on the current speed.

- Loss of pressure > 20% for EU
- Loss of pressure > 25% for USA
- Loss of pressure > 0.4 bar and **Vehicle speed** > 160 **km/h**
- Loss of pressure > 0.5 bar and **Vehicle speed** < 160 **km/h**

Fault effects

- Warning light **Tire Pressure Monitoring (TPM)**
- Monitoring still Active

Diagnosis information - Tire pressure monitoring system control module

Pressure warning - Minimum pressure below limit

Diagnostic conditions

- Ignition on
- Monitoring Active (e.g. while driving)
- If monitoring is not active (e.g. after an extended idle time), it can take up to 2 minutes for the fault to be entered after the fault cause occurs.

Possible fault causes

- Minimum pressure below limit

INFORMATION
The warning thresholds for this fault/this warning are different depending on country or coding.

- Tyre pressure < 1.6 bar or
- Tyre pressure < 1.4 bar

Fault effects

- Warning light **Tire Pressure Monitoring (TPM)**
- Monitoring still Active

Diagnosis information - Tire pressure monitoring system control module

Pressure warning - Pressure too low (Warning stage 1)

Diagnostic conditions

- Ignition on
- Check for fault condition every 10 minutes

Possible fault causes

- Loss of pressure > 0.3 bar

Fault effects

♦ none - Monitoring still Active

Diagnosis information - Tire pressure monitoring system control module

Pressure warning - Pressure too low (Warning stage 2)

Diagnostic conditions

- Ignition on
- Monitoring Active (e.g. while driving)
- If monitoring is not active (e.g. after an extended idle time), it can take up to 2 minutes for the fault to be entered after the fault cause occurs.

Possible fault causes

- Monitoring still Active

Diagnosis information - Tire pressure monitoring system control module

Pressure warning - Minimum pressure below limit

Diagnostic conditions

- Ignition on
- Monitoring Active (e.g. while driving)
- If monitoring is not active (e.g. after an extended idle time), it can take up to 2 minutes for the fault to be entered after the fault cause occurs.

Possible fault causes

- Minimum pressure below limit

INFORMATION
The warning thresholds for this fault/this warning are different depending on country or coding.

- Tyre pressure < 1.6 bar or
- Tyre pressure < 1.4 bar

Fault effects

- Warning light **Tire Pressure Monitoring (TPM)**
- Monitoring still Active

Diagnosis information - Tire pressure monitoring system control module

Pressure warning - Pressure too low (Warning stage 1)

Diagnostic conditions

- Ignition on
- Check for fault condition every 10 minutes

Possible fault causes

- Loss of pressure > 0.3 bar

Fault effects

♦ none - Monitoring still Active

Diagnosis information - Tire pressure monitoring system control module

Radio interference

Diagnostic conditions

● while driving (to approx. **10 min**)

Possible fault causes

● Radio interference, e.g. due to other radio-transmitting components (wireless headphones, etc.)

Fault setting condition(s)

● Radio interference exists (interference level above limit value)
● Partial reception failure of at least one wheel electronics unit
● Vehicle driving for at least 10 minutes

Fault effects

♦ No monitoring of the tire pressure for the affected wheel
♦ Warning light **Tire Pressure Monitoring (TPM)**

C11005

Diagnosis information - Tire pressure monitoring system control module

Control module Faulty

Diagnostic conditions

- Ignition on

Possible fault causes

- **Tire pressure monitoring system control module** Faulty

Fault effects

♦ none **Tire Pressure Monitoring (TPM)**
♦ Warning light **Tire Pressure Monitoring (TPM)**

Diagnostic information - Tire pressure monitoring system control module

No or incorrect coding

NOTE

Pollution of the environment if wheel electronics are not disposed of correctly.

♦ Wheel electronics contain batteries with lithium thionyl chloride.
♦ Do not disposed of these batteries in normal trash (see Environment Manual).
♦ Used or faulty wheel electronics must be brought to the specified return centers for batteries.

Diagnostic conditions

- **Control module** Tire Pressure Monitoring (TPM) - internal function test
- Ignition on
- Approx. 1 minute of driving

Fault setting condition(s)

- No or incorrect coding/parameters set for Tire Pressure Monitoring (TPM) control unit
- Tire Pressure Monitoring (TPM) control unit is in wrong mode (production) --> perform coding
- Tire Pressure Monitoring (TPM) control unit faulty

Fault effects

♦ System does not function
♦ Display on instrument cluster

Diagnosis information - Tire pressure monitoring system control module

Wheel set selection necessary

Diagnostic conditions

● while driving

Possible fault causes

● **Wheel electronics** new
● Position **Wheel electronics** interchanged

ⓘ After selection of the wheel set in the instrument cluster, the TPM system changes to learning mode and the new or replaced wheel electronics are learned and assigned.

Fault effects

♦ none **Tire Pressure Monitoring (TPM)**

Diagnosis information - Tire pressure monitoring system control module

CAN bus Fault

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

♦ Loose contact or corrosion on connectors or lines
♦ **CAN high** / **CAN low**
Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

♦ none **Tire Pressure Monitoring (TPM)**

Nominal values Line test

Short circuit to B+ :
♦ Setpoint voltage **- 0.5 V** ⇒ **+ 0.5 V**

Short circuit to ground :
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit :
♦ Setpoint resistance **< 2 Ohm**

Diagnostic information - CAN

Communication with control unit not possible

INFORMATION
Internal function test completed.

Diagnostic conditions
The PAS control unit initially tests internal function sequences during wake-up. If these are OK, all diagnosable outputs are then tested and any faults are stored.
Wake-up of the control unit by:

- Event-controlled CAN message
- Key contact (terminal S)
- Ignition ON

Possible fault causes

- No power supply to the control unit
- Incorrect control unit coding
- Short circuit or open circuit in CAN network
- Control unit faulty (in most cases, faulty coding is the cause and not the control unit)

Fault effects

- Communication is no longer possible via the CAN bus
- No other control units can communicate with the control unit

Diagnostic information - CAN

Communication with control unit not possible

INFORMATION
Internal function test completed.

Diagnostic conditions
The PAS control unit initially tests internal function sequences during wake-up. If these are OK, all diagnosable outputs are then tested and any faults are stored.
Wake-up of the control unit by:

- Event-controlled CAN message
- Key contact (terminal S)
- Ignition ON

Possible fault causes

- No power supply to the control unit
- Incorrect control unit coding
- Short circuit or open circuit in CAN network
- Control unit faulty (in most cases, faulty coding is the cause and not the control unit)

Fault effects

- Communication is no longer possible via the CAN bus
- No other control units can communicate with the control unit

Diagnostic information - CAN

Fault entry in the specified control unit

NOTE
Internal function test completed.

Diagnostic conditions
The control unit initially tests internal function sequences after wake-up. If they are OK, all diagnosable outputs are then tested and any faults are stored.
Wake-up of the control unit by:

- Event-controlled CAN message
- Wake-up signal via wake-up line
- Key contact (terminal S)
- Ignition on

Possible fault causes

- Incorrect control unit coding
- The peripheral equipment connected to the specified control unit is faulty
- Control unit faulty (in most cases, faulty coding is the cause and not the control unit)

Fault effects

- The stated control unit sends only substitute values via the CAN
- Other control units detect these substitute values and set this fault code

Diagnostic information - CAN

Fault entry in the specified control unit

NOTE
Internal function test completed.

Diagnostic conditions
The control unit initially tests internal function sequences after wake-up. If they are OK, all diagnosable outputs are then tested and any faults are stored.
Wake-up of the control unit by:

- Event-controlled CAN message
- Wake-up signal via wake-up line
- Key contact (terminal S)
- Ignition on

Possible fault causes

- Incorrect control unit coding
- The peripheral equipment connected to the specified control unit is faulty
- Control unit faulty (in most cases, faulty coding is the cause and not the control unit)

Fault effects

- The stated control unit sends only substitute values via the CAN
- Other control units detect these substitute values and set this fault code

Diagnosis information - Tire pressure monitoring system control module

Supply voltage

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- **Supply voltage** Limit exceeded (Voltage 60 s > 17.5 V)
- **Supply voltage** Below limit (Voltage 60 s < 9.0 V)

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Tire pressure monitoring system control module

Supply voltage

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- **Supply voltage** Limit exceeded (Voltage 60 s > 17.5 V)
- **Supply voltage** Below limit (Voltage 60 s < 9.0 V)

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - PSM

PSM control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test

Possible fault causes

♦ **PSM control module** faulty

NOTE
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ In case of control-unit damage, only the PSM control unit (TC/ABS) is replaced.
♦ Please observe the coding of the control module.
♦ After the Test drive , read out the **Fault memory** again with the PIWIS Tester. Additional fault sources that could damage the **PSM control module** should be recognized and remedied.

Diagnosis information - PSM

PSM control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test

Possible fault causes

♦ **PSM control module** faulty

NOTE
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ In case of control-unit damage, only the PSM control unit (TC/ABS) is replaced.
♦ Please observe the coding of the control module.
♦ After the Test drive , read out the **Fault memory** again with the PIWIS Tester. Additional fault sources that could damage the **PSM control module** should be recognized and remedied.

Diagnosis information - PSM control module

Coding

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ **PSM control module** incorrectly coded
♦ **PSM control module** not coded

Fault effects

♦ **Control module** No function / Limited function PSM

Diagnosis information - PSM

Fault Sport mode

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)
This fault is set on vehicles equipped with the Sport Chrono package if one of the following systems is faulty:

- **DME control module**
- **PDK control unit**
- **Gateway control module**
- **PASM control module**
- **Center-differential lock control unit**

Diagnosis information - PSM

Fault Sport mode

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)
This fault is set on vehicles equipped with the Sport Chrono package if one of the following systems is faulty:

- **DME control module**
- **PDK control unit**
- **Gateway control module**
- **PASM control module**
- **Center-differential lock control unit**

Diagnosis information - PSM

Fault Sport mode

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)
This fault is set on vehicles equipped with the Sport Chrono package if one of the following systems is faulty:

- **DME control module**
- **PDK control unit**
- **Gateway control module**
- **PASM control module**
- **Center-differential lock control unit**

Diagnosis information - PSM

Fault Sport mode

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)
This fault is set on vehicles equipped with the Sport Chrono package if one of the following systems is faulty:

- **DME control module**
- **PDK control unit**
- **Gateway control module**
- **PASM control module**
- **Center-differential lock control unit**

Diagnosis information - PSM

PSM hydraulic unit faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Actual value for ABS valve outlet at rear left is evaluated in the **PSM control module** and does not show a plausible value (**PSM hydraulic unit** faulty).
- Actual value for ABS **Switch-over valve** is evaluated in the **PSM control module** and does not show a plausible value (**PSM hydraulic unit**) faulty).
- Short circuit to B+/mutual short circuit or open circuit in the lines (internally in the **PSM hydraulic unit**)

Fault effects

♦ The PSM functions are switched off

Diagnosis information - PSM

PSM hydraulic unit faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Actual value for ABS valve outlet at rear left is evaluated in the **PSM control module** and does not show a plausible value (**PSM hydraulic unit** faulty).
- Actual value for ABS **Switch-over valve** is evaluated in the **PSM control module** and does not show a plausible value (**PSM hydraulic unit**) faulty).
- Short circuit to B+/mutual short circuit or open circuit in the lines (internally in the **PSM hydraulic unit**)

Fault effects

♦ The PSM functions are switched off

Diagnostic information - PSM control unit

Multi-collision braking initiated

Diagnostic conditions

- Airbag control unit detected a crash
- Ignition switched on and off again after crash event

Possible fault causes

ⓘ If the airbag control unit detects a crash, the PSM control unit initiates braking in order to prevent a multiple collision.

♦ The fault is set if the PSM control unit has performed multi-collision braking.

Fault effects

♦ The vehicle is no longer ready to drive (because a crash was detected)

Diagnostic information - PSM control unit

Multi-collision brake deactivated

Diagnostic conditions

- Ignition on

Possible fault causes

♦ The multi-collision brake was deactivated via coding
♦ There is a fault in the airbag control unit or PSM control unit, preventing activation of the multi-collision brake
♦ Interference in communication via CAN to the airbag control unit or to the accelerator pedal
♦ A PSM fault or a communication error of the PSM to the airbag or to the accelerator pedal occurred during multi-collision braking.

Fault effects

♦ The multi-collision brake is not active

Diagnostic information - PSM control unit

Multi-collision braking cancelled

Diagnostic conditions

- Ignition on

Possible fault causes

♦ The driver actively cancelled the multi-collision braking process by depressing the accelerator pedal over 90%

Fault effects

♦ The multi-collision brake is not active

Diagnosis information - PSM

Return pump faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- while driving **Vehicle speed** >= 15 km/h (9 mph)

Fault setting condition(s)

- Fuse in current distributor faulty
- **Motor relay** faulty
- **Return pump** locks up/runs too smoothly
- Short circuit to B+/ground or open circuit in the line
- **PSM hydraulic unit** faulty

Fault effects

♦ The PSM functions are switched off

Diagnosis information - PSM

PSM hydraulic unit faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Actual value for ABS valve outlet at rear left is evaluated in the **PSM control module** and does not show a plausible value (**PSM hydraulic unit** faulty).
- Actual value for ABS **Switch-over valve** is evaluated in the **PSM control module** and does not show a plausible value (**PSM hydraulic unit**) faulty).
- Short circuit to B+/mutual short circuit or open circuit in the lines (internally in the **PSM hydraulic unit**)

Fault effects

♦ The PSM functions are switched off

Diagnosis information - PSM

PSM hydraulic unit faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Actual value for ABS valve outlet at rear left is evaluated in the **PSM control module** and does not show a plausible value (**PSM hydraulic unit** faulty).
- Actual value for ABS **Switch-over valve** is evaluated in the **PSM control module** and does not show a plausible value (**PSM hydraulic unit**) faulty).
- Short circuit to B+/mutual short circuit or open circuit in the lines (internally in the **PSM hydraulic unit**)

Fault effects

♦ The PSM functions are switched off

Diagnosis information - PSM

Pressure sensor Fault

ⓘ INFORMATION

The **Pressure sensor** is integrated into the **PSM hydraulic unit** .

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- **Pressure sensor** faulty
- **PSM control module** faulty

Fault effects

♦ The PSM functions are switched off

Diagnosis information - PSM

Line fault Speed sensor

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

- Short circuit to B+ in the wiring harness
- Short circuit between the signal and ground line of the **Speed sensor**
- Open circuit in the circuit
- **PSM control module** faulty

Fault effects

♦ The PSM functions are switched off

Diagnosis information - PSM

Faulty Speed sensor

ⓘ INFORMATION

If, in the circuit of the **Speed sensor** , electrical Fault are stored, these must be remedied first. If, after correction of the electrical Fault the **Speed sensor** is stored as Fault , observe the information below.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Driving **Vehicle speed** > 10 km/h (6 mph)

Fault setting condition(s)

Speed sensor is defective, heavy soiling between multi-pole ring and **Speed sensor** , damage on the multi-pole ring or wheel bearing, the magnetic strength of the magnetic plates integrated into the multi-pole ring has decreased greatly, the wheel bearing was incorrectly installed during repair.

- **Speed sensor** Wheel faulty
- Wheel bearing faulty or installed backward
- **PSM control module** faulty

Fault effects

♦ The PSM functions are switched off

Diagnosis information - PSM

Line fault Speed sensor

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

- Short circuit to B+ in the wiring harness
- Short circuit between the signal and ground line of the **Speed sensor**
- Open circuit in the circuit
- **PSM control module** faulty

Fault effects

♦ The PSM functions are switched off

Diagnosis information - PSM

Faulty Speed sensor

ⓘ INFORMATION

If, in the circuit of the **Speed sensor** , electrical Fault are stored, these must be remedied first. If, after correction of the electrical Fault the **Speed sensor** is stored as Fault , observe the information below.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Driving **Vehicle speed** > 10 km/h (6 mph)

Fault setting condition(s)

Speed sensor is defective, heavy soiling between multi-pole ring and **Speed sensor** , damage on the multi-pole ring or wheel bearing, the magnetic strength of the magnetic plates integrated into the multi-pole ring has decreased greatly, the wheel bearing was incorrectly installed during repair.

- **Speed sensor** Wheel faulty
- Wheel bearing faulty or installed backward
- **PSM control module** faulty

Fault effects

♦ The PSM functions are switched off

Diagnosis information - PSM

Line fault Speed sensor

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

- Short circuit to B+ in the wiring harness
- Short circuit between the signal and ground line of the **Speed sensor**
- Open circuit in the circuit
- **PSM control module** faulty

Fault effects

♦ The PSM functions are switched off

Diagnosis information - PSM

Faulty Speed sensor

ⓘ INFORMATION

If, in the circuit of the **Speed sensor** , electrical Fault are stored, these must be remedied first. If, after correction of the electrical Fault the **Speed sensor** is stored as Fault , observe the information below.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Driving **Vehicle speed** > 10 km/h (6 mph)

Fault setting condition(s)

Speed sensor is defective, heavy soiling between multi-pole ring and **Speed sensor** , damage on the multi-pole ring or wheel bearing, the magnetic strength of the magnetic plates integrated into the multi-pole ring has decreased greatly, the wheel bearing was incorrectly installed during repair.

- **Speed sensor** Wheel faulty
- Wheel bearing faulty or installed backward
- **PSM control module** faulty

Fault effects

♦ The PSM functions are switched off

Diagnosis information - PSM8, TC/ABS

Speed sensor line fault

Diagnostic conditions
The control unit PSM(TC/ABS) initially tests internal function sequences when the ignition is switched on (terminal 15). If they are OK, all diagnosable outputs are then tested and any faults are stored.

- Ignition on

Possible fault causes

- ♦ Short circuit to B+ in wiring harness
- ♦ Short circuit to ground in wiring harness
- ♦ Short circuit between the signal and ground lines of the speed sensor
- ♦ Open circuit in electric circuit
- ♦ PSM(TC/ABS) control unit faulty

Fault effects

- ♦ The PSM/ABS(TC/ABS) functions are switched off

Diagnosis information - PSM

Faulty Speed sensor

ⓘ INFORMATION

If, in the circuit of the **Speed sensor** , electrical Fault are stored, these must be remedied first. If, after correction of the electrical Fault the **Speed sensor** is stored as Fault , observe the information below.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Driving **Vehicle speed** > 10 km/h (6 mph)

Fault setting condition(s)

Speed sensor is defective, heavy soiling between multi-pole ring and **Speed sensor** , damage on the multi-pole ring or wheel bearing, the magnetic strength of the magnetic plates integrated into the multi-pole ring has decreased greatly, the wheel bearing was incorrectly installed during repair.

- **Speed sensor** Wheel faulty
- Wheel bearing faulty or installed backward
- **PSM control module** faulty

Fault effects

♦ The PSM functions are switched off

Diagnosis information - PSM

Wheel speed - Monitoring

ⓘ INFORMATION

Check tire pressure and wheel size. Erase fault memory and carry out a test drive.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- In the circuit of the **Speed sensor** , no electrical Fault is stored.
- The vehicle must be driven.
- The Fault is stored if the averaged speed of a wheel exceeds the speeds of the other wheels by at least 6% for longer than 20 s.
- Vehicle speed is >20 km/h (12 mph)

Fault setting condition(s)

- Wrong wheel size on the vehicle (driving with the **emergency spare wheel** can **NOT** be the cause)
- Tire pressure differs by a large amount
- **PSM control module** faulty

Fault effects

♦ The PSM functions are switched off

Diagnosis information - PSM

Stop light switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test
- Actuate foot brake and then release it again

Fault setting condition(s)

- Adjustment of the **Stop light switch** not OK ⇒ See Workshop Manual (Incorrect operation: pedal pushed/pulled up)
- System not bled
- Mechanism of the **Stop light switch** not OK
- Short circuit to B+/ground or open circuit in the line

Diagnosis information - PSM

PSM steering angle sensor not calibrated

ⓘ INFORMATION

● Always in **PIWIS Tester** ⇒ **PSM control module** ⇒ Read out **actual values**, the calibrated values and repeat **calibration** if required.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on
● Drive the vehicle

Fault setting condition(s)

● Open circuit of the power supply
● Work on the chassis
● **PSM steering angle sensor** faulty
● **PSM control module** faulty

Fault effects

♦ The PSM functions are switched off

Diagnosis information - PSM

PSM steering angle sensor not initialized

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Drive the vehicle

Fault setting condition(s)

- Open circuit of the power supply
- **PSM steering angle sensor** faulty
- **PSM control module** faulty

Fault effects

♦ The PSM functions are switched off

Diagnosis information - PSM

Fault Drive-Off Assistant

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Engine running

- **Clutch pedal** actuated

- Reverse gear engaged

Fault setting condition(s)

- The clutch switch/reversing-light switch was(were) detected as permanently or never actuated

.

Possible fault causes

♦ Clutch switch/reversing light switch:
Incorrect adjustment or a Mechanical fault

Fault effects

♦ Failure of Drive-Off Assistant

Diagnosis information - PSM

Internal control unit fault

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test not completed successfully

Possible fault causes

- **PSM control module** faulty (internal calculation error.)

Fault effects

♦ The PSM functions are switched off

Diagnosis information - PSM

Fault Sport mode

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)
This fault is set on vehicles equipped with the Sport Chrono package if one of the following systems is faulty:

- **DME control module**
- **PDK control unit**
- **Gateway control module**
- **PASM control module**
- **Center-differential lock control unit**

Diagnosis information - PSM

PSM hydraulic unit - Function restriction

INFORMATION
The faults treated here are caused by faulty components or malfunctions within the hydraulic unit.

Diagnostic conditions
There are several fault paths for the faults in the hydraulic unit. This means that several diagnostic conditions can result in the existing fault entry.

- to Ignition on
- All models: 60 seconds to Ignition on
- while driving (**Vehicle speed** > 30 **km/h**)

Fault setting condition(s)

- Power supply Short circuit to B+/ground/between lines or open circuit in the lines
- Fuses **PSM hydraulic unit** Faulty
- **Sensor** Brake pressure Electrical fault
- Ventil unit Faulty
- **Hydraulic pump** Electrical fault
- **Hydraulic pump** Mechanical fault

Fault effects

♦ none or Limited function PSM

Diagnosis information - PSM

Faulty Speed sensor

ⓘ INFORMATION

If, in the circuit of the **Speed sensor** , electrical Fault are stored, these must be remedied first. If, after correction of the electrical Fault the **Speed sensor** is stored as Fault , observe the information below.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Driving **Vehicle speed** > 10 km/h (6 mph)

Fault setting condition(s)

Speed sensor is defective, heavy soiling between multi-pole ring and **Speed sensor** , damage on the multi-pole ring or wheel bearing, the magnetic strength of the magnetic plates integrated into the multi-pole ring has decreased greatly, the wheel bearing was incorrectly installed during repair.

- **Speed sensor** Wheel faulty
- Wheel bearing faulty or installed backward
- **PSM control module** faulty

Fault effects

♦ The PSM functions are switched off

Diagnosis information - PSM

Faulty Speed sensor

ⓘ INFORMATION

If, in the circuit of the **Speed sensor** , electrical Fault are stored, these must be remedied first. If, after correction of the electrical Fault the **Speed sensor** is stored as Fault , observe the information below.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Driving **Vehicle speed** > 10 km/h (6 mph)

Fault setting condition(s)

Speed sensor is defective, heavy soiling between multi-pole ring and **Speed sensor** , damage on the multi-pole ring or wheel bearing, the magnetic strength of the magnetic plates integrated into the multi-pole ring has decreased greatly, the wheel bearing was incorrectly installed during repair.

- **Speed sensor** Wheel faulty
- Wheel bearing faulty or installed backward
- **PSM control module** faulty

Fault effects

♦ The PSM functions are switched off

Diagnosis information - PSM control module

Speed sensor - Electrical fault

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ **Sensor** Faulty
♦ **PSM control module** Faulty

Fault effects

♦ none or Limited function PSM

Nominal values Line test

Short circuit to B+ :
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground :
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit :
♦ Setpoint resistance **< 2 Ohm**

Diagnosis information - PSM

Faulty Speed sensor

ⓘ INFORMATION

- Fuses **PSM hydraulic unit** Faulty
- **Sensor** Brake pressure Electrical fault
- Ventil unit Faulty
- **Hydraulic pump** Electrical fault
- **Hydraulic pump** Mechanical fault

Fault effects

♦ none or Limited function PSM

Diagnosis information - Steering wheel electronics control module

Steering-angle sensor

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Faulty
- Mechanical fault

Fault effects

♦ Function not available or available only to a limited extent

Diagnostic information - CAN

Fault entry in the specified control unit

INFORMATION
Internal function text completed!

Diagnostic conditions

The control unit initially tests internal function sequences after wake-up. If these are OK, all diagnosable outputs are then tested and any faults are stored.
Wake-up of the control unit by:

- Event-controlled CAN message
- Wake-up signal via wake-up line
- Key contact (terminal S)
- Ignition on

Possible fault causes

- Incorrect control unit coding
- The peripheral equipment connected to the specified control unit is faulty
- Control unit faulty (in most cases, faulty coding is the cause and not the control unit)

Fault effects

- The stated control unit sends only substitute values via the CAN
- Other control units detect these substitute values and set this fault code

Diagnosis information - Steering wheel electronics control module

Steering-angle sensor

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Calibration

Fault effects

♦ Function not available or available only to a limited extent

Fault effects

- The stated control unit sends only substitute values via the CAN
- Other control units detect these substitute values and set this fault code

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

Diagnosis information - PSM control module

PSM OFF button - Signal implausible

Diagnostic conditions

- Ignition on

Fault setting condition(s)

- Short circuit to B+/ground/between lines or open circuit in the lines
- **Button** stuck

- **Button** Faulty

ⓘ The measured value >PSM-OFF button (CAN, A/C operating panel)< can also be used to test the button signal.

Fault effects

- **PSM OFF button** No function

Nominal values Line test

Short circuit to B+ :
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground :
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit :
♦ Setpoint resistance **< 2 Ohm**

Diagnosis information - PSM

Overvoltage

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on (upon Ignition on , only the PSM warning light lights up; no fault code stored)
- Drive at > 6 km/h (4 mph) (the conditions for storing the fault code are now met)

Fault setting condition(s)

- Overvoltage

Fault effects

♦ No function

Diagnosis information - PSM

PSM control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test

Possible fault causes

♦ **PSM control module** faulty

NOTE
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ In case of control-unit damage, only the PSM control unit (TC/ABS) is replaced.
♦ Please observe the coding of the control module.
♦ After the Test drive , read out the **Fault memory** again with the PIWIS Tester. Additional fault sources that could damage the **PSM control module** should be recognized and remedied.

Diagnosis information - PSM control module

Coding

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ **PSM control module** incorrectly coded
♦ **PSM control module** not coded

Fault effects

♦ **Control module** No function / Limited function PSM

Diagnosis information - PSM control module

Coding

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ **PSM control module** incorrectly coded
♦ **PSM control module** not coded

Fault effects

♦ **Control module** No function / Limited function PSM

Diagnosis information - PSM control module

Combination sensor - Signal implausible

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- while driving

Possible fault causes

♦ Intermittent contact or Short circuit to B+/ground/between lines or open circuit in the lines (**Combination sensor** <=> **PSM control module**)
♦ **Combination sensor** incorrect installed
♦ **Combination sensor** Faulty

Fault effects

♦ none or Limited function PSM

Diagnosis information - PSM

Faulty Speed sensor

ⓘ INFORMATION

If, in the circuit of the **Speed sensor** , electrical Fault are stored, these must be remedied first. If, after correction of the electrical Fault the **Speed sensor** is stored as Fault , observe the information below.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Driving **Vehicle speed** > 10 km/h (6 mph)

Fault setting condition(s)

Speed sensor is defective, heavy soiling between multi-pole ring and **Speed sensor** , damage on the multi-pole ring or wheel bearing, the magnetic strength of the magnetic plates integrated into the multi-pole ring has decreased greatly, the wheel bearing was incorrectly installed during repair.

- **Speed sensor** Wheel faulty
- Wheel bearing faulty or installed backward
- **PSM control module** faulty

Fault effects

♦ The PSM functions are switched off

Diagnosis information - PSM

PSM control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test

Possible fault causes

♦ **PSM control module** faulty

NOTE
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ In case of control-unit damage, only the PSM control unit (TC/ABS) is replaced.
♦ Please observe the coding of the control module.
♦ After the Test drive , read out the **Fault memory** again with the PIWIS Tester. Additional fault sources that could damage the **PSM control module** should be recognized and remedied.

Diagnosis information - PSM control module

Combination sensor - Signal implausible

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- while driving

Possible fault causes

♦ Intermittent contact or Short circuit to B+/ground/between lines or open circuit in the lines (**Combination sensor** <=> **PSM control module**)
♦ **Combination sensor** incorrect installed
♦ **Combination sensor** Faulty

Fault effects

♦ none or Limited function PSM

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

Diagnosis information - PSM

PSM hydraulic unit - Function restriction

INFORMATION
The faults treated here are caused by faulty components or malfunctions within the hydraulic unit.

Diagnostic conditions
There are several fault paths for the faults in the hydraulic unit. This means that several diagnostic conditions can result in the existing fault entry.

- to Ignition on
- All models: 60 seconds to Ignition on
- while driving (**Vehicle speed** > 30 **km/h**)

Fault setting condition(s)

- Power supply Short circuit to B+/ground/between lines or open circuit in the lines
- Fuses **PSM hydraulic unit** Faulty
- **Sensor** Brake pressure Electrical fault
- Ventil unit Faulty
- **Hydraulic pump** Electrical fault
- **Hydraulic pump** Mechanical fault

Fault effects

♦ none or Limited function PSM

Diagnosis information - PSM

Rolling test mode

Diagnostic conditions

- Ignition on

Possible fault causes

Depending on fault code:

- Rolling test mode Active
- Rolling test mode was active but was cancelled incorrectly

Fault effects

♦ none

Diagnosis information - PSM control module

Stopping distance reduction via ACC - above/below limit value

Diagnostic conditions

- Ignition on

Fault setting condition(s)

These faults are diagnosed when the ACC control unit requests acceleration or deceleration of the vehicle, but the value actually measured via the combination sensor differs greatly from the requested acceleration/deceleration.
This can occur, for example, in case of a sudden approach to an obstacle or abrupt braking (decelerating and thereby falling below the limit value, 0C6B02).
This also could be caused by a faulty hydraulic unit, for example (acceleration is maintained even though deceleration was requested, 0C6B01)

Possible fault causes

♦ Abrupt vehicle deceleration (e.g. rear-end collision)
♦ Extreme driving situation
♦ Implausible acceleration measurement of the combination sensor

♦ Mechanical fault in the hydraulic unit or electrical fault in the PSM control unit

Fault effects

♦ Limited function PSM

Diagnosis information - PSM control module

Stopping distance reduction via ACC - above/below limit value

Diagnostic conditions

- Ignition on

Fault setting condition(s)

These faults are diagnosed when the ACC control unit requests acceleration or deceleration of the vehicle, but the value actually measured via the combination sensor differs greatly from the requested acceleration/deceleration.
This can occur, for example, in case of a sudden approach to an obstacle or abrupt braking (decelerating and thereby falling below the limit value, 0C6B02).
This also could be caused by a faulty hydraulic unit, for example (acceleration is maintained even though deceleration was requested, 0C6B01)

Possible fault causes

♦ Abrupt vehicle deceleration (e.g. rear-end collision)
♦ Extreme driving situation
♦ Implausible acceleration measurement of the combination sensor

♦ Mechanical fault in the hydraulic unit or electrical fault in the PSM control unit

Fault effects

♦ Limited function PSM

Diagnosis information - PSM control module

Stopping distance reduction - check ACC fault memory content

Diagnostic conditions

- Ignition on

Fault setting condition(s)

These faults are diagnosed if an internal function test of the components involved in stopping distance reduction fails.
The components and functions are tested before, during and after a deceleration or acceleration request by the ACC control unit.

Possible fault causes

♦ CAN communication disturbed
♦ Other fault memory entries and therefore possibly faulty components in the braking system (combination sensor, brake-pedal sensor, hydraulic unit, PSM control unit).

Fault effects

♦ Limited function PSM

Diagnosis information - PSM control module

Coding

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Open circuit :
♦ Setpoint resistance **< 2 Ohm**

Diagnosis information - PSM

PSM control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test

Possible fault causes

♦ **PSM control module** faulty

NOTE
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ In case of control-unit damage, only the PSM control unit (TC/ABS) is replaced.
♦ Please observe the coding of the control module.
♦ After the Test drive , read out the **Fault memory** again with the PIWIS Tester. Additional fault sources that could damage the **PSM control module** should be recognized and remedied.

Diagnosis information - PSM

PSM control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test

Possible fault causes

♦ **PSM control module** faulty

NOTE
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ In case of control-unit damage, only the PSM control unit (TC/ABS) is replaced.
♦ Please observe the coding of the control module.
♦ After the Test drive , read out the **Fault memory** again with the PIWIS Tester. Additional fault sources that could damage the **PSM control module** should be recognized and remedied.

Diagnosis information - PSM

PSM control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test

Possible fault causes

♦ **PSM control module** faulty

NOTE
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ In case of control-unit damage, only the PSM control unit (TC/ABS) is replaced.
♦ Please observe the coding of the control module.
♦ After the Test drive , read out the **Fault memory** again with the PIWIS Tester. Additional fault sources that could damage the **PSM control module** should be recognized and remedied.

Diagnosis information - PSM

PSM control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test

Possible fault causes

♦ **PSM control module** faulty

NOTE
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ In case of control-unit damage, only the PSM control unit (TC/ABS) is replaced.
♦ Please observe the coding of the control module.
♦ After the Test drive , read out the **Fault memory** again with the PIWIS Tester. Additional fault sources that could damage the **PSM control module** should be recognized and remedied.

Diagnosis information - PSM

PSM control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test

Possible fault causes

♦ **PSM control module** faulty

NOTE
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ In case of control-unit damage, only the PSM control unit (TC/ABS) is replaced.
♦ Please observe the coding of the control module.
♦ After the Test drive , read out the **Fault memory** again with the PIWIS Tester. Additional fault sources that could damage the **PSM control module** should be recognized and remedied.

Diagnosis information - PSM

PSM control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test

Possible fault causes

♦ **PSM control module** faulty

NOTE
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ In case of control-unit damage, only the PSM control unit (TC/ABS) is replaced.
♦ Please observe the coding of the control module.

Diagnosis information - PSM

PSM control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test

Possible fault causes

♦ **PSM control module** faulty

NOTE
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ In case of control-unit damage, only the PSM control unit (TC/ABS) is replaced.
♦ Please observe the coding of the control module.
♦ After the Test drive , read out the **Fault memory** again with the PIWIS Tester. Additional fault sources that could damage the **PSM control module** should be recognized and remedied.

Diagnosis information - PSM

PSM control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test

Possible fault causes

♦ **PSM control module** faulty

NOTE
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ In case of control-unit damage, only the PSM control unit (TC/ABS) is replaced.
♦ Please observe the coding of the control module.
♦ After the Test drive , read out the **Fault memory** again with the PIWIS Tester. Additional fault sources that could damage the **PSM control module** should be recognized and remedied.

Diagnosis information - PSM

PSM control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test

Possible fault causes

♦ **PSM control module** faulty

NOTE
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ In case of control-unit damage, only the PSM control unit (TC/ABS) is replaced.
♦ Please observe the coding of the control module.
♦ After the Test drive , read out the **Fault memory** again with the PIWIS Tester. Additional fault sources that could damage the **PSM control module** should be recognized and remedied.

Diagnosis information - PSM control module

Rolling test mode

Diagnostic conditions

- Ignition on

Possible fault causes

Depending on fault code:

- Rolling test mode Active
- Rolling test mode was active but was cancelled incorrectly

Fault effects

♦ none

Diagnosis information - PSM

Undervoltage

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on (upon Ignition on , only the PSM warning light lights up; no fault code stored)
- Drive at > 6 km/h (4 mph) (the conditions for storing the fault code are now met)

Fault setting condition(s)

- Fuse in fuse holder
- Undervoltage
- Short circuit to ground in the wiring harness
- Open circuit in the circuit
- **PSM control module** faulty

C11001

Diagnosis information - PSM

Overvoltage

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on (upon Ignition on , only the PSM warning light lights up; no fault code stored)
- Drive at > 6 km/h (4 mph) (the conditions for storing the fault code are now met)

Fault setting condition(s)

- Overvoltage

Fault effects

♦ No function

C11005

Diagnosis information - PSM

PSM control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test

Possible fault causes

♦ **PSM control module** faulty

NOTE
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ In case of control-unit damage, only the PSM control unit (TC/ABS) is replaced.
♦ Please observe the coding of the control module.
♦ After the Test drive , read out the **Fault memory** again with the PIWIS Tester. Additional fault sources that could damage the **PSM control module** should be recognized and remedied.

Diagnosis information - PSM

Version coding faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Drive the vehicle

Fault setting condition(s)
♦ The wrong vehicle model or the wrong vehicle type is coded in the **Gateway control module**
♦ The wrong engine type or the wrong transmission type is coded in the **DME control module**
♦ Wrong **PSM hydraulic unit** installed

Check and correction of variant coding in the PIWIS Tester:

Gateway control module
► Check and correct the **coded variant** in the **PIWIS Tester** ⇒ **Gateway** ⇒ **Coding** ⇒ **Vehicle variants** ⇒ **Vehicle model, vehicle type**

DME control module
► Check and correct the **coded variant** in the **PIWIS Tester** ⇒ **DME** ⇒ **Vehicle data** ⇒ **Engine type, transmission type**

PSM control module (Vehicles with PCCB brake system)
► Check and correct the **coded variant** in the **PIWIS Tester** ⇒ **PSM(TC/ABS)** ⇒ **Coding** ⇒ **Variant** (code the variant matching the vehicle here)

Fault effects

♦ The PSM functions are switched off

C11007

Diagnosis information - PSM

Combination sensor not calibrated

INFORMATION
This fault code does NOT lead to:

♦ Activation of the warning light in the instrument cluster (PSM) warning light stays OFF)
♦ Functional impairments in the PSM- system remains fully functional.

INFORMATION
The transverse and axial acceleration sensor and the rate-of-turn sensor are integrated into the >combination sensor< housing. If a fault is detected in one of these three sensors, the > combination sensor< must be replaced. The integrated axial acceleration sensor must be calibrated after replacement.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Connect PIWIS Tester to the vehicle
- Ignition on and read/erase **Fault memory PSM control module**
- Drive the vehicle
- Connect PIWIS Tester to the vehicle after the test drive
- Ignition on and read out **Fault memory** again

Fault setting condition(s)

- The **Combination sensor** was not calibrated
or calibration was carried out incorrectly.

Diagnosis information - PSM control module

Combination sensor - Signal implausible

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- while driving

Possible fault causes

- Short circuit to B+/ground/between lines or open circuit in the lines
- **Combination sensor** Faulty
- **PSM control module** Function restriction

Fault effects

- none or Limited function PSM

Diagnosis information - PSM control module

Combination sensor - Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

- **Combination sensor** Faulty
- **PSM control module** Faulty

Fault effects

- none or Limited function PSM

Diagnosis information - PSM

PSM control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test

Possible fault causes

♦ **PSM control module** faulty

NOTE
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ In case of control-unit damage, only the PSM control unit (TC/ABS) is replaced.
♦ Please observe the coding of the control module.
♦ After the Test drive , read out the **Fault memory** again with the PIWIS Tester. Additional fault sources that could damage the **PSM control module** should be recognized and remedied.

Diagnosis information - PSM

PSM control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test

Possible fault causes

♦ **PSM control module** faulty

NOTE
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ In case of control-unit damage, only the PSM control unit (TC/ABS) is replaced.
♦ Please observe the coding of the control module.
♦ After the Test drive , read out the **Fault memory** again with the PIWIS Tester. Additional fault sources that could damage the **PSM control module** should be recognized and remedied.

Diagnosis information - Steering wheel electronics control module

Steering-angle sensor

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Faulty
- Mechanical fault

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - PSM

PSM control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test

Possible fault causes

♦ **PSM control module** faulty

NOTE
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ In case of control-unit damage, only the PSM control unit (TC/ABS) is replaced.
♦ Please observe the coding of the control module.
♦ After the Test drive , read out the **Fault memory** again with the PIWIS Tester. Additional fault sources that could damage the **PSM control module** should be recognized and remedied.

Diagnosis information - PSM

PSM control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test

Possible fault causes

♦ **PSM control module** faulty

NOTE
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ In case of control-unit damage, only the PSM control unit (TC/ABS) is replaced.
♦ Please observe the coding of the control module.
♦ After the Test drive , read out the **Fault memory** again with the PIWIS Tester. Additional fault sources that could damage the **PSM control module** should be recognized and remedied.

Diagnosis information - PSM

PSM control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **PSM control module** internal function test

Possible fault causes

♦ **PSM control module** faulty

NOTE
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ In case of control-unit damage, only the PSM control unit (TC/ABS) is replaced.
♦ Please observe the coding of the control module.
♦ After the Test drive , read out the **Fault memory** again with the PIWIS Tester. Additional fault sources that could damage the **PSM control module** should be recognized and remedied.

Diagnosis information - PSM

PSM control module faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)
Maximum difference reached

ⓘ This fault entry can be an indication of worn-out parking-brake shoes.

Fault effects
The parking brake can only be released but no longer applied. The actuators automatically move to assembly position for renewed adjustment/calibration.

Diagnosis information - Parking brake control unit

Parking brake No function

Diagnostic conditions

- Ignition on
- Actuation **Parking brake**

Fault setting condition(s)

- Overload **Parking brake** (reversible)
- Internal control unit fault (reversible)
- Fault entry **PSM control module** (**Speed sensor**)

Fault effects

Parking brake control unit - Function temporarily unavailable or available only to a limited extent

Diagnostic information - parking brake control unit

Emergency braking via parking brake not available

ⓘ During emergency braking using the parking brake, the parking brake button is pressed and held when travelling at a speed of more than 5 km/h (3 mph). The parking brake control unit then sends a deceleration request to the PSM control unit, which then initiates braking using the PSM hydraulic system. As soon as the vehicle speed falls below a certain limit value (approx. 2 km/h or 1.5 mph), the parking brake is closed and the vehicle is brought to a standstill.

Diagnostic conditions

- Emergency braking performed using the parking brake (see above)

Fault setting condition(s)

- Emergency braking function could not be performed

Possible fault causes

♦ Other fault memory entries in the parking brake control unit or PSM control unit that prevent braking using PSM/the parking brake

Fault effects

♦ Emergency braking function is not available
♦ Warning in instrument cluster

Diagnosis information - Control module

Control unit faulty

⚠WARNING

♦ Danger of injury and crushing when components are moved.
♦ Open or close the rear lid only if there are neither persons, animals nor objects in the movement range of the lid.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Diagnosis information - Control module

Control unit faulty

⚠WARNING

♦ Danger of injury and crushing when components are moved.
♦ Open or close the rear lid only if there are neither persons, animals nor objects in the movement range of the lid.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)
Control unit faulty

Fault effects
Function not available or available only to a limited extent

Diagnostic information - door control unit

084C - Outer door handle switch, continuously actuated

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- The button is stuck or permanently actuated

Possible fault causes

- The button is stuck or permanently actuated
- Short circuit to ground

Fault effects

- No function

Diagnosis information - Component(s)

Function light

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Open circuit
- Faulty

Fault effects
Light does not function

Diagnostic information - Door control unit

Exterior mirror dimming - electrical fault

Diagnostic conditions

- Ignition on
- Automatic dimming active

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line

Function restrictions

♦ No function or restricted function

Diagnosis information - Control module

Lamp

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Short circuit to ground
- Open circuit
- Short circuit between the lines
- Faulty

Fault effects

- Light does not function

Diagnostic information - Control unit

Button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

♦ The button is stuck or permanently actuated.

Fault effects

♦ The affected function no longer reacts

Diagnosis information - Component(s)

Function light

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Open circuit
- Faulty

Fault effects
Light does not function

Diagnostic information - door control unit

084C - Outer door handle switch, continuously actuated

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- The button is stuck or permanently actuated

Possible fault causes

- The button is stuck or permanently actuated
- Short circuit to ground

Fault effects

- No function

Diagnostic information - Door control unit

Data record invalid

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Control unit data record faulty or incorrect

Possible fault causes

♦ Incorrect data record programmed
♦ Data record faulty

Fault effects

♦ Restricted door functionality

Diagnosis information - Control module

Lock cylinder

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)
The button is stuck or permanently actuated.

Fault effects

No function

Diagnosis information - Control module

Lamp

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Short circuit to ground
- Open circuit
- Short circuit between the lines
- Faulty

Fault effects

- Light does not function

Diagnostic information - Control unit

Button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

♦ The button is stuck or permanently actuated.

Fault effects

♦ The affected function no longer reacts

Diagnostic information - door control unit

05CA - Central locking motors, short circuit to B+
0843 - Central locking closing unit, implausible signal

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Central locking system actuated

Fault setting condition(s)

- Short circuit to B+
- Signal implausible

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the lines to the central locking motor
♦ Central locking motor faulty
♦ Door control unit faulty

Fault effects

♦ No function

Diagnostic information - Door control unit

Power windows motor - mechanical fault

Diagnostic conditions

- Ignition on
- Supply voltage > 12 V
- Power windows switch actuated

Possible fault causes

- Window guides stiff
- Power windows mechanism stiff

Diagnostic information - Control unit

Driver power window button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

♦ The button is stuck or permanently actuated.

Fault effects

♦ The window cannot be opened or closed

ⓘDiagnostic information - Door control unit

No/incorrect coding

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Coding incorrect or not carried out

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Component(s)

Button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)
The button is stuck or permanently actuated.

Fault effects
The affected function no longer reacts

Diagnostic information - Control unit

Button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

♦ The button is stuck or permanently actuated.

Fault effects

♦ The affected function no longer reacts

Diagnostic information

Door mirror adjusting motor

Diagnostic conditions

- Ignition on
- Battery positive voltage OK (11.4 to 14.5 V)
- Internal function test on door control unit
- Door mirror actuated with the mirror adjustment switch

Possible fault causes

- Short circuit to B+/ground or open circuit in the lines
- Door mirror adjusting motor faulty
- Door control unit faulty

Diagnostic information

Door mirror folding motor

Diagnostic conditions

- Ignition on
- Battery positive voltage OK (11.4 to 14.5 V)
- Door mirror folding function active

Possible fault causes

- Folding mirror mechanically stiff/blocked
- Door mirror folding motor faulty
- Door control unit faulty

Diagnostic information - Control unit

Button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

♦ The button is stuck or permanently actuated.

Fault effects

♦ The affected function no longer reacts

Diagnostic information

Door mirror adjusting motor

Diagnostic conditions

- Ignition on
- Battery positive voltage OK (11.4 to 14.5 V)
- Internal function test on door control unit
- Door mirror actuated with the mirror adjustment switch

Possible fault causes

- Short circuit to B+/ground or open circuit in the lines
- Door mirror adjusting motor faulty
- Door control unit faulty

Diagnostic information - Door

Central locking system button - signal implausible

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Button pressed > 60 second(s)
- Short circuit to ground

Fault effects

♦ Central locking system button does not work

Diagnostic information - Door control unit

Power windows motor - thermal protection active

Diagnostic conditions

- Ignition on
- Power windows switch actuated

Possible fault causes

♦ Window guides stiff
♦ Frequent actuation of power windows switch

Fault setting condition(s)

- Power windows motor, temperature too high

Fault effects

♦ Function available to a limited extent; power windows can still only be moved towards open

Diagnostic information

Door mirror adjusting motor

Diagnostic conditions

- Ignition on
- Battery positive voltage OK (11.4 to 14.5 V)
- Internal function test on door control unit
- Door mirror actuated with the mirror adjustment switch

Possible fault causes

- Short circuit to B+/ground or open circuit in the lines
- Door mirror adjusting motor faulty
- Door control unit faulty

Diagnostic information - door control unit

05CA - Central locking motors, short circuit to B+
0843 - Central locking closing unit, implausible signal

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Central locking system actuated

Fault setting condition(s)

- Short circuit to B+
- Signal implausible

Possible fault causes

- Short circuit to B+/ground or open circuit in the lines to the central locking motor
- Central locking motor faulty
- Door control unit faulty

Fault effects

- No function

Diagnostic information - Door control unit

Lamp for mirror indicator

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Short circuit to B+/ground or open circuit
- Faulty

Fault effects

♦ Lamp does not function

Diagnostic information - Door control unit

Control unit faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)
Control unit faulty

Fault effects
Function not available or available only to a limited extent

Diagnosis information - Control module

Child lock button

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- The button is stuck or permanently actuated.
- Short circuit to ground

Fault effects

♦ Switch positions cannot be detected.

Diagnosis information - Control module

Rear right power window button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)
The button is stuck or permanently actuated.

Fault effects

♦ The window cannot be opened or closed

Diagnostic information

Mirror heating, driver

INFORMATION
This fault was detected by the driver door control unit.

Diagnostic conditions

- Ignition on
- Battery voltage OK (11.4 to 14.5 V)
- Internal function test on driver door control unit
- Engine on
- Switch on mirror heating

Possible fault causes

♦ Mirror heating in door mirror glass faulty
♦ Lines faulty

Function restrictions

♦ No function or restricted function

Diagnosis information - Control module

Passenger power windows button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)
The button is stuck or permanently actuated.

Fault effects

♦ The window cannot be opened or closed

Diagnosis information - Control module

Rear left power window button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)
The button is stuck or permanently actuated.

Fault effects

♦ The window cannot be opened or closed

Diagnostic information - Door control unit

Power supply

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Power supply - below limit value - 9 V
- Power supply - above limit value - 16 V

Fault effects

♦ It may no longer be possible to activate the actuators

Diagnostic information - Control unit

Driver power window button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Diagnostic information - Rear-end electronics

Production mode active/Coding Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- One or more production modes or production interventions are activated.
- No/incorrect coding
- **Rear-end electronics** control unit faulty

Fault effects

♦ Comfort functions: Function not available or available only to a limited extent

Diagnosis information - Rear-end electronics

800708 PSM rotation speed signal implausible

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **Vehicle speed** > 10 **km/h**
- **Supply voltage** 7 ... 18 V

Fault setting condition(s)

- Signal **Speed sensor** via CAN > 10 s low

Possible fault causes

♦ Fault in system PSM
► Perform diagnosis/fault finding in the following system: PSM
♦ CAN data bus Faulty

Fault effects

♦ **Electronic steering column lock (ELV)** No function

ⓘ INFORMATION

Electronic steering column lock (ELV) is not locked even when the fault becomes passive again. The fault must be deleted from the fault memory so that the **Electronic steering column lock (ELV)** can lock again.

Diagnosis information - Rear-end electronics

800808 Signal Stop light switch implausible

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Actuate foot brake and then release it again

Fault setting condition(s)

- Signal **Stop light switch** via CAN data bus and Signal **Stop light switch** via electrical line of **PSM control module** > 500 ms different.

Possible fault causes

♦ Fault in system PSM
► Perform diagnosis/fault finding in the following system: PSM
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ CAN data bus Faulty
♦ **Control module Rear-end electronics** Faulty

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines :

♦ Setpoint resistance **> 0.9 MOhm**

Diagnosis information - Rear-end electronics

Sun blind

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- mechanically sluggish
- Engine Faulty

Fault effects
The affected function no longer reacts

Diagnosis information - Rear-end electronics

Sun blind

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- mechanically sluggish
- Engine Faulty

Fault effects
The affected function no longer reacts

Diagnosis information - Rear-end electronics

Upper part of lid lock, rear

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **Rear-end electronics** coded correctly

Fault setting condition(s)

- Short circuit to B+
- Open circuit
- Short circuit between the lines
- Faulty

Fault effects

♦ Limited function

Diagnosis information - Rear-end electronics

Upper part of lid lock, rear

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **Rear-end electronics** coded correctly

Fault setting condition(s)

- Short circuit to B+
- Open circuit
- Short circuit between the lines
- Faulty

Fault effects

♦ Limited function

Diagnosis information - Component(s)

Relay, heated rear window

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Short circuit to ground
- Short circuit to B+
- Short circuit between the lines
- Faulty

Fault effects
The affected function no longer reacts

Diagnosis information - Component(s)

Relay, heated rear window

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Short circuit to ground
- Short circuit to B+
- Short circuit between the lines
- Faulty

Fault effects
The affected function no longer reacts

Diagnosis information - Rear-end electronics

Rear-end electronics Power supply

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

● Power supply Below limit
(Voltage < 9 V for > 15 s)

● Power supply Limit exceeded
(Voltage > 15 V for > 15 s)

Possible fault causes

♦ Fuse Faulty
♦ Short circuit to ground or open circuit in lines
♦ **Control module Rear-end electronics** Faulty

Diagnosis information - Rear-end electronics

Rear-end electronics Power supply

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

● Power supply Below limit
(Voltage < 9 V for > 15 s)

● Power supply Limit exceeded
(Voltage > 15 V for > 15 s)

Possible fault causes

♦ Fuse Faulty
♦ Short circuit to ground or open circuit in lines
♦ **Control module Rear-end electronics** Faulty

Diagnosis information - Rear-end electronics

Rear-end electronics Power supply

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

● Power supply Below limit
(Voltage < 9 V for > 15 s)

● Power supply Limit exceeded
(Voltage > 15 V for > 15 s)

Possible fault causes

♦ Fuse Faulty
♦ Short circuit to ground or open circuit in lines
♦ **Control module Rear-end electronics** Faulty

Diagnosis information - Rear-end electronics

Rear-end electronics Power supply

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

● Power supply Below limit
(Voltage < 9 V for > 15 s)

● Power supply Limit exceeded
(Voltage > 15 V for > 15 s)

Possible fault causes

♦ Fuse Faulty
♦ Short circuit to ground or open circuit in lines
♦ **Control module Rear-end electronics** Faulty

Diagnostic information - Rear-end electronics

802001 Lid button, rear

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Signal **Lid button, rear** actuated

> 45 s

Possible fault causes

- Button is stuck or permanently actuated.

Fault effects

Function not available or available only to a limited extent

Diagnosis information - Interior-surveillance button

802201 Interior-surveillance button - The button is stuck or permanently actuated.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Interior-surveillance button** must be coded
- Ignition on

INFORMATION

Button only installed for Country version USA/Canada (B-pillar on driver side)

Fault setting condition(s)

- Signal **Interior-surveillance button** actuated

> 10 s

Fault effects

The affected function no longer reacts

Diagnosis information - Rear-end electronics

Upper part of lid lock, rear

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **Rear-end electronics** coded correctly

Fault setting condition(s)

- Short circuit to B+
- Open circuit
- Short circuit between the lines
- Faulty

Fault effects

♦ Limited function

Diagnosis information - Rear-end electronics

Sun blind

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- mechanically sluggish
- Engine Faulty

Fault effects
The affected function no longer reacts

Diagnosis information - Rear-end electronics

Upper part of lid lock, rear

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **Rear-end electronics** coded correctly

Fault setting condition(s)

- Short circuit to B+
- Open circuit
- Short circuit between the lines
- Faulty

Fault effects

♦ Limited function

Diagnosis information - Rear-end electronics

NOTE

For vehicles with **Porsche Vehicle Tracking System (PVTS)**, see **Tequipment (TEQ) instructions,** main group **9063**!

►This fault code relates to the **Porsche Vehicle Tracking System (PVTS**).
More information is available in attached documents or from the respective service provider.

Diagnosis information - Rear-end electronics

Rear-end electronics Immobilizer

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- **Control module Rear-end electronics** Immobilizer Authentication data incorrect
- **Control module Rear-end electronics** incomplete taught
- **Control module Rear-end electronics** not taught (**Control module Rear-end electronics** new)
- Different data **DME control module** <-> **Rear-end electronics** during teaching

► Teach >component protection< using >PIWIS Tester II< ⇒ >Diagnostics< ⇒ >Online teaching functions<.

Fault effects

♦ Alarm system triggers

Diagnosis information - Rear-end electronics

Rear-end electronics Immobilizer

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- **Control module Rear-end electronics** Immobilizer Authentication data incorrect
- **Control module Rear-end electronics** incomplete taught
- **Control module Rear-end electronics** not taught (**Control module Rear-end electronics** new)
- Different data **DME control module** <-> **Rear-end electronics** during teaching

► Teach >component protection< using >PIWIS Tester II< ⇒ >Diagnostics< ⇒ >Online teaching functions<.

Fault effects

♦ Alarm system triggers

Diagnosis information - Rear-end electronics

Voltage converter, Output implausible

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ **Supply line** for the **Rear-end electronics** to the **Voltage converter**: Open circuit/short circuit to ground
♦ **Voltage converter** Faulty

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V** ⇒ **+ 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Diagnosis information - Rear-end electronics

Upper part of lid lock, rear

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **Rear-end electronics** coded correctly

Fault setting condition(s)

- Short circuit to B+
- Open circuit
- Short circuit between the lines
- Faulty

Fault effects

♦ Limited function

Diagnosis information - Rear-end electronics

Upper part of lid lock, rear

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

- Faulty

Fault effects

♦ Limited function

Diagnosis information - Rear-end electronics

81010E Spoiler drive Speed sensor Faulty
81020E Spoiler drive Speed sensor plus Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

Short circuit to ground

Fault effects

Spoiler is de-standardized and moves to a safe position.

Diagnosis information - Rear-end electronics

81010E Spoiler drive Speed sensor Faulty
81020E Spoiler drive Speed sensor plus Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

Short circuit to ground

Fault effects

Spoiler is de-standardized and moves to a safe position.

Diagnosis information - Component(s)

81030E Spoiler drive Position sensor
81040E Spoiler drive plus Position sensor

ⓘ INFORMATION

The Position sensor is a Hall-effect sensor. The extended end position is detected by a Hall-effect sensor.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Current <0.2 mA and >20.0 mA

Fault effects

Spoiler is de-standardized and moves to a safe position.

Diagnosis information - Component(s)

81030E Spoiler drive Position sensor
81040E Spoiler drive plus Position sensor

ⓘ INFORMATION

The Position sensor is a Hall-effect sensor. The extended end position is detected by a Hall-effect sensor.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Current <0.2 mA and >20.0 mA

Fault effects

Spoiler is de-standardized and moves to a safe position.

Diagnosis information - Spoiler drive

81050E Spoiler drive Position conflict
81060E Spoiler drive Plus position conflict

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

Spoiler in position E (retracted), and hall sender reference signal/switching state is implausible.

Fault effects

Spoiler is de-standardized and moves to a safe position.

Diagnosis information - Spoiler drive

81050E Spoiler drive Position conflict
81060E Spoiler drive Plus position conflict

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

Spoiler in position E (retracted), and hall sender reference signal/switching state is implausible.

Fault effects

Spoiler is de-standardized and moves to a safe position.

Diagnosis information - Component(s)

81080C Relay Spoiler drive

ⓘ INFORMATION

Relay serves the purpose of polarity reversal Engine extension/retraction.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Relay Faulty

Fault effects

The affected function no longer reacts

Diagnosis information - Rear-end electronics

81090E Spoiler motor/drive - overcurrent
810A0E Spoiler motor/drive plus - overcurrent

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Overload or short circuit to ground

Diagnosis information - Rear-end electronics

81090E Spoiler motor/drive - overcurrent
810A0E Spoiler motor/drive plus - overcurrent

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Overload or short circuit to ground

Diagnosis information - LIN bus Master

Communication with LIN component

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

● Eine Kommunikation mit dem im Fehlertext bezeichneten Bauteil war/ist nicht möglich.

Possible fault causes

♦ Die Spannungsversorgung des bezeichneten Bauteils ist nicht oder nur eingeschränkt vorhanden.
♦ Die LIN-Leitung ist zwischen dem Bauteilstecker des bezeichneten Bauteils und dem ersten Splice nach dem Bauteil unterbrochen.
♦ LIN component is incorrectly coded in the control unit.
♦ **LIN component** Faulty
♦ Control unit faulty

Fault effects

♦ Functions in the control unit are available only with restrictions.
♦ Functions in the control unit are not available.
♦ Fahrzeug übergreifende Funktionen sind nicht verfügbar.

Diagnosis information - Rear-end electronics

82020E Interior mirror Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- **Interior mirror** Faulty

Fault effects

The affected function no longer reacts

Diagnosis information - Rear-end electronics

830101 Motor, sliding roof - Overvoltage
830102 Motor, sliding roof - Undervoltage

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Supply voltage above permissible tolerance
- Supply voltage below permissible tolerance
- Leads Faulty
- **Motor, sliding roof** Faulty

Fault effects

The affected function no longer reacts

Diagnosis information - Rear-end electronics

830101 Motor, sliding roof - Overvoltage
830102 Motor, sliding roof - Undervoltage

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Supply voltage above permissible tolerance
- Supply voltage below permissible tolerance
- Leads Faulty
- **Motor, sliding roof** Faulty

Fault effects

The affected function no longer reacts

Diagnosis information - Rear-end electronics

83020E Drive Motor, sliding roof Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **Sliding roof** coded

Fault setting condition(s)

- **Motor, sliding roof** Faulty

Fault effects

The affected function no longer reacts

Diagnosis information - Rear-end electronics

84010E Roof console Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- **Roof console** Faulty

Fault effects

The affected function no longer reacts

Diagnosis information - Component(s)

Function light

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Open circuit
- Faulty

Fault effects
Light does not function

Diagnosis information - Component(s)

Function light

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Open circuit
- Faulty

Fault effects
Light does not function

Diagnosis information - Control module

Temperature

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- **Device temperature** - Limit exceeded
- **Device temperature** - Below limit

Fault effects
Function not available or available only to a limited extent

Diagnosis information - Component(s)

Button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)
The button is stuck or permanently actuated.

Fault effects
The affected function no longer reacts

Diagnosis information - Component(s)

Button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)
The button is stuck or permanently actuated.

Fault effects
The affected function no longer reacts

Diagnosis information - Component(s)

Button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)
The button is stuck or permanently actuated.

Fault effects
The affected function no longer reacts

Diagnosis information - Component(s)

Button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)
The button is stuck or permanently actuated.

Fault effects
The affected function no longer reacts

Diagnosis information - Component(s)

Button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)
The button is stuck or permanently actuated.

Fault effects
The affected function no longer reacts

Diagnosis information - Component(s)

Button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)
The button is stuck or permanently actuated.

Fault effects
The affected function no longer reacts

Diagnosis information - Rear-end electronics

85010E Passenger compartment monitoring sensor Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- **Passenger compartment monitoring sensor** Faulty

Fault effects

The affected function no longer reacts

Diagnosis information - Rear-end electronics

85020E Tilt sensor Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- **Tilt sensor** Faulty

Fault effects

The affected function no longer reacts

Diagnosis information - Rear-end electronics

High-volume horn for alarm system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Lines/connections
- **High-volume horn for alarm system**

Fault effects
The affected function no longer reacts

Diagnosis information - Rear-end electronics

85040E Alarm-system light-emitting diode Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Short circuit to B+/ground/between lines or open circuit in the lines
- **Alarm-system light-emitting diode** Faulty

Fault effects

♦ **Alarm-system light-emitting diode** No function

Diagnosis information - Rear-end electronics

Light bulb

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Light bulb Faulty
- **Power supply** Faulty
- Ground supply Faulty
- Light unit Faulty

Fault effects

Light does not function

Diagnosis information - Rear-end electronics

Light bulb

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Light bulb Faulty
- **Power supply** Faulty
- Ground supply Faulty
- Light unit Faulty

Fault effects

Light does not function

Diagnosis information - Rear-end electronics

Light bulb

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Light bulb Faulty
- **Power supply** Faulty
- Ground supply Faulty
- Light unit Faulty

Fault effects

Light does not function

Diagnosis information - Rear-end electronics

Light bulb

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Light bulb Faulty
- **Power supply** Faulty
- Ground supply Faulty
- Light unit Faulty

Fault effects

Light does not function

Diagnosis information - Interior-surveillance button

87050E Interior-surveillance button LED faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Interior-surveillance button** must be coded
- Ignition on

INFORMATION

Button only installed for Country version USA/Canada (B-pillar on driver side)

Possible fault causes

♦ LED faulty

Fault setting condition(s)

- **Rear-end electronics** detects overload when button is pressed

Diagnosis information - Rear-end electronics

Light bulb

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Light bulb Faulty
- **Power supply** Faulty
- Ground supply Faulty
- Light unit Faulty

Fault effects

Light does not function

Diagnosis information - Rear-end electronics

Sun blind

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- mechanically sluggish
- Engine Faulty

Fault effects
The affected function no longer reacts

Diagnosis information - Rear-end electronics

Light bulb

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Light bulb Faulty
- **Power supply** Faulty
- Ground supply Faulty
- Light unit Faulty

Fault effects

Light does not function

Diagnosis information - Rear-end electronics

Light bulb

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Light bulb Faulty
- **Power supply** Faulty
- Ground supply Faulty
- Light unit Faulty

Fault effects

Light does not function

Diagnosis information - Rear-end electronics

Light bulb

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Light bulb Faulty
- **Power supply** Faulty
- Ground supply Faulty
- Light unit Faulty

Fault effects

Light does not function

Diagnosis information - Rear-end electronics

Light bulb

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Light bulb Faulty
- **Power supply** Faulty
- Ground supply Faulty
- Light unit Faulty

Fault effects

Light does not function

Diagnosis information - Rear-end electronics

Light bulb

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Light bulb Faulty
- **Power supply** Faulty
- Ground supply Faulty
- Light unit Faulty

Fault effects

Light does not function

Diagnosis information - Rear-end electronics

Light bulb

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)
The button is stuck or permanently actuated.

Fault effects
The affected function no longer reacts

Diagnosis information - Rear-end electronics

Electronic steering column lock (ELV) ELV enable line

Diagnostic conditions

● The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.
● Ignition on

Fault setting condition(s)

● Below limit
● ELV enable line, Short circuit to ground
● ELV enable line, Short circuit to B+
● ELV enable line, Open circuit

Fault effects

Electronic steering column lock (ELV) No function

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Diagnosis information - Rear-end electronics

Electronic steering column lock (ELV) ELV enable line

Diagnostic conditions

● The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.
● Ignition on

Fault setting condition(s)

● Below limit

Diagnosis information - Rear-end electronics

8D010E Sunblind motor

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

- Mechanical fault
- **Supply voltage** Below limit
- Coding incorrect or not carried out (pin 8 on plug housing has no ground)
- **Sunblind motor** Faulty

Fault effects

The affected function no longer reacts

Diagnosis information - Rear-end electronics

Rear-end electronics Power supply

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

● Power supply Below limit
(Voltage < 9 V for > 15 s)

● Power supply Limit exceeded
(Voltage > 15 V for > 15 s)

Possible fault causes

♦ Fuse Faulty
♦ Short circuit to ground or open circuit in lines
♦ **Control module Rear-end electronics** Faulty

Diagnosis information - Rear-end electronics

Rear-end electronics Power supply

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

● Power supply Below limit
(Voltage < 9 V for > 15 s)

● Power supply Limit exceeded
(Voltage > 15 V for > 15 s)

Possible fault causes

♦ Fuse Faulty
♦ Short circuit to ground or open circuit in lines
♦ **Control module Rear-end electronics** Faulty

C11004

Diagnosis information - Rear-end electronics

Control module Rear-end electronics, Programming

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ **Rear-end electronics** No/incorrect coding
♦ **Control module Rear-end electronics** Faulty

Diagnosis information - Rear-end electronics

C11005 Rear-end electronics Function restriction

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- RAM/ROM fault

Possible fault causes

♦ **Control module Rear-end electronics** Faulty

Fault effects

- **Rear-end electronics** No function

C11006

Diagnostic information - Rear-end electronics

Production mode active/Coding Faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- One or more production modes or production interventions are activated.
- No/incorrect coding
- **Rear-end electronics** control unit faulty

Fault effects

♦ Comfort functions: Function not available or available only to a limited extent

Diagnosis information - Rear-end electronics

Rear-end electronics Calibration

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- **Panorama roof system**, Calibration incorrect or not carried out
- **Rear spoiler**, Calibration incorrect or not carried out
- **Roof console Control module Rear-end electronics** incomplete taught
- **Control module Rear-end electronics** not taught (**Control module Rear-end electronics** new)

► In the >PIWIS Tester II< ⇒ >Diagnostics< ⇒ Rear-end electronics => Drive links/tests => Teaching <, perform the respective **standardization/calibration/teaching** operations.

Fault effects

♦ Function not available or available only to a limited extent

C13006

Diagnosis information - Rear-end electronics

NOTE

For vehicles with **Porsche Vehicle Tracking System (PVTS)**, see **Tequipment (TEQ) instructions,** main group **9063**!

►This fault code relates to the **Porsche Vehicle Tracking System (PVTS**).
More information is available in attached documents or from the respective service provider.

Diagnosis information - Component(s)

LIN user

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)
No signal/communication

Fault effects
The affected function no longer reacts

Diagnosis information - LIN bus Master

Communication with LIN component

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

● Eine Kommunikation mit dem im Fehlertext bezeichneten Bauteil war/ist nicht möglich.

Possible fault causes

♦ Die Spannungsversorgung des bezeichneten Bauteils ist nicht oder nur eingeschränkt vorhanden.
♦ Die LIN-Leitung ist zwischen dem Bauteilstecker des bezeichneten Bauteils und dem ersten Splice nach dem Bauteil unterbrochen.
♦ LIN component is incorrectly coded in the control unit.
♦ **LIN component** Faulty
♦ Control unit faulty

Fault effects

♦ Functions in the control unit are available only with restrictions.
♦ Functions in the control unit are not available.
♦ Fahrzeug übergreifende Funktionen sind nicht verfügbar.

C13013

Diagnosis information - LIN bus Master

Communication with LIN component

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

● Eine Kommunikation mit dem im Fehlertext bezeichneten Bauteil war/ist nicht möglich.

Possible fault causes

♦ Die Spannungsversorgung des bezeichneten Bauteils ist nicht oder nur eingeschränkt vorhanden.
♦ Die LIN-Leitung ist zwischen dem Bauteilstecker des bezeichneten Bauteils und dem ersten Splice nach dem Bauteil unterbrochen.
♦ LIN component is incorrectly coded in the control unit.
♦ **LIN component** Faulty
♦ Control unit faulty

Fault effects

♦ Functions in the control unit are available only with restrictions.
♦ Functions in the control unit are not available.
♦ Fahrzeug übergreifende Funktionen sind nicht verfügbar.

Diagnostic information - Door control unit

Control unit faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)
Control unit faulty

Fault effects
Function not available or available only to a limited extent

Diagnostic information - Door control unit

Power supply

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Power supply - below limit value - 9 V
- Power supply - above limit value - 16 V

Fault effects

♦ It may no longer be possible to activate the actuators

ⓘDiagnostic information - Door control unit

No/incorrect coding

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Coding incorrect or not carried out

Fault effects

♦ Function not available or available only to a limited extent

Diagnostic information - Door control unit

Power windows motor - thermal protection active

Diagnostic conditions

- Ignition on
- Power windows switch actuated

Possible fault causes

♦ Window guides stiff
♦ Frequent actuation of power windows switch

Fault setting condition(s)

- Power windows motor, temperature too high

Fault effects

♦ Function available to a limited extent; power windows can still only be moved towards open

Diagnostic information - door control unit

05CA - Central locking motors, short circuit to B+
0843 - Central locking closing unit, implausible signal

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Central locking system actuated

Fault setting condition(s)

- Short circuit to B+
- Signal implausible

Possible fault causes

- Short circuit to B+/ground or open circuit in the lines to the central locking motor
- Central locking motor faulty
- Door control unit faulty

Fault effects

- No function

Diagnosis information - Control module

Lamp

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Short circuit to ground
- Open circuit
- Short circuit between the lines
- Faulty

Fault effects

- Light does not function

Diagnostic information - Door control unit

Power supply

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Power supply - below limit value - 9 V
- Power supply - above limit value - 16 V

Fault effects

♦ It may no longer be possible to activate the actuators

Diagnostic information - Door control unit

Power supply

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Power supply - below limit value - 9 V
- Power supply - above limit value - 16 V

Fault effects

♦ It may no longer be possible to activate the actuators

Diagnostic information - Control unit

Driver power window button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

♦ The button is stuck or permanently actuated.

Fault effects

♦ The window cannot be opened or closed

Diagnostic information - door control unit

05CA - Central locking motors, short circuit to B+
0843 - Central locking closing unit, implausible signal

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Central locking system actuated

Fault setting condition(s)

- Short circuit to B+
- Signal implausible

Possible fault causes

- Short circuit to B+/ground or open circuit in the lines to the central locking motor
- Central locking motor faulty
- Door control unit faulty

Fault effects

- No function

Diagnostic information - Control unit

Driver power window button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

♦ The button is stuck or permanently actuated.

Fault effects

♦ The window cannot be opened or closed

Diagnostic information

Thermal protection for power window, driver

INFORMATION
This fault was detected by the driver door control unit.

Diagnostic conditions

- Ignition on
- Battery positive voltage OK (11.4 to 14.5 V)
- Internal function test on driver door control unit

Possible fault causes

- Frequent opening and closing of driver door window
- Window guides stiff

Diagnosis information - Component(s)

Function light

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Open circuit
- Faulty

Fault effects
Light does not function

Diagnostic information - door control unit

084C - Outer door handle switch, continuously actuated

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- The button is stuck or permanently actuated

Possible fault causes

- The button is stuck or permanently actuated
- Short circuit to ground

Fault effects

- No function

Diagnostic information - Door control unit

Control unit faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)
Control unit faulty

Fault effects
Function not available or available only to a limited extent

Diagnostic information - Door control unit

Data record invalid

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, delete the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Control unit data record faulty or incorrect

Possible fault causes

♦ Incorrect data record programmed
♦ Data record faulty

Fault effects

♦ Restricted door functionality

Diagnosis information - Control module

Lamp

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Short circuit to ground
- Open circuit
- Short circuit between the lines
- Faulty

Fault effects

- Light does not function

Diagnostic information - Trailer hitch

Control module Overtemperature

INFORMATION
♦ The trailer hitch control unit monitors the circuits to the trailer. Faults in the vehicle and in the trailer are entered as fault entries in the trailer hitch control unit.
♦ Lighting faults are stored only from the last connected trailer. If another trailer is detected (e.g., connector out and in again), all lighting faults are first erased.
♦ Using a suitable test cable (tool) or a functional trailer, it can be tested if the fault on the vehicle is present or is located in the trailer.
♦ Observe the fault status during fault finding. (Is the fault currently present?)

Diagnostic conditions

- Internal function test on **Control module** Trailer hitch
- Ignition on

Fault setting condition(s)

- Trailer hitch control unit temperature limit value exceeded
- Trailer hitch control unit faulty

Fault effects

♦ System does not function
♦ Display in instrument cluster

B200044

Diagnostic information - trailer hitch

Left tail light, trailer

ⓘ INFORMATION

● This and all other lighting faults are only stored by the last trailer used. This means that if another trailer is detected (trailer in socket), all lighting faults will first be deleted.
● During fault finding, check the fault status to see whether the fault is currently present or not!
● Use a suitable test cable (loaded with > 5 W) or a trailer (which is definitely OK) to check whether the fault is present on the vehicle and whether it is a recurring fault.

Diagnostic conditions

● Internal function test on trailer hitch control unit
● Ignition on
● Trailer detected via connector in trailer socket

Possible fault causes

♦ Left tail light bulb faulty; trailer
♦ Open circuit in wiring for left tail light; vehicle and/or trailer
♦ Open circuit in ground connection for left tail light
♦ Short circuit to ground or B+ in wiring; vehicle and/or trailer
♦ Trailer hitch control unit faulty

Diagnostic information - trailer hitch

Right tail light, trailer

ⓘ INFORMATION

● This and all other lighting faults are only stored by the last trailer used. This means that if another trailer is detected (trailer in socket), all lighting faults will first be deleted.
● During fault finding, check the fault status to see whether the fault is currently present or not!
● Use a suitable test cable (loaded with > 5 W) or a trailer (which is definitely OK) to check whether the fault is present on the vehicle and whether it is a recurring fault.

Diagnostic conditions

● Internal function test on trailer hitch control unit
● Ignition on
● Trailer detected via connector in trailer socket

Possible fault causes

♦ Right tail light bulb faulty; trailer
♦ Open circuit in wiring for right tail light; vehicle and/or trailer
♦ Open circuit in ground connection for right tail light
♦ Short circuit to ground or B+ in wiring; vehicle and/or trailer
♦ Trailer hitch control unit faulty

Diagnostic information - trailer hitch

Diagnostic information - Trailer hitch

Control module Trailer hitch Initialization (learning end positions) not successful

INFORMATION

♦ The trailer hitch control unit monitors the circuits to the trailer. Faults in the vehicle and in the trailer are entered as fault entries in the trailer hitch control unit.
♦ Lighting faults are stored only from the last connected trailer. If another trailer is detected (e.g., connector out and in again), all lighting faults are first erased.
♦ Using a suitable test cable (tool) or a functional trailer, it can be tested if the fault on the vehicle is present or is located in the trailer.
♦ Observe the fault status during fault finding. (Is the fault currently present?)

WARNING

Danger of injury and damage when extending or retracting the trailer hitch (ball bar).

♦ Make sure that no persons, animals or obstacles are in the movement range.
♦ Never retract the ball bar when bicycle racks or other parts, for example, are still fitted.
♦ No connectors or adapters may be plugged into the trailer socket when retracting the ball bar.

INFORMATION

● The ball bar of the electrically adjustable trailer hitch must learn the limit stops. The system must perform an initialization run in order to teach these!
● If this has not been performed (button LEDs flash simultaneously), this can be done with the PIWIS Tester (Drive links/checks), or the ball bar can be completely extended or retracted by keeping the button pressed.
● The ball bar can only be moved by actuating the button if the rear lid is open.

Diagnostic conditions

● Internal function test on trailer hitch control unit
● Ignition on

Possible fault causes

♦ Initialization run was not performed or was not performed completely
♦ Trailer hitch control unit faulty

Diagnosis information - Trailer hitch

Button faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● During fault finding, check the fault status to see whether the fault is currently present or not!
● Use a suitable test cable (loaded with > 5 W) or a trailer (which is definitely OK) to check whether the fault is present on the vehicle and whether it is a recurring fault.

Diagnostic conditions

● Internal function test on trailer hitch control unit
● Ignition on
● Trailer detected via connector in trailer socket

Possible fault causes

♦ Brake light bulb faulty; trailer
♦ Open circuit in brake light wiring; vehicle and/or trailer
♦ Short circuit to ground or B+ in wiring; vehicle and/or trailer
♦ Trailer hitch control unit faulty

C10F313

Diagnostic information - trailer hitch

Brake light, trailer

ⓘ INFORMATION

● This and all other lighting faults are only stored by the last trailer used. This means that if another trailer is detected (trailer in socket), all lighting faults will first be deleted.
● During fault finding, check the fault status to see whether the fault is currently present or not!
● Use a suitable test cable (loaded with > 5 W) or a trailer (which is definitely OK) to check whether the fault is present on the vehicle and whether it is a recurring fault.

Diagnostic conditions

● Internal function test on trailer hitch control unit
● Ignition on
● Trailer detected via connector in trailer socket

Possible fault causes

♦ Brake light bulb faulty; trailer
♦ Open circuit in brake light wiring; vehicle and/or trailer
♦ Short circuit to ground or B+ in wiring; vehicle and/or trailer
♦ Trailer hitch control unit faulty

C119613

Diagnosis information - Trailer hitch

Button faulty

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- **Button** Trailer hitch extended period pressed (> 120 seconds)
- Lines/connections faulty
- **Rocker switch** faulty

Fault effects

- System switches off
- Display on instrument cluster

P057100

Diagnosis information - Trailer hitch

Signal Brake light

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

The trailer hitch control unit receives the brake light signal in two ways: as an analog signal via the signal line from the **Control module Rear-end electronics**, and via the Comfort CAN bus (9700).

- Lines/connections Brake light **Control module Rear-end electronics**
- Fault in area **Control module Rear-end electronics**

Fault effects

♦ Display on instrument cluster

P175700

Diagnostic information - trailer hitch

Trailer hitch control unit power supply

Diagnostic conditions

The **trailer hitch** control unit initially tests internal function sequences when the ignition is switched on (terminal 15).
All diagnosable connections are checked and any faults are stored.

- Ignition on
- Engine running (in the case of overvoltage)

Possible fault causes

♦ Vehicle electrical system voltage too low (below lower limit value, < 9.5 V > 30 seconds).
♦ Fuse faulty: (right fuse carrier, fuse 10)
♦ Short circuit to ground or open circuit in the lines
♦ Ground connection not OK
♦ Battery faulty

♦ Vehicle electrical system voltage too high (above upper limit value > 17.7 V)
♦ Generator regulator faulty
♦ Trailer hitch control unit faulty

Fault effects

♦ System not active

P175700

Diagnostic information - Trailer hitch

Power supply Trailer

Diagnostic conditions
The trailer hitch control unit initially tests internal function sequences when the ignition is switched on (terminal 15).
All diagnosable connections are checked and any faults are stored.

- Ignition on
- Trailer connected

Possible fault causes

♦ Fuse/s faulty: See circuit diagram or operating instructions

♦ Connecting line faulty, short circuit to ground or open circuit
♦ Coding Trailer hitch incorrect
♦ Ground connection not OK
♦ Battery faulty
♦ Trailer hitch control unit faulty

Fault effects

♦ System not active

Diagnostic information - Trailer hitch

No/incorrect coding

INFORMATION
♦ Under menu item **Coding** in the **PIWIS Tester,** it is possible to switch automatic pivoting calibration of the ball bar on or off.
♦ The trailer hitch control unit monitors the circuits to the trailer. Faults in the vehicle and in the trailer are entered as fault entries in the trailer hitch control unit.
♦ Lighting faults are stored only from the last connected trailer. If another trailer is detected (e.g., connector out and in again), all lighting faults are first erased.
♦ Using a suitable test cable (tool) or a functional trailer, it can be tested if the fault on the vehicle is present or is located in the trailer.
♦ Correct **trailer identification** takes place when a loaded trailer line (load connected) is plugged in.
♦ Observe the fault status during fault finding. (Is the fault currently present?)
♦ A 5-pin plug is pre-installed in the vehicle for the North American market. It is intended for the connection of a brake booster.

Diagnostic conditions

- Internal function test on **Control module** Trailer hitch
- Ignition on

Fault setting condition(s)

- Trailer hitch control unit not coded or incorrect coding/parameters set
- Trailer hitch control unit is in wrong mode (Production) --> Perform coding
- Trailer hitch control unit faulty

Fault effects

♦ System does not function
♦ Display in instrument cluster

Diagnosis information - Airbag

Driver's airbag

ⓘ INFORMATION

The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

⚠WARNING

Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING

Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.
When you connect the test tool 5056/C and then switch the ignition on and off, the fault code for stage 2 is detected because there is no airbag unit connected to it. The fault code must be deleted after removal of test tool 5056/C and after performing the repair or must be processed in accordance with the corresponding instructions.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.
♦ A triggering event (accident or similar) has occurred

ⓘ INFORMATION

The specified values and value ranges correspond to the OK state in each case.

Line test with no components connected

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING

Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.
When you connect the test tool 5056/C and then switch the ignition on and off, the fault code for stage 2 is detected because there is no airbag unit connected to it. The fault code must be deleted after removal of test tool 5056/C and after performing the repair or must be processed in accordance with the corresponding instructions.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.
♦ A triggering event (accident or similar) has occurred

ⓘ INFORMATION

The specified values and value ranges correspond to the OK state in each case.

Line test with no components connected

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING

Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.
When you connect the test tool 5056/C and then switch the ignition on and off, the fault code for stage 2 is detected because there is no airbag unit connected to it. The fault code must be deleted after removal of test tool 5056/C and after performing the repair or must be processed in accordance with the corresponding instructions.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.
♦ A triggering event (accident or similar) has occurred

ⓘ INFORMATION

The specified values and value ranges correspond to the OK state in each case.

Line test with no components connected

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING

Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.
When you connect the test tool 5056/C and then switch the ignition on and off, the fault code for stage 2 is detected because there is no airbag unit connected to it. The fault code must be deleted after removal of test tool 5056/C and after performing the repair or must be processed in accordance with the corresponding instructions.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.
♦ A triggering event (accident or similar) has occurred

- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.
When you connect the test tool 5056/C and then switch the ignition on and off, the fault code for stage 2 is detected because there is no airbag unit connected to it. The fault code must be deleted after removal of test tool 5056/C and after performing the repair or must be processed in accordance with the corresponding instructions.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** > 9.1 V
- Ignition on > 5 Second(s), then:
- Ignition off > 2 Second(s), then:
- Ignition on > 5 Second(s)

● Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.
♦ A triggering event (accident or similar) has occurred

ⓘ INFORMATION

The specified values and value ranges correspond to the OK state in each case.

Line test with no components connected

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** > 9.1 V
- Ignition on > 5 Second(s), then:
- Ignition off > 2 Second(s), then:
- Ignition on > 5 Second(s)

● Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.
♦ A triggering event (accident or similar) has occurred

ⓘ INFORMATION

The specified values and value ranges correspond to the OK state in each case.

Line test with no components connected

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

ⓘ INFORMATION
The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

⚠WARNING
Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.
When you connect the test tool 5056/C and then switch the ignition on and off, the fault code for stage 2 is detected because there is no airbag unit connected to it. The fault code must be deleted after removal of test tool 5056/C and after performing the repair or must be processed in accordance with the corresponding instructions.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

Diagnosis information - Airbag

Ignition circuit Belt tensioner

INFORMATION
The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

WARNING
Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.
When you connect the test tool 5056/C and then switch the ignition on and off, the fault code for stage 2 is detected because there is no airbag unit connected to it. The fault code must be deleted after removal of test tool 5056/C and after performing the repair or must be processed in accordance with the corresponding instructions.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** > 9.1 V
- Ignition on > 5 Second(s), then:
- Ignition off > 2 Second(s), then:
- Ignition on > 5 Second(s)

● Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.
♦ A triggering event (accident or similar) has occurred

- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.
When you connect the test tool 5056/C and then switch the ignition on and off, the fault code for stage 2 is detected because there is no airbag unit connected to it. The fault code must be deleted after removal of test tool 5056/C and after performing the repair or must be processed in accordance with the corresponding instructions.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.
♦ A triggering event (accident or similar) has occurred

ⓘ INFORMATION

The specified values and value ranges correspond to the OK state in each case.

Line test with no components connected

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

ⓘ INFORMATION

The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

⚠WARNING

Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING

Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.
When you connect the test tool 5056/C and then switch the ignition on and off, the fault code for stage 2 is detected because there is no airbag unit connected to it. ► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.
When you connect the test tool 5056/C and then switch the ignition on and off, the fault code for stage 2 is detected because there is no airbag unit connected to it. The fault code must be deleted after removal of test tool 5056/C and after performing the repair or must be processed in accordance with the corresponding instructions.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.
♦ A triggering event (accident or similar) has occurred

ⓘ INFORMATION

The specified values and value ranges correspond to the OK state in each case.

Line test with no components connected

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

Knee airbag

ⓘ INFORMATION

The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

⚠WARNING

Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING

Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.
When you connect the test tool 5056/C and then switch the ignition on and off, the fault code for stage 2 is detected because there is no airbag unit connected to it. ► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.
When you connect the test tool 5056/C and then switch the ignition on and off, the fault code for stage 2 is detected because there is no airbag unit connected to it. The fault code must be deleted after removal of test tool 5056/C and after performing the repair or must be processed in accordance with the corresponding instructions.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.
♦ A triggering event (accident or similar) has occurred

ⓘ INFORMATION

The specified values and value ranges correspond to the OK state in each case.

Line test with no components connected

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

Knee airbag

ⓘ INFORMATION
The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

⚠WARNING
Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.
When you connect the test tool 5056/C and then switch the ignition on and off, the fault code for stage 2 is detected because there is no airbag unit connected to it. ► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.
When you connect the test tool 5056/C and then switch the ignition on and off, the fault code for stage 2 is detected because there is no airbag unit connected to it. The fault code must be deleted after removal of test tool 5056/C and after performing the repair or must be processed in accordance with the corresponding instructions.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.
♦ A triggering event (accident or similar) has occurred

ⓘ INFORMATION

The specified values and value ranges correspond to the OK state in each case.

Line test with no components connected

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

INFORMATION

The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

⚠WARNING

Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING

Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.
When you connect the test tool 5056/C and then switch the ignition on and off, the fault code for stage 2 is detected because there is no airbag unit connected to it. Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING

Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.
When you connect the test tool 5056/C and then switch the ignition on and off, the fault code for stage 2 is detected because there is no airbag unit connected to it. The fault code must be deleted after removal of test tool 5056/C and after performing the repair or must be processed in accordance with the corresponding instructions.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** > 9.1 V
- Ignition on > 5 Second(s), then:
- Ignition off > 2 Second(s), then:
- Ignition on > 5 Second(s)

● Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.
♦ A triggering event (accident or similar) has occurred

ⓘ INFORMATION

The specified values and value ranges correspond to the OK state in each case.

Line test with no components connected

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter<

deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.

NOTE
The specified values and value ranges correspond to the OK state in each case.

Ignition circuits

♦ Setpoint resistance - 1.2 Ohm ⇒ 6.0 Ohm

Line test without connected components

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V** ⇒ **+ 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ Affected ignition circuit does not ignite or does not ignite in the specified time.

Diagnosis information - Airbag

Battery main switch switching unit (**Disconnection element** - Open circuit Battery)

⚠WARNING
Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** > 9.1 V
- Ignition on > 5 Second(s), then:
- Ignition off > 2 Second(s), then:
- Ignition on > 5 Second(s)
- Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter<

deviates from the specified value.

Diagnosis information - Airbag

Airbag sensor

ⓘ INFORMATION

The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

⚠WARNING
Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.
► Make sure that the airbag control unit is always installed securely in the vehicle before and after working on the airbag system.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** > 9.1 V
- Ignition on > 5 Second(s), then:
- Ignition off > 2 Second(s), then:
- Ignition on > 5 Second(s)
- Airbag triggering unit Internal function test

Possible fault causes

♦ The wiring harness between the airbag triggering unit, driver airbag unit and side airbags in the seats has many disconnection points, which also must be considered as possible fault causes.

In particular, check the:
- **Disconnection point X110.1A1 ⇒ Disconnection point X110.2A1**
- **Disconnection point X120.1A1 ⇒ Disconnection point X120.2A1**

► Additionally observe the following Workshop Manual: >970941< **Main wiring harness** Repair door disconnection point

♦ **Coding** - Ignition circuit is connected and OK, but is not coded. (in case of coding error)
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ **Airbag sensor** incorrect
♦ **Airbag sensor** Faulty

Line test with no components connected

♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ **Airbag sensor** incorrect
♦ **Airbag sensor** Faulty

Line test with no components connected

ⓘ INFORMATION
The specified values and value ranges correspond to the OK state in each case.

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

Diagnosis information - Airbag

Airbag sensor

ⓘ INFORMATION

The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

⚠WARNING
Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.
► Make sure that the airbag control unit is always installed securely in the vehicle before and after working on the airbag system.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** > 9.1 V
- Ignition on > 5 Second(s), then:
- Ignition off > 2 Second(s), then:
- Ignition on > 5 Second(s)
- Airbag triggering unit Internal function test

Possible fault causes

♦ The wiring harness between the airbag triggering unit, driver airbag unit and side airbags in the seats has many disconnection points, which also must be considered as possible fault causes.

In particular, check the:
- **Disconnection point X110.1A1 ⇒ Disconnection point X110.2A1**
- **Disconnection point X120.1A1 ⇒ Disconnection point X120.2A1**

► Additionally observe the following Workshop Manual: >970941< **Main wiring harness** Repair door disconnection point

♦ **Coding** - Ignition circuit is connected and OK, but is not coded. (in case of coding error)
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ **Airbag sensor** incorrect
♦ **Airbag sensor** Faulty

Line test with no components connected

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

B101812

Diagnosis information - Airbag

Airbag sensor

ⓘ INFORMATION

The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

⚠WARNING
Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.
► Make sure that the airbag control unit is always installed securely in the vehicle before and after working on the airbag system.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** > 9.1 V
- Ignition on > 5 Second(s), then:
- Ignition off > 2 Second(s), then:
- Ignition on > 5 Second(s)
- Airbag triggering unit Internal function test

Possible fault causes

♦ The wiring harness between the airbag triggering unit, driver airbag unit and side airbags in the seats has many disconnection points, which also must be considered as possible fault causes.

In particular, check the:
- **Disconnection point X110.1A1 ⇒ Disconnection point X110.2A1**
- **Disconnection point X120.1A1 ⇒ Disconnection point X120.2A1**

► Additionally observe the following Workshop Manual: >970941< **Main wiring harness** Repair door disconnection point

♦ **Coding** - Ignition circuit is connected and OK, but is not coded. (in case of coding error)
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ **Airbag sensor** incorrect
♦ **Airbag sensor** Faulty

Line test with no components connected

ⓘ INFORMATION
The specified values and value ranges correspond to the OK state in each case.

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

Refer to the stored fault code for the fault cause.

⚠WARNING
Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.
► Make sure that the airbag control unit is always installed securely in the vehicle before and after working on the airbag system.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** > 9.1 V
- Ignition on > 5 Second(s), then:
- Ignition off > 2 Second(s), then:
- Ignition on > 5 Second(s)
- Airbag triggering unit Internal function test

Possible fault causes

♦ The wiring harness between the airbag triggering unit, driver airbag unit and side airbags in the seats has many disconnection points, which also must be considered as possible fault causes.

In particular, check the:
- **Disconnection point X110.1A1 ⇒ Disconnection point X110.2A1**
- **Disconnection point X120.1A1 ⇒ Disconnection point X120.2A1**

► Additionally observe the following Workshop Manual: >970941< **Main wiring harness** Repair door disconnection point

♦ **Coding** - Ignition circuit is connected and OK, but is not coded. (in case of coding error)
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ **Airbag sensor** incorrect
♦ **Airbag sensor** Faulty

Line test with no components connected

ⓘ INFORMATION
The specified values and value ranges correspond to the OK state in each case.

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

⚠WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** > 9.1 V
- Ignition on > 5 Second(s), then:
- Ignition off > 2 Second(s), then:
- Ignition on > 5 Second(s)
- Airbag triggering unit Internal function test

Possible fault causes

♦ The wiring harness between the airbag triggering unit, driver airbag unit and side airbags in the seats has many disconnection points, which also must be considered as possible fault causes.

In particular, check the:
- **Disconnection point X110.1A1 ⇒ Disconnection point X110.2A1**
- **Disconnection point X120.1A1 ⇒ Disconnection point X120.2A1**

► Additionally observe the following Workshop Manual: >970941< **Main wiring harness** Repair door disconnection point

♦ **Coding** - Ignition circuit is connected and OK, but is not coded. (in case of coding error)
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ **Airbag sensor** incorrect
♦ **Airbag sensor** Faulty

Line test with no components connected

ⓘ INFORMATION
The specified values and value ranges correspond to the OK state in each case.

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

Diagnosis information - Airbag

Airbag sensor

ⓘ INFORMATION

The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

⚠WARNING
Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.
► Make sure that the airbag control unit is always installed securely in the vehicle before and after working on the airbag system.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.

♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.
♦ A triggering event (accident or similar) has occurred

ⓘ INFORMATION

The specified values and value ranges correspond to the OK state in each case.

Ignition circuits

♦ Setpoint resistance Seat belt buckle connected - 60 Ohm ⇒ 160 Ohm
♦ Setpoint resistance Seat belt buckle **not** connected - 240 Ohm ⇒ 620 Ohm

Line test without connected components

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V** ⇒ **+ 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

Diagnosis information - Airbag

Buckle switch

ⓘ INFORMATION
The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

⚠WARNING
Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** > 9.1 V
- Ignition on > 8 Second(s), then:
- Ignition off > 2 Second(s), then:
- Ignition on > 8 Second(s)
- Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.
♦ A triggering event (accident or similar) has occurred

♦ Sensor for seat position Faulty

ⓘ INFORMATION

The specified values and value ranges correspond to the OK state in each case.

Line test without connected components

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

Diagnosis information - Airbag

Sensor for seat position

ⓘ INFORMATION

The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

⚠WARNING

Uncontrolled triggering of the airbag

- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING

Driving with attached/connected special tools or commercially available tools

- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** > 9.1 V
- Ignition on > 5 Second(s), then:
- Ignition off > 2 Second(s), then:
- Ignition on > 5 Second(s)
- Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Sensor for seat position incorrect
♦ Sensor for seat position Faulty

► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
• Contusions, crushing injuries or death
• Traffic hazard

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

• Ignition on
• Airbag triggering unit Internal function test
► Actuate the following component: **Airbag OFF key-operated switch**

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.

♦ Implausible signal - Measured resistance less than 2,900 Ohm and greater than 1,200 Ohm

ⓘ INFORMATION

The specified values and value ranges correspond to the OK state in each case.

Line test without connected components

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

Diagnostic information - airbag

Occupant detection control unit

⚠WARNING
Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► Never hang the **PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.
► Make sure that the airbag control unit is always installed securely in the vehicle before and after working on the airbag system.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools or commercially available tools attached instead of the airbag units.

ⓘ The occupant detection system is only installed for equipment option (I-no.) '4UQ - Advanced-Airbag'. This system then consists of the occupant detection control unit and the occupant detection pressure sensor (sensor mat). If this equipment is not installed, a simple seat occupancy detection system (seat occupancy sensor) is automatically installed.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test on airbag triggering unit

Possible fault causes

♦ Occupant detection not coded/deactivated
♦ Electrical fault in circuit - short circuit to B+/ground/between lines or open circuit in the lines
♦ Ingress of moisture (e.g. spilled drink, rain, etc.) on the front-passenger seat

♦ Occupant detection control unit faulty
♦ Airbag control unit faulty

In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Airbag triggering unit Internal function test

Possible fault causes

♦ Calibration - **Seat occupancy detection control unit** Calibration incorrect or not carried out
♦ **Seat occupancy detection control unit** serial number incorrect
♦ Electrical fault in circuit - Short circuit to B+/ground/between lines or open circuit in the lines
♦ Short circuit to B+ - Check plug connections, connectors and wiring and correct any problem(s).
♦ Short circuit to ground - Check plug connections, connectors and wiring and correct any problem (s).
♦ Open circuit - Check plug connections, connectors and wiring and correct any problem(s).
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter<

deviates from the specified value.

ⓘ INFORMATION

The specified values and value ranges correspond to the OK state in each case.

Line test without connected components

Short circuit to B+:

♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:

♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:

♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:

♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

Diagnosis information - Airbag

Seat occupancy detection

⚠WARNING
Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Diagnostic information - airbag

Occupant detection control unit - calibration incorrect

⚠WARNING
Uncontrolled triggering of the airbag
• Contusions, crushing injuries or death

► Never hang the **PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.
► Make sure that the airbag control unit is always installed securely in the vehicle before and after working on the airbag system.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
• Contusions, crushing injuries or death
• Traffic hazard

► Never drive with special tools or commercially available tools attached instead of the airbag units.

ⓘ The occupant detection system is only installed for equipment option (I-no.) '4UQ - Advanced-Airbag'. This system then consists of the occupant detection control unit and the occupant detection pressure sensor (sensor mat). If this equipment is not installed, a simple seat occupancy detection system (seat occupancy sensor) is automatically installed.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

• Ignition on

Possible fault causes

♦ Calibration of occupant detection not performed or not performed correctly

Fault effects

♦ Airbag warning light is **ON**
♦ Automatic deactivation of the front-passenger airbag does not work

Diagnosis information - Airbag

Fault Belt force sensor / belt buckle switch

⚠WARNING
Uncontrolled triggering of the airbag
• Contusions, crushing injuries or death

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
• Contusions, crushing injuries or death
• Traffic hazard

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

• Ignition on
• Airbag triggering unit Internal function test

Possible fault causes

ⓘ The belt force sensor/belt buckle switch is installed in the front-passenger buckle and monitors the tensile force acting on the buckle. The belt force sensor/belt buckle switch is powered by the seat occupancy detection control unit.
The belt buckle itself (inserted/not inserted) is wired with the airbag control unit.

♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Part stuck and exerting pressure or tension on the belt buckle while the front-passenger seat belt is not fastened
♦ Belt force sensor/belt buckle switch faulty
♦ Seat occupancy detection control unit faulty

Fault effects
Affected ignition circuit does not ignite or does not ignite in the specified time.

B102411

Diagnosis information - Airbag

Passenger's airbag

ⓘ INFORMATION

The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

⚠WARNING

Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING

Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.
When you connect the test tool 5056/C and then switch the ignition on and off, the fault code for stage 2 is detected because there is no airbag unit connected to it. The fault code must be deleted after removal of test tool 5056/C and after performing the repair or must be processed in accordance with the corresponding instructions.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.
♦ A triggering event (accident or similar) has occurred

ⓘ INFORMATION

The specified values and value ranges correspond to the OK state in each case.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.
♦ A triggering event (accident or similar) has occurred

ⓘ INFORMATION

The specified values and value ranges correspond to the OK state in each case.

Line test with no components connected

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

Diagnosis information - Airbag

Passenger's airbag

ⓘ INFORMATION

The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

⚠WARNING

Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING

Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.
When you connect the test tool 5056/C and then switch the ignition on and off, the fault code for stage 2 is detected because there is no airbag unit connected to it. The fault code must be deleted after removal of test tool 5056/C and after performing the repair or must be processed in accordance with the corresponding instructions.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.
♦ A triggering event (accident or similar) has occurred

ⓘ INFORMATION

The specified values and value ranges correspond to the OK state in each case.

Line test with no components connected

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

Diagnosis information - Airbag

Passenger's airbag

ⓘ INFORMATION

The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

⚠WARNING

Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING

Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.
When you connect the test tool 5056/C and then switch the ignition on and off, the fault code for stage 2 is detected because there is no airbag unit connected to it. The fault code must be deleted after removal of test tool 5056/C and after performing the repair or must be processed in accordance with the corresponding instructions.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.
♦ A triggering event (accident or similar) has occurred

Diagnosis information - Airbag

Airbag sensor

ⓘ INFORMATION

The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

⚠WARNING
Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.
► Make sure that the airbag control unit is always installed securely in the vehicle before and after working on the airbag system.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** > 9.1 V
- Ignition on > 5 Second(s), then:
- Ignition off > 2 Second(s), then:
- Ignition on > 5 Second(s)
- Airbag triggering unit Internal function test

Possible fault causes

♦ The wiring harness between the airbag triggering unit, driver airbag unit and side airbags in the seats has many disconnection points, which also must be considered as possible fault causes.

In particular, check the:
- **Disconnection point X110.1A1 ⇒ Disconnection point X110.2A1**
- **Disconnection point X120.1A1 ⇒ Disconnection point X120.2A1**

► Additionally observe the following Workshop Manual: >970941< **Main wiring harness** Repair door disconnection point

♦ **Coding** - Ignition circuit is connected and OK, but is not coded. (in case of coding error)
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ **Airbag sensor** incorrect
♦ **Airbag sensor** Faulty

Line test with no components connected

ⓘ INFORMATION
The specified values and value ranges correspond to the OK state in each case.

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:

- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING

Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** > 9.1 V
- Ignition on > 8 Second(s), then:
- Ignition off > 2 Second(s), then:
- Ignition on > 8 Second(s)
- Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.
♦ A triggering event (accident or similar) has occurred

ⓘ INFORMATION

The specified values and value ranges correspond to the OK state in each case.

Ignition circuits

♦ Setpoint resistance Seat belt buckle connected - 60 Ohm ⇒ 160 Ohm
♦ Setpoint resistance Seat belt buckle **not** connected - 240 Ohm ⇒ 620 Ohm

Line test without connected components

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V** ⇒ **+ 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

Diagnosis information - Airbag

Buckle switch

ⓘ INFORMATION

The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

⚠WARNING

Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING

Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** > 9.1 V
- Ignition on > 8 Second(s), then:
- Ignition off > 2 Second(s), then:
- Ignition on > 8 Second(s)
- Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.
♦ A triggering event (accident or similar) has occurred

ⓘ INFORMATION

The specified values and value ranges correspond to the OK state in each case.

Ignition circuits

♦ Setpoint resistance Seat belt buckle connected - 60 Ohm ⇒ 160 Ohm
♦ Setpoint resistance Seat belt buckle **not** connected - 240 Ohm ⇒ 620 Ohm

Line test without connected components

Short circuit to B+:

ⓘ INFORMATION
The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

⚠WARNING
Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.
When you connect the test tool 5056/C and then switch the ignition on and off, the fault code for stage 2 is detected because there is no airbag unit connected to it. The fault code must be deleted after removal of test tool 5056/C and after performing the repair or must be processed in accordance with the corresponding instructions.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

ⓘ INFORMATION

The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

⚠WARNING
Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.
► Make sure that the airbag control unit is always installed securely in the vehicle before and after working on the airbag system.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** > 9.1 V
- Ignition on > 5 Second(s), then:
- Ignition off > 2 Second(s), then:
- Ignition on > 5 Second(s)
- Airbag triggering unit Internal function test

Possible fault causes

♦ The wiring harness between the airbag triggering unit, driver airbag unit and side airbags in the seats has many disconnection points, which also must be considered as possible fault causes.

In particular, check the:
- **Disconnection point X110.1A1 ⇒ Disconnection point X110.2A1**
- **Disconnection point X120.1A1 ⇒ Disconnection point X120.2A1**

► Additionally observe the following Workshop Manual: >970941< **Main wiring harness** Repair door disconnection point

♦ **Coding** - Ignition circuit is connected and OK, but is not coded. (in case of coding error)
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ **Airbag sensor** incorrect
♦ **Airbag sensor** Faulty

- Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ deactivated - The ignition circuit is deactivated, because the wear/age limit was reached.

NOTE
The specified values and value ranges correspond to the OK state in each case.

Ignition circuits

♦ Setpoint resistance - 1.2 Ohm ⇒ 6.0 Ohm

Line test without connected components

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Warning light for Airbag is **ON**
♦ Affected ignition circuit does not ignite or does not ignite in the specified time.

Diagnosis information - Airbag

High-voltage battery main switch switching unit (**Disconnection element** - Open circuit Battery)

⚠WARNING
Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** > 9.1 V
- Ignition on > 5 Second(s), then:
- Ignition off > 2 Second(s), then:
- Ignition on > 5 Second(s)
- Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Electrical fault in circuit - Electrical connection between two ignition circuits (mutual short circuit). Short circuit in wiring harness of two ignition circuits
♦ Short circuit to B+/ground/between lines or open circuit in the lines
♦ Limit exceeded - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.
♦ Below limit - This fault is recognized if the angle measured between >control unit and igniter< deviates from the specified value.

Diagnostic information - airbag

Occupant detection control unit

⚠WARNING
Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► Never hang the **PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.
► Make sure that the airbag control unit is always installed securely in the vehicle before and after working on the airbag system.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools or commercially available tools attached instead of the airbag units.

ⓘ The occupant detection system is only installed for equipment option (I-no.) '4UQ - Advanced-Airbag'. This system then consists of the occupant detection control unit and the occupant detection pressure sensor (sensor mat). If this equipment is not installed, a simple seat occupancy detection system (seat occupancy sensor) is automatically installed.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test on airbag triggering unit

Possible fault causes

♦ Occupant detection not coded/deactivated
♦ Electrical fault in circuit - short circuit to B+/ground/between lines or open circuit in the lines
♦ Ingress of moisture (e.g. spilled drink, rain, etc.) on the front-passenger seat

♦ Occupant detection control unit faulty
♦ Airbag control unit faulty

ⓘ INFORMATION

The specified values and value ranges correspond to the OK state in each case.

♦ Setpoint resistance **> 0.9 MOhm**

Fault effects

♦ Airbag warning light is **ON**
♦ Restricted function/no function of airbag control unit

Diagnosis information - Airbag

Multi-collision braking did not take place

⚠WARNING
Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.
► Make sure that the airbag control unit is always installed securely in the vehicle before and after working on the airbag system.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools and/ or commercially available tools attached instead of the airbag units.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Airbag triggering unit detected a crash
- Ignition switched on and off again after crash event

Possible fault causes

ⓘ If the airbag control unit detects a crash, the PSM control unit initiates braking in order to prevent a multiple collision.

♦ The fault is set if the PSM control unit could not perform multi-collision braking.

Fault effects

♦ No functional restrictions for the airbag triggering unit

Diagnostic information - airbag

Airbag control unit faulty

⚠WARNING
Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► Never hang the **PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.
► Make sure that the airbag control unit is always installed securely in the vehicle before and after working on the airbag system.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools or commercially available tools attached instead of the airbag units.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test on airbag triggering unit

Possible fault causes

♦ Airbag control unit faulty

Fault effects

♦ Airbag warning light is **ON**
♦ Restricted function/no function of airbag control unit

B200094

Diagnostic information - airbag

Airbag control unit faulty

⚠WARNING
Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► Never hang the **PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.
► Make sure that the airbag control unit is always installed securely in the vehicle before and after working on the airbag system.

⚠WARNING
Driving with attached/connected special tools or commercially available tools
- **Contusions, crushing injuries or death**
- **Traffic hazard**

► Never drive with special tools or commercially available tools attached instead of the airbag units.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test on airbag triggering unit

Possible fault causes

♦ Airbag control unit faulty

Fault effects

♦ Airbag warning light is **ON**
♦ Restricted function/no function of airbag control unit

Diagnosis information - Airbag

Control module Airbag

INFORMATION

The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

WARNING

Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.
► Make sure that the airbag control unit is always installed securely in the vehicle before and after working on the airbag system.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Airbag triggering unit Internal function test

Possible fault causes

♦ **Coding** - Ignition circuit is connected and OK, but is not coded.
♦ Data record implausible - The data/programming version does not match the vehicle equipment.
♦ not compatible - the **Control module** Airbag (Airbag triggering unit) does not match the vehicle
♦ No data record programmed - the **Control module** Airbag (Airbag triggering unit) must be programmed.

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

Diagnosis information - Airbag

Control module Airbag

Disposal according to ISO

⚠ WARNING
Uncontrolled triggering of the airbag
● Contusions, crushing injuries or death

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on
● Airbag triggering unit Internal function test

Possible fault causes

♦ Disposal according to ISO - Fault is entered if disposal ignition was not carried out fully.

Fault effects

♦ Warning light for Airbag is **ON**
♦ **Control module** Airbag Limited function / No function

Diagnosis information - Airbag

Supply voltage

ⓘ INFORMATION

The information contained here in the document does not refer to the installation location of the component. Refer to the fault code text or the diagnosed object text for the installation location of the component (e.g. front, rear, left, right, driver side, passenger side). Refer to the stored fault code for the fault cause.

⚠WARNING

Uncontrolled triggering of the airbag
- **Contusions, crushing injuries or death**

► **Never hang the PIWIS Tester** on or over the steering wheel.
► Before working on the ignition circuits of the airbag system, always disconnect the battery from the vehicle electrical system and ensure that the vehicle electrical system is de-energized.
► Wait for at least one minute before starting work on the airbag system.
► Perform fault finding on the ignition circuits of the airbag system and its lines only using approved special tools.

Diagnostic conditions

- Ignition on
- Airbag triggering unit Internal function test

Possible fault causes

♦ Below limit (Vehicle voltage)
- Fuse 14 in the Fuse carrier **Instrument panel** right
- Fuse 11 in the **Current distributor**
- **Generator wiring harness**
- **Alternator** Charging current/voltage too low
- Short circuit to ground or open circuit in lines

♦ Limit exceeded (Vehicle voltage)
- **Alternator** Charging current/voltage Too high

NOTE

The specified values and value ranges correspond to the OK state in each case.

♦ Supply voltage Airbag control unit 6.0 V ⇒ 16.5 V

Line test without connected components

Short circuit to B+:

♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:

♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:

♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:

♦ Setpoint resistance **> 0.9 MOhm**

U101100

Diagnostic information

Battery

Possible fault causes

- Battery discharged, loads are not deactivated
- Battery not charged
- Negative charging balance, usage behavior of customer
- Contact resistance at the terminal clamps or in the B+ and/or ground line
- Closed-circuit current too great
- Generator or generator regulator faulty
- Battery-acid level and/or density is incorrect
- Battery too old/faulty

Fault effects

- Voltage supply/supply voltage fault entry in various control modules

U101200

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

U112200

Diagnostic information - valid for all control units

Read out control unit fault memory content

INFORMATION
This fault code indicates one or more faults/notes in the fault memory of the designated control unit.
Existing faults/notes in the designated control unit must be processed first.

NOTE
Use the [F7] button to show/hide notes in the fault memory.

Possible fault causes

- Fault in the designated control unit
- Note in the designated control unit

Fault effects

- Functions in the control unit are available only with restrictions
- Functions in the control unit are not available

Fault effects

♦ Affected axis does not function

Diagnosis information - Seat adjustment memory control module

Hall-effect sensor, Engine Lumbar height adjustment, vertical

INFORMATION

From model year 2012 onwards, the seat positions are no longer detected by a hall sender in the electric motor. The control unit detects the fluctuations in current in the supply lines that occur when the motor is running and converts these to revolutions.

Diagnostic conditions

- Ignition on
- ► Activation of the affected axle in both directions

Fault setting condition(s)

- Hall sensor signal does not change at Activation **Adjusting motor**
- Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

♦ Affected axis limp-home mode
♦ The memory seat adjustment control unit cannot store the position of the affected axis or cannot move to the stored position.

Diagnosis information - Seat adjustment memory control module

Hall-effect sensor, Lumbar curvature motor

INFORMATION

From model year 2012 onwards, the seat positions are no longer detected by a hall sender in the electric motor. The control unit detects the fluctuations in current in the supply lines that occur when the motor is running and converts these to revolutions.

Diagnostic conditions

- Ignition on
- ► Activation of the affected axle in both directions

Fault effects

♦ Affected axis does not function

076E

Diagnosis information - Seat adjustment memory control module

Lumbar curvature motor

Diagnostic conditions

- Ignition on
- ► Activation of the affected axle in both directions

Fault setting condition(s)

- Overtemperature **Seat adjustment motor**

Fault effects

♦ Affected axis does not function

Diagnosis information - Seat adjustment memory control module

Hall-effect sensor, Engine Lumbar height adjustment, vertical

INFORMATION

From model year 2012 onwards, the seat positions are no longer detected by a hall sender in the electric motor. The control unit detects the fluctuations in current in the supply lines that occur when the motor is running and converts these to revolutions.

Diagnostic conditions

- Ignition on
- ► Activation of the affected axle in both directions

Fault setting condition(s)

- Hall sensor signal does not change at Activation **Adjusting motor**
- Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

♦ Affected axis limp-home mode
♦ The memory seat adjustment control unit cannot store the position of the affected axis or cannot move to the stored position.

Diagnosis information - Seat adjustment memory control module

Hall-effect sensor, Lumbar curvature motor

INFORMATION

From model year 2012 onwards, the seat positions are no longer detected by a hall sender in the electric motor. The control unit detects the fluctuations in current in the supply lines that occur when the motor is running and converts these to revolutions.

Diagnostic conditions

- Ignition on
- ► Activation of the affected axle in both directions

Fault setting condition(s)

- Hall sensor signal does not change at Activation **Adjusting motor**
- Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

♦ Affected axis limp-home mode
♦ The memory seat adjustment control unit cannot store the position of the affected axis or cannot move to the stored position.

Diagnosis information - Seat adjustment memory control module

Coding pin (Fault code 07D5)

Diagnostic conditions

- Ignition on

Fault setting condition(s)

- **Seat adjustment memory control module** adapted to wrong seat (Driver's side or Passenger's side)
- Line from coding pin to ground pin in plug Faulty (connector B)

Fault effects

- No seat function restriction
- CAN bus function restriction

Diagnosis information - Seat adjustment memory control module

Hall-effect sensor, **Seat fore-and-aft adjustment motor**

INFORMATION

From model year 2012 onwards, the seat positions are no longer detected by a hall sender in the electric motor. The control unit detects the fluctuations in current in the supply lines that occur when the motor is running and converts these to revolutions.

Diagnostic conditions

- Ignition on
- ► Activation of the affected axle in both directions

Fault setting condition(s)

- Hall sensor signal does not change at Activation **Adjusting motor**
- Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

♦ Affected axis limp-home mode
♦ The memory seat adjustment control unit cannot store the position of the affected axis or cannot move to the stored position.

Diagnosis information - Seat adjustment memory control module

Hall-effect sensor, **Motor for backrest adjustment**

INFORMATION

From model year 2012 onwards, the seat positions are no longer detected by a hall sender in the electric motor. The control unit detects the fluctuations in current in the supply lines that occur when the motor is running and converts these to revolutions.

Diagnostic conditions

- Ignition on
- ► Activation of the affected axle in both directions

Fault setting condition(s)

- Hall sensor signal does not change at Activation **Adjusting motor**
- Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

♦ Affected axis limp-home mode
♦ The memory seat adjustment control unit cannot store the position of the affected axis or cannot move to the stored position.

Diagnosis information - Seat adjustment memory control module

Hall-effect sensor, **Seat height adjustment motor**

INFORMATION

From model year 2012 onwards, the seat positions are no longer detected by a hall sender in the electric motor. The control unit detects the fluctuations in current in the supply lines that occur when the motor is running and converts these to revolutions.

Diagnostic conditions

- Ignition on
- ► Activation of the affected axle in both directions

Fault setting condition(s)

- Hall sensor signal does not change at Activation **Adjusting motor**
- Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

♦ Affected axis limp-home mode
♦ The memory seat adjustment control unit cannot store the position of the affected axis or cannot move to the stored position.

Diagnosis information - Seat adjustment memory control module

Hall-effect sensor, **Seat angle adjustment motor**

INFORMATION

From model year 2012 onwards, the seat positions are no longer detected by a hall sender in the electric motor. The control unit detects the fluctuations in current in the supply lines that occur when the motor is running and converts these to revolutions.

Diagnostic conditions

- Ignition on
- ► Activation of the affected axle in both directions

Fault setting condition(s)

- Hall sensor signal does not change at Activation **Adjusting motor**
- Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

♦ Affected axis limp-home mode
♦ The memory seat adjustment control unit cannot store the position of the affected axis or cannot move to the stored position.

Diagnosis information - Auxiliary heater control unit

Control unit faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **Auxiliary heater control unit ON**
- CAN Active

Possible fault causes

♦ Internal control unit fault

Fault effects

♦ No function **Auxiliary heater control unit**

Diagnosis information - Auxiliary heater control unit

Function restriction Undervoltage

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Auxiliary heater control unit** Active

Possible fault causes

♦ none Display
♦ lower limit value below limit

Fault setting condition(s)

- none Display : Voltage drop
- lower limit value below limit : Voltage Heater < 10 V +/- 0.2 V to > 25 Second(s)

Fault effects

♦ **Auxiliary heater control unit** No function

Diagnosis information - Auxiliary heater control unit

Function restriction Overvoltage

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Auxiliary heater control unit** Active

Possible fault causes

♦ upper limit value exceeded

Fault setting condition(s)

- upper limit value exceeded : Voltage Heater > 15.5 V

Fault effects

♦ **Auxiliary heater control unit** No function

Diagnosis information - Auxiliary heater control unit

Power supply

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Auxiliary heater control unit** Active

Possible fault causes

♦ Limit exceeded
♦ Below limit

Fault setting condition(s)

- Limit exceeded : Voltage > 16 V
- Below limit : Voltage < 9 V

Fault effects

♦ **Auxiliary heater control unit** No function

Diagnosis information - Auxiliary heater control unit

Fuel level display

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ **Fuel level display** Reserve (via CAN)

Fault effects

♦ **Auxiliary heater control unit** No function

Diagnosis information - Auxiliary heater control unit

Control module not coded

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ **Coding** - does not match vehicle

Fault effects

♦ **Auxiliary heater control unit** No function

Diagnosis information - Auxiliary heater control unit

Receiver Auxiliary heater

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- No signal/communication : Communication Active
- Implausible signal : Message at Communication Active
- Faulty : **Auxiliary heater control unit** Active

Possible fault causes

- No signal/communication : Short circuit to B+/ground/between lines or open circuit in the lines
- Implausible signal : Deviation Signal
- Faulty : Receiver Faulty via LIN bus

Fault effects

- start **Auxiliary heater control unit** with **Remote control not** possible

Diagnosis information - Auxiliary heater control unit

3/2-way directional-control valve Short circuit to B+/ground/between lines or open circuit in the lines

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Short circuit to ground : **3/2-way directional-control valve** Active
- Short circuit to B+ : **3/2-way directional-control valve** not active
- Open circuit : **3/2-way directional-control valve** Active

Possible fault causes

- Short circuit to ground
- Short circuit to B+
- Open circuit

Fault setting condition(s)

- Short circuit to ground : U < 2.3 V
- Short circuit to B+ : U > 5.3 V
- Open circuit : I < 52 - 235 mA

Fault effects

- Short circuit to B+ : No malfunction
- **Auxiliary heater control unit** No function

057E

Diagnosis information - Auxiliary heater control unit

No flame formation

⚠WARNING

Explosive, toxic gasoline!
Severe burns to the body!
Harm to the respiratory tract, eyes and skin!

♦ Take work-related fire-protection measures.
♦ Ensure good ventilation.
♦ **DO NOT** permit ignition sources in the area.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● during Starting process Auxiliary heater

Possible fault causes

♦ Open circuit Fuel line forward / to **Metering pump**
♦ No flame formation
♦ Air throughput disrupted, Intake air or exhaust gas flow
♦ Auxiliary heater extended period switched off

Fault effects

♦ **Auxiliary heater control unit** No function
♦ **Auxiliary heater control unit** locked

to 5 x Fault code 057E successively

057F

Diagnosis information - Auxiliary heater control unit

Flame interruption

⚠WARNING

Explosive, toxic gasoline!
Severe burns to the body!
Harm to the respiratory tract, eyes and skin!

♦ Take work-related fire-protection measures.
♦ Ensure good ventilation.
♦ **DO NOT** permit ignition sources in the area.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● during 10 Minute(s) Auxiliary heater

Possible fault causes

♦ Open circuit Fuel line forward / to **Metering pump**
♦ No flame formation

Fault effects

♦ **Auxiliary heater control unit** No function

0581

Diagnosis information - Auxiliary heater control unit

Repeated flame interruption

⚠WARNING

Explosive, toxic gasoline!
Severe burns to the body!
Harm to the respiratory tract, eyes and skin!

♦ Take work-related fire-protection measures.
♦ Ensure good ventilation.
♦ **DO NOT** permit ignition sources in the area.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● during Full load Auxiliary heater

Possible fault causes

♦ Open circuit Fuel line forward / to **Metering pump**
♦ No flame formation during Full load Auxiliary heater

Fault effects

♦ **Auxiliary heater control unit** No function

0582

Diagnosis information - Auxiliary heater control unit

Heater overheated

⚠WARNING

Explosive, toxic gasoline!
Severe burns to the body!
Harm to the respiratory tract, eyes and skin!

♦ Take work-related fire-protection measures.
♦ Ensure good ventilation.
♦ **DO NOT** permit ignition sources in the area.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● no Display : **Metering pump** Active
● Limit exceeded : **Metering pump** Active
● Implausible signal : Heating Open circuit

Possible fault causes

♦ **Temperature** Too high
♦ **Temperature** increase Too high
♦ Time exceeded

Fault setting condition(s)

● no Display: **Coolant temperature** > 120 °C (248 °F), **Temperature sensor** Surface > 120 °C (248 °F) or **Metering pump** is switched off
● Limit exceeded : **Temperature Coolant** > 25° **Temperature** Surface at **Coolant temperature** > 70 °C (158 °F)
or **Temperature** Surface > 30° **Temperature Coolant** at **Coolant temperature** > 70 °C (158 °F)
● Implausible signal : Time exceeded < 900 Second(s)

Fault effects

♦ **Auxiliary heater control unit** No function

Diagnosis information - Auxiliary heater control unit

Temperature sensor Coolant ,Short circuit to ground or open circuit in lines

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Short circuit to ground : **Auxiliary heater control unit** Active
- Open circuit : **Auxiliary heater control unit** Active

Possible fault causes

♦ Short circuit to ground
♦ Open circuit

Fault setting condition(s)

- Short circuit to ground : **Coolant temperature** calculated > 200°C (392 °F)

- Open circuit : **Coolant temperature** calculated < - 45°C (-49 °F)

Fault effects

♦ **Auxiliary heater control unit** No function
♦ **Auxiliary heater control unit** locked

0585

Diagnosis information - Auxiliary heater control unit

Metering pump Short circuit to B+/ground/between lines or open circuit in the lines

⚠WARNING

Explosive, toxic gasoline!
Severe burns to the body!
Harm to the respiratory tract, eyes and skin!

♦ Take work-related fire-protection measures.
♦ Ensure good ventilation.
♦ **DO NOT** permit ignition sources in the area.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Short circuit to ground : **Metering pump** Active
- Short circuit to B+ : **Metering pump** not active
- Open circuit : **Metering pump** Active

Possible fault causes

♦ Short circuit to ground
♦ Short circuit to B+
♦ Open circuit

Fault setting condition(s)

- Short circuit to ground : U < 1,5V
- Short circuit to B+ : U > 3.5 V
- Open circuit : I < 50 - 120 mA

Fault effects

♦ **Auxiliary heater control unit** No function

0586

Diagnosis information - Auxiliary heater control unit

Fresh-air blower Short circuit to B+/ground/between lines or open circuit in the lines , Mechanical fault

⚠WARNING

Explosive, toxic gasoline!
Severe burns to the body!
Harm to the respiratory tract, eyes and skin!

♦ Take work-related fire-protection measures.
♦ Ensure good ventilation.
♦ **DO NOT** permit ignition sources in the area.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Short circuit to ground : **Fresh-air blower** Active
- Short circuit to B+ : **Fresh-air blower** not active
- Open circuit : **Fresh-air blower** Active
- Mechanical fault : **Fresh-air blower** Active

Possible fault causes

♦ Short circuit to ground
♦ Short circuit to B+
♦ Open circuit
♦ Mechanical fault

Fault setting condition(s)

- Short circuit to ground : U < 3 V at Operating voltage > 8.5 V
- Short circuit to B+ : U > 8,5 V
- Open circuit : U < Operating voltage - 2 V
- Mechanical fault : ---

Fault effects

♦ **Auxiliary heater control unit** No function

0587

Diagnosis information - Auxiliary heater control unit

Coolant pump Short circuit to B+/ground/between lines or open circuit in the lines

⚠WARNING

Explosive, toxic gasoline!
Severe burns to the body!
Harm to the respiratory tract, eyes and skin!

♦ Take work-related fire-protection measures.
♦ Ensure good ventilation.
♦ **DO NOT** permit ignition sources in the area.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Short circuit to ground : **Coolant pump** Active
- Short circuit to B+ : **Coolant pump** not active and Engine off
- Open circuit : **Coolant pump** Active and Engine off

Possible fault causes

♦ Short circuit to ground
♦ Short circuit to B+
♦ Open circuit

Fault setting condition(s)

- Short circuit to ground : U < 1,5V
- Short circuit to B+ : U > 3.5 V
- Open circuit : I < 50 - 120 mA

Fault effects

♦ **Auxiliary heater control unit** No function

Diagnosis information - Auxiliary heater control unit

Undervoltage Cutout (CAN)

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Heater Active

Possible fault causes

♦ Undervoltage via CAN from **Gateway control module**

Fault effects

♦ Auxiliary heater off

Diagnosis information - Auxiliary heater control unit

Flame monitor

⚠WARNING

Explosive, toxic gasoline!
Severe burns to the body!
Harm to the respiratory tract, eyes and skin!

♦ Take work-related fire-protection measures.
♦ Ensure good ventilation.
♦ **DO NOT** permit ignition sources in the area.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Short circuit to ground : **Auxiliary heater control unit** Active
- Open circuit : **Auxiliary heater control unit** Active
- Implausible signal : Start Heater

Possible fault causes

♦ Short circuit to ground
♦ Open circuit
♦ Implausible signal

Fault setting condition(s)

- Short circuit to ground : **Temperature** calculated < -53°C (-63 °F)
- Open circuit : **Temperature** calculated > 560°C (1,040 °F)
- Implausible signal : Overtemperature despite Fan to

Fault effects

♦ **Auxiliary heater control unit** No function
♦ **Auxiliary heater control unit** locked

Diagnosis information - Auxiliary heater control unit

Glow plug Short circuit to B+/ground/between lines or open circuit in the lines Electrical fault

⚠WARNING

Explosive, toxic gasoline!
Severe burns to the body!
Harm to the respiratory tract, eyes and skin!

♦ Take work-related fire-protection measures.
♦ Ensure good ventilation.
♦ **DO NOT** permit ignition sources in the area.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Short circuit to ground : Glow plug Active
- Short circuit to B+ : Glow plug not active
- Open circuit : Glow plug Active
- Electrical fault : Glow plug Active

Possible fault causes

♦ Short circuit to ground
♦ Short circuit to B+
♦ Open circuit
♦ Electrical fault

Fault setting condition(s)

- Short circuit to ground : U < 2,3 V
- Short circuit to B+ : U > 0.5 * Operating voltage
- Open circuit : I < 2 A
- Electrical fault : ----

Fault effects

♦ **Auxiliary heater control unit** No function

Diagnosis information - Auxiliary heater control unit

LIN bus

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- no communication during **Remote control for auxiliary heater**

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

♦ start **Auxiliary heater control unit** with **Remote control not** possible

Diagnosis information - Auxiliary heater control unit

Component protection

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Auxiliary heater control unit** Active

Possible fault causes

♦ no or incorrect basic setting/adaptation : teaching not performed

Fault effects

♦ start **Auxiliary heater control unit not** possible

Diagnosis information - Auxiliary heater control unit

incorrect Heater installed

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ Heater - does not match vehicle

Fault effects

♦ **Auxiliary heater control unit** No function

Diagnosis information - Auxiliary heater control unit

Component protection Active

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Auxiliary heater control unit** Active

Possible fault causes

♦ none Display : Identification Component **not** possible
♦ Implausible signal : Identification Vehicle **not** possible

Fault effects

♦ start **Auxiliary heater control unit not** possible

Diagnosis information - Auxiliary heater control unit

Closed circuit **Remote control**

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- No signal/communication : Active Communication
- Implausible signal : Message at Communication Active

Possible fault causes

♦ No signal/communication : Short circuit to B+/ground/between lines or open circuit in the lines
♦ Implausible signal : Deviation Signal

Fault effects

♦ start **Auxiliary heater control unit** with **Remote control not** possible

Diagnosis information - Auxiliary heater control unit

Control module locked

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Auxiliary heater control unit** Active

Possible fault causes

- Fault code 0003 or 0583 or 05D2 or 0C67
- Fault code 0582 or 0C67 Fault type(s) none Display
- Fault code 0C68 Fault type(s) Short circuit to B+ or Fault type(s) Open circuit
- 5 x equal Fault code 0446 or 01BE Fault type(s) none Display

Diagnostic information - manual air conditioner

Power supply for the sensors (5 V)

NOTE
The fault is detected when a voltage of:
♦ greater than 5.5 V (upper limit exceeded)
or
♦ less than 4.5 V (below lower limit)
is present for longer than 15 seconds.
When the fault is detected, regulation is no longer possible and the temperature mixing flap, footwell/defroster flap and central flap are entered.

Diagnostic conditions:

- Ignition on
- 20 seconds diagnostic time
- No power supply fault stored

Possible fault causes:

♦ Short circuit to B+/ground or mutual short circuit in the lines
♦ Flap motor faulty
♦ Air conditioning regulator faulty

Diagnostic information - manual air conditioner

Power supply for the sensors (5 V)

NOTE
The fault is detected when a voltage of:
♦ greater than 5.5 V (upper limit exceeded)
or
♦ less than 4.5 V (below lower limit)
is present for longer than 15 seconds.
When the fault is detected, regulation is no longer possible and the temperature mixing flap, footwell/defroster flap and central flap are entered.

Diagnostic conditions:

- Ignition on
- 20 seconds diagnostic time
- No power supply fault stored

Possible fault causes:

♦ Short circuit to B+/ground or mutual short circuit in the lines
♦ Flap motor faulty
♦ Air conditioning regulator faulty

Diagnosis information - Air-conditioning system

Interior temperature sensor

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

High-voltage interior heater - Power supply

⚠WARNING

High voltage on the high-voltage system of the hybrid vehicle.

- **Electric shock from touching live parts**
- **Severe burns or death**
- **Health risks for persons with life-assisting systems**

⇒ The system must be isolated from the power supply by a high-voltage technician before carrying out any work on the high-voltage vehicle electrical system and any repair work on the body.
⇒ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
⇒ Observe General **WARNING NOTES** for working on the high-voltage vehicle electrical system.

► Please read the following document in the PIWIS information system:

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

- Power supply **Air-conditioning system regulator** 9... 16 V

Fault setting condition(s)

♦ Electric interior heater sends fault signal via LIN bus:
High voltage - Voltage Below limit
High voltage - Voltage Limit exceeded

Possible fault causes

♦ **High-voltage interior heater** Faulty

- **High-voltage power electronics control unit** Faulty
- High voltage - Power supply Faulty

Diagnosis information - Air-conditioning system

High-voltage interior heater - Faulty

⚠WARNING

High voltage on the high-voltage system of the hybrid vehicle.

- **Electric shock from touching live parts**
- **Severe burns or death**
- **Health risks for persons with life-assisting systems**

⇒ The system must be isolated from the power supply by a high-voltage technician before carrying out any work on the high-voltage vehicle electrical system and any repair work on the body.
⇒ All work on vehicles equipped with a high-voltage vehicle electrical system must be performed only by persons with the proper electrical training. The work must be performed as instructed by a high-voltage technician.
⇒ Observe General **WARNING NOTES** for working on the high-voltage vehicle electrical system.

► Please read the following document in the PIWIS information system:

♦ **2X00IN** Isolating high-voltage electrical system from power supply/starting high-voltage electrical system

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test
- Power supply **Air-conditioning system regulator** 9... 16 V

Fault setting condition(s)

♦ Electric interior heater sends fault signal via LIN bus

Possible fault causes

♦ **High-voltage interior heater** Faulty

Diagnosis information - Air-conditioning system

High-voltage interior heater - Communication

No function

Diagnosis information - Air-conditioning system

Communication **Servo motor** LIN bus 1

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- no communication LIN bus 1
- Short circuit to B+/ground/between lines or open circuit in the lines
- **Servo motor** Faulty

Fault effects

No function of the **Servo motor**

Diagnosis information - Air-conditioning system

Servo motor Flap control box

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Power supply checked
- Internal function test **Servo motor**

Fault setting condition(s)

Servo motor Mechanical fault
- blocked
- Fault present for 1 ... 11 s

Servo motor Electrical fault
- Fault present for 1 ... 11 s

Servo motor not programmed
- Fault present for 1 ... 11 s

Servo motor Message missing
- Fault present for 1 ... 20 s

Possible fault causes

Servo motor Mechanical fault
- Flap or Engine blocked
- Axle or limit stop broken

Servo motor Electrical fault
- Short circuit to B+/ground or open circuit in the line

Servo motor not programmed
- Component Faulty
- no/incorrect coding/calibration

Servo motor Message missing
- Component Faulty
- Open circuit LIN line

Fault effects

- Limited function
- Function **Servo motor** Faulty

Diagnosis information - Air-conditioning system

Servo motor Flap control box

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Power supply checked
- Internal function test **Servo motor**

Fault setting condition(s)

Servo motor Mechanical fault
- blocked
- Fault present for 1 ... 11 s

Servo motor Electrical fault
- Fault present for 1 ... 11 s

Servo motor not programmed
- Fault present for 1 ... 11 s

Servo motor Message missing
- Fault present for 1 ... 20 s

Possible fault causes

Servo motor Mechanical fault
- Flap or Engine blocked
- Axle or limit stop broken

Servo motor Electrical fault
- Short circuit to B+/ground or open circuit in the line

Servo motor not programmed
- Component Faulty
- no/incorrect coding/calibration

Servo motor Message missing
- Component Faulty
- Open circuit LIN line

Fault effects

- Limited function
- Function **Servo motor** Faulty

Diagnosis information - Air-conditioning system

Servo motor Flap control box

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Power supply checked
- Internal function test **Servo motor**

Fault setting condition(s)

Servo motor Mechanical fault

Servo motor Electrical fault
- Fault present for 1 ... 11 s

Servo motor not programmed
- Fault present for 1 ... 11 s

Servo motor Message missing
- Fault present for 1 ... 20 s

Possible fault causes

Servo motor Mechanical fault
- Flap or Engine blocked
- Axle or limit stop broken

Servo motor Electrical fault
- Short circuit to B+/ground or open circuit in the line

Servo motor not programmed
- Component Faulty
- no/incorrect coding/calibration

Servo motor Message missing
- Component Faulty
- Open circuit LIN line

Fault effects

- Limited function
- Function **Servo motor** Faulty

Diagnosis information - Air-conditioning system

Communication **Servo motor** LIN bus 1

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- no communication LIN bus 1
- Short circuit to B+/ground/between lines or open circuit in the lines
- **Servo motor** Faulty

Fault effects

No function of the **Servo motor**

Diagnosis information - Air-conditioning system

Servo motor Flap control box

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Power supply checked
- Internal function test **Servo motor**

Fault setting condition(s)

Servo motor Mechanical fault
- blocked
- Fault present for 1 ... 11 s

Servo motor Electrical fault
- Fault present for 1 ... 11 s

Servo motor not programmed
- Fault present for 1 ... 11 s

Servo motor Message missing
- Fault present for 1 ... 20 s

Possible fault causes

Servo motor Mechanical fault
- Flap or Engine blocked
- Axle or limit stop broken

Servo motor Electrical fault
- Short circuit to B+/ground or open circuit in the line

Servo motor not programmed
- Component Faulty

- Fault present for 1 ... 11 s

Servo motor Electrical fault
- Fault present for 1 ... 11 s

Servo motor not programmed
- Fault present for 1 ... 11 s

Servo motor Message missing
- Fault present for 1 ... 20 s

Possible fault causes

Servo motor Mechanical fault
- Flap or Engine blocked
- Axle or limit stop broken

Servo motor Electrical fault
- Short circuit to B+/ground or open circuit in the line

Servo motor not programmed
- Component Faulty
- no/incorrect coding/calibration

Servo motor Message missing
- Component Faulty
- Open circuit LIN line

Fault effects

- Limited function
- Function **Servo motor** Faulty

Diagnosis information - Air-conditioning system

Communication **Servo motor** LIN bus 1

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- no communication LIN bus 1
- Short circuit to B+/ground/between lines or open circuit in the lines
- **Servo motor** Faulty

Fault effects

No function of the **Servo motor**

Diagnosis information - Air-conditioning system

Servo motor Flap control box

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Power supply checked
- Internal function test **Servo motor**

Fault setting condition(s)

Servo motor Mechanical fault
- blocked
- Fault present for 1 ... 11 s

Servo motor Electrical fault
- Fault present for 1 ... 11 s

Servo motor not programmed

  t > 1 < 15 s

Fault effects

♦ Fan Function Faulty

Diagnosis information **- Air-conditioning system**

Fan regulator

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test

Fault setting condition(s)

Short circuit to ground
- Period of time
  t > 1 < 11 s
- Signal Current
  I > 80 A

Short circuit to B+
- Period of time
  t > 1 < 11 s

- Ignition on
- Power supply checked
- Internal function test **Servo motor**

Fault setting condition(s)

Servo motor Mechanical fault
- blocked
- Fault present for 1 ... 11 s

Servo motor Electrical fault
- Fault present for 1 ... 11 s

Servo motor not programmed
- Fault present for 1 ... 11 s

Servo motor Message missing
- Fault present for 1 ... 20 s

Possible fault causes

Servo motor Mechanical fault
- Flap or Engine blocked
- Axle or limit stop broken

Servo motor Electrical fault
- Short circuit to B+/ground or open circuit in the line

Servo motor not programmed
- Component Faulty
- no/incorrect coding/calibration

Servo motor Message missing
- Component Faulty
- Open circuit LIN line

Fault effects

- Limited function
- Function **Servo motor** Faulty

Diagnosis information **- Air-conditioning system**

Vehicle voltage

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test

Fault setting condition(s)

Voltage too low
- Signal Voltage
  U < 9 V
  U > 6 V

Voltage Too high
- Signal Voltage
  U > 16 V

Fault effects

♦ Limited function

C11001

Diagnosis information **- Air-conditioning system**

Vehicle voltage

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test

Fault setting condition(s)

Voltage too low
- Signal Voltage
  U < 9 V
  U > 6 V

Voltage Too high
- Signal Voltage
  U > 16 V

Fault effects

♦ Limited function

C11002

Diagnosis information **- Air-conditioning system**

Lights **Air-conditioning system regulator**

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Diagnostic information - Tire pressure monitoring system control module

Calibration instruction

NOTE

Pollution of the environment if wheel electronics are not disposed of correctly.

♦ Wheel electronics contain batteries with lithium thionyl chloride.
♦ Do not disposed of these batteries in normal trash (see Environment Manual).
♦ Used or faulty wheel electronics must be brought to the specified return centers for batteries.

Diagnostic conditions

- **Control module** Tire Pressure Monitoring (TPM): internal function test
- Ignition on
- Approx. 1 minute of driving

Fault setting condition(s)

- Control unit **Instrument cluster** : incorrect parameters assigned
- Tire pressure not displayed on the instrument cluster
- Data record with setpoint pressure values for **Tire Pressure Monitoring (TPM)** outside the permissible range (1.7.....5.2 bar/24.7.....75.4 psi)
- Tire Pressure Monitoring (TPM) control unit faulty.

Fault effects

♦ System does not function
♦ Display on instrument cluster

- Internal control unit fault

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - TV tuner

Device temperature

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM on

Possible fault causes

♦ **Device temperature**, Limit exceeded

Fault setting condition(s)

- **Device temperature** > 85 °C (185 °F)

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - TV tuner

Programming

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM on

Possible fault causes

♦ Incorrect data record
♦ Faulty data record

Fault setting condition(s)

- The data record is checked after every programming operation.

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - TV tuner

Antenna 1

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM on

Possible fault causes

- Short circuit to B+
- Short circuit to ground
- Open circuit

Affected contacts on the control unit connector TV tuner

Plug [C]

- Contact 1 (Signal)
- Contact 2 (Ground)

Fault setting condition(s)

- This fault is set if the **>antenna wiring<** procedure determines a limit-value violation (internal resistance measurement).

Fault effects

- Function temporarily unavailable or available only to a limited extent

Diagnosis information - TV tuner

Antenna 1

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM on

Possible fault causes

- Short circuit to B+
- Short circuit to ground
- Open circuit

Affected contacts on the control unit connector TV tuner

Plug [C]

- Contact 1 (Signal)
- Contact 2 (Ground)

Fault setting condition(s)

- This fault is set if the **>antenna wiring<** procedure determines a limit-value violation (internal resistance measurement).

Fault effects

- Function temporarily unavailable or available only to a limited extent

Diagnosis information - TV tuner

Antenna 2

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM on

Possible fault causes

- Short circuit to B+
- Short circuit to ground
- Open circuit

Affected contacts on the control unit connector TV tuner

Plug [C]

- Contact 3 (Signal)
- Contact 4 (Ground)

Fault setting condition(s)

- This fault is set if the **>antenna wiring<** procedure determines a limit-value violation (internal resistance measurement).

Fault effects

- Function temporarily unavailable or available only to a limited extent

Diagnosis information - TV tuner

Antenna 2

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM on

Possible fault causes

- Short circuit to B+
- Short circuit to ground
- Open circuit

Affected contacts on the control unit connector TV tuner

Plug [C]

- Contact 3 (Signal)
- Contact 4 (Ground)

Fault setting condition(s)

- This fault is set if the **>antenna wiring<** procedure determines a limit-value violation (internal resistance measurement).

Fault effects

- Function temporarily unavailable or available only to a limited extent

Diagnosis information - TV tuner

Antenna 3

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM on

Possible fault causes

- Short circuit to B+
- Short circuit to ground
- Open circuit

Affected contacts on the control unit connector TV tuner

Plug [C]

- Contact 5 (Signal)
- Contact 6 (Ground)

Fault setting condition(s)

- This fault is set if the **>antenna wiring<** procedure determines a limit-value violation (internal resistance measurement).

Fault effects

- Function temporarily unavailable or available only to a limited extent

Diagnosis information - TV tuner

Antenna 3

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM on

Possible fault causes

- Short circuit to B+
- Short circuit to ground
- Open circuit

Affected contacts on the control unit connector TV tuner

Plug [C]

- Contact 5 (Signal)
- Contact 6 (Ground)

Fault setting condition(s)

- This fault is set if the **>antenna wiring<** procedure determines a limit-value violation (internal resistance measurement).

Fault effects

- Function temporarily unavailable or available only to a limited extent

Diagnosis information - TV tuner

Antenna 4

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM on

Possible fault causes

- Short circuit to B+
- Short circuit to ground
- Open circuit

Affected contacts on the control unit connector TV tuner

Plug [C]

- Contact 7 (Signal)
- Contact 8 (Ground)

Fault setting condition(s)

- This fault is set if the **>antenna wiring<** procedure determines a limit-value violation (internal resistance measurement).

Fault effects

- Function temporarily unavailable or available only to a limited extent

Diagnosis information - TV tuner

Antenna 4

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM on

Possible fault causes

- Short circuit to B+
- Short circuit to ground
- Open circuit

Affected contacts on the control unit connector TV tuner

Plug [C]

- Contact 7 (Signal)
- Contact 8 (Ground)

Fault setting condition(s)

- This fault is set if the **>antenna wiring<** procedure determines a limit-value violation (internal resistance measurement).

Fault effects

- Function temporarily unavailable or available only to a limited extent

Diagnosis information - TV tuner

Video signal

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM on

Possible fault causes

- ♦ loose, oxidized, corroded, interrupted
- ♦ Short circuit to ground
- ♦ Short circuit to B+
- ♦ Short circuit between the lines

Affected contacts on the control unit connector

Plug [A]

- ♦ Contact 4 (Terminal 31)
- ♦ Contact 5 (Video signal)

Fault setting condition(s)

- This fault is set when the >Audio and video Rear Seat Entertainment< sequence determines a limit-value violation (internal resistance measurement).

Fault effects

- ♦ Function not available or available only to a limited extent

Diagnosis information - TV tuner

Video signal

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM on

Possible fault causes

- loose, oxidized, corroded, interrupted
- Short circuit to ground
- Short circuit to B+
- Short circuit between the lines

Affected contacts on the control unit connector

Plug [A]

- Contact 4 (Terminal 31)
- Contact 5 (Video signal)

Fault setting condition(s)

- This fault is set when the >Audio and video Rear Seat Entertainment< sequence determines a limit-value violation (internal resistance measurement).

Fault effects

- Function not available or available only to a limited extent

Diagnosis information - BOSE amplifier, external

Microphone

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM switched on

Fault setting condition(s)

- Line short circuit
- Open circuit in lines
- Microphone faulty
- **BOSE amplifier, external** faulty

Fault effects

- Audio pilot failure
- Hands-free not possible (telephone)

Diagnosis information - BOSE amplifier, external

Bass front left

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM switched on
- PCM switched on and loudspeaker self-test performed

Fault setting condition(s)

- Line short circuit
- Open circuit in lines
- Loudspeaker faulty
- **BOSE amplifier, external** faulty

Fault effects

- Changed sound

Diagnosis information - BOSE amplifier, external

Bass front right

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM switched on
- PCM switched on and loudspeaker self-test performed

Fault setting condition(s)

- Line short circuit
- Open circuit in lines
- Loudspeaker faulty
- **BOSE amplifier, external** faulty

Fault effects

- Changed sound

Diagnosis information - BOSE amplifier, external

Loudspeaker High-pitch rear left

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Loudspeaker self-test performed

Fault setting condition(s)

- Line short circuit
- Open circuit in lines
- Loudspeaker faulty
- **BOSE amplifier, external** faulty

Fault effects

- Changed sound

Diagnosis information - BOSE amplifier, external

Loudspeaker High-pitch rear right

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Loudspeaker self-test performed

Fault setting condition(s)

- Line short circuit
- Open circuit in lines
- Loudspeaker faulty
- **BOSE amplifier, external** faulty

Fault effects

- Changed sound

Diagnosis information - BOSE amplifier, external

Loudspeaker Middle-pitch and High-pitch front left

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM switched on
- PCM switched on and loudspeaker self-test performed

Fault setting condition(s)

- Line short circuit
- Open circuit in lines
- Loudspeaker faulty
- **BOSE amplifier, external** faulty

Fault effects

- Changed sound

Diagnosis information - BOSE amplifier, external

Loudspeaker Middle-pitch and High-pitch front right

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM switched on
- PCM switched on and loudspeaker self-test performed

Fault setting condition(s)

- Line short circuit
- Open circuit in lines
- Loudspeaker faulty
- **BOSE amplifier, external** faulty

Fault effects

- Changed sound

Diagnosis information - BOSE amplifier, external

Loudspeaker Instrument panel middle

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM switched on
- PCM switched on and loudspeaker self-test performed

Fault setting condition(s)

- Line short circuit
- Open circuit in lines
- Loudspeaker faulty
- **BOSE amplifier, external** faulty

Fault effects

- Changed sound

Diagnosis information - BOSE amplifier, external

Subwoofer front and rear

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM switched on
- PCM switched on and loudspeaker self-test performed

Fault setting condition(s)

- Line short circuit
- Open circuit in lines
- **Subwoofer** faulty
- **BOSE amplifier, external** faulty

Fault effects

- Changed sound

Diagnosis information - BOSE amplifier, external

Loudspeaker Middle-pitch and High-pitch rear left

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM switched on
- PCM switched on and loudspeaker self-test performed

Fault setting condition(s)

- Line short circuit
- Open circuit in lines
- Loudspeaker faulty
- **BOSE amplifier, external** faulty

Fault effects

- Changed sound

Diagnosis information - BOSE amplifier, external

Loudspeaker Middle-pitch and High-pitch rear right

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM switched on
- PCM switched on and loudspeaker self-test performed

Fault setting condition(s)

- Line short circuit
- Open circuit in lines
- Loudspeaker faulty
- **BOSE amplifier, external** faulty

Fault effects

- Changed sound

Diagnosis information - BOSE amplifier, external

Loudspeaker Middle-pitch and High-pitch rear left

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM switched on
- PCM switched on and loudspeaker self-test performed

Fault setting condition(s)

- Line short circuit
- Open circuit in lines
- Loudspeaker faulty
- **BOSE amplifier, external** faulty

Fault effects

- Changed sound

Diagnosis information - BOSE amplifier, external

Loudspeaker Middle-pitch and High-pitch rear right

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM switched on
- PCM switched on and loudspeaker self-test performed

Fault setting condition(s)

- Line short circuit
- Open circuit in lines
- Loudspeaker faulty
- **BOSE amplifier, external** faulty

Fault effects

- Changed sound

Diagnosis information - BOSE amplifier, external

Bass front left

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM switched on
- PCM switched on and loudspeaker self-test performed

Fault setting condition(s)

- Line short circuit
- Open circuit in lines
- Loudspeaker faulty
- **BOSE amplifier, external** faulty

Fault effects

- Changed sound

Diagnosis information - BOSE amplifier, external

Bass front right

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM switched on
- PCM switched on and loudspeaker self-test performed

Fault setting condition(s)

- Line short circuit
- Open circuit in lines
- Loudspeaker faulty
- **BOSE amplifier, external** faulty

Fault effects

- Changed sound

Diagnosis information - BOSE amplifier, external

Loudspeaker High-pitch rear left

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Loudspeaker self-test performed

Fault setting condition(s)

- Line short circuit
- Open circuit in lines
- Loudspeaker faulty
- **BOSE amplifier, external** faulty

Fault effects

- Changed sound

Diagnosis information - BOSE amplifier, external

Loudspeaker High-pitch rear right

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Loudspeaker self-test performed

Fault setting condition(s)

- Line short circuit
- Open circuit in lines
- Loudspeaker faulty
- **BOSE amplifier, external** faulty

Fault effects

- Changed sound

Diagnosis information - BOSE amplifier, external

Loudspeaker High-pitch front left

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Loudspeaker self-test performed

Fault setting condition(s)

- Line short circuit
- Open circuit in lines
- Loudspeaker faulty
- **BOSE amplifier, external** faulty

Fault effects

- Changed sound

Diagnosis information - BOSE amplifier, external

Loudspeaker High-pitch front right

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Loudspeaker self-test performed

Fault setting condition(s)

- Line short circuit
- Open circuit in lines
- Loudspeaker faulty
- **BOSE amplifier, external** faulty

Fault effects

- Changed sound

Diagnosis information - BOSE amplifier, external

Control module BOSE amplifier, external

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM switched on

Fault setting condition(s)

- Internal malfunction **BOSE amplifier, external**
- Mechanical fan blockage

Fault effects

- External BOSE amplifier switch-off

Diagnosis information - BOSE amplifier, external

Power supply

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM switched on

Fault setting condition(s)

- Voltage supply > 18 V
- Voltage supply < 9 V

Fault effects

- External BOSE amplifier switch-off

Diagnosis information - BOSE amplifier, external

Control module BOSE amplifier, external

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM switched on

Fault setting condition(s)

- Internal malfunction **BOSE amplifier, external**
- Mechanical fan blockage

Fault effects

- External BOSE amplifier switch-off

Diagnosis information - BOSE amplifier, external

Overtemperature or Undertemperature

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM switched on

Fault setting condition(s)

- Overtemperature **BOSE amplifier, external**
- Undertemperature **BOSE amplifier, external**

Fault effects

- Volume reduction
- PCM muting
- External BOSE amplifier switch-off

Diagnosis information - BOSE amplifier, external

Configuration

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- PCM switched on

Fault setting condition(s)

- Wrong vehicle coding in **BOSE amplifier, external**
- Incorrect programming **BOSE amplifier, external**

Fault effects

- External BOSE amplifier malfunction

Diagnosis information - Steering wheel electronics control module

Steering-wheel lighting

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Short circuit to ground

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Steering-angle sensor

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Faulty
- Mechanical fault

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Steering-angle sensor

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Faulty
- Mechanical fault

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Steering-angle sensor

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Faulty
- Mechanical fault

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

High-beam/direction-indicator light switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, high-beam/direction-indicator light switch**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

High-beam/direction-indicator light switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, high-beam/direction-indicator light switch**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Wiper/washer system switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, wiper/washer system switch**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Wiper/washer system switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

- **Voltage value, wiper/washer system switch**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Wiper/washer system switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, wiper/washer system switch**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Wiper/washer system switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, wiper/washer system switch**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Front-wiper interval switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, front-wiper interval switch**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Front-wiper interval switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, front-wiper interval switch**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Front-wiper interval switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, front-wiper interval switch**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Windshield washer system (SRA) switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, headlight washer system button**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Switch, on-board computer

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, on-board computer switch**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Switch, on-board computer

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, on-board computer switch**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Switch, on-board computer

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, on-board computer switch**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Cruise-control/ACC ON/OFF button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, cruise-control/ACC ON/OFF button** , Signal not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Cruise-control/ACC ON/OFF button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, cruise-control/ACC ON/OFF button** , Signal not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Cruise-control/ACC ON/OFF button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, cruise-control/ACC ON/OFF button** , Signal not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Cruise control/adaptive cruise control (ACC) switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, cruise-control/ACC switch** , Signal not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Cruise control/adaptive cruise control (ACC) switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, cruise-control/ACC switch** , Signal not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Cruise control/adaptive cruise control (ACC) switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, cruise-control/ACC switch** , Signal not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Cruise control/adaptive cruise control (ACC) switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, cruise-control/ACC switch** , Signal not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Horn button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Button is stuck or permanently actuated.
- **Voltage value, horn button**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Voice-control button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, Voice-control button**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Rocker switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, rocker switch**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Rocker switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, rocker switch**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Steering-wheel heater

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Short circuit to ground
- Open circuit
- Current consumption Too high
- Current consumption too low

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Steering-wheel heater

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Short circuit to ground
- Open circuit
- Current consumption Too high
- Current consumption too low

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Steering-wheel heater

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Short circuit to ground
- Open circuit
- Current consumption Too high
- Current consumption too low

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Steering-wheel heater

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Short circuit to ground
- Open circuit
- Current consumption Too high
- Current consumption too low

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Steering-wheel heating switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Button is stuck or permanently actuated.
- **Voltage value, steering-wheel heating switch**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Steering-wheel heating switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Button is stuck or permanently actuated.
- **Voltage value, steering-wheel heating switch**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Steering-wheel temperature sensor

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Open circuit
- Signal implausible

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Steering-wheel temperature sensor

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Open circuit
- Signal implausible

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Windshield washer system (SRA) switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, headlight washer system button**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Remote control

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Signal implausible
- Short circuit to ground
- no communication

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Remote control

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Signal implausible
- Short circuit to ground
- no communication

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Remote control

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Signal implausible
- Short circuit to ground
- no communication

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Remote control

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Signal implausible
- Short circuit to ground
- no communication

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Remote control

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Signal implausible
- Short circuit to ground
- no communication

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Remote control

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Signal implausible
- Short circuit to ground
- no communication

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Multi-function control unit

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Supply voltage**
- no communication

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Multi-function control unit

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- Faulty

Fault effects

Cruise-control/ACC ON/OFF button

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, cruise-control/ACC ON/OFF button** , Signal not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Rear-wiper switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, rear-wiper switch**, not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

ACC rocker switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, ACC rocker switch** , Signal not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

ACC rocker switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, ACC rocker switch** , Signal not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

ACC rocker switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, ACC rocker switch** , Signal not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

ACC rocker switch

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V
- Terminal 15 (via CAN) Active

Fault setting condition(s)

- **Voltage value, ACC rocker switch** , Signal not OK

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Steering wheel electronics control module

Supply voltage

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- **Supply voltage** 8 ... 16 V

Coding

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Coding incorrect or not carried out

Fault effects

♦ No function

Diagnostic information - ParkAssist

ParkAssist ultrasound sensor

DANGER

Increased risk of accidents due to movement of the vehicle!

♦ Never step in front of or behind a vehicle unless it has been secured against rolling by the parking brake and transmission.
♦ The ParkAssist is subject to physical detection limits and does not free the driver from his/her responsibility to be careful.
♦ The system cannot detect short, thin and small obstacles and persons who are lying on the ground. It also cannot detect surfaces with unfavourable reflective characteristics, e.g. snow or glass.

Diagnostic conditions

- Internal function test on ParkAssist control unit
- Ignition on
- Reverse gear or transmission range R selected
- Vehicle speed briefly higher than 14 km/h (9 mph)

Fault setting condition(s)

INFORMATION

Fault entry due to ambient conditions: this fault can also occur if the sensors are heavily soiled, iced-up or have been painted. In addition, intense sound sources such as pneumatic hammers can cause interference.

- Signal lead Short circuit to B+/ground or open circuit in the line
- **Supply line**
- **Ground line**
- **ParkAssist ultrasound sensor** faulty

Fault effects

♦ System switches off
♦ Display in instrument cluster

♦ The system cannot detect short, thin and small obstacles and persons who are lying on the ground. It also cannot detect surfaces with unfavourable reflective characteristics, e.g. snow or glass.

Diagnostic conditions

- Internal function test on ParkAssist control unit
- Ignition on
- Reverse gear or transmission range R selected
- Vehicle speed briefly higher than 14 km/h (9 mph)

Fault setting condition(s)

INFORMATION

Fault entry due to ambient conditions: this fault can also occur if the sensors are heavily soiled, iced-up or have been painted. In addition, intense sound sources such as pneumatic hammers can cause interference.

- Signal lead Short circuit to B+/ground or open circuit in the line
- **Supply line**
- **Ground line**
- **ParkAssist ultrasound sensor** faulty

Fault effects

♦ System switches off
♦ Display in instrument cluster

Diagnostic information - ParkAssist

ParkAssist ultrasound sensor

DANGER

Increased risk of accidents due to movement of the vehicle!

♦ Never step in front of or behind a vehicle unless it has been secured against rolling by the parking brake and transmission.
♦ The ParkAssist is subject to physical detection limits and does not free the driver from his/her responsibility to be careful.
♦ The system cannot detect short, thin and small obstacles and persons who are lying on the ground. It also cannot detect surfaces with unfavourable reflective characteristics, e.g. snow or glass.

Supply voltage Sensors below limit

DANGER

Increased risk of accidents due to movement of the vehicle!

♦ Never step in front of or behind a vehicle unless it has been secured against rolling by the parking brake and transmission.
♦ The ParkAssist is subject to physical detection limits and does not free the driver from his/her responsibility to be careful.
♦ The system cannot detect short, thin and small obstacles and persons who are lying on the ground. It also cannot detect surfaces with unfavourable reflective characteristics, e.g. snow or glass.

ⓘ INFORMATION

● The sensors are supplied with power only when the ignition is switched on and with the Shift lever or selector lever in position R.
● A voltage which is below the required supply voltage may be caused if the resistance of the loads (sensors) is too low

Diagnostic conditions

● Internal function test on ParkAssist control unit
● Ignition on
● Reverse gear or transmission range R selected
● Vehicle speed briefly higher than 14 km/h (9 mph)

Fault setting condition(s)

● Wiring connection between control unit and sensor faulty
(open circuit, short circuit to ground or B+)
● Sensors faulty
● ParkAssist control unit faulty

Fault effects

DANGER

Increased risk of accidents due to movement of the vehicle!

♦ Never step in front of or behind a vehicle unless it has been secured against rolling by the parking brake and transmission.
♦ The ParkAssist is subject to physical detection limits and does not free the driver from his/her responsibility to be careful.
♦ The system cannot detect short, thin and small obstacles and persons who are lying on the ground. It also cannot detect surfaces with unfavourable reflective characteristics, e.g. snow or glass.

Diagnostic conditions

- Internal function test on ParkAssist control unit
- Ignition on
- Reverse gear or transmission range R selected
- Vehicle speed briefly higher than 14 km/h (9 mph)

Fault setting condition(s)

INFORMATION

Fault entry due to ambient conditions: this fault can also occur if the sensors are heavily soiled, iced-up or have been painted. In addition, intense sound sources such as pneumatic hammers can cause interference.

- Signal lead Short circuit to B+/ground or open circuit in the line
- **Supply line**
- **Ground line**
- **ParkAssist ultrasound sensor** faulty

Fault effects

♦ System switches off
♦ Display in instrument cluster

Diagnostic information - ParkAssist

Diagnostic information - ParkAssist

No/incorrect coding

DANGER

Increased risk of accidents due to movement of the vehicle!

♦ Never step in front of or behind a vehicle unless it has been secured against rolling by the parking brake and transmission.
♦ The ParkAssist is subject to physical detection limits and does not free the driver from his/her responsibility to be careful.
♦ The system cannot detect short, thin and small obstacles and persons who are lying on the ground. It also cannot detect surfaces with unfavourable reflective characteristics, e.g. snow or glass.

ⓘ INFORMATION

● The sensors are supplied with power only when the ignition is switched on and with the Shift lever or selector lever in position R.

Diagnostic conditions

● Internal function test on ParkAssist control unit
● Ignition on
● Reverse gear or transmission range R selected
● Vehicle speed briefly higher than 14 km/h (9 mph)

Fault setting condition(s)

● ParkAssist control unit not coded or incorrect coding/parameters set
● Control unit is in wrong mode (Production) --> Perform coding
● ParkAssist control unit faulty

Fault effects

♦ System does not function
♦ Display in instrument cluster

Diagnostic information - ParkAssist

ParkAssist control unit, supply voltage

⚠DANGER
Increased risk of accidents due to movement of the vehicle!

♦ Never stand in front of or behind a vehicle that has not been secured against rolling away by the parking brake and transmission.
♦ The **ParkAssist** system has physical detection limits. The driver is ultimately responsible for taking utmost care while driving.
♦ The system cannot detect short, thin and small obstacles and persons who are lying on the ground. It also cannot detect surfaces with unfavorable reflective characteristics, e.g. snow or glass.

ⓘ INFORMATION

● The sensors are supplied with power only when the ignition is switched on and with the shift lever or selector lever in position R.

Diagnostic conditions

● Internal function test on **ParkAssist control unit**
● Ignition on
● Reverse gear or transmission range R selected
● Vehicle speed briefly higher than 14 km/h (9 mph)

Fault setting condition(s)

● Supply voltage, overvoltage or undervoltage
● Supply voltage, below limit value
● Supply voltage, above limit value

Possible fault causes

● Fuse (terminal 15) in fuse box faulty
● Faulty line connection between fuse box and **ParkAssist control unit** (open circuit, short circuit to ground)
● Relay (terminal 15) faulty
● Relay (terminal 15) activation faulty
● Main fuse in main fuse box faulty
● Line connection between fuse box and main fuse faulty
● **ParkAssist control unit** faulty

Fault effects

- System switches off
- Display in instrument cluster

Diagnostic information - ParkAssist

Diagnostic information - Front-end electronics

Production mode active

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- One or more production modes or production interventions are activated.
- **Front-end electronics** control unit faulty

Fault effects

♦ Comfort functions: Function not available or available only to a limited extent

Diagnosis information - Front-end electronics

no Engine oil pressure

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on

Fault effects

Front-end electronics No function

Diagnosis information - Front-end electronics

Rpm signal PSM control module, implausible

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **Vehicle speed** v > 10 **km/h**
- **Supply voltage** 7 < u < 18 V

Fault setting condition(s)

- **Wheel speed**: Implausible signal from **PSM control module** for t > 10 s

Fault effects

- **Electronic steering column lock (ELV)** No function

INFORMATION

► **Electronic steering column lock (ELV)** does not lock if Fault is entered passively

Diagnosis information - Front-end electronics

Power supply KESSY control unit

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Power or ground supply faulty

Fault setting condition(s)

- **Supply voltage** < 9 V
- **Supply voltage** > 15 V

Fault effects

KESSY control unit No function

Diagnosis information - Front-end electronics

Power supply KESSY control unit

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Power or ground supply faulty

Fault setting condition(s)

- **Supply voltage** < 9 V
- **Supply voltage** > 15 V

Fault effects

KESSY control unit No function

Diagnosis information - Front-end electronics

Power supply KESSY control unit

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Power or ground supply faulty

Fault setting condition(s)

- **Supply voltage** < 9 V
- **Supply voltage** > 15 V

Fault effects

KESSY control unit No function

Diagnosis information - Front-end electronics

Power supply KESSY control unit

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Power or ground supply faulty

Fault setting condition(s)

- **Supply voltage** < 9 V
- **Supply voltage** > 15 V

Fault effects

KESSY control unit No function

Diagnosis information - Front-end electronics

Ignition lock Open circuit

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on

Fault effects

Front-end electronics No function

Diagnosis information - Front-end electronics

Filler flap Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Open circuit/short circuit to ground
- **Filler-flap servo motor** blocked

Fault effects

♦ **Filler flap** No function

Diagnosis information - Front-end electronics

Horn Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Open circuit/short circuit to ground
- **Horn** Faulty

Fault effects

♦ **Horn** No function

Diagnosis information - Front-end electronics

Front-end electronics Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault effects

- **Front-end electronics** No function

Diagnosis information - Front-end electronics

Steering Limp-home

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on

Fault effects

♦ Steering Limp-home

Diagnosis information - Front-end electronics

Front-end electronics Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault effects

- **Front-end electronics** No function

Diagnosis information - Front-end electronics

Steering Limp-home

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on

Fault effects

♦ Steering Limp-home

Diagnosis information - Front-end electronics

Steering Valve

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

♦ Steering Limited function

Diagnosis information - Front-end electronics

Steering Limp-home

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on

Fault effects

♦ Steering Limp-home

Diagnosis information - Front-end electronics

Steering Valve

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

♦ Steering Limited function

Diagnosis information - Front-end electronics

Steering Valve

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

♦ Steering Limited function

Diagnosis information - Front-end electronics

DME control module Confirmation failed

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Different data **DME control module** <-> **Front-end electronics** during teaching
- **Front-end electronics** incomplete taught

► Teach >component protection< using >PIWIS Tester II< ⇒ >Diagnostics< ⇒ >Online teaching functions<.

Fault effects

♦ no Engine running

Diagnosis information - Front-end electronics

Electronic steering column lock (ELV) Confirmation failed

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Implausible signal during **Electronic steering column lock (ELV)** locked

/ unlocked

Fault effects

♦ **Electronic steering column lock (ELV)** locked

/ unlocked not

Possible fault causes

♦ **Electronic steering column lock (ELV)** not to Immobilizer taught

Diagnosis information - Front-end electronics

Rear-end electronics Confirmation failed

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Different data **DME control module** <-> **Rear-end electronics** during teaching
- **Front-end electronics** incomplete taught

Fault effects

♦ Alarm system triggers

Diagnosis information - Front-end electronics

High-voltage power electronics control unit Confirmation failed

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

● Different data **High-voltage power electronics control unit** <-> **Front-end electronics** during teaching
● **Front-end electronics** incomplete taught

Fault effects

♦ no Engine start

Diagnosis information - Rear-end electronics

NOTE

For vehicles with **Porsche Vehicle Tracking System (PVTS)**, see **Tequipment (TEQ) instructions,** main group **9063**!

►This fault code relates to the **Porsche Vehicle Tracking System (PVTS**).
More information is available in attached documents or from the respective service provider.

Diagnosis information - Rear-end electronics

►This fault code relates to the **Porsche Vehicle Tracking System (PVTS**).
More information is available in attached documents or from the respective service provider.

Diagnosis information - Front-end electronics

DME control module Confirmation failed

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Different data **DME control module** <-> **Front-end electronics** during teaching
- **Front-end electronics** incomplete taught

► Teach >component protection< using >PIWIS Tester II< ⇒ >Diagnostics< ⇒ >Online teaching functions<.

Fault effects

♦ no Engine running

Diagnosis information - Front-end electronics

Immobilizer not taught

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Immobilizer not taught

Fault effects

♦ Engine start **not** possible

Diagnosis information - Front-end electronics

Garage door opener Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **Garage door opener** in the **Control module Front-end electronics** coded

Fault setting condition(s)

- **Garage door opener** sends fault signal to **Control module Front-end electronics**

Fault effects

♦ **Garage door opener** No function

Diagnostic information - front-end electronics

Rain/light sensor, voltage

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Above limit value
- Below limit value

Fault effects

Rain/light sensor, no function

Diagnostic information - front-end electronics

Rain/light sensor, voltage

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Above limit value
- Below limit value

Fault effects

Rain/light sensor, no function

Diagnostic information - front-end electronics

Rain/light sensor faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

♦ **Rain/light sensor** faulty

Fault effects

Rain/light sensor, no function

Diagnostic information - front-end electronics

Rain/light sensor faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

♦ **Rain/light sensor** faulty

Fault effects

Rain/light sensor, no function

Diagnosis information - Front-end electronics

Rain sensor no/incorrect coding/calibration

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- **Rain sensor** coded

Fault effects

Rain sensor No function

Diagnosis information - Front-end electronics

Rain sensor Implausible signal

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- **Rain sensor** coded

Fault effects

Rain sensor No function

Diagnosis information - Front-end electronics

Electrically adjustable steering column (EVLS)

⚠CAUTION
Adjustment of the **Electrically adjustable steering column (EVLS)** !
Intervention during the adjustment can cause injuries to the hands or fingers.

♦ Switch the ignition off or disconnect the power supply for the **Electrically adjustable steering column (EVLS)** .

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on

Fault effects

Electrically adjustable steering column (EVLS) No function

Diagnosis information - Front-end electronics

Electrically adjustable steering column (EVLS)

⚠CAUTION
Adjustment of the **Electrically adjustable steering column (EVLS)** !
Intervention during the adjustment can cause injuries to the hands or fingers.

♦ Switch the ignition off or disconnect the power supply for the **Electrically adjustable steering column (EVLS)** .

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on

Fault effects

Electrically adjustable steering column (EVLS) No function

Diagnosis information - Front-end electronics

Electrically adjustable steering column (EVLS)

⚠CAUTION
Adjustment of the **Electrically adjustable steering column (EVLS)** !
Intervention during the adjustment can cause injuries to the hands or fingers.

♦ Switch the ignition off or disconnect the power supply for the **Electrically adjustable steering column (EVLS)** .

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on

Fault effects

Electrically adjustable steering column (EVLS) No function

Diagnosis information - Front-end electronics

Electrically adjustable steering column (EVLS)

⚠CAUTION
Adjustment of the **Electrically adjustable steering column (EVLS)** !
Intervention during the adjustment can cause injuries to the hands or fingers.

♦ Switch the ignition off or disconnect the power supply for the **Electrically adjustable steering column (EVLS)** .

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on

Fault effects

Electrically adjustable steering column (EVLS) No function

Diagnosis information - Front-end electronics

Electrically adjustable steering column (EVLS)

⚠CAUTION
Adjustment of the **Electrically adjustable steering column (EVLS)** !
Intervention during the adjustment can cause injuries to the hands or fingers.

♦ Switch the ignition off or disconnect the power supply for the **Electrically adjustable steering column (EVLS)** .

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on

Fault effects

Electrically adjustable steering column (EVLS) No function

Diagnosis information - Front-end electronics

Switch Electrically adjustable steering column (EVLS)

⚠CAUTION
Adjustment of the **Electrically adjustable steering column (EVLS)** !
Intervention during the adjustment can cause injuries to the hands or fingers.

♦ Switch the ignition off or disconnect the power supply for the **Electrically adjustable steering column (EVLS)** .

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on

Fault effects

Electrically adjustable steering column (EVLS) No function

Diagnosis information - Front-end electronics

Electrically adjustable steering column (EVLS) no/incorrect coding/calibration

⚠CAUTION
Adjustment of the **Electrically adjustable steering column (EVLS)** !
Intervention during the adjustment can cause injuries to the hands or fingers.

♦ Switch the ignition off or disconnect the power supply for the **Electrically adjustable steering column (EVLS)** .

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ **Electrically adjustable steering column (EVLS)** not coded
♦ **Electrically adjustable steering column (EVLS)** not calibrated

Fault effects

Electrically adjustable steering column (EVLS) No function

Diagnosis information - Front-end electronics

Wiper Voltage

⚠CAUTION
Wiper motor start-up!
Danger of injury to hands and fingers when working on the wiper mechanism when the engine is running!

♦ Switch ignition off and/or disconnect the power supply for the wiper motor.

NOTE
Risk of damage to components!
Risk of damage to paintwork on the hood and wiper arms.

♦ The wiper arms may touch the hood if the hood is open and the wiper motor is running.
♦ Do not open the hood/engine compartment lid when the wiper arms are raised - risk of damage to paintwork and mechanism.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Limit exceeded
- Below limit

Fault effects

♦ **Wiper** No function

Diagnosis information - Front-end electronics

Wiper Voltage

⚠CAUTION
Wiper motor start-up!
Danger of injury to hands and fingers when working on the wiper mechanism when the engine is running!

♦ Switch ignition off and/or disconnect the power supply for the wiper motor.

NOTE
Risk of damage to components!
Risk of damage to paintwork on the hood and wiper arms.

♦ The wiper arms may touch the hood if the hood is open and the wiper motor is running.
♦ Do not open the hood/engine compartment lid when the wiper arms are raised - risk of damage to paintwork and mechanism.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Limit exceeded
- Below limit

Fault effects

♦ **Wiper** No function

Diagnosis information - Front-end electronics

Wiper overload

⚠CAUTION
Wiper motor start-up!
Danger of injury to hands and fingers when working on the wiper mechanism when the engine is running!

♦ Switch ignition off and/or disconnect the power supply for the wiper motor.

NOTE
Risk of damage to components!
Risk of damage to paintwork on the hood and wiper arms.

♦ The wiper arms may touch the hood if the hood is open and the wiper motor is running.
♦ Do not open the hood/engine compartment lid when the wiper arms are raised - risk of damage to paintwork and mechanism.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Fault setting condition(s)

● Overload protection: Permanently above limit value (> 4 seconds)

Possible fault causes

♦ **Wiper motor** blocked / Faulty
♦ **Wiper linkage** blocked / mechanically sluggish
♦ **Wiper arm** blocked / mechanically sluggish

Diagnosis information - Front-end electronics

Wiper no communication

⚠CAUTION
Wiper motor can come on!
Danger of injury to hands and fingers when working on the wiper mechanism when the engine is running!

♦ Switch ignition off and/or disconnect the power supply for the wiper motor.

NOTE
Risk of damage to parts!
Risk of damage to paintwork on the hood and wiper arms.

♦ The wiper arms can touch the hood if the hood is open and the wiper motor is running.
♦ Do not open the hood/engine compartment lid when the wiper arms are raised - risk of damage to paintwork and mechanism.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ No power supply for the **Wiper** or only limited power supply available.
♦ Open circuit in LIN line between the **Front-end electronics** control unit and the **Wiper**
♦ **Wiper** faulty

Fault setting condition(s)

● No communication with the **Wiper** for t > 4 s

Fault effects

● **Wiper**: Function not available or available only to a limited extent

Diagnosis information - Front-end electronics

Wiper Faulty

⚠CAUTION
Wiper motor can come on!
Danger of injury to hands and fingers when working on the wiper mechanism when the engine is running!

♦ Switch ignition off and/or disconnect the power supply for the wiper motor.

NOTE
Risk of damage to parts!
Risk of damage to paintwork on the hood and wiper arms.

♦ The wiper arms can touch the hood if the hood is open and the wiper motor is running.
♦ Do not open the hood/engine compartment lid when the wiper arms are raised - risk of damage to paintwork and mechanism.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ **Wiper** Faulty

Fault setting condition(s)

● **Wiper** reports fault for t > 4 s

Fault effects

Wiper No function

Diagnosis information - Front-end electronics

Window washer system pump Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on

Fault effects

Window washer system pump No function

Diagnosis information - Front-end electronics

Rain sensor no communication

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **Rain sensor** coded

Possible fault causes

♦ No power supply for the **Rain sensor** or only limited power supply available.
♦ Open circuit in LIN line between the **Front-end electronics** control unit and the **Rain sensor**
♦ **Rain sensor** faulty

Fault setting condition(s)

- No communication with the **Rain sensor** for t > 4 s

Fault effects

- **Rain sensor** No function

Diagnosis information - Front-end electronics

Electronic steering column lock (ELV), Supply voltage (Terminal 30) Below limit

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Open circuit/short circuit to ground
♦ Fuse Faulty

Fault setting condition(s)

- **Supply voltage** Below limit

Fault effects

- **Electronic steering column lock (ELV)** Function not available or available only to a limited extent

Diagnosis information - Front-end electronics

Electronic steering column lock (ELV) Terminal 15

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- Below limit

- The measured value does **not** correspond to setpoint specification

Fault effects

Electronic steering column lock (ELV) not locked

Diagnosis information - Front-end electronics

Electronic steering column lock (ELV) Engine Voltage

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line (supply line) between **Front-end electronics** <-> Engine **Electronic steering column lock (ELV)**

Fault effects

Electronic steering column lock (ELV) Engine No function

Diagnosis information - Front-end electronics

Electronic steering column lock (ELV) Engine Position/s implausible

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on

Fault effects

Electronic steering column lock (ELV) Engine No function

Diagnosis information - Front-end electronics

Electronic steering column lock (ELV) Engine Voltage

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to ground in the Power supply

Fault effects

Electronic steering column lock (ELV) Engine No function

Diagnosis information - Front-end electronics

Locking motor

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- Communication **Electronic steering column lock (ELV)** with **Front-end electronics**

Fault effects

Electronic steering column lock (ELV) No function

Diagnosis information - Front-end electronics

Electronic steering column lock (ELV) Switch implausible

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- **Electronic steering column lock (ELV)** Switch Position/s implausible

Fault effects

Electronic steering column lock (ELV) Engine No function

Diagnosis information - Front-end electronics

Electronic steering column lock (ELV) Switch implausible

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- **Electronic steering column lock (ELV)** Switch Position/s implausible

Fault effects

Electronic steering column lock (ELV) Engine No function

Diagnosis information - Front-end electronics

Engine Electronic steering column lock (ELV) Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Engine **Electronic steering column lock (ELV)** Faulty

Fault effects

Engine **Electronic steering column lock (ELV)** No function

Diagnosis information - Front-end electronics

Electronic steering column lock (ELV) Engine Short circuit Terminal 30

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- **Electronic steering column lock (ELV)** Engine Power or ground supply faulty

Fault effects

Electronic steering column lock (ELV) Engine No function

Diagnosis information - Front-end electronics

Electronic steering column lock (ELV) Engine Short circuit Terminal 30

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- **Electronic steering column lock (ELV)** Engine Power or ground supply faulty

Fault effects

Electronic steering column lock (ELV) Engine No function

Diagnosis information - Front-end electronics

Electronic steering column lock (ELV) Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ **Electronic steering column lock (ELV)** Faulty

Fault effects

Electronic steering column lock (ELV) No function

Diagnosis information - Front-end electronics

Electronic steering column lock (ELV) Motor current Limit exceeded

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Current , - The measured value does **not** correspond to setpoint specification

Fault effects

Electronic steering column lock (ELV) Engine No function

Diagnosis information - Front-end electronics

Electronic steering column lock (ELV) Motor current Limit exceeded

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Current , - The measured value does **not** correspond to setpoint specification

Fault effects

Electronic steering column lock (ELV) Engine No function

Diagnosis information - Front-end electronics

Electronic steering column lock (ELV) Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ **Electronic steering column lock (ELV)** Faulty

Fault effects

Electronic steering column lock (ELV) No function

Diagnosis information - Front-end electronics

Electronic steering column lock (ELV) Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ **Electronic steering column lock (ELV)** Faulty

Fault effects

Electronic steering column lock (ELV) No function

Diagnosis information - Front-end electronics

Electronic steering column lock (ELV) Enabling line, Electrical fault

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+
♦ Short circuit to ground

Fault setting condition(s)

- **Electronic steering column lock (ELV)** Enabling line Faulty

Fault effects

Electronic steering column lock (ELV) No function

Diagnosis information - Front-end electronics

Electronic steering column lock (ELV) Enabling line, Electrical fault

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+
♦ Short circuit to ground

Fault setting condition(s)

- **Electronic steering column lock (ELV)** Enabling line Faulty

Fault effects

Electronic steering column lock (ELV) No function

Diagnosis information - Front-end electronics

Electronic steering column lock (ELV) Motor current Limit exceeded

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Current , - The measured value does **not** correspond to setpoint specification

Fault effects

Electronic steering column lock (ELV) Engine No function

Diagnosis information - Front-end electronics

Relay stuck

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition off
- Feedback activated but Relay **not** activated

Fault effects

Engine start **not** possible

Diagnosis information - Front-end electronics

Relay stuck

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition off
- Feedback activated but Relay **not** activated

Fault effects

Engine start **not** possible

Diagnosis information - Front-end electronics

Relay stuck

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition off
- Feedback activated but Relay **not** activated

Fault effects

Engine start **not** possible

Diagnosis information - Front-end electronics

Relay stuck

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition off
- Feedback activated but Relay **not** activated

Fault effects

Engine start **not** possible

Diagnosis information - Front-end electronics

Relay stuck

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition off
- Feedback activated but Relay **not** activated

Fault effects

Engine start **not** possible

Diagnosis information - Front-end electronics

Relay stuck

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition off
- Feedback activated but Relay **not** activated

Fault effects

Engine start **not** possible

Diagnosis information - Front-end electronics

Output Terminal 15 SV implausible

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on
- Current **Control module** Output Too high

Fault effects

Engine start **not** possible

Diagnosis information - Front-end electronics

Keys Position/s implausible

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Keys in the **Ignition lock**
- Switch **Ignition lock** internal , Position implausible

Fault effects

Engine start **not** possible

Diagnosis information - Front-end electronics

Electronic ignition starting switch Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Keys in the **Ignition lock**

Possible fault causes

- ♦ Switch in the **Ignition lock** faulty
- ♦ Short circuit to B+/ground or open circuit in the line

Fault effects

Engine start **not** possible

Diagnosis information - Front-end electronics

Electronic ignition starting switch Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Keys in the **Ignition lock**

Possible fault causes

- Switch in the **Ignition lock** faulty
- Short circuit to B+/ground or open circuit in the line

Fault effects

Engine start **not** possible

Diagnosis information - Front-end electronics

Electronic ignition starting switch Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Keys in the **Ignition lock**

Possible fault causes

- Switch in the **Ignition lock** faulty
- Short circuit to B+/ground or open circuit in the line

Fault effects

Engine start **not** possible

Diagnosis information - Front-end electronics

Electronic ignition starting switch Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Keys in the **Ignition lock**

Possible fault causes

- Switch in the **Ignition lock** faulty
- Short circuit to B+/ground or open circuit in the line

Fault effects

Engine start **not** possible

Diagnosis information - Front-end electronics

Electronic ignition starting switch Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Keys in the **Ignition lock**

Possible fault causes

- Switch in the **Ignition lock** faulty
- Short circuit to B+/ground or open circuit in the line

Fault effects

Engine start **not** possible

Diagnosis information - Front-end electronics

Electronic ignition starting switch Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Keys in the **Ignition lock**

Possible fault causes

- Switch in the **Ignition lock** faulty
- Short circuit to B+/ground or open circuit in the line

Fault effects

Engine start **not** possible

Diagnosis information - Front-end electronics

Electronic ignition starting switch Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Keys in the **Ignition lock**

Possible fault causes

- Switch in the **Ignition lock** faulty
- Short circuit to B+/ground or open circuit in the line

Fault effects

Engine start **not** possible

Diagnosis information - Front-end electronics

Electronic ignition starting switch Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Keys in the **Ignition lock**

Possible fault causes

- Switch in the **Ignition lock** faulty
- Short circuit to B+/ground or open circuit in the line

Fault effects

Engine start **not** possible

Diagnosis information - Front-end electronics

Electronic ignition starting switch Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Keys in the **Ignition lock**

Possible fault causes

- Switch in the **Ignition lock** faulty
- Short circuit to B+/ground or open circuit in the line

Fault effects

Engine start **not** possible

Diagnosis information - Front-end electronics

Electronic ignition starting switch Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Keys in the **Ignition lock**

Possible fault causes

- Switch in the **Ignition lock** faulty
- Short circuit to B+/ground or open circuit in the line

Fault effects

Engine start **not** possible

Diagnosis information - Front-end electronics

Electronic ignition starting switch Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Keys in the **Ignition lock**

Possible fault causes

- Switch in the **Ignition lock** faulty
- Short circuit to B+/ground or open circuit in the line

Fault effects

Engine start **not** possible

Diagnosis information - Front-end electronics

Electronic ignition starting switch Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Keys in the **Ignition lock**

Possible fault causes

- Switch in the **Ignition lock** faulty
- Short circuit to B+/ground or open circuit in the line

Fault effects

Engine start **not** possible

Diagnosis information - Front-end electronics

Heating Windscreen washer system spray nozzle Short circuit

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ **Supply line Front-end electronics** <-> **Windscreen washer system spray nozzle**: Short circuit to ground

Fault effects

Heating **Windscreen washer system spray nozzle** No function

Diagnosis information - Front-end electronics

Direction indicator light Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

Direction indicator light No function

Diagnosis information - Front-end electronics

Direction indicator light Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

Direction indicator light No function

Diagnosis information - Front-end electronics

Direction indicator light Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

Direction indicator light No function

Diagnosis information - Front-end electronics

Direction indicator light Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

Direction indicator light No function

Diagnosis information - Front-end electronics

Side direction indicator Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

Side direction indicator No function

Diagnosis information - Front-end electronics

Side direction indicator Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

Side direction indicator No function

Diagnosis information - Front-end electronics

Side light Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on

Fault effects

Side light No function

Diagnosis information - Front-end electronics

Side light Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Fault setting condition(s)

- Ignition on

Fault effects

Side light No function

Diagnosis information - Front-end electronics

Dipped beam headlight Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

Dipped beam headlight No function

Diagnosis information - Front-end electronics

Dipped beam headlight Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

Dipped beam headlight No function

Diagnosis information - Front-end electronics

High beam Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

High beam No function

Diagnosis information - Front-end electronics

High beam Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

High beam No function

Diagnosis information - Front-end electronics

Auxiliary high beam headlight Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

Auxiliary high beam headlight No function

Diagnosis information - Front-end electronics

Auxiliary high beam headlight Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

Auxiliary high beam headlight No function

Diagnosis information - Front-end electronics

Side direction indicator Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

Side direction indicator No function

Diagnosis information - Front-end electronics

Side direction indicator Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

Side direction indicator No function

Diagnosis information - Front-end electronics

Dipped-beam screen Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

Headlight cover No function

Diagnosis information - Front-end electronics

Dipped-beam screen Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

Headlight cover No function

Diagnosis information - Front-end electronics

Servo motor for headlight beam adjustment Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line
♦ **Servo motor for headlight beam adjustment** Faulty

Fault effects

Servo motor for headlight beam adjustment No function

Diagnosis information - Front-end electronics

Servo motor for headlight beam adjustment Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line
♦ **Servo motor for headlight beam adjustment** Faulty

Fault effects

Servo motor for headlight beam adjustment No function

Diagnosis information - Front-end electronics

Angle sensor Headlight beam adjustment not calibrated

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- **Angle sensor Headlight beam adjustment** not calibrated

Fault effects

Headlight beam adjustment No function

Diagnostic information - front-end electronics

Headlight beam adjustment angle sensor - short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Short circuit to B+/ground or open circuit in the line

Fault finding notes

- Separate lines for power supply and signal transmission between the sensor and control unit

Fault effects

♦ Headlight beam adjustment does not function

Diagnostic information - front-end electronics

Headlight beam adjustment angle sensor - short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, clear the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Short circuit to B+/ground or open circuit in the line

Fault finding notes

- Separate lines for power supply and signal transmission between the sensor and control unit

Fault effects

♦ Headlight beam adjustment does not function

Diagnosis information - Front-end electronics

Headlight washer system pump Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground/between lines or open circuit in the lines

Fault effects

Headlight washer system pump No function

Diagnosis information - Front-end electronics

Antenna Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line

Fault effects

- Vehicle access system (KESSY): Function not available or available only to a limited extent

Diagnosis information - Front-end electronics

Antenna Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line

Fault effects

- Vehicle access system (KESSY): Function not available or available only to a limited extent

Diagnosis information - Front-end electronics

Antenna Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line

Fault effects

- Vehicle access system (KESSY): Function not available or available only to a limited extent

Diagnosis information - Front-end electronics

Antenna Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line

Fault effects

- Vehicle access system (KESSY): Function not available or available only to a limited extent

Diagnosis information - Front-end electronics

Antenna Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line

Fault effects

- Vehicle access system (KESSY): Function not available or available only to a limited extent

Diagnosis information - Front-end electronics

Antenna Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line

Fault effects

- Vehicle access system (KESSY): Function not available or available only to a limited extent

Diagnosis information - Front-end electronics

Antenna Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line

Fault effects

- Vehicle access system (KESSY): Function not available or available only to a limited extent

Diagnosis information - Front-end electronics

Front-end electronics Faulty

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault effects

- **Front-end electronics** No function

Diagnosis information - Front-end electronics

Power supply KESSY control unit

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Power or ground supply faulty

Fault setting condition(s)

- **Supply voltage** < 9 V
- **Supply voltage** > 15 V

Fault effects

KESSY control unit No function

Diagnosis information - Front-end electronics

Antenna Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line

Fault effects

- Vehicle access system (KESSY): Function not available or available only to a limited extent

Diagnosis information - Front-end electronics

Proximity sensor Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to B+/ground or open circuit in the line

Fault effects

Vehicle access system (KESSY) via **Proximity sensor** No function

Diagnosis information - Front-end electronics

Proximity sensor Short circuit to B+/ground or open circuit in the line

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

- No/incorrect coding

Fault effects

♦ **Control module Front-end electronics** Limited function

Diagnosis information - Front-end electronics

Electrically adjustable steering column (EVLS) no/incorrect coding/calibration

⚠CAUTION
Adjustment of the **Electrically adjustable steering column (EVLS)** !
Intervention during the adjustment can cause injuries to the hands or fingers.

♦ Switch the ignition off or disconnect the power supply for the **Electrically adjustable steering column (EVLS)** .

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ **Electrically adjustable steering column (EVLS)** not coded
♦ **Electrically adjustable steering column (EVLS)** not calibrated

Fault effects

Electrically adjustable steering column (EVLS) No function

C13001

Diagnosis information - Front-end electronics

Wiper no communication

⚠CAUTION
Wiper motor can come on!
Danger of injury to hands and fingers when working on the wiper mechanism when the engine is running!

♦ Switch ignition off and/or disconnect the power supply for the wiper motor.

NOTE
Risk of damage to parts!
Risk of damage to paintwork on the hood and wiper arms.

♦ The wiper arms can touch the hood if the hood is open and the wiper motor is running.
♦ Do not open the hood/engine compartment lid when the wiper arms are raised - risk of damage to paintwork and mechanism.

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on

Possible fault causes

♦ No power supply for the **Wiper** or only limited power supply available.
♦ Open circuit in LIN line between the **Front-end electronics** control unit and the **Wiper**
♦ **Wiper** faulty

Fault setting condition(s)

● No communication with the **Wiper** for t > 4 s

Fault effects

● **Wiper**: Function not available or available only to a limited extent

Diagnosis information - Front-end electronics

Rain sensor no communication

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- **Rain sensor** coded

Possible fault causes

♦ No power supply for the **Rain sensor** or only limited power supply available.
♦ Open circuit in LIN line between the **Front-end electronics** control unit and the **Rain sensor**
♦ **Rain sensor** faulty

Fault setting condition(s)

- No communication with the **Rain sensor** for t > 4 s

Fault effects

Diagnostic information - Headlights

Control module Programming

⚠WARNING
HBA Xenon: Electric shock and burns from high voltage.

♦ The lights should always be switched off before removing and installing the headlights.
♦ Only operate the gas-discharge lamp when installed in the headlight.
♦ Carry out repair work on the headlight or wiring only with the component removed and separated from the voltage supply.

Diagnostic conditions

- Headlights switched on
- Ignition on

Fault setting condition(s)

- **Control module** Headlights incorrectly programmed
- **Control module** Headlights not programmed
- Incorrect software version left right
- incorrect hardware version left right
- **Control module** not in operating mode

Fault effects

♦ System switches off
♦ Display in instrument cluster

Diagnostic information - Headlight control unit

Control unit, coded incorrectly

⚠ CAUTION
Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas-discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or wiring when the part is removed and disconnected from the power supply.

Diagnostic conditions

- Headlight control unit coded incorrectly
- Ignition on

Possible fault causes

♦ Line connection from **headlight** control unit to headlight housing connector faulty
♦ Wiring at headlight control unit connector Pin 5 and Pin 6 interchanged
♦ Headlight control unit faulty

Diagnostic information - Headlight control unit

Control unit, coded incorrectly

⚠ CAUTION
Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas-discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or wiring when the part is removed and disconnected from the power supply.

Diagnostic conditions

- Headlight control unit coded incorrectly
- Ignition on

Possible fault causes

♦ Line connection from **headlight** control unit to headlight housing connector faulty
♦ Wiring at headlight control unit connector Pin 5 and Pin 6 interchanged
♦ Headlight control unit faulty

80140E

Diagnostic information - Headlights

Control module faulty

⚠WARNING

HBA Xenon: Electric shock and burns from high voltage.

♦ The lights should always be switched off before removing and installing the headlights.

Diagnosis information - headlight control unit

Gas discharge lamp, xenon, power supply

⚠ WARNING

HBA Xenon: Electric shock and burns from high voltage!

- ♦ Wait an appropriate amount of time for cooling
- ♦ Wear suitable protective gloves to protect your hands.

⚠ CAUTION

Danger of injury from high voltage!

- ♦ The light must always be switched off when removing and installing the headlights.
- ♦ The gas discharge lamp may only be operated when installed in the headlight.
- ♦ Only carry out repairs to the headlight or the wiring when the part is removed and disconnected from the power supply.

Diagnostic conditions

- Headlight (xenon) control unit internal function test
- Ignition on

Possible fault causes

- ♦ Wiring harness in headlight faulty (headlight housing)
- ♦ Headlight control unit faulty

802108

Diagnostic information - Headlights

Control module Power supply

⚠WARNING

HBA Xenon: Electric shock and burns from high voltage.

♦ The lights should always be switched off before removing and installing the headlights.
♦ Only operate the gas-discharge lamp when installed in the headlight.
♦ Carry out repair work on the headlight or wiring only with the component removed and separated from the voltage supply.

Diagnostic conditions

- Headlights switched on
- Ignition on

Fault setting condition(s)

- **Control module** Headlights **Power supply**
- Signal Terminal 15
- Signal Terminal 56b

Fault effects

♦ System switches off, Headlights **OFF**

Control module faulty

⚠WARNING

HBA Xenon: Electric shock and burns from high voltage.

♦ The lights should always be switched off before removing and installing the headlights.
♦ Only operate the gas-discharge lamp when installed in the headlight.
♦ Carry out repair work on the headlight or wiring only with the component removed and separated from the voltage supply.

Diagnostic conditions

- Headlights switched on
- Ignition on

Fault setting condition(s)

- **Control module** Headlights faulty

Fault effects

♦ System switches off
♦ Display in instrument cluster

Diagnostic information - Headlight control unit

Power supply to HBA angle sensor (not leveling system)

⚠ CAUTION
Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas-discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or wiring when the part is removed and disconnected from the power supply.

🛈 INFORMATION
♦ The angle sensor (compression) is also referred to as the vehicle level sensor.
♦ The power supply (5 V) for the angle sensors is supplied via the **left headlight control unit**.
♦ HBA (headlight beam adjustment) is also referred to as AHBA (automatic headlight beam adjustment)
♦ In the case of the leveling system, the signal comes from the leveling system control unit via CAN

Diagnostic conditions

- Internal function test on headlight (Xenon) control unit
- Ignition on

Possible fault causes

♦ Supply voltage line connection faulty, contacts faulty
♦ Ground supply line connection faulty, contacts faulty
♦ **Headlight** control unit coded incorrectly
♦ Line connection in headlight housing
♦ Headlight control unit (Xenon)

Diagnostic information - Headlight control unit

Power supply to HBA angle sensor (not leveling system)

⚠ CAUTION
Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas-discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or wiring when the part is removed and disconnected from the power supply.

🛈 INFORMATION
♦ The angle sensor (compression) is also referred to as the vehicle level sensor.
♦ The power supply (5 V) for the angle sensors is supplied via the **left headlight control unit**.
♦ HBA (headlight beam adjustment) is also referred to as AHBA (automatic headlight beam adjustment)
♦ In the case of the leveling system, the signal comes from the leveling system control unit via CAN

Diagnostic conditions

- Internal function test on headlight (Xenon) control unit
- Ignition on

Possible fault causes

♦ Supply voltage line connection faulty, contacts faulty
♦ Ground supply line connection faulty, contacts faulty
♦ **Headlight** control unit coded incorrectly
♦ Line connection in headlight housing
♦ Headlight control unit (Xenon)

Diagnostic information - Xenon headlights

Front compression angle sensor (only for Xenon without **leveling system control unit (PASM)**)

NOTE

♦ On vehicles with level control/PASM, the signal for the vehicle position is generated via the leveling system/PASM control unit. This has four angle sensors for compression.
♦ The signal values are then sent to the headlights via CAN
♦ Calibration takes place in the **leveling system control unit (PASM)**
♦ Calibration takes place in the left Xenon headlight only on vehicles without a **leveling system control unit (PASM)**

Diagnostic conditions

- Headlights switched on
- Ignition on

Fault setting condition(s)

- **Angle sensor** calibration incorrect or not carried out
- >**Commissioning**< function under Maintenance/repairs not performed
- **Angle sensor power supply**

- **Angle sensor** faulty

Fault effects

♦ System switches off
♦ Display in instrument cluster

804208

Diagnostic information - Xenon headlights

Front compression angle sensor (only for Xenon without **leveling system control unit (PASM)**)

NOTE

♦ On vehicles with level control/PASM, the signal for the vehicle position is generated via the leveling system/PASM control unit. This has four angle sensors for compression.
♦ The signal values are then sent to the headlights via CAN
♦ Calibration takes place in the **leveling system control unit (PASM)**
♦ Calibration takes place in the left Xenon headlight only on vehicles without a **leveling system control unit (PASM)**

Diagnostic conditions

- Headlights switched on
- Ignition on

Fault setting condition(s)

- **Angle sensor** calibration incorrect or not carried out
- >**Commissioning**< function under Maintenance/repairs not performed
- **Angle sensor power supply**
- **Angle sensor** signal line faulty
- **Angle sensor** faulty

Fault effects

♦ System switches off

Adaptive Frontlighting System

⚠WARNING

HBA Xenon: Electric shock and burns from high voltage.

♦ The lights should always be switched off before removing and installing the headlights.
♦ Only operate the gas-discharge lamp when installed in the headlight.
♦ Carry out repair work on the headlight or wiring only with the component removed and separated from the voltage supply.

NOTE

Among other things, the **Adaptive Frontlighting System** (AFS) is a dynamic light distribution and is produced by a cylinder that can rotate. It possesses three different positions/contours to change the light/dark limit for ideal highway, motorway and poor-weather lighting.

Diagnostic conditions

- Internal function test on Headlights control unit
- Ignition on
- Driving lights switched on

Fault setting condition(s)

ⓘ INFORMATION

♦ The stepper motor/servo motor for the adaptive frontlighting system (AFS) and its mechanical components and wiring cannot be replaced individually.
The headlight housing must be replaced if repairs are needed.

- Leads Contacts
- **Servo motor Adaptive Frontlighting System** (**Headlight housing**)

Fault effects

♦ **Adaptive Frontlighting System** Function not available or available only to a limited extent

Diagnosis information - headlight control unit

HBA stepper motor

⚠ CAUTION

Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or the wiring when the part is removed and disconnected from the power supply.

Diagnostic conditions

- Headlight (xenon) control unit internal function test
- Ignition on

Possible fault causes

♦ Line connection or contacts to HBA servo motor faulty
♦ HBA stepper motor overheated
♦ HBA stepper motor mechanically blocked
♦ HBA stepper motor faulty
♦ **Headlight** control unit coded incorrectly

Diagnosis information - headlight control unit

Stepper motor HBA version conflict

⚠ CAUTION
Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or the wiring when the part is removed and disconnected from the power supply.

Diagnostic conditions

- Headlight (xenon) control unit internal function test
- Ignition on

Possible fault causes

♦ Software version of HBA stepper motor is not supported by control unit
♦ HBA stepper motor faulty
♦ Headlight control unit wrong software version
♦ Headlight control unit faulty

Diagnosis information - headlight control unit

HBA stepper motor

⚠ CAUTION

Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or the wiring when the part is removed and disconnected from the power supply.

Diagnostic conditions

- Headlight (xenon) control unit internal function test
- Ignition on

Possible fault causes

♦ Line connection or contacts to HBA servo motor faulty
♦ HBA stepper motor overheated
♦ HBA stepper motor mechanically blocked
♦ HBA stepper motor faulty
♦ **Headlight** control unit coded incorrectly

805301

Diagnosis information - headlight control unit

Stepper motor HBA version conflict

⚠ CAUTION
Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or the wiring when the part is removed and disconnected from the power supply.

Diagnostic conditions

- Headlight (xenon) control unit internal function test
- Ignition on

Possible fault causes

♦ Software version of HBA stepper motor is not supported by control unit
♦ HBA stepper motor faulty
♦ Headlight control unit wrong software version
♦ Headlight control unit faulty

805301

Diagnosis information - headlight control unit

Stepper motor HBA switched off

⚠ CAUTION
Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or the wiring when the part is removed and disconnected from the power supply.

Diagnostic conditions

- Headlight (xenon) control unit internal function test
- Ignition on

Possible fault causes

♦ HBA stepper motor version is not supported by control unit
♦ HBA stepper motor switched off due to overtemperature
♦ Supply voltage too low
♦ Headlight control unit wrong software version

Diagnosis information - headlight control unit

HBA stepper motor

⚠ CAUTION

Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or the wiring when the part is removed and disconnected from the power supply.

Diagnostic conditions

- Headlight (xenon) control unit internal function test

Diagnosis information - headlight control unit

Gas discharge lamp, xenon, power supply

⚠ WARNING

HBA Xenon: Electric shock and burns from high voltage!

♦ Wait an appropriate amount of time for cooling
♦ Wear suitable protective gloves to protect your hands.

⚠ CAUTION

Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or the wiring when the part is removed and disconnected from the power supply.

Diagnostic conditions

- Headlight (xenon) control unit internal function test
- Ignition on

Possible fault causes

♦ Wiring harness in headlight faulty (headlight housing)
♦ Headlight control unit faulty

806301

Diagnosis information - headlight control unit

Gas discharge lamp (xenon)

⚠ WARNING

HBA Xenon: Electric shock and burns from high voltage!

♦ Wait an appropriate amount of time for cooling
♦ Wear suitable protective gloves to protect your hands.

⚠ CAUTION

Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or the wiring when the part is removed and disconnected from the power supply.

Diagnostic conditions

- **Headlight** (xenon) control unit internal function test
- Ignition on

Possible fault causes

♦ Line connection from headlight control unit to gas discharge lamp (xenon) faulty
♦ Gas discharge lamp (Xenon) faulty
♦ Headlight control unit faulty

806301

Diagnosis information - headlight control unit

Gas discharge lamp (xenon)

⚠ WARNING

HBA Xenon: Electric shock and burns from high voltage!

♦ Wait an appropriate amount of time for cooling

Diagnostic information - Control module Headlights

Vehicle identification, different Vehicle Identification Number (VIN)
Vehicle Identification Number (VIN) , implausible

⚠ CAUTION

Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas-discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or wiring when the part is removed and disconnected from the power supply.

ⓘ INFORMATION

♦ Calibration is not possible with different/implausible **Vehicle Identification Number (VIN)** .

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on
- Internal function test on headlight (Xenon) control unit

ⓘ NOTE

This fault is set when the Vehicle Identification Number (VIN) entered in the control unit is not the same as the one reported via CAN.
A new control unit receives the Vehicle Identification Number (VIN) when it is connected for the first time.

Fault setting condition(s)

- Coded Vehicle Identification Number (VIN) in the control unit is not the same as the vehicle's VIN sent via CAN.
- Control unit is new, used for the first time or vehicle handover not yet performed.
- Control unit comes from another vehicle.
- Vehicle Identification Number (VIN) not entered correctly in the **Control module** Headlights .

► Check and correct the Vehicle Identification Number (VIN) of the **Control module** Headlights (in the PIWIS Tester ⇒ **Control module** Headlights ⇒ Extended identification ⇒ Chassis number)

Fault effects

♦ System does not function
♦ Display in instrument cluster

C058

Diagnostic information - Headlight control unit

Control unit, coded incorrectly

⚠ CAUTION
Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas-discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or wiring when the part is removed and disconnected from the power supply.

Diagnostic conditions

- Headlight control unit coded incorrectly
- Ignition on

Possible fault causes

♦ Line connection from **headlight** control unit to headlight housing connector faulty
♦ Wiring at headlight control unit connector Pin 5 and Pin 6 interchanged
♦ Headlight control unit faulty

Diagnostic information - Headlight control unit

Stepper motor, dyn. cornering light, version conflict

⚠ **CAUTION**
Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas-discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or wiring when the part is removed and disconnected from the power supply.

ⓘ **INFORMATION**
♦ Software for the stepper motor does not match software for the control unit; software versions are not compatible.
♦ The stepper motor/servo motor for the dynamic cornering light and its mechanical components and wiring cannot be replaced individually.
The headlight housing must be replaced if repairs are needed.

Diagnostic conditions

- Internal function test on headlight (Xenon) control unit
- Ignition on

Possible fault causes

♦ Software version of stepper motor is not supported by control unit
♦ Stepper motor for dynamic cornering light faulty
♦ Headlight control unit has wrong software version
♦ Headlight control unit faulty

805500

Diagnostic information - Headlight control unit

Stepper motor for dyn. cornering light switched off

⚠ CAUTION
Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas-discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or wiring when the part is removed and disconnected from the power supply.

INFORMATION
The stepper motor/servo motor for the dynamic cornering light and its mechanical components and wiring cannot be replaced individually.
The headlight housing must be replaced if repairs are needed.

Diagnostic conditions

- Internal function test on headlight (Xenon) control unit
- Ignition on

Possible fault causes

♦ Mechanism of stepper motor for dyn. cornering light sluggish or blocked
♦ Dynamic cornering light wiring faulty
♦ Stepper motor for dynamic cornering light faulty
♦ Headlight control unit faulty

805500

Diagnostic information - Headlight control unit

Stepper motor for dyn. cornering light, position sensor

⚠ CAUTION
Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas-discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or wiring when the part is removed and disconnected from the power supply.

INFORMATION
The stepper motor/servo motor for the dynamic cornering light and its mechanical components and wiring cannot be replaced individually.
The headlight housing must be replaced if repairs are needed.

Diagnostic conditions

- Internal function test on headlight (Xenon) control unit
- Ignition on

Possible fault causes

♦ Mechanism of stepper motor for dyn. cornering light sluggish or blocked
♦ Dynamic cornering light wiring faulty
♦ Stepper motor for dynamic cornering light faulty
♦ Headlight control unit faulty

Diagnostic information - Headlight control unit

Stepper motor, dyn. cornering light, version conflict

⚠ CAUTION
Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas-discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or wiring when the part is removed and disconnected from the power supply.

🛈 INFORMATION
♦ Software for the stepper motor does not match software for the control unit; software versions are not compatible.
♦ The stepper motor/servo motor for the dynamic cornering light and its mechanical components and wiring cannot be replaced individually.
The headlight housing must be replaced if repairs are needed.

Diagnostic conditions

- Internal function test on headlight (Xenon) control unit
- Ignition on

Possible fault causes

♦ Software version of stepper motor is not supported by control unit
♦ Stepper motor for dynamic cornering light faulty
♦ Headlight control unit has wrong software version
♦ Headlight control unit faulty

Diagnostic information - Headlight control unit

Stepper motor for dyn. cornering light switched off

⚠ CAUTION
Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas-discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or wiring when the part is removed and disconnected from the power supply.

🛈 INFORMATION
The stepper motor/servo motor for the dynamic cornering light and its mechanical components and wiring cannot be replaced individually.
The headlight housing must be replaced if repairs are needed.

Diagnostic conditions

- Internal function test on headlight (Xenon) control unit
- Ignition on

Possible fault causes

♦ Mechanism of stepper motor for dyn. cornering light sluggish or blocked
♦ Dynamic cornering light wiring faulty
♦ Stepper motor for dynamic cornering light faulty
♦ Headlight control unit faulty

Diagnostic information - Headlight control unit

Stepper motor for dyn. cornering light, position sensor

⚠ CAUTION
Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas-discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or wiring when the part is removed and disconnected from the power supply.

🛈 INFORMATION
The stepper motor/servo motor for the dynamic cornering light and its mechanical components and wiring cannot be replaced individually.
The headlight housing must be replaced if repairs are needed.

Diagnostic conditions

- Internal function test on headlight (Xenon) control unit
- Ignition on

Possible fault causes

♦ Mechanism of stepper motor for dyn. cornering light sluggish or blocked
♦ Dynamic cornering light wiring faulty
♦ Stepper motor for dynamic cornering light faulty
♦ Headlight control unit faulty

805605

♦ Stepper motor for dynamic cornering light faulty
♦ Headlight control unit faulty

805807

Diagnostic information - Headlights

Bulb stat. Cornering light

⚠WARNING

HBA Xenon: Electric shock and burns from high voltage.

♦ The lights should always be switched off before removing and installing the headlights.
♦ Only operate the gas-discharge lamp when installed in the headlight.
♦ Carry out repair work on the headlight or wiring only with the component removed and separated from the voltage supply.

Diagnostic conditions

- Headlights switched on
- Ignition on

Fault setting condition(s)

- Bulb Cornering light
- Lines/connections

Fault effects

♦ System switches off
♦ Display in instrument cluster

80580B

Diagnostic information - Headlights

Bulb stat. Cornering light

⚠WARNING

HBA Xenon: Electric shock and burns from high voltage.

♦ The lights should always be switched off before removing and installing the headlights.
♦ Only operate the gas-discharge lamp when installed in the headlight.
♦ Carry out repair work on the headlight or wiring only with the component removed and separated from the voltage supply.

Diagnostic conditions

- Headlights switched on
- Ignition on

Fault setting condition(s)

- Bulb Cornering light
- Lines/connections

Fault effects

♦ System switches off
♦ Display in instrument cluster

805904

Diagnosis information - headlight control unit

HBA stepper motor

⚠ CAUTION
Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or the wiring when the part is removed and disconnected from the power supply.

Diagnostic conditions

- Headlight (xenon) control unit internal function test
- Ignition on

Possible fault causes

♦ Line connection or contacts to HBA servo motor faulty
♦ HBA stepper motor overheated
♦ HBA stepper motor mechanically blocked
♦ HBA stepper motor faulty
♦ **Headlight** control unit coded incorrectly

805904

Diagnosis information - headlight control unit

Stepper motor HBA version conflict

⚠ CAUTION

Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or the wiring when the part is removed and disconnected from the power supply.

Diagnostic conditions

- Headlight (xenon) control unit internal function test
- Ignition on

Possible fault causes

♦ Software version of HBA stepper motor is not supported by control unit
♦ HBA stepper motor faulty
♦ Headlight control unit wrong software version
♦ Headlight control unit faulty

805904

Diagnosis information - headlight control unit

Stepper motor HBA switched off

⚠ CAUTION

Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or the wiring when the part is removed and disconnected from the power supply.

Diagnostic conditions

- Headlight (xenon) control unit internal function test
- Ignition on

Possible fault causes

♦ HBA stepper motor version is not supported by control unit
♦ HBA stepper motor switched off due to overtemperature
♦ Supply voltage too low
♦ Headlight control unit wrong software version

Diagnostic information - Headlights

Adaptive Frontlighting System

⚠WARNING

HBA Xenon: Electric shock and burns from high voltage.

♦ The lights should always be switched off before removing and installing the headlights.
♦ Only operate the gas-discharge lamp when installed in the headlight.
♦ Carry out repair work on the headlight or wiring only with the component removed and separated from the voltage supply.

NOTE

Among other things, the **Adaptive Frontlighting System** (AFS) is a dynamic light distribution and is produced by a cylinder that can rotate. It possesses three different positions/contours to change the light/dark limit for ideal highway, motorway and poor-weather lighting.

Diagnostic conditions

- Internal function test on Headlights control unit
- Ignition on
- Driving lights switched on

Fault setting condition(s)

ⓘ INFORMATION

♦ The stepper motor/servo motor for the adaptive frontlighting system (AFS) and its mechanical components and wiring cannot be replaced individually.
The headlight housing must be replaced if repairs are needed.

- Leads Contacts
- **Servo motor Adaptive Frontlighting System** (**Headlight housing**)

Fault effects

Diagnosis information - headlight control unit

Gas discharge lamp, xenon, power supply

⚠ WARNING

HBA Xenon: Electric shock and burns from high voltage!

♦ Wait an appropriate amount of time for cooling
♦ Wear suitable protective gloves to protect your hands.

⚠ CAUTION

Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or the wiring when the part is removed and disconnected from the power supply.

Diagnostic conditions

- Headlight (xenon) control unit internal function test
- Ignition on

Possible fault causes

♦ Wiring harness in headlight faulty (headlight housing)
♦ Headlight control unit faulty

Diagnosis information - headlight control unit

Gas discharge lamp (xenon)

⚠ WARNING

HBA Xenon: Electric shock and burns from high voltage!

♦ Wait an appropriate amount of time for cooling
♦ Wear suitable protective gloves to protect your hands.

⚠ CAUTION

Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or the wiring when the part is removed and disconnected from the power supply.

Diagnostic conditions

- **Headlight** (xenon) control unit internal function test
- Ignition on

Possible fault causes

♦ Line connection from headlight control unit to gas discharge lamp (xenon) faulty
♦ Gas discharge lamp (Xenon) faulty
♦ Headlight control unit faulty

806301

Diagnosis information - headlight control unit

Gas discharge lamp (xenon)

⚠ WARNING

HBA Xenon: Electric shock and burns from high voltage!

♦ Wait an appropriate amount of time for cooling
♦ Wear suitable protective gloves to protect your hands.

⚠ CAUTION

Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or the wiring when the part is removed and disconnected from the power supply.

Diagnostic conditions

- **Headlight** (xenon) control unit internal function test

808308

Diagnostic information - Control module Headlights

Vehicle identification, different Vehicle Identification Number (VIN)
Vehicle Identification Number (VIN) , implausible

⚠ **CAUTION**
Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas-discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or wiring when the part is removed and disconnected from the power supply.

ⓘ **INFORMATION**

♦ Calibration is not possible with different/implausible **Vehicle Identification Number (VIN)** .

Diagnostic conditions
The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

● Ignition on
● Internal function test on headlight (Xenon) control unit

ⓘ **NOTE**
This fault is set when the Vehicle Identification Number (VIN) entered in the control unit is not the same as the one reported via CAN.
A new control unit receives the Vehicle Identification Number (VIN) when it is connected for the first time.

Fault setting condition(s)

● Coded Vehicle Identification Number (VIN) in the control unit is not the same as the vehicle's VIN sent via CAN.
● Control unit is new, used for the first time or vehicle handover not yet performed.
● Control unit comes from another vehicle.
● Vehicle Identification Number (VIN) not entered correctly in the **Control module** Headlights .

► Check and correct the Vehicle Identification Number (VIN) of the **Control module** Headlights (in the PIWIS Tester ⇒ **Control module** Headlights ⇒ Extended identification ⇒ Chassis number)

Fault effects

♦ System does not function
♦ Display in instrument cluster

C058

Diagnostic information - Headlight control unit

Control unit, coded incorrectly

⚠ **CAUTION**
Danger of injury from high voltage!

♦ The light must always be switched off when removing and installing the headlights.
♦ The gas-discharge lamp may only be operated when installed in the headlight.
♦ Only carry out repairs to the headlight or wiring when the part is removed and disconnected from the power supply.

Diagnostic conditions

- Headlight control unit coded incorrectly
- Ignition on

Possible fault causes

♦ Line connection from **headlight** control unit to headlight housing connector faulty
♦ Wiring at headlight control unit connector Pin 5 and Pin 6 interchanged
♦ Headlight control unit faulty

Diagnosis information - Front camera control unit

Front camera control unit

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Function restriction

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Front camera control unit

Fault effects

♦ Function not available or available only to a limited extent

Diagnosis information - Front camera control unit

Front camera control unit

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Fault setting condition(s)

- Function restriction

Fault effects

Front camera glass heating

Diagnostic conditions

The control unit must be active in order to test internal function sequences and diagnosable inputs/outputs.
In the event of a fault, check whether the fault is permanently >present<. To perform the check, erase the fault memory, meet the diagnostic conditions and read out the fault memory again.

- Ignition on

Possible fault causes

♦ Short circuit to ground
♦ Short circuit to B+
♦ Open circuit
♦ Short circuit between the lines

Fault effects

♦ Function not available or available only to a limited extent

Setpoint definitions

NOTE
The specified values and value ranges correspond to the OK state in each case.

Line test

Short circuit to B+:
♦ Setpoint voltage **- 0.5 V ⇒ + 0.5 V**

Short circuit to ground:
♦ Setpoint resistance **> 0.9 MOhm**

Open circuit:
♦ Setpoint resistance **< 2 Ohm**

Short circuit between lines:
♦ Setpoint resistance **> 0.9 MOhm**

000285

C12002

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

C12003

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

C12004

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

C12005

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

C12006

Diagnostic information - valid for all control units

Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

C12207

Diagnostic information - valid for all control units

Communication with control unit

INFORMATION
Communication with the control unit designated in the fault text is/was not possible.

Possible fault causes

♦ The power supply for the designated control unit is not present or is present only to a limited extent.
♦ The CAN line CAN-High and/or CAN-Low is interrupted between the control unit connector of the designated control unit and the first splice behind the control unit.
♦ Control unit faulty

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions of the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

C20000

Diagnostic information - valid for all control units

Communication with CAN bus

INFORMATION
Communication with the CAN bus designated in the fault text is/was not possible.

Possible fault causes

♦ Short circuit of the CAN-High line to ground
♦ Short circuit of the CAN-High line to B+
♦ Short circuit of the CAN-High line to interference signal
♦ Open circuit in the CAN-High line

♦ Short circuit of the CAN-Low line to ground
♦ Short circuit of the CAN-Low line to B+
♦ Short circuit of the CAN-Low line to interference signal
♦ Open circuit in the CAN-Low line

♦ Defective control unit in combination with the designated CAN bus

Fault effects

♦ Cross-vehicle functions are not available
♦ Existing substitute/emergency functions in the control units are active
♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

C20001

♦ Functions in the control units are available only with restrictions
♦ Functions in the control units are not available

Porsche Connect – FAQ (Frequently Asked Questions)

Services: Porsche Connect App, Google Earth®, Google Street View®, Realtime Traffic Information, Apple CarPlay®

Status: November 2015

1. Which SIM card do I need for the connectivity required to use Porsche Connect services?

You can use any standard SIM card that has a data option enabled. To use the LTE (4G) mobile network you also need a suitable 4G/LTE tariff option if you don't already have one. Further information is available from your mobile network provider.

Some SIM cards (especially from Pay As You Go providers) need to be registered/activated before using them for the first time.
Also, if your mobile contract has a data cap you may find that services are restricted or even suspended depending on how much data you've used.

Avoid using a SIM card adapter (e.g. for micro or nano SIMs): vibrations can shake the SIM card out of the adapter and the parts can get jammed in the PCM module.

2. Is there a way to permanently disable the data connection in PCM?

To disable the data connection in PCM:
1. Press the **PHONE** button > press the **OPT** button > select **SET PHONE** > and then **Data connection**.
2. Select **Off** to disable the data connection.

3. How do I know if the data connection is active?

› If the PCM SIM card data connection is active, you will see arrows above the 2G (EDGE)/3G/4G (LTE) display in the status line (bottom left of PCM display).
If the PCM WiFi hotspot data connection is active, you will see the WiFi symbol in the status line (bottom left of PCM display).

4. How much does it cost to use the services after the first 12 months?

› For information on the services, visit www.porsche.com/connect.

5. Is it possible to use a data connection and make a call at the same time?

› If you use the SIM card for a data connection and phone call at the same time, you may temporarily experience restricted service if network quality is poor.
Ideally you should use a SIM card for a data connection and pair your phone with PCM using Bluetooth®.

6. Services (e.g. Realtime Traffic Information) are currently unavailable. What should I do?

› Poor local network quality can result in temporary service loss or restriction.
Make sure there is a data connection by checking that the SIM card is inserted or that the WiFi hotspot is active. If necessary, restart PCM.

7. A service is taking a very long time to update. What might be the reason for this, and what should I do?

› Poor local network quality can result in temporary service loss or restriction.
To get the best from your services we recommend 3G or 4G (LTE) data speeds.

8. If I change my car, will the services I ordered be transferred to the new one?

› Service orders are tied to a specific vehicle. If a car changes ownership, the new owner can use the services until the subscription period expires. You will need to reorder the services for your new vehicle.

9. I'd like to connect my mobile phone to the vehicle to use telephony, but without allowing active services to use the data included in my mobile contract. How can I do this?

Ideally you should use a SIM card for a data connection and pair your phone to PCM via Bluetooth®.
To pair your mobile phone with PCM:

1. Make sure the Bluetooth® function is activated on your mobile phone and in PCM (in PCM, press the **PHONE** button > press the **OPT** button > and select **SET PHONE** > to find Bluetooth).
2. Press the **PHONE** button > and select **Connect phone** > **Search for new phone** in PCM.
PCM generates and displays a six-digit Bluetooth® code which will also be displayed on your mobile phone.
3. Check that the Bluetooth® code displayed on PCM and the phone match, and confirm.

If the phone has paired successfully, PCM displays the number entered (**Keypad** menu).
If you have a Bluetooth® connection with a SIM Access Profile (SAP) your mobile contract may be used for data transfers, so we recommend that you use a separate SIM card in PCM (preferably 4G (LTE) enabled, with a flat-rate data plan).

10. Which services are available in my country?

Service availability and functionality may vary in individual countries.
Information on the availability of the services by country is available from your Porsche Partner.

11. What do I need to be aware of if I go to another country?

To use services in another country or in areas close to the border, you need to activate (and deactivate as necessary) PCM Roaming as follows:
1. Press the **PHONE** button > press the **OPT** button > and select **SET PHONE** > **Data connections**.
2. Check the box to activate roaming (and uncheck the box to deactivate it).

If you receive internet packet data you may incur additional costs depending on your mobile service tariff or how long you stay abroad.
We recommend that you use a flat-rate data plan.

12. How do I set up PCM so that I don’t need to enter my SIM card PIN every time PCM starts?

To deactivate the PCM SIM card PIN request:
1. Press the **PHONE** button > press the **OPT** button > and select **SET PHONE** > **Phone** > **SIM card**.
2. To deactivate the PIN request, check the **Note PIN** box.

13. Where can I find information on which mobile phones are compatible with PCM?

There is a list of selected compatible mobile phones online at www.porsche.com.

14. I can’t pair my mobile phone with PCM. What is the problem?

Make sure the following conditions are met before starting the pairing process:
- Your mobile phone is compatible with PCM. There is a list of selected compatible mobile phones online at www.porsche.com.
- The Bluetooth® function has been activated on both your mobile phone and PCM.

If your mobile phone operating system is Windows® or iOS®, we recommend initiating the connection from the phone:
To do this, search for available devices in your phone’s Bluetooth® menu. To make PCM discoverable, press the **PHONE** button.

In order to start the pairing process, the **Search for phone** display must be visible.
Select PCM from the list of available devices shown on your mobile phone.
(To display the PCM Bluetooth® device name, press the **PHONE** button > press the **OPT** button >
and select **SET PHONE** > **Bluetooth** > **Bluetooth name**.)

15. I'd like to use Apple CarPlay® but the function isn't listed in PCM. What should I do?

1. Make sure the iPhone® you are using has the latest iOS® software installed and that Siri® and Apple CarPlay® have been activated in the settings (we recommend iOS® 8.4 or higher).
2. Disconnect your iPhone® from the USB interface in the centre console and then reconnect it.
Confirm the message asking if you want to use Apple CarPlay®.

If Apple CarPlay® still doesn't work, try changing your USB cable.
Some functions may not always be available in all countries or regions.
For information on availability by country, visit http://www.apple.com/ios/feature-availability/#applecarplay-applecarplay.

16. I'd like to use one of my iPhone® apps in PCM using Apple CarPlay® but the app isn't displayed in PCM. What should I do?

Apps on the iPhone® you are using can only be displayed if they are supported by Apple CarPlay®.
For information on supported apps, visit www.apple.com/ios/carplay.
Some functions may not always be available in all countries or regions.
For information on availability by country, visit http://www.apple.com/ios/feature-availability/#applecarplay-applecarplay.

17. The Porsche Connect app will not start or the app content is not displayed in PCM. What should I do?

❯ Make sure the following conditions are met:

- The Porsche Car Connect app is installed on your mobile phone (you can download it from the Apple® App Store or Google Play®).
- The Porsche Connect app has been started.
- WiFi is activated on your mobile phone.
- WiFi is activated on PCM. Press the **PHONE** button >press the **OPT** button > and select **SET PHONE** > **WiFi settings** > **Activate WiFi**.
- The PCM WiFi access data (**hotspot name** and **hotspot password**) have been correctly entered in your mobile phone's WiFi settings.

1. Press the **HOME** button > and select **Apps**. Available Porsche Connect app content will be displayed.
2. Restart the Porsche Connect app if necessary.

18. How can I check if the Realtime Traffic Information service is activated?

❯ Press the PCM **MAP** button and activate the **Traffic flow** map content using the side menu at the top right-hand edge of the screen. Active map content is shown in red and inactive content in white.
Make sure there is a data connection by checking that the SIM card is inserted or that the WiFi hotspot is active.

19. How do I activate Google Street View®?

❯ Press the PCM **MAP** button and activate the **Google Earth** map content using the side menu at the top right-hand edge of the screen. Active map content is shown in red and inactive content in white. Set the map scale to 100 m and select the Google Street View® symbol to explore the area. Note: This function is not available while driving.

20. Fault diagnosis has reported a fault in PCM.
Can I see which of the components (the central computer and the display control panel) is faulty?

❯ To see whether the display control panel or central computer is faulty you need to run a check with the PIWIS Tester. Error codes, measured values and routines help to determine which component is faulty.

21. Can the PIWIS Tester diagnose vehicle-specific Porsche Connect errors (e.g. the USB interface or WiFi, etc.)?

❯ The PIWIS Tester detects electrical hardware faults originating in PCM.
It cannot identify faults originating from an inserted or connected component such as a faulty SIM card or a component connected via USB.
So use the PIWIS tester to check if a component is detected by the system when you connect or insert it.

22. I checked the available documentation for a solution to a Porsche Connect issue but there wasn't one.
What should I do next?

❯ 1. Go through all the steps in the Porsche Connect check list. This is available in the PIWIS Information System under Standard Documents (tile **WM – Workshop Manual** in area 99 under Porsche Connect – 9940).
2. Check that the ticket documentation is complete (see additional check list). This is available in the PIWIS Information System under Standard Documents.
3. Attach the completed checklist in the PRMS or SRM (depending on the type of fault).
4. The importer allocates the ticket as per the standard process, according to the type of error (IT support → SRM or TCC → PRMS)

23. Which fault finding steps should I go through if the customer identifies a suspected malfunction in Porsche Connect online services?

❯ In such cases please use the Porsche Connect troubleshooting process model. This is available in the PIWIS Information System under Standard Documents (tile **WM – Workshop Manual** in area 99 under Porsche Connect – 9940).

24. I'd like to use one of my iPhone® apps in PCM using Apple CarPlay® but the app isn't displayed in PCM. What should I do?

❯ Apps on the iPhone® you are using can only be displayed if they are supported by Apple CarPlay®.
For information on supported apps, visit www.apple.com/ios/carplay.
Please also use the Support Guideline for Apple CarPlay provided by PAG.
This is available in the PIWIS Information System under Standard Documents (tile **WM – Workshop Manual** in area 99 under Porsche Connect – 9940).

25. Porsche Connect services are currently unavailable to the customer. What should I do?

❯ Please use the Support Guideline for backend-based (e.g. Realtime Traffic Information) or app-based (e.g. Porsche Connect app) services.
This is available in the PIWIS Information System under Standard Documents.
Please refer to the service-specific fault finding guidelines for more information. This is available in the PIWIS Information System under Standard Documents (tile **WM – Workshop Manual** in area 99 under Porsche Connect – 9940).

26. What's the difference between the Porsche Car Connect app and the Porsche Connect app?

The Porsche Car Connect app:
Among other things, the app allows you to call up vehicle information remotely and control selected vehicle functions.

The Porsche Connect app:
The app connects the smartphone with PCM and allows it to use functions such as streaming music or transferring a calendar or address book destinations from the smartphone to PCM.

27. When connecting using the SIM card, PCM requests APN (access point) settings. What should I do?

If there are several access points available, the message **Multiple access points (APNs) available** appears on PCM.
A list of the available access points is displayed. In PCM, choose the access point you want to use.

If the SIM card has no access point configured, the system needs to discover the APN settings via your mobile network provider.
Then to configure the APN settings in PCM, select **Configure access point**.
To reset the settings, select the **Reset APN configuration menu**.

Porsche Connect - Fault Finding Guide

Service: “Real Time Traffic Information” (RTTI)

Date: July 2015

General information and initial questions

- Fault Finding Guides help you to locate the causes of faults step by step.
- Before you discuss the Fault Finding Guide with your customers, the following questions help you to carry out fault finding efficiently:

When did the service stop working?	Ambient conditions have a huge influence on the functionality of services. The use of services requires good reception (e.g. reception can be very limited in underground car parks).
How was the online connection established? Via the SIM card in the PCM or via the device (Bluetooth/Wi-Fi)?	Depending on how the online connection was establshed, you will find different test steps that you can use.
Are all services not working or are only individual services affected?	If individual services are not working, please concentrate initially on questions relating to “Checking service-specific or general causes of faults”.

- For correcting faults, please also use the FAQs (Frequently Asked Questions) about Porsche Connect that are provided in the PPN.

- **Checking the online connection when using a SIM card in the vehicle slot**
- **Checking the online connection when using a device via Bluetooth or Wi-Fi**
- **Checking service-specific or general causes of faults**

Checking the online connection when using a SIM card in the vehicle slot

- Check whether there is a SIM card in the vehicle slot
- Check whether the SIM card is defective

Checking the online connection when using a device via Bluetooth or WiFi

Checking service-specific or general causes of faults

Checking the online connection when using a SIM card in the vehicle slot

Check whether there is a SIM card in the vehicle slot

Test step

"Check whether there is a SIM card in the vehicle slot. To do this, lift up the cover flap with the Porsche logo at the centre under your PCM display. Underneath, you will find the SD card slots and the SIM card slot for your Porsche."

Note

This can also be checked on the PCM head unit:
a) status bar, left margin, connection icon, data connection.
b) Connections menu: possible displays: "SIM inserted", "PIN required", "Connect", hotspot name, device name)

Result check

"Is there a SIM card in the vehicle slot in your Porsche?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Insert a suitable SIM card in the vehicle slot of your Porsche and check whether a connection can be established."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the SIM card is defective

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Illustrations: SIM card in vehicle slot

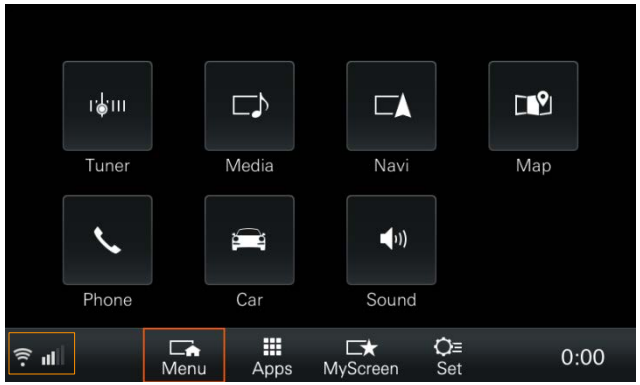

Fig. 1: Home screen on PCM head unit

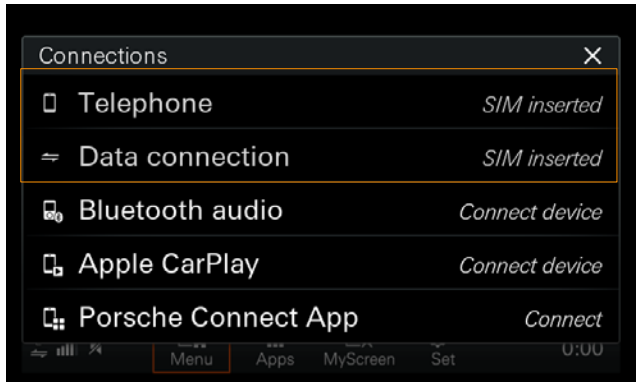

Fig. 2: “Connections” menu, variant 1

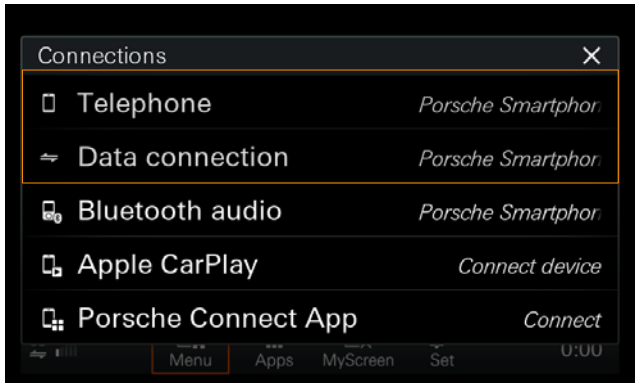

Fig. 3: “Connections” menu, variant 2

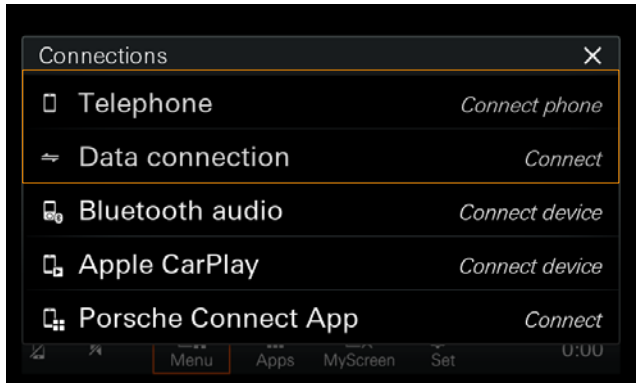

Fig. 4: “Connections” menu, variant 3

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check whether there is a SIM card in the vehicle slot

Check whether the SIM card is defective

Test step

"Insert a different SIM card that you know is working perfectly in the vehicle slot of your Porsche."

Result check

"Is your original SIM card working?

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Please contact your mobile phone service provider and request a new SIM card."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

- **Check the online connection when using a SIM card in the vehicle slot**
- **Check the online connection when using a device via Bluetooth or Wi-Fi**
  - Check whether Bluetooth is activated on your device
  - Check whether Bluetooth is activated on the PCM
  - Check whether Wi-Fi hotspot/mobile internet is activated on your device
  - Check whether Wi-Fi is activated on the PCM
  - Check whether the device is supported
- **Check service-specific or general causes of faults**

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check whether Bluetooth is activated on your device

Test step

"Check whether Bluetooth is activated in your device settings."

Note

If you are connecting for the first time, make sure that the device is visible for other Bluetooth equipment. Please check this in your device settings as well.

Result check

"Is Bluetooth activated on your device?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Activate Bluetooth on your device. If you are trying to connect your device to your Porsche for the first time, switch on Bluetooth and activate your device's visibility option before starting the connection process."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether Bluetooth is activated on the PCM

Check whether Wi-Fi hotspot/mobile internet is activated on your device

Check whether Wi-Fi is activated on the PCM

Check whether the device is supported

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Illustrations: Bluetooth on device

Illustrations show menus on the iPhone 6 as an example

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check whether Bluetooth is activated on your device

Check whether Bluetooth is activated on the PCM

Test step

"Check whether Bluetooth is activated in your PCM settings. You will find the option under:
PHONE -> OPT -> SET PHONE -> Bluetooth -> Disable/enable Bluetooth."

Result check

"Is Bluetooth activated on PCM in your Porsche?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Activate the "Bluetooth" option on PCM in your Porsche."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether Wi-Fi hotspot/mobile internet is activated on your device

Check whether Wi-Fi is activated on the PCM

Check whether the device is supported

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Fig. 14: “WLAN settings” menu on PCM head unit

Check service-specific or general causes of faults

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

- Check whether Bluetooth is activated on your device
- Check whether Bluetooth is activated on the PCM
- Check whether Wi-Fi Hotspot/Mobile Internet is activated on your device
- Check whether WLAN is activated on the PCM
- Check whether the device is supported

Test step

"Please specify the model designation of the device you want to use with your Porsche."

Note

The available documents must be used to check whether and to what extent the customer's device is supported.

Result check

Is the customer's device compatible?

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Your device is not compatible/not fully compatible with all the functions of your Porsche. For the full range of functions, please use a compatible device in your Porsche."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check service-specific or general causes of faults

- **Check the online connection when using a SIM card in the vehicle slot**
- **Check the online connection when using a device via Bluetooth or Wi-Fi**
- **Check service-specific or general causes of faults**
  - Check whether the correct vehicle equipment is installed (Connect package)
  - Check whether the RTTI service is activated in the vehicle
  - Check for simultaneous use of service and phone
  - Check whether the mobile data allowance has been used up
  - Check whether the network quality is poor (tunnel, weather, etc.)
  - Check whether the mobile phone network is down

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Check whether the correct vehicle equipment is installed (Connect package)

Test step

"Please specify the 17-character chassis number (VIN) of your Porsche. You will find this combination of digits and letters under the heading "E" (Germany) in your registration document or at the bottom of the windscreen."

Note

The VIN provided by the customer must be used to check whether the correct equipment is installed in the customer's vehicle.

Result check

Does the customer vehicle have the Connect package installed?

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Unfortunately, the RTTI service is not available for your Porsche. The service can only be used in vehicles with the Porsche Connect package."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the RTTI service is activated in the vehicle

Check for simultaneous use of service and phone

Check whether the mobile data allowance has been used up

Check whether the network quality is poor (tunnel, weather, etc.)

Check whether the mobile phone network is down

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Check whether the correct vehicle equipment is installed (Connect package)

Check whether the RTTI service is activated in the vehicle

Test step

"Check whether you have activated the option for displaying RTTI data. To do this, proceed as follows: Touch "MAP" on your PCM start screen to go to the map display. Touch the white icon (3 layers) at the top right of the screen. A menu bar containing several icons appears. The "Traffic flow" icon shows the traffic flow data of the RTTI service."

Note

If the icon cannot be found at the described position, the customer did not purchase the RTTI service.

Result check

"Is the "Traffic flow" icon orange?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Activate the RTTI service by touching the Traffic flow icon. The RTTI service is activated if the icon is orange."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check for simultaneous use of service and phone

Check whether the mobile data allowance has been used up

Check whether the network quality is poor (tunnel, weather, etc.)

Check whether the mobile phone network is down

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Illustrations: RTTI service activation

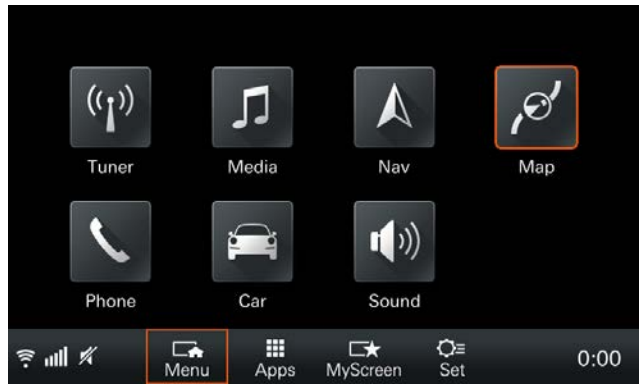

Fig. 15: Home screen of the PCM head unit

Fig. 16: Map view and menu on PCM head unit

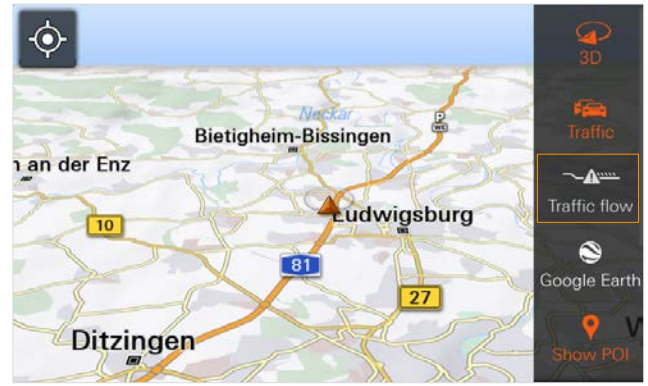

Fig. 17: Map view and menu on PCM head unit

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Check whether the correct vehicle equipment is installed (Connect package)

Check whether the RTTI service is activated in the vehicle

Check for simultaneous use of service and phone

Test step

"Did you make a phone call while using the RTTI service or are you using your data services (e.g. the RTTI service) and the phone with the same SIM card?"

Result check

Were both applications used separately or are both applications used with different SIM cards?

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Availability of the service can sometimes be limited while you are using the phone. Particularly when using the RTTI service and telephone function with one SIM card and if network coverage is bad, the service can be limited temporarily in rare cases."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

Check whether the mobile data allowance has been used up

Check whether the network quality is poor (tunnel, weather, etc.)

Check whether the mobile phone network is down

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

- Check whether the correct vehicle equipment is installed (Connect package)
- Check whether the RTTI service is activated in the vehicle
- Check for simultaneous use of service and phone
- Check whether the mobile data allowance has been used up

Test step

"Please check the status of your monthly data allowance."

Note

If data services (e.g. RTTI) and the telephone are used with the same SIM card, any text message sent by the mobile phone provider concerning the critical status of the monthly data volume will be displayed in the customer's PCM system.
Menu item in PCM for recording usage (PHONE -> OPT -> SET PHONE -> Data connections -> Data usage limit)

Result check

"Is there any data remaining from the monthly data allowance?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Please contact your mobile phone provider in order to increase your data allowance."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

- Check whether the network quality is poor (tunnel, weather, etc.)
- Check whether the mobile phone network is down

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Illustrations: Mobile data allowance

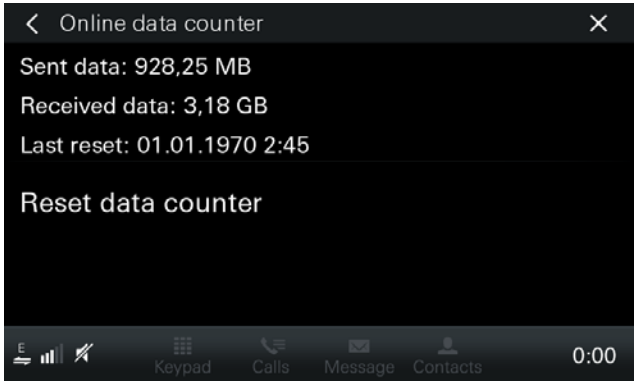

Fig. 20: “Online data counter” menu on PCM head unit

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

- Check whether the correct vehicle equipment is installed (Connect package)
- Check whether the RTTI service is activated in the vehicle
- Check for simultaneous use of service and phone
- Check whether the mobile data allowance has been used up
- Check whether the network quality is poor (tunnel, weather, etc.)

Test step

"Please check the current network reception strength of your Porsche. To do this, check the icon on the left of the status bar."
"Please check the current network reception strength of your device. To do this, check the icon in the status bar at the top of the display."
"At least 2 bars should be displayed here."

Result check

"Is there sufficient reception (at least 2 bars or at least mobile phone standard 3G or E)?"

Yes	The cause was not identified. Continue fault finding with the next test step.
No	"Please move to an area with better reception."

Does the problem persist?

Yes (Next test step) **No** (End fault finding)

- Check whether the mobile phone network is down

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

Illustrations: Poor network quality (tunnel, weather, etc.)

Illustration shows iPhone 6 menu as an example

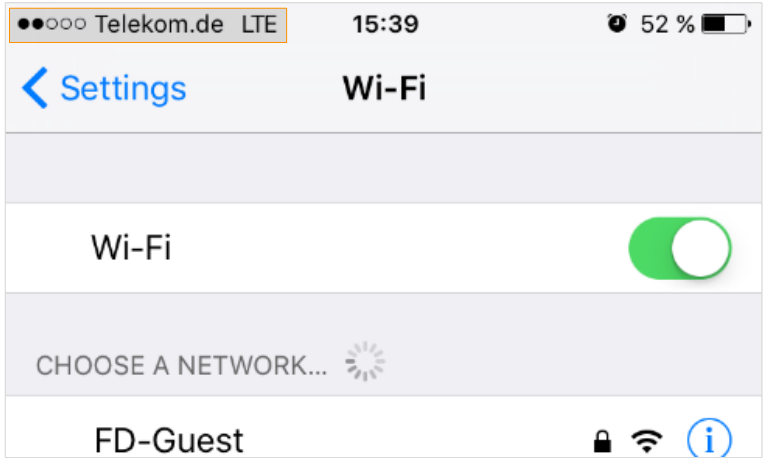

Fig. 22: iOS status bar

Check the online connection when using a SIM card in the vehicle slot

Check the online connection when using a device via Bluetooth or Wi-Fi

Check service-specific or general causes of faults

- Check whether the correct vehicle equipment is installed (Connect package)
- Check whether the RTTI service is activated in the vehicle
- Check for simultaneous use of service and phone
- Check whether the mobile data allowance has been used up
- Check whether the network quality is poor (tunnel, weather, etc.)
- Check whether the mobile phone network is down

Test step

"Please check the current network reception strength of your Porsche. To do this, check the icon on the left of the status bar."
"Please check the current network reception strength of your device. To do this, check the icon in the status bar at the top of the display."

Result check

"Do you have a network signal?"

Yes	The cause was not identified. Refer the customer to the Service department.
No	"Please move to an area with better reception or wait until the problem is fixed. The relevant department has already been informed and is working on resolving the problem."

Does the problem persist?

Yes (Contact the workshop) **No** (End fault finding)

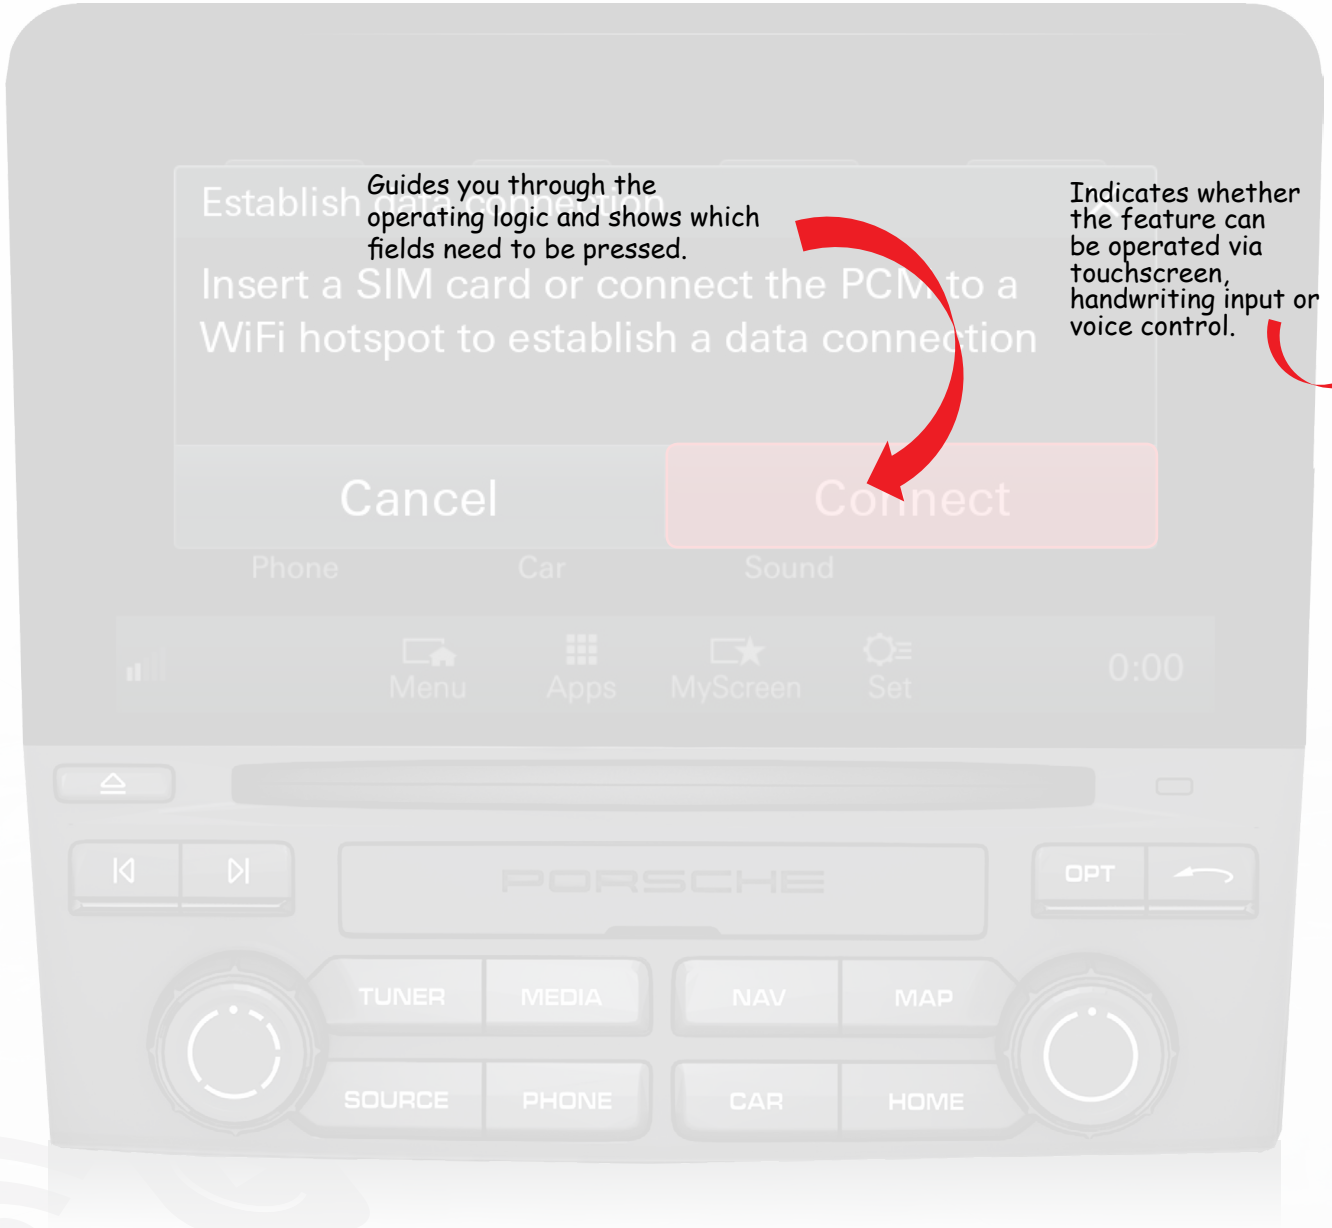
Tutorial

I want to transfer a navigation destination to the PCM.

You can use the Porsche Connect App to transfer [illegible] an iPhone to the PCM. After destinations have been successfully transferred, they can be selected in the PCM and used for navigation.

Shows the title and describes the procedure.



Guides you through the operating logic and shows which fields need to be pressed.

Indicates whether the feature can be operated via touchscreen, handwriting input or voice control.

Prerequisites

PCM

PCM including navigation module

Shows the necessary prerequisites.

Note

Shows further information.

Depending on [illegible] manufacturer and operating system, the coupling procedure may vary

Shows additional information.

Goes back to the previous step.

Back

Shows the end of the chapter and either returns to the contents overview or goes to the next example.

PCM

I want to create a custom start screen.

Back

You can create up to three custom start screens.

Prerequisites

PCM	PCM including navigation module
Connect	Connect Plus

PCM

I want to create a custom start screen.

You can freely configure a start screen by removing and adding individual elements.

First, remove one of the preconfigured elements by pressing and holding your finger on it and dragging it to the right.
